2.	Tilos szennyvíz, szennyvíztiszta, szennyvíztiszta tartalmú komposzt felhasználása.	A	2007. évi CXIX. Törvény 49. § (1) d), e) (NJSZ); 30/2001. (IV. 3.) Korm. Rendelet 4. § (2) (NJSZ) 90/2008. (VII. 18.) FVM rendelet 1. § (1) g), h), (NJSZ); 59/2008. (IV. 29.) FVM rendelet 6. § (3); (JFGK1, HMGY)	Hígtrágya, szennyvíz, szennyvíztiszta csak talajvédelmi célra engedély birtokában használható fel mezőgazdasági területen.	A felsorolt anyagok általánosított használata.	
3.	Az erózióérzékeny területeken dohány, cukorrépa, takarmányrépa, burgonya, csicsóka termesztése tilos.	A	50/2008. (IV. 24.) FVM rendelet 1. számú melléklet (5) (HMKÁ 5)	12%-nál nagyobb lejtésű területen az alábbi kultúrák termesztése tilos: dohány, cukorrépa, takarmányrépa, burgonya, csicsóka.	12 %-nál kisebb lejtésű erózióérzékeny területen a felsorolt növényeket termesztik.	
4.	Talajvizsgálaton alapuló tápanyag-gazdálkodási terv készítése talajszaktől bevonásával.	A	2007. évi CXIX. Törvény 42. § (NJSZ); 59/2008. (IV. 29.) FVM rendelet 6. § (1) (JFGK1, HMGY) 90/2008. (VII. 18.) FVM rendelet 2. § (3) (NJSZ)	A talaj tápanyag-szolgáltatását és a természet növények tápanyagigényét figyelembe véve, környezeti célú tápanyag-gazdálkodást kell folytatni. A műtréztérzékeny területen a tápanyag-gazdálkodás tervezése során a kijutandó tápanyagok mennyiségének meghatározásakor figyelembe kell venni a talaj tápanyag-ellátottságát, a természet növények a termőhely adottságához igazított termésszintjéhez tartozó tápanyagigényét. Egyszerűsített talajvédelmi tervet kell készíteni a mezőgazdasági területen során keletkező nem veszélyes hulladékok termőföldön történő felhasználásának engedélyezésekor.	Nem készült tervszerű tápanyag-szállítás, talajszaktől bevonása nem történik meg.	
5.	Kötelezettségvállalási időszak alatt legalább egy alkalommal szőlőgyeget növény termesztése, vagy állattartás kijuttatása.	A	2007. évi CXIX. Törvény 35. § 39. § (1) e), 42. § (NJSZ)	A talaj tápanyag-szolgáltatását és a természet növények tápanyagigényét figyelembe véve, környezeti célú tápanyag-gazdálkodást kell folytatni. A földhasználatának szerves anyagok kijuttatásával kell gondoskodni a talaj szervesanyag-tartalmának megőrzéséről.	5 éves gyakorisággal ritkábban alkalmaznak, illetve egyáltalán nem alkalmaznak szőlőgyeget, vagy állattartást. A műtrépa használat jellemző.	
6.	A talaj forgatása – beleértve a szervestrágya bedolgozását is – csak a lejtő irányával merőlegesen történhet.	A	2007. évi CXIX. Törvény 36. § (1) ac) (NJSZ)	A földhasználati erózióval veszélyeztetett területen a víz- és szél-erózió megakadályozása érdekében kötelező szántó művelési ágú földrészeleten szántóval művelni folytatni.	Az erózió veszélyének a megnevezése a gyakorlatban szubjektív, a helytelen művelési módok alkalmazása általában csak a terület vízszáfordítálatlan károsodását követően válik nyilvánvalóvá.	
7.	Szántóerő növényvédőszer hatóanyag alkalmazása.	A	2008. évi XLVI. Törvény 5. § (3) (JFGK4) 43/2010. (IV. 23.) FVM rendelet 1. § (3) (JFGK10)	A növényvédelmi tevékenység során tilos a gazdasági növényekre veszélyt nem jelentő szervesanyagok pusztítása, életük rombolása, elterjedését növényvédelmi eszközökkel való akadályozása. A növényvédelmi szempontból hasznos élő szervezetek (beleértve a méheket is) minden fejlődési alakját védeni kell. A felhasználott növényvédőszernek a védekezésnél elérni kívánt célnak leginkább megfelelőnek kell lenniük és a lehető legkevesebb mellékhatással kell járniuk az emberi egészségre, a nem célszervezetekre és a környezetre.	Engedélyezett növényvédőszer és hatóanyagok alkalmazása jellemző, bármilyen további korlátozás nélkül.	

8.	Akkredítált laboratóriumban bővíteni talajvizsgálat elvégzése talajtani szakértő bevonásával.	V	39/2008. (IV. 29.) FVM rendelet 6. § (7) (JFG 1, HMGY)	Nitrástereteken területen a kijuttatandó műtrágya hatóanyag mennyiségét talajvizsgálatokra alaposan kell meghatározni.	Nitrástereteken területen szőlőn talajvizsgálatok elvégzése jellemző. Nitrástereteken területen kívül nem végeznek talajvizsgálatokat, vagy 5 évvel ritkábban teszik azt meg. A bővíteni talajvizsgálat elvégzése nem gyakorlat.	9
9.	Közpérmű létesítés elvégzése a kötelezettségvállalási időszak alatt legalább egy alkalommal.	V	2007. évi CXIX. Törvény 35. §, 36. § (1) ab), 40. § (NJSZ)	Olyan művelési módot kell alkalmazni, amely a talaj szerkesztettségének megőrzésével, a talajtömörödés megakadályozásával, megszüntetésével elősegíti a csapadékvíz talajba jutását a talajtömörödésnek megelőzésével vagy megszüntetésével meg kell akadályozni a káros vízborítást vagy behívó kialakulását.	A szokásos gazdasági gyakorlat a közpérmű szántás jelenti. A talajlázítás nem része a szokásos gazdasági gyakorlatnak.	18
10.	Az alántérítésbe vont teljes területen - az élő szennyezőanyagok és vetőmag kivételével - a talaj maximális mérete 5 ha.	V	1996. évi LIII. Törvény 6. § (2), 7. § (1), 8. § (1) 16. § (1), 17. § (1) (NJSZ)	A vadon élő szervezetek, továbbá ezek állományai, életközösségei megőrzését elősegítő védelmével együtt kell biztosítani. A vadon élő szervezetek élőhelyeinek, azok biológiai sokféleségének megőrzése érdekében minden tevékenységet a természeti értékek és területek kímélésével kell végezni. A tájhasználat és a természeti értékek felhasználása során meg kell őrizni a táj természetes és természetközeli állapotát, továbbá gondoskodni kell a táj esztétikai adottságait és a jellegét meghatározó természeti értékek, természeti rendszerek és az egyedi tájértékek fennmaradásáról. Biztosítani kell a fenntartható használatot, ami magában foglalja a tartamosságot, a természetközeli módszerek alkalmazását és a biológiai sokféleség védelmét.	Jellemzően nagy kiterjedésű szennyezőterületek alakultak ki. A szennyezőterületek háromnegyede 40 ha feletti kiterjedésű.	33
11.	Pillangós szálak takarmánynövények, azok fővető keveréke illetve zöldgáz vagy megfelelő betakarítás szarvasa során kaszálással területet kell hagyni 5-10% természetben, táblaként, kaszálásonként változó helyen, a talaj szelével érintkezően legalább 6 méter szélességben.	V	1996. évi LIII. törvény 8. § (1), 17. § (1) (NJSZ)	A vadon élő szervezetek, továbbá ezek állományai, életközösségei megőrzését elősegítő védelmével együtt kell biztosítani. A vadon élő szervezetek élőhelyeinek, azok biológiai sokféleségének megőrzése érdekében minden tevékenységet a természeti értékek és területek kímélésével kell végezni.	Jellemző gyakorlat a teljes terület egy menetben történő betakarítása.	15
12.	Pillangós szálak takarmánynövények, azok fővető keveréke, illetve zöldgáz vagy megfelelő kaszálása, szarvasa és szarvasa során madárbarát kaszálás (kiszórt kaszálás alkalmazása, vadriasztó lánc és eszközök alkalmazása, max. 5 km/h sebesség).	V	1996. évi LIII. törvény 8. § (1), 17. § (1) (NJSZ)	A vadon élő szervezetek, továbbá ezek állományai, életközösségei megőrzését elősegítő védelmével együtt kell biztosítani. A vadon élő szervezetek élőhelyeinek, azok biológiai sokféleségének megőrzése érdekében minden tevékenységet a természeti értékek és területek kímélésével kell végezni.	Nem gyakorlat a madárbarát kaszálási módok alkalmazása.	6
13.	Növényvédelmi előrejelzés alkalmazása.	V	2008. évi XLVI. Törvény 5. § (3) (JFGK4); 43/2010. (IV. 23.) FVM rendelet 1/A § (1), (3) (JFGK10);	A növényvédelmi tevékenységet a károsítókra célzottan, időben és időben okos módon és eszközzel kell végezni. A védekezésre vonatkozó döntést növényvédelmi előrejelzésre alapozva kell meghozni.	A gyakorlatban növényvédelmi előrejelzés nem ellenőrzés, egyénileg nem szakértői módon történik, illetve nem történik meg. A jogszabályi előírás összefoglalja, hogy az integrált növényvédelem irányelveinek megvalósításakor mire kell törekedni. Ugyanakkor nem kötelező érvényű, vagyis a gyakorlatban a növényvédelmi előrejelzés alkalmazása elmarad.	1

14.	Kötelezettségvállalási időszak alatt növényvédőszer mentes tartós zöldugarméhlegelő szegély fenntartása a bevim terület körületeinek legalább 25 %-án, legalább 3 méter szélességben.	V	1996. évi LIII. törvény 8. § (1), 17. § (1) (NJSZ)	A vadon élő szervezetek, továbbá ezek állományai, életközösségei megőrzését előlélyük védelmével együtt kell biztosítani. A vadon élő szervezetek előlélyeinek, azok biológiai sokféleségének megóvása érdekében minden tevékenységet a természeti értékek és területek kíméletével kell végezni.	Növényvédőszer-mentes szegélyek, zöldugar, vagy méhlegelő nem kerülnek kialakításra.	16
15.	Kötelezettségvállalási időszak alatt növényvédőszer mentes tartós zöldugarméhlegelő szegély fenntartása a bevim terület körületeinek legalább 25 %-án, legalább 6 méter szélességben.	V	1996. évi LIII. törvény 8. § (1), 17. § (1) (NJSZ)	A vadon élő szervezetek, továbbá ezek állományai, életközösségei megőrzését előlélyük védelmével együtt kell biztosítani. A vadon élő szervezetek előlélyeinek, azok biológiai sokféleségének megóvása érdekében minden tevékenységet a természeti értékek és területek kíméletével kell végezni.	Növényvédőszer-mentes szegélyek, zöldugar, vagy méhlegelő nem kerülnek kialakításra.	33
16.	A vetésszerkezetben legalább 15 % szűlőpiliságos takarmánynövény, valamint legalább 5 % zöldugar tartása.	V	1996. évi LIII. Törvény 6. § (2), 7. § (1), 8. § (1) 16. § (1), 17. § (1) (NJSZ)	A vadon élő szervezetek, továbbá ezek állományai, életközösségei megőrzését előlélyük védelmével együtt kell biztosítani. A vadon élő szervezetek előlélyeinek, azok biológiai sokféleségének megóvása érdekében minden tevékenységet a természeti értékek és területek kíméletével kell végezni. A tájhasznosítás és a természeti értékek felhasználása során meg kell őrizni a táj természetes és természetközeli állapotát, továbbá gondoskodni kell a táj esztétikai adottságait és a jellegét meghatározó természeti értékek, természeti rendszerek és az egyedi tájértékek fennmaradásáról. A történelmi kialakított természetvédelmi hasznosítási módok figyelembevételével biztosítani kell a természeti terület használatát és fejlesztését során a táj jellegének, esztétikai, természeti értékeinek, a tájakra jellemző természeti rendszereknek és egyedi tájértékeknek a megőrzését. A mező-, erdő-, nád-, hal-, vadgazdálkodás során biztosítani kell a fenntartható használatot, ami magában foglalja a tartamosságát, a természetközeli módszerek alkalmazását és a biológiai sokféleség védelmét.	Jellemzően aránytalan vetésszerkezet a kukorica/tápanyagforgó irányban.	87
17.	Kötelezettségvállalási időszak alatt további egy alkalommal zöldugarnövény termesztése, vagy állománygya kijuttatása.	V	Id: 5. számú előírás	Id: 5. számú előírás	Id: 5. számú előírás	39
18.	Kiszárolás ellenőrző (fennsárol) szaporítóanyag felhasználása szakmailag elvárható mennyiségben adott területre véve.	V	43/2010. (IV. 23.) FVM rendelet 1/A § (3) (JFGK10)	Reszisztens vagy tolerans növényfajta, fennsárolt vetőmagok és ellenőrző szaporítóanyagok használata	A jogszabályi előírás összefoglalja, hogy az integrált növényvédelem irányelveinek megvalósításakor mire kell törekedni. Ugyanakkor nem kötelező érvény, vagyis a gyakorlatban a szaporítóanyag ellenőrzése nem történik meg.	15
19.	Növényvédelmi és talajvédelmi szakirányú bevonása a gazdálkodásban.	V	43/2010. (IV. 23.) FVM rendelet 1/A § (3) (JFGK10)	A károsítók megfelelő módszerekkel és rendelkezésre álló eszközökkel folyamatosan figyelni kell. A megfelelő eszközök közé tartoznak a helyszínen végzett megfigyelések, tudományosan megalapozott előrejelzési és korai diagnosztikai rendszerek, továbbá szakirányú javaslatának felhasználása.	A jogszabályi előírás összefoglalja, hogy az integrált növényvédelem irányelveinek megvalósításakor mire kell törekedni. Ugyanakkor nem kötelező érvény, vagyis a gyakorlatban a szakirányú bevonása a gazdálkodásban nem történik meg.	4
20.	A kötelezettségvállalási időszak alatt legalább egy alkalommal a területen képződő melléktermékek (különböző szalma- és számaradványok) visszaforgatása a talajba	V	2007. évi CXIX. Törvény 36. § (1) ab, 39. § (1) e (NJSZ)	Olyan művelési módot alkalmazni, amely a talaj szerkezettségének megóvásával, a talajtömörödés megakadályozásával, megakadályozásával elősegíti a csapadékvíz talajba jutását, a földhasználatnak szerves anyagok kijuttatásával kell gondoskodnia a talaj szervesanyag-tartalmának megőrzéséről	A szalma és számaradványok jellemzően elszállításra kerülnek, a tápanyagutánpótlás jellemzően műtrágyával történik	19

Horizontális gyep földhasználati kategória

Sor-szám	Az alintézkedés előírásai	Előírás típusa	A referencia szint jogszabályi azonosítása	A referenciaszint jogszabályi tartalma	Szokásos gazdálkodási gyakorlat meghatározás	A támogatás mértéke euró/ha
21.	Vízrel telített talajon mindennemű gépi munkavégzés tilos.	A	Id: 1. számú előírás	Id: 1. számú előírás	Id: 1. számú előírás	az alapsomag előírásai: 109
22.	Tilos hígtrágya, szennyvíz, szennyvíztisztítási tartalom komposzt felhasználása.	A	Id: 2. számú előírás	Id: 2. számú előírás	Id: 2. számú előírás	
23.	Tápanyag-utánpótlás csak a legelő állatok által elfoglalt területekből származhat, trágya kizárása tilos.	A	1996. évi LIII. törvény 16. § (4) (NJSZ)	Gyepgazdálkodás elősorban a gyepművelés igazodó lehetőségeivel, kaszálással, valamint a vegyi anyagok mértékelt, természetkímélő használatával történhet.	Hozamfokozás szerves vagy műtrágyával megvalósítható.	
24.	A gyepterületeket legelvéssel, illetve kaszálással kell hasznosítani.	A	1996. évi LIII. törvény 16. § (4) (NJSZ); 10/2015. (III. 13.) FM rendelet 2. § b), c) (NJSZ)	Gyepgazdálkodás elősorban a gyepművelés igazodó lehetőségeivel, kaszálással, valamint a vegyi anyagok mértékelt, természetkímélő használatával történhet. A gyepterület, a hasznosítás szempontjából nemkívánatos fás szarvas növényekről mentes kell legyen, rendszeres legelés hiányában tárgyév augusztus 31-ig legalább egyszer ismét kaszálást kell végezni.	A gyepterületek egy része gondozatlan.	
25.	A gyepterület öntözése tilos.	A	1996. évi LIII. törvény 16. § (4) (NJSZ); 50/2008. (IV. 24.) FVM rendelet 1. sz. melléklet 2.1. (HMKÁ 2)	Gyepgazdálkodás elősorban a gyepművelés igazodó lehetőségeivel, kaszálással, valamint a vegyi anyagok mértékelt, természetkímélő használatával történhet. Öntözési célú vízhasználat csak érvényes vízjogi üzemeltetési engedély alapján végezhető.	Hozamfokozás céljából öntözésre sor kerülhet.	
26.	Beltárolásos vízellátás levezetése tilos.	A	1996. évi LIII. törvény, 17. § (3) (NJSZ)	A termőföld hasznosítása, illetve a hasznosításra alkalmazott területek használatát, igénybevétele, meliorációs tervek készítése és végrehajtása, egyéb mezőgazdasági tevékenységek folytatása, valamint a vízgazdálkodás és a vízrendezés során a természetes és természetközeli állapot vízfelületeket, mocsárokat és más vízes élőhelyeket, valamint a mezőgazdasági termelés számára kedvezőtlen termőhelyi adottságú területek természetes növényállományát meg kell őrizni.	Mezőgazdasági termelés számára kedvező területeken a beltárolás elvezetés megvalósítható.	
27.	Napnyugtától napkeletig a gépi munkavégzés tilos.	A	1996. évi LIII. törvény 8. § (1), 17. § (1) (NJSZ)	A vadon élő szervezetek, továbbá ezek állományai, életközösségei megőrzését élőhelyük védelmével együtt kell biztosítani. A vadon élő szervezetek élőhelyeinek, azok biológiai sokféleségének megőrzése érdekében minden tevékenységet a természeti értékek és területek kímélésével kell végezni.	Ejzarkai munkavégzés munkacsoport idején rendszeres.	
28.	Gyepterületen csak szarvasmarha, juh, kecske, szamár, ló, őszvér és bivaly legelhet.	A	1996. évi LIII. törvény 16. § (4) (NJSZ)	Gyepgazdálkodás elősorban a gyepművelés igazodó lehetőségeivel, kaszálással, valamint a vegyi anyagok mértékelt, természetkímélő használatával történhet.	Egyéb hasznosításokat (lőfa) is a gyepre hajtatnak.	
29.	Állategység (legelőterület) megléte: min. 0,2 AE/ha.	A	1996. évi LIII. törvény 16. § (4) (NJSZ); 10/2015. (III. 13.) FM rendelet 2. § d) (NJSZ)	Gyepgazdálkodás elősorban a gyepművelés igazodó lehetőségeivel, kaszálással, valamint a vegyi anyagok mértékelt, természetkímélő használatával történhet. Nem állhat fenn a gyepterület olyan helytelen legelési módokból eredő károsodása (túllegelés), amelyek során az állományalkotó fűfélék rövidke rágása és taposás következtében a gyep foltokban károsult és a talajfelszín fedetlenné válik.	A gyepterületek egy része gondozatlan.	

30.	A terület legalább 5, legfeljebb 10%-át kaszálásonként változó helyen kaszálásról kell hagyni.	V	1996. évi LIII. törvény 16. § (4) (NJSZ); 2 9/2007. (X. 18.) Korm. Rendelet 4. § (1) (JFGK1, 2, JFGK 3); 273/2004. (X. 8.) Korm. Rendelet (JFGK2, JFGK3)	Gyeggyászkodás elősorban a gyepűpuzhoz igazodó lehetőséssel, kaszálással, valamint a vegyi anyagok mérse- kelt, természetidejű használatával történhet. Natura 2000 gyepterületeken a terület legalább 5, legfeljebb 10%-át beletartva a természetvédelmi érdekből hatósági határozattal elrendelt eseti korlátozással érintett földterületeket is – kaszálásonként változó helyen kaszálásról kell hagyni.	Natura 2000 gyepterületeken kívül a takarmány egy menetben történő betakarítása jellemző.	41
31.	A terület legalább 10, legfeljebb 15%-át kaszálásonként változó helyen kaszálásról kell hagyni.	V	Id: 30. számú előírás	Id: 30. számú előírás	Id: 30. számú előírás	62
32.	Madárbarát kaszálás (kiszorító kaszálás alkalmazása, vadriasztó lánc és eszközök alkalmazása, max. 8 km/h sebesség).	V	1996. évi LIII. törvény 16. § (4) (NJSZ); 269/2007. (X. 18.) Korm. Rendelet 5. § (1) (JFGK 2, JFGK, 3)	Gyeggyászkodás elősorban a gyepűpuzhoz igazodó lehetőséssel, kaszálással, valamint a vegyi anyagok mérse- kelt, természetidejű használatával történhet. A kaszálást a kaszáláshoz tartozó terület közepénjéből indulva vagy a táblával mellől, az on elő állatok zavartól mentesen kell elvégezni. A kaszálás során vadriasztó lánc használata kötelező. (Natura 2000 gyepterületeken)	Natura 2000 gyepterületeken kívül nem gyakorolt a madárbarát kaszálási módok alkalmazása.	12
33.	Kaszálási korlátozás időben: Kaszálás június 15. után végezhető.	V	1996. évi LIII. törvény 16. § (4) (NJSZ); 269/2007. (X. 18.) Korm. Rendelet 5. § (3) (JFGK 2, JFGK, 3)	Gyeggyászkodás elősorban a gyepűpuzhoz igazodó lehetőséssel, kaszálással, valamint a vegyi anyagok mérse- kelt, természetidejű használatával történhet. Natura 2000 gyepterületeken a kaszálás tervezett időpontját a tevékenység megkezdése előtt a földhasználatnak legalább öt munkanappal írásban be kell jelentenie a művelési terület szerinti illetékes állami természetvédelmi szervnek.	Natura 2000 gyepterületeken kívül az első kaszálásra általában május elején kerül sor.	21
34.	Legeltetési sűrűség min. 0,2 AE/ha, max. 1,5 AE/ha a gyepék túlleltetési tilalmának figyelembe vételével.	V	1996. évi LIII. törvény 16. § (4) (NJSZ); 10/2015. (III. 13.) FM rendelet 2. § d) (NJSZ)	Gyeggyászkodás elősorban a gyepűpuzhoz igazodó lehetőséssel, kaszálással, valamint a vegyi anyagok mérse- kelt, természetidejű használatával történhet. Nem állhat fenn a gyepterület olyan helytelen legeltetési módból eredő károsodása (túlleltetés), amelynek során az állományalkotó fűfélék rövidke rágása és taposás következtében a gyep foltokban károsult és a talajfelszín fedetlenné válik.	A gyepterületek egy része gondozatlan.	78

41.	Levegőanalízis elvégzése.	V	2007. évi CXIX. törvény 42. § (NJSZ); 59/2008. (IV. 29.) FVM rendelet 6. § (1) (JFGK1, HMGV)	A talaj tápanyag-szolgáltatást és a természet növények tápanyagigényét figyelembe véve, környezeti kímélő tápanyag-gazdálkodást kell folytatni. A nitrátszennyezés területén a tápanyag-gazdálkodás tervezése során a kijuttatandó tápanyagok mennyiségének meghatározásakor figyelembe kell venni a talaj tápanyag-ellátottságát, a természet növények a termőhely adottságaihoz igazított természetjéhez tartozó tápanyagigényét.	Nem készült tervezett tápanyag-számlás.	21
42.	Előrejelzésen - beleértve a szexiferomon csapdák legalább 1 db/2 ha sűrűségű kihelyezését - alapuló növényvédelem alkalmazása.	V	2008. évi XLVI. törvény 5. § (3) (JFGK 4, JFGK 10); 43/2010. (IV. 23.) FVM rendelet 1/A § (1), (3) (JFGK 10)	A növényvédelmi tevékenységet a károsítókra célszerűen, térben és időben előzetesen és eszközökkel kell végezni. A védekezésre vonatkozó döntést növényvédelmi előrejelzésre alapozva kell meghozni. A károsítókat megfelelő módszerekkel és rendelkezésre álló eszközökkel folyamatosan figyelni kell. A megfelelő eszközök közt tartoznak a helyszínen végzett megfigyelések, tudományosan megalapozott előrejelzési és korai diagnosztikai rendszerek, továbbá szakirányú javaslatainak felhasználása.	A gyakorlatban növényvédelmi előrejelzés nem ellenőrzött, egyenlő nem szakértő módon történik, illetve nem történik meg. Nem alkalmaznak szexiferomon csapdákat. A jogszabályi előírás összefoglalja, hogy az integrált növényvédelem irányelveinek megvalósításakor mire kell törekedni. Ugyanakkor nem kötelező érvényű, vagyis a gyakorlatban a csapdák alkalmazása elmarad.	48
43.	Madarodók kihelyezése: 3 db/ha sűrűségben, kihelyezési útmutató alapján.	V	1996. évi LIII. törvény 8. § (1), 17. § (1) (NJSZ)	A vadon élő szervezetek, továbbá ezek állományai, életközösségei megőrzését előhelyük védelmével együtt kell biztosítani. A vadon élő szervezetek előhelyeinek, azok biológiai sokféleségének megóvása érdekében minden tevékenységet a természeti értékek és területek kímélésével kell végezni.	A szokásos gazdálkodási gyakorlatnak nem része a madarodók kihelyezése.	36

44.	1 ml/ha hatékony szelídítő bűvőhely kialakítása.	V	1996. évi LIII. törvény 8. § (1), 17. § (1) (NJSZ)	A vadon élő szervezetek, továbbá ezek állományai, életközösségei megőrzését előhelyük védelmével együtt kell biztosítani. A vadon élő szervezetek előhelyeinek, azok biológiai sokféleségének megóvása érdekében minden tevékenységet a természeti értékek és területek kímélésével kell végezni.	A szokásos gazdálkodói gyakorlatnak nem része hogy a ragadozó rovarok számára bűvőhelyeket alakítsanak ki.	24
45.	Hagyományos gyümölcsös fenntartása 30-150 db/ha, kőzetű állományúval (szőlőültetvény esetében ez az előírás nem alkalmazható).	V	1996. évi LIII. 7. § (1) (NJSZ)	A történelmileg kialakult természetvédelmi hasznosítási módok figyelembevételével biztosítani kell a természeti terület használatát és fejlesztése során a táj jellegének, esztétikai, természeti értékeinek, a tájakra jellemző természeti rendszereknek és egyedi tájértékeknek a megőrzését.	A gazdálkodói gyakorlatban a hagyományos gyümölcsösök kivágásra, felújításra kerülnek, és ezeket ~~szőlőültetvény~~ illetve szuperintenzív ültetvények váltják fel.	179
46.	Növényvédelmi és talajvédelmi szakirányú bevonása a gazdálkodásba.	V	Id: 19. számú előírás	Id: 19. számú előírás	Id: 19. számú előírás	45

A szükséges engedélyeztetés alapján öntözés történik, amely az alintézkedés ezen területi lehatárolásával nem kívánatos.	
62.	Március 1. és július 31. között napoyogtatás napkezdéig gépi munkavégzés tilos.	ZA	1996. évi LIII. törvény 8. § (1), 17. § (1) (NJSZ)	A vadon élő szervezetek, továbbá ezek állományai, életközösségei megőrzését elősegítő védelemmel együtt kell biztosítani. A vadon élő szervezetek élőhelyeinek, azok biológiai sokféleségének megőrzése érdekében minden tevékenységet a természeti értékek és területek kíméletével kell végezni.	Elszakai munkavégzés munkavégzés idején rendszeres.	

63.	Fokozottan védett, földön fészkelő madarak fészkeinek, fészkeinek megalkotása esetén, az haladéktalanul jelezni kell az illetékes állami természetvédelmi szervnek. A megtalált fészkek körül min. 1 ha védőzóna kialakítása.	ZA	1996. évi LIII. törvény 8. § (1), 17. § (1) (NJSZ)	A vadon élő szervezetek, továbbá ezek állományai, életközösségei megőrzését előlélyük védelmével együtt kell biztosítani. A vadon élő szervezetek előlélyeinek, azok biológiai sokféleségének megőrzése érdekében minden tevékenységet a természeti értékek és területek kíméletével kell végezni.	Nincs bejelentési kötelezettség, nem alakítanak ki védőzónát madarak fészkei körül.
64.	Pillangós szalasz takarmányok, azok főves keveréke, illetve szőlőgáz vagy méhlegelő betakarítása, szarvasa során kaszálással területet kell hagyni 5-10% természetben, táblaként, kaszálásokkal valóhoz helyen, a tábla széleivel érintkezően legalább 6 méter szélességben.	ZA	Id: 11. számú előírás	Id: 11. számú előírás	Id: 11. számú előírás
65.	Pillangós szalasz takarmányok, azok főves keveréke, illetve szőlőgáz vagy méhlegelő kaszálása, szarvasa és szarvasa során madárbarát kaszálás (kiszorító kaszálás alkalmazása, vadriasztó lenc és eszközök alkalmazása, max. 8 km/h sebesség).	ZA	Id: 12. számú előírás	Id: 12. számú előírás	Id: 12. számú előírás
66.	A július 31-e előtt végzett kaszálás, szarvasa megkezdése előtt legalább 5 munkanappal írásban, elektronikus úton, illetve e-mail címen be kell jelezni az illetékes állami természetvédelmi szervnek a kaszálás pontos helyét és tervezett kezdési időpontját.	ZA	1996. évi LIII. törvény 8. § (1), 17. § (1) (NJSZ)	A vadon élő szervezetek, továbbá ezek állományai, életközösségei megőrzését előlélyük védelmével együtt kell biztosítani. A vadon élő szervezetek előlélyeinek, azok biológiai sokféleségének megőrzése érdekében minden tevékenységet a természeti értékek és területek kíméletével kell végezni.	A takarmány érettségi fokának megfelelő betakarítás jellemző, hatósági kontroll nélkül.
67.	Kaszálás, szarvasa szőlős legelői időpontja július 1. kivéve az évelő szalasz pillangós takarmányok telepítését követő első kaszálást, mely a nemzeti park, igazgatóság, város nyilatkozata alapján korábbi időpontban is elvégezhető.	ZA	1996. évi LIII. törvény 8. § (1), 17. § (1) (NJSZ)	A vadon élő szervezetek, továbbá ezek állományai, életközösségei megőrzését előlélyük védelmével együtt kell biztosítani. A vadon élő szervezetek előlélyeinek, azok biológiai sokféleségének megőrzése érdekében minden tevékenységet a természeti értékek és területek kíméletével kell végezni.	A takarmány érettségi fokának megfelelő betakarítás jellemző.
68.	A tábla szélein legalább 6 méter széles növényvédőszer-mentes táblaszegélyt kell hagyni.	ZA	1996. évi LIII. törvény 8. § (1), 17. § (1) (NJSZ)	A vadon élő szervezetek, továbbá ezek állományai, életközösségei megőrzését előlélyük védelmével együtt kell biztosítani. A vadon élő szervezetek előlélyeinek, azok biológiai sokféleségének megőrzése érdekében minden tevékenységet a természeti értékek és területek kíméletével kell végezni.	Növényvédőszer-mentes szegélyek nem kerülnek kialakításra.
69.	Rovarölő szerek nem alkalmazhatók, kivéve a repce, a mustar, illetve az olajfák rovarirtását.	ZA	2008. évi XLVI. Törvény 5. § (6) (JFGK 4, JFGK 10) 43/2010. (IV. 23.) FVM rendelet 5. § (3) (JFGK 10)	Engedélyköteles terméket Magyarországon csak az élelmiszerlánc-felügyeleti szerv által kiadott engedély alapján lehet forgalomba hozni és felhasználni. A növényvédő szert a forgalmazás és a felhasználás szempontjából a Nemzeti Élelmiszerlánc-biztonsági Hivatal I., II. és III. forgalmi kategóriába kell sorolja.	Engedélyezett rovarölő szerek rendszeres alkalmazása jellemző.
70.	Rágcsálóirtó szerek és talajfertőtlenítő szerek alkalmazása tilos.	ZA	2008. évi XLVI. Törvény 5. § (6) (JFGK 4, JFGK 10) 43/2010. (IV. 23.) FVM rendelet 5. § (3) (JFGK 10)	Engedélyköteles terméket Magyarországon csak az élelmiszerlánc-felügyeleti szerv által kiadott engedély alapján lehet forgalomba hozni és felhasználni. A növényvédő szert a forgalmazás és a felhasználás szempontjából a Nemzeti Élelmiszerlánc-biztonsági Hivatal I., II. és III. forgalmi kategóriába kell sorolja.	Engedélyezett rágcsálóirtó szerek rendszeres alkalmazása jellemző.

71.	A tematikus előirányzatokhoz tartozó területen élő növényfajok (szilas pillangós takarmánynövények, azok fűves keveréke, zöldugor) termesztése, vagy a kitermesztő vetésszerkezet betartása fővetésű növények tekintetében: legalább 20% kalászos gabona, legalább 20% szilas pillangós takarmánynövény (évelő szilas pillangósok, vagy azok keveréke, illetve fűves keveréke), legalább 20% zöldugor, legalább 10 % ősi káposztarepce, legfeljebb 20% egyéb kultúra	ZA	1996. évi LIII. Törvény 6. § (2), 7. § (1), 8. § (1) 16. § (1), 17. § (1) (NJSZ)	A vadon élő szervezetek, továbbá ezek állományai, életközösségei megőrzését előlélyük védelmével együtt kell biztosítani. A vadon élő szervezetek előlélyeinek, azok biológiai sokféleségének megőrzése érdekében minden tevékenységet a természeti értékek és területek kíméletével kell végezni. A tájhasznosítás és a természeti értékek felhasználása során meg kell őrizni a táj természetes és természetközeli állapotát, továbbá gondoskodni kell a táj esztétikai adottságait és a jellegét meghatározó természeti értékek, természeti rendszerek és az egyedi tájterületek fennmaradásáról. A történelmileg kialakult természetközeli hasznosítási módok figyelembevételével biztosítani kell a természeti terület használatát és fejlesztését során a táj jellegének, esztétikai, természeti értékeinek, a tájakra jellemző természeti rendszereknek és egyedi tájterületeknek a megőrzését. A mező-, erdő-, nád-, hal-, vadgazdálkodás során biztosítani kell a fenntartható használatot, ami magában foglalja a tartamosságot, a természetközeli módok alkalmazását és a biológiai sokféleség védelmét.	Jellemzően aránytalan vetésszerkezet a kukorica/napraforgó irányban.
72.	Repce esetén a teljes repceterületnek az illetékes állami természetvédelmi szerv által kijelölt legalább 5 legfeljebb 10 %-án a madarak téli táplálékának biztosítása érdekében téli holtakartás.	ZA	1996. évi LIII. Törvény 6. § (2), 7. § (1), 8. § (1) 16. § (1), 17. § (1) (NJSZ)	A vadon élő szervezetek, továbbá ezek állományai, életközösségei megőrzését előlélyük védelmével együtt kell biztosítani. A vadon élő szervezetek előlélyeinek, azok biológiai sokféleségének megőrzése érdekében minden tevékenységet a természeti értékek és területek kíméletével kell végezni. A tájhasznosítás és a természeti értékek felhasználása során meg kell őrizni a táj természetes és természetközeli állapotát, továbbá gondoskodni kell a táj esztétikai adottságait és a jellegét meghatározó természeti értékek, természeti rendszerek és az egyedi tájterületek fennmaradásáról. A történelmileg kialakult természetközeli hasznosítási módok figyelembevételével biztosítani kell a természeti terület használatát és fejlesztését során a táj jellegének, esztétikai, természeti értékeinek, a tájakra jellemző természeti rendszereknek és egyedi tájterületeknek a megőrzését. A mező-, erdő-, nád-, hal-, vadgazdálkodás során biztosítani kell a fenntartható használatot, ami magában foglalja a tartamosságot, a természetközeli módok alkalmazását és a biológiai sokféleség védelmét.	A holtakartás nem jellemző, a holtakartás miatt a madarak tápláléka nem biztosított.
73.	A talajfelszín megőrzésével járó gépi munkavégzés április 15. és június 15. között nem végezhető, kivéve a betakarítás utáni tartóztatást.	ZA	1996. évi LIII. törvény 8. § (1), 17. § (1) (NJSZ)	A vadon élő szervezetek, továbbá ezek állományai, életközösségei megőrzését előlélyük védelmével együtt kell biztosítani. A vadon élő szervezetek előlélyeinek, azok biológiai sokféleségének megőrzése érdekében minden tevékenységet a természeti értékek és területek kíméletével kell végezni.	Jellemző a talajmunkák (pl. mechanikai gyomirtás) végzése a fészkelési időszakban.

74.	Evelő növénykultúrák, kalászos gabonák, és szőlőtermesztés során növényvédőszeresek és műtrágya kijuttatása április 15. és július 1. között nem megengedett.	ZA	2009. évi XLVI. Törvény 5. § (6) (JFGK 4, JFGK 10); 43/2010. (IV. 23.) FVM rendelet 5. § (3) (JFGK 10)	Engedélyköteles terméket Magyarországon csak az elemi-szerlánc-felügyeleti szerv által kiadott engedély alapján lehet forgalomba hozni és felhasználni. A növényvédő szer a forgalmazás és a felhasználás szempontjából a Nemzeti Élelmiszerlánc-biztonsági Hivatal I., II. és III. forgalmi kategóriába kell sorolnia.	A növényvédőszeresek és műtrágya kijuttatása ebben az időszakban nem korlátozott, ezért kijuttatásuk alapszabályban megengedett.	
75.	Beltér-időszakos vizális levezetése tilos, melynek területe - a vonatkozó kezelési szabályok betartása mellett - az adott kultúra kiterjedésébe beleszámlázható.	ZA	1996. évi LIII. törvény, 17. § (3) (NISZ)	A termőföld hasznosítása, illetve a hasznosításra alkalmas terület hasznosítása, igénybevétele, meliorációs tervek készítése és végrehajtása, egyéb mezőgazdasági tevékenységek folytatása, valamint a vizsgálatok és a vizsgálatok során a természetes és természetközeli állapotú vízfolyásokat, nádasokat és más vizes élőhelyeket, valamint a mezőgazdasági termelés számára kedvezőtlen termőhelyi adottságú területek természetes növényállományát meg kell őrizni.	Mezőgazdasági termelés számára kedvező területeken a beltér elvezetés megengedett.

248.	Táblánként minimálisan 6 méter szélességű kaszálatlan területet kell kialakítani.	ZA	1996. évi LIII. törvény 8. § (1), 17. § (1) (NJSZ)	A vadon élő szervezetek, továbbá ezek állományai, életközösségei megőrzését előbelyük védelmével együtt kell biztosítani. A vadon élő szervezetek előbelyeinek, azok biológiai sokféleségének megőrzése érdekében minden tevékenységet a természeti értékek és területek kíméletesen kell végezni.	Jellemző gyakorlat a takarmány egy menetben történő teljes betakarítása, kaszálatlan területek meghagyása nélkül.	

249.	A teljes gyepterület legfeljebb 50%-án az illetékes állami természetvédelmi szerv írásos véleménye alapján kíméleti területet kell kijelölni, ahol csak július 1. után folytatható legeltetés illetve kaszálás.	ZA	1996. évi LIII. törvény 8. § (1), 17. § (1) (NJSZ)	A vadon élő szervezetek, továbbá ezek állományai, életközösségei megőrzését előhelyük védelmével együtt kell biztosítani. A vadon élő szervezetek előhelyeinek, azok biológiai sokféleségének megóvása érdekében minden tevékenységet a természeti értékek és területek kíméletével kell végezni.	A takarmány értékei fokozottan meg kellő betápláltság jellemző, hatósági kontroll nélkül.
250.	Madarbarat kaszálás (köznyom kaszálás alkalmazása, vadriasztó lánc és esakörök alkalmazása, max. 8 km/h sebesség).	ZA	Id: 32. számú előírás	Id: 32. számú előírás	Id: 32. számú előírás
251.	A kaszálás megkezdése előtt legalább 5 munkanappal írásban elektronikus úton, illetve e-mail címen be kell jelenteni az illetékes állami természetvédelmi szervnek a kaszálás pontos helyét és tervben kezdési időpontját.	ZA	1996. évi LIII. törvény 16. § (4) (NJSZ), 269/2007. (X. 18.) Korm. Rendelet 5. § (3) (JFGK2, JFGK 3)	Gyepgazdálkodás elõsorban a gyepgushoz igazodó legeltetéssel, kaszálással, valamint a vegyi anyagok mérésével, természetközeli használatával történhet. Natura 2000 gyepterületeken a kaszálás tervben időpontját a tevékenység megkezdése előtt a földhatalnoknak legalább öt munkanappal írásban be kell jelentenie a működési terület szerinti illetékes állami természetvédelmi szervnek.	Natura 2000 gyepterületen kívül nincs kaszálásra vonatkozó bejelentési kötelezettség a védett madarak és fajokkal gyakran sérülnek.
252.	Gyepterületen a szalmas takarmány tarolása a kaszálást követő 30 napon túl tilos.	ZA	1996. évi LIII. törvény 16. § (4) (NJSZ), 269/2007. (X. 18.) Korm. Rendelet 5. § (4) (JFGK2, JFGK 3)	Gyepgazdálkodás elõsorban a gyepgushoz igazodó legeltetéssel, kaszálással, valamint a vegyi anyagok mérésével, természetközeli használatával történhet. Natura 2000 gyepterületeken a szalmas takarmány tarolása a kaszálást követő 30 napon túl tilos.	Natura 2000 gyepterületen kívül a balék a tél folyamán a kaszalt területen maradhatnak, a gyepfelzárás gyakran sérül.
253.	Invasziós és természetközeli növényfajok megtelepedését és terjedését meg kell akadályozni, mechanikus védekezéssel vagy speciális növényvédőszer-kijuttatással.	ZA	269/2007. (X. 18.) Korm. rendelet 5. § (2) (JFGK2, JFGK 3) 10/2015. (III. 13.) FM rendelet 2. § a), b), c) (NJSZ)	Az invazív és természetközeli növényfajok megtelepedését és terjedését meg kell akadályozni, állományuk visszaszorításáról gondoskodni kell mechanikus védekezéssel vagy speciális növényvédőszer-kijuttatással, ezen a technológián túl egyéb vegyszerhasználat tilos. A gyepterületen, a különböző kémiai, fizikai, biológiai – gyomszabályozási módszerek alkalmazásával meg kell akadályozni a gyomnövények, beleértve a veszélyes gyomnövények keletését, a szaporító képletek kialakítását. A gyepterület, a hasznosítás szempontjából nemkívánatos fás szárú növényektől mentes kell legyen, rendszeres legeltetés hiányában tárgyév augusztus 31-éig legalább egyszer tisztázni kaszálást kell végezni.	A gyakorlatban sokszor elhanyagolják az idegenhonos növények elterjedésének megakadályozását.
254.	Fogasolás/gyepszellőztetés csak az illetékes állami természetvédelmi szerv írásos engedélye alapján lehetséges.	ZA	1996. évi LIII. törvény 16. § (4) (NJSZ)	Gyepgazdálkodás elõsorban a gyepgushoz igazodó legeltetéssel, kaszálással, valamint a vegyi anyagok mérésével, természetközeli használatával történhet.	A hozam növelése érdekében fogasolást alkalmaznak, ami által a gyep felzárás sérül.

255.	Fokozottan védett, földön fészkelő madarak fészkeinek, fiókáinak megújítása, esetén azt haladéktalanul jelenteni kell az illetékes állami természetvédelmi szervnek. A megújítást fészkek körül min. 1 ha védőzóna kialakítása.	ZA	1996. évi LIII. törvény 16. § (4) (NJSZ); 269/2007. (X. 18.) Korm. Rendelet 5. § (3) (JFGK2, JFGK 3)	Gyeggyandózkodás előfordulás a gyepfűszőrtől igazodó legeltetéssel, kaszálással, valamint a vegyi anyagok mérgezők, természetvédelmi használatával történhet. Natura 2000 gyepfűszőrtől a kaszálás tervezett időpontját a tevékenység megkezdése előtt a földhasználónak legalább öt munkanappal írásban be kell jelentenie a működési terület szerinti illetékes állami természetvédelmi szervnek.	Natura 2000 gyepfűszőrtől kívül nincs kaszálásra vonatkozó bejelentési kötelezettség a védett madarak és fészkek gyakran sérülnek.	
256.	Kaszálás legkorábbi időpontja július 1	ZA	1996. évi LIII. törvény 16. § (4) (NJSZ); 269/2007. (X. 18.) Korm. Rendelet 5. § (3) (JFGK2, JFGK 3)	Gyeggyandózkodás előfordulás a gyepfűszőrtől igazodó legeltetéssel, kaszálással, valamint a vegyi anyagok mérgezők, természetvédelmi használatával történhet. Natura 2000 gyepfűszőrtől a kaszálás tervezett időpontját a tevékenység megkezdése előtt a földhasználónak legalább öt munkanappal írásban be kell jelentenie a működési terület szerinti illetékes állami természetvédelmi szervnek.	Natura 2000 gyepfűszőrtől kívül az első kaszálás általában május elején kerül sor.	
257.	Villanypásztor, kerti, karsm csak az illetékes állami természetvédelmi szerv előzetes írásos nyilatkozata alapján létesíthető, illetve alkalmazható.	ZA	1996. évi LIII. törvény 16. § (4) (NJSZ)	Gyeggyandózkodás előfordulás a gyepfűszőrtől igazodó legeltetéssel, kaszálással, valamint a vegyi anyagok mérgezők, természetvédelmi használatával történhet.	Villanypásztor, kerti, karsm létesítéséhez nincs szükség engedélyre, ezért alkalmazása gyakori, az állatok természetes élőhelyét zavarja.

O14 What area is eligible?

- ☒ Agricultural area defined for the CAP plan
☐ Agricultural land including and beyond agricultural area
☐ Non-agricultural land

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

List of relevant GAEC and SMR

Code	Description
GAEC01	Maintenance of permanent grassland based on a ratio of permanent grassland in relation to agricultural area at national, regional, sub-regional, group-of-holdings or holding level in comparison to the reference year 2018. Maximum decrease of 5% compared to the reference year.
GAEC02	Protection of wetland and peatland
GAEC03	Ban on burning arable stubble, except for plant health reasons
GAEC06	Minimum soil cover to avoid bare soil in periods that are most sensitive
GAEC07	Crop rotation in arable land, except for crops growing under water
GAEC08	Retention of landscape features. Ban on cutting hedges and trees during the bird breeding and rearing season. As an option, measures for avoiding invasive plant species
GAEC09	Ban on converting or ploughing permanent grassland designated as environmentally-sensitive permanent grasslands in Natural 2000 sites
SMR01	Directive 2000/60/EC of 23 October 2000 of the European Parliament and of the Council establishing a framework for Community action in the field of water policy: Article 11(3), point (e), and point (h), as regards mandatory requirements to control diffuse sources of pollution by phosphates
SMR02	Council Directive 91/676/EEC of 12 December 1991 concerning the protection of waters against pollution caused by nitrates from agricultural sources: Articles 4 and 5
SMR03	Directive 2009/147/EC of the European Parliament and of the Council of 30 November 2009 on the conservation of wild birds: Article 3(1), Article 3(2), point (b), Article 4(1), (2) and (4)
SMR04	Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild flora and fauna: Article 6(1) and (2)
SMR06	Council Directive 96/22/EC of 29 April 1996 concerning the prohibition on the use in stockfarming of certain substances having a hormonal or thyrostatic action and beta-agonists, and repealing Directives 81/602/EEC, 88/146/EEC and 88/299/EEC: Article 3, points (a), (b), (d) and (e), and Articles 4, 5 and 7
SMR07	Regulation (EC) No 1107/2009 of the European Parliament and of the Council of 21 October 2009 concerning the placing of plant protection products on the market and repealing Council Directives 79/117/EEC and 91/414/EEC: Article 55, first and second sentence
SMR08	Directive 2009/128/EC of the European Parliament and of the Council of 21 October 2009 establishing a framework for Community action to achieve the sustainable use of pesticides: Article 5(2) and Article 8(1) to (5); Article 12 with regard to restrictions on the use of pesticides in protected areas defined on the basis of Directive 2000/60/EC and Natura 2000 legislation; Article 13(1) and (3) on handling and storage of pesticides and disposal of remnants

List of relevant mandatory national standards

In accordance with Article 70(3) of Regulation (EU) 2021/2115, all standards shall comply with relevant Community or national requirements.

The Good Agricultural and Environmental Conditions (GAEC) established on the basis of Chapter I of Title VI of Regulation (EU) No 1306/2013 (4) have been transposed into national legislation on the basis of the correspondence shown in the table below.

Main topic	Requirements and standards		National legislation
Water	SMR 1	Council Directive 91/676/EEC of 12 December 1991 concerning the protection of waters against pollution caused by nitrates from agricultural sources (OJ L 375, 31.12.1991, p. 1)	59/2008. (IV. Decree No 29) of the Minister for Agriculture and Rural Development laying down detailed rules for the action programme necessary for the protection of waters against pollution caused by nitrates from agricultural sources, and on the procedures for reporting and recording data, Sections 3,5(1), 6(2), 6, 7, 9, 8 (1-11-11, 9), 10 (1), (2), (6).
	GAEC 1	Establishment of buffer strips along water courses	50/2008. (IV. Decree No 24 of the Minister for Agriculture and Rural Development laying down the conditions necessary to maintain a 'Good Agricultural and Environmental Condition' to be met in order to claim the single area payment and certain rural development payments and the conversion rate of animals into livestock units
	GAEC 2	Where the use of water for irrigation is permitted, compliance with the relevant authorisation procedures	50/2008. (IV. Decree No 24 of the Minister for Agriculture and Rural Development laying down the conditions necessary to maintain a 'Good Agricultural and Environmental Condition' to be met in order to claim the single area payment and certain rural development payments and the conversion rate of animals into livestock units
	GAEC 3	Protection of ground water against pollution: prohibition of direct discharge into groundwater and measures to prevent indirect pollution of groundwater through discharge on the ground and percolation through the soil of dangerous substances, as listed in the Annex to Directive 80/68/EEC in its version in force on the last day of its validity, as far as it relates to agricultural activity	50/2008. (IV. Decree No 24 of the Minister for Agriculture and Rural Development laying down the conditions necessary to maintain a 'Good Agricultural and Environmental Condition' to be met in order to claim the single area payment and certain rural development payments and the conversion rate of animals into livestock units
Soil and carbon stock	GAEC 4	Minimum soil cover	50/2008. (IV. Decree No 24 of the Minister for Agriculture and Rural Development laying down the conditions necessary to maintain a 'Good Agricultural and Environmental Condition' to be met in order to claim the single area payment and certain rural development payments and the conversion rate of animals into livestock units
	GAEC 5	Minimum land management reflecting site specific conditions to limit erosion	50/2008. (IV. Decree No 24 of the Minister for Agriculture and Rural Development laying down the conditions necessary to maintain a 'Good Agricultural and Environmental Condition' to be met in order to claim the single area payment and certain rural development payments and the conversion rate of animals into livestock units

	GAEC 6	Maintenance of soil organic matter level through appropriate practices including ban on burning arable stubble, except for plant health reasons	50/2008. (IV. Decree No 24 of the Minister for Agriculture and Rural Development laying down the conditions necessary to maintain a 'Good Agricultural and Environmental Condition' to be met in order to claim the single area payment and certain rural development payments and the conversion rate of animals into livestock units
Biodiversity	SMR 2	Directive 2009/147/EC of the European Parliament and of the Council of 30 November 2009 on the conservation of wild birds (OJ L 20, 26.1.2010, p. 7)	275/2004. Sections 9(2)(a)(c) and 269/2007 of Government Decree No 269/2007 of 8 October 2007 on nature protection areas of European Community importance Sections 3, 4 and 5 of Government Decree No 17/1999 of 18 October 2011 on land use rules for the maintenance of NATURA 2000 grasslands.
	SMR 3	Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild flora and fauna (OJ L 206, 22.7.1992, p. 7)	275/2004. Sections 9(2)(a)(c) and 269/2007 of Government Decree No 269/2007 of 8 October 2007 on nature protection areas of European Community importance Sections 3, 4, 5 and 5 of Government Decree No 45/2011 of 18 October 2011 on the land use rules for the maintenance of NATURA 2000 grasslands.
Landscape, minimum level of maintenance	GAEC 7	Conservation of landscape features, including, where appropriate, hedges, ponds, ditches, trees in line, group of trees, scattered trees, field margins and terraces, and including a ban on cutting hedges and trees during the bird breeding and rearing season and, alternatively, possible measures to prevent the emergence of invasive alien plants	50/2008. (IV. Decree No 24 of the Minister for Agriculture and Rural Development laying down the conditions necessary to maintain a 'Good Agricultural and Environmental Condition' to be met in order to claim the single area payment and certain rural development payments and the conversion rate of animals into livestock units
Food security	SMR 4	Regulation (EC) No 178/2002 of the European Parliament and of the Council of 28 January 2002 laying down the general principles and requirements of food law, establishing the European Food Safety Authority and laying down procedures in matters of food safety (OJ L 31, 1.2.2002, p. 1)	Act XLVI of 2008 on the food chain and its official supervision
	SMR 5	Council Directive 96/22/EC of 29 April 1996 concerning the prohibition on the use in stockfarming of certain substances having a hormonal or thyrostatic action and beta-agonists, and repealing Directives 81/602/EEC, 88/146/EEC and 88/299/EEC (OJ L 125, 23.5.1996, p. 3)	24/2004. (III. Decree No 2 of the Minister for Agriculture and Rural Development sections 3(a)(b)(c)(e)(f), 4, 5 and 8 of the prohibition on the use in stockfarming of certain substances having a hormonal or thyrostatic action and of beta-agonists
Identification and registration	SMR 6	Council Directive 2008/71/EC of 15 July 2008 on identification and registration of pigs (OJ L 213,	116/2003. (XI. Decree No 18 of the Minister for Agriculture and Rural Development sections 3, 7, 8, 9, 17, 21 and 26 on the

on of animals		8.8.2005, p. 31)	marking of pigs and the Unified Registration and Identification System.
			119/2007. Section 10(4) of Decree No 118/2011 of 18 October 2007 of the Minister for Agriculture and Rural Development on the national registration system for enclosures, holdings and certain data relating thereto
	SMR 7	Regulation (EC) No 1760/2000 of the European Parliament and of the Council of 17 July 2000 establishing a system for the identification and registration of bovine animals and regarding the labelling of beef and beef products and repealing Council Regulation (EC) No 820/97(OJ L 204, 11.8.2000, p. 1)	99/2002. (XI. Sections 3, 7, 8, 19, 23 and 31 of Decree No 5/1999 of the Minister for Agriculture and Rural Development on the marking of cattle species and the Unified Registration and Identification System.
	SMR 8	Council Regulation (EC) No 21/2004 of 17 December 2003 establishing a system for the identification and registration of ovine and caprine animals and amending Regulation (EC) No 1782/2003 and Directives 92/102/EEC and 64/432/EEC (OJ L 5, 9.1.2004, p. 8)	182/2009. (XII. Decree No 30) of the Minister for Agriculture and Rural Development on the Uniform Registration and Identification System for ovine and caprine animals, Sections 3(1), 4, 5, 6, 9(8), 10, 11(1)-(6) and 26(1)
Animal diseases	SMR 9	Regulation (EC) No 999/2001 of the European Parliament and of the Council of 22 May 2001 laying down rules for the prevention, control and eradication of certain transmissible spongiform encephalopathies (OJ L 147, 31.5.2001, p. 1)	179/2009. (XII. Decree No 29) of the Minister for Agriculture and Rural Development on the prevention, control and control of transmissible spongiform encephalopathies, Sections 6, 13, 18 and 19(1)(a)
Pesticides	SMR 10	Regulation (EC) No 1107/2009 of the European Parliament and of the Council of 21 October 2009 concerning the placing of plant protection products on the market and repealing Council Directives 79/117/EEC and 91/414/EEC (OJ L 309, 24.11.2009, p. 1)	Section 5(6) of Act XLVI of 2008 on the food chain and its official supervision
			43/2010. (IV. Sections 5(2), (4), 6(1), 16, 27, 29, 32-36 of Decree No 23 of the Minister for Agriculture and Rural Development on plant protection activities
			89/2004. Ministry of Agriculture and Rural Development Decree (V.15) on the authorisation of the placing on the market and use of plant protection products and on the packaging, marking, storage and transport of plant protection products, Sections 19-24 and 31
Animal welfare	SMR 11	Council Directive 2008/119/EC of 18 December 2008 laying down minimum standards for the protection of calves (OJ L 10, 15.1.2009, p. 7)	32/1999. Ministry of Agriculture and Rural Development (III.31.) FVM, on animal protection rules for the keeping of farm animals (in particular Annex 1 thereto)
	SMR 12	Council Directive 2008/120/EC of 18 December 2008 laying down minimum standards for the protection of pigs (OJ L 47, 18.2.2009, p. 5).	32/1999. Ministry of Agriculture and Rural Development (III.31.) FVM, on animal protection rules for the keeping of farm animals (in particular Annex 2 thereto)
	SMR 13	Council Directive 98/58/EC of 20	32/1999. Ministry of Agriculture and Rural

	July 1998 concerning the protection of animals kept for farming purposes (OJ L 221, 8.8.1998, p. 23)	Development Decree (III.31.) on animal protection rules for the keeping of farm animals

The aid must be complied with throughout the entire commitment period:

(a) the conditions necessary to maintain the 'Good Agricultural and Environmental Condition' to be met in order to claim the single area payment and certain rural development payments and the conversion rate of animals into livestock units. (IV. The provisions on good agricultural and environmental conditions (GAEC) laid down in Decree No 24/1999 of the Minister for Agriculture and Rural Development and the statutory management requirements (SMRs) established on the basis of Annex II of Regulation (EU) No 1306/2013;

Regulation No 10/2015 on the rules for the use of the payment for agricultural practices beneficial for the climate and the environment and the conditions for maintaining arable land, permanent grassland and land under permanent crops in a state suitable for cultivation or grazing (III. Decree No 13/1999 of the Minister for Agriculture (hereinafter: 10/2015. (III. The criteria and minimum activities laid down pursuant to Section 2 of Decree No 13/1999 of the Minister for Agriculture.

(2) During the whole commitment period, the following shall be observed in the whole area covered by the commitment:

(a) Government Decree No 59/2008 laying down detailed rules for the action programme necessary for the protection of waters against pollution caused by nitrates from agricultural sources and the procedures for reporting and recording data. (IV. Decree No 29/1999 of the Minister for Agriculture and Rural Development (Decree No 29) of the Minister for Agriculture and Rural Development (Decree No 29) of the Minister for Agriculture and Rural Development (GAP);

(b) Government Decree No 43/2010 on plant protection activities (IV. The general principles of integrated pest management set out in Annex VIII to MARD Decree.

Link between GAEC, SMR and national standards with the intervention

Ineligible costs for the intervention:

Activities of the Rural Development Programme 2014-2020 covered by the ongoing commitment

Calculation method

Calculation method:

The determination of the aid amounts for each standard was based on an objective source of data. To this end, the aid amounts have been determined on the basis of a combination of data sources:

1. Test Plant System of the Institute of Agricultural Economics:

In the first place, data on the production value and the costs of certain crops at sector level were taken into account in the test plant system. The test plant system collects sectoral data on the most important crops each year for more than 90 % of farmland, which are an important basis for background calculations, both in arable, grass, vegetable and plantation crops. The sector's results may vary due to the weather of the growing season and other economic reasons (e.g. inflation, etc.), but the analysis of the data for the last three years showed a steady increase in both production value and costs, which was why a 10 % correction of the 2019 figures for the years 2022-2025 was justified in the background calculation.

2. Determination of agricultural machinery costs:

Three data sources were used in relation to the cost of agricultural machinery

— Research results of the Institute for Agricultural Training of the National Centre for Agricultural

Research and Innovation for 2020;

— Current market farm labour service fees for 2021;

— expert calculations.

A 15 % correction of the average of the two different sources of data has been used to determine the background database for machine work, which contains the most important machine work operations arising during the grant. For some complex specifications (e.g. the construction of bee pastures, greenugars), a number of operational costs are presented, which have been calculated taking into account a complete technological process and determined with the involvement of experts.

3. Performance of the squeeze area pro rata:

As there are significant differences in revenue and cultivation costs for arable, vegetable and plantation crops at sector level, it is justified to proportional the aggregate figures to the area. In the case of crop area ratios, the average of the national crop structure data for 2017-2019 is the basis for the calculation correction. The crop structure data of the Agricultural Economic Institute were used in the calculation. All agricultural crops sown in Hungary have been included in the sowing area calculation, which together cover 4 300 000 hectares of agricultural land, thus adequately representing the sectoral proportions of current national agriculture. The resulting value has been corrected for the data from the test run system.

4. Determination of agronomic effects:

The agri-environmental management payment is a compensatory payment under EU legislation, so that the additional costs incurred and the amount of aid intended to compensate for the loss of profits were determined individually for each standard with the involvement of an expert. With regard to agronomic aspects, the expected impacts have been determined taking into account the aid calculation experience of previous grant periods.

The calculation shall be based on the determination of the additional costs incurred by the standards and the extent of the loss of income. When calculating the aid amount, the expected income development of compliant farmers is compared with farms where the AEM rules are not applied. This makes it possible to ensure that, in practice, the types of farming that are common are not subsidised, but only the increased standards are the basis for the compensation.

For each standard, income and costs determining income are grouped into 4 categories:

- Expected loss of income
- Expected revenue increase
- Expected additional costs
- Expected cost reduction

Additional explanation

Background calculation of the agri-environmental intervention, which is also detailed in the annexes: The structure of the agri-environmental payment is based on management standards, which makes it possible to determine the level of support on the basis of the measurability, controllability and expected agronomic effects of each of the standards. The standards overlap in the different Thematic Standards Groups (TECS), which has led to the development of a background structure to ensure, on the one hand, that TECS are comparable and, on the other hand, that a standard (within a branch) is indicated with an aid amount. The calculation has been determined separately for each requirement, using available data sources and expert estimates from previous periods. In all cases, it is important that, since the payment is made annually and per hectare, a correction has been applied when determining the level of compensation. In such cases, the costs were determined in equal proportions per year. Analysis of the compensatory amounts: As the agri-environmental management requirements for the next aid period are largely the same as in the previous period, a comparative analysis of the aid rates for the two periods has also been carried out, which is set out in detail in the Annex.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

What are the models of the commitment(s) in the intervention?

- ☐ result based (with possibility to pick and choose)
☒ management based (with possibility to pick and choose)
☐ hybrid (management and result based)

Please explain the obligations/possibilities for beneficiaries in relation to the commitments set out in the intervention

An agri-environmental payment is a voluntary payment scheme in which participants in their farming surplus to achieve agri-environmental objectives undertake activities.

The grant shall be subject to compliance by the beneficiary for the entire duration of the commitment, with the activities undertaken among the commitments set out in the Thematic Groups of Specifications.

In each of the thematic sets of specifications, the specifications may fall into the following two categories:

I. Compulsory standards that go beyond the GAEC and SMR minimum requirements:

—These standards and/or combinations of standards must be met by land use category (arable, grassland, plantation, reed) and per area (horizontal (A), zonal (ZA) category).

—The mandatory requirements shall be complied with throughout the entire area of the contiguous area (KET) covered by all commitments supported in the relevant thematic set of specifications.

—The payment amount is not determined by specification, but is calculated as a single sum for all mandatory standards for the relevant set of thematic standards.

II. In addition, the so-called ‘optional requirements’ (V), which go beyond the basic package, address various environmental challenges (crop structure requirements, soil and water protection, biodiversity conservation, etc.) from which applicants are free to choose. The payment amount is set at standard level.

—The establishment of at least one set of standards, up to a maximum of two sets of standards per thematic set of standards for applicants for support, with the exception of arable land, grasses and horizontal reeds, shall be required for all areas.

—for each contiguous area (KET) covered by a set of thematic specifications, one of these two sets of requirements should be selected, no further combinations are possible.

—in so far as the number of optional specifications so permits, the sets of specifications shall contain at least two optional specifications and the sets of specifications shall differ for at least one of the chosen specifications.

—For the thematic groups of GAEC ploughs and grasses, it is possible to choose a standard in addition to the basic package, but it is not mandatory.

—There is no optional requirement for the horizontal reed thematic set, so it is not possible to choose a specification in addition to the basic package.

—The applicant for support shall select a set of specifications for the coherent area (KET) covered by all the commitments of the relevant thematic set of specifications, with the exception of arable land, grasses and horizontal reeds.

Output value of hectares covered by thematic sets of specifications 2021/2115 establishing rules on support for strategic plans to be drawn up by Member States under the Common Agricultural Policy (CAP Strategic Plans) and financed by the European Agricultural Guarantee Fund (EAGF) and by the European Agricultural Fund for Rural Development (EAFRD) and repealing Regulations (EU) No 1305/2013 and

(EU) No 1307/2013

Pursuant to paragraph 5 of Article 102 (Planned unit amounts and planned outputs) of Regulation (EU) No 575/2013, annual planned outputs for all unit amounts are aggregated on an annual basis.

What is the duration of contracts?

As of 2023, according to Article 70 of the CAP Strategic Plan Regulation (environmental, climate and other management commitments), the payment will be made where part of the contracts will expire on 31 December 2024 and for the new agri-environment programmes starting from 2025, the support period will run from 1 January 2025 to 31 December 2029.

10 WTO compliance

Green Box

Paragraph 12 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 12 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(3)(b) - 70 - Payments under Article 70	50.00%	20.00%	80.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD19_O14_U01_HA - Horizontal arable land unit amount under the Agri-environmental and Climate Measure payments (AECM)	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.12; R.14; R.19; R.21; R.22; R.23; R.24; R.31; R.34	Yes
RD19_O14_U02_HA - Horizontal grassland unit amount under the Agri-environmental and Climate Measure payments (AECM)	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.12; R.14; R.19; R.20; R.21; R.22; R.23; R.31	Yes
RD19_O14_U03_HA - Horizontal plantations (pome fruits) unit amount under the Agri-environmental and Climate Measure payments (AECM)	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.19; R.20; R.21; R.22; R.24; R.31	Yes
RD19_O14_U04_HA - Horizontal plantations (other fruits) unit amount under the Agri-environmental and Climate Measure payments (AECM)	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.19; R.20; R.21; R.22; R.24; R.31	Yes
RD19_O14_U05_HA - Horizontal plantations (grapes) - unit amount under the Agri-environmental and Climate Measure payments (AECM)	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.19; R.20; R.21; R.22; R.24; R.31	Yes
RD19_O14_U06_HA - Horizontal reed - unit amount under the Agri-environmental and Climate Measure payments (AECM)	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.14; R.19; R.20; R.21; R.22; R.31	Yes
RD19_O14_U07_HA - Zonal arable land with great bustard - unit amount under the Agri-environmental and Climate Measure payments (AECM)	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.12; R.14; R.19; R.20; R.21; R.22; R.23; R.24; R.31; R.33; R.34	Yes
RD19_O14_U08_HA - Zonal arable land with great bustard protection - unit amount under the Agri-environmental and Climate Measure payments (AECM)	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.12; R.14; R.19; R.20; R.21; R.22; R.23; R.24; R.31; R.33; R.34	Yes
RD19_O14_U09_HA - Zonal cropland with Plainland's birds protection - unit amount under the Agri-environmental and Climate Measure payments (AECM)	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.12; R.14; R.19; R.20; R.21; R.22; R.23; R.24; R.31; R.33; R.34	Yes
RD19_O14_U10_HA - Agri-environmental and Climate Measure payments (AECM) - unit amount of zonal cropland with mountain and hill bird protection	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.12; R.14; R.19; R.20; R.21; R.22; R.23; R.24; R.31; R.33; R.34	Yes
RD19_O14_U11_HA - Agri-environmental and climate Measure payments (AECM) unit amount of arable land for zonal water protection — Erosion-sensitive area demarcation	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.12; R.14; R.19; R.20; R.21; R.22; R.23; R.24; R.31; R.34	Yes
RD19_O14_U12_HA - Agri-environmental and climate Measure (AECM) payments - unit amount for zonal arable land conservation — inland water sensitive area delimitation	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.12; R.14; R.19; R.20; R.21; R.22; R.23; R.24; R.31; R.34	Yes
RD19_O14_U13_HA - Agri-environmental and Climate Measure (AECM) payments - unit amount of arable land for zonal water protection — drought sensitive area delimitation	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.12; R.14; R.19; R.20; R.21; R.22; R.23; R.24; R.31; R.34	Yes

RD19_O14_U14_HA - Agri-environmental and Climate Measure (AECM) payments - unit amount of zonal grassland — with great bustards protection standards	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.12; R.14; R.19; R.20; R.21; R.22; R.23; R.31; R.33	Yes
RD19_O14_U15_HA - Agri-environmental and Climate Measure (AECM) payments - unit amount of zonal grassland — with Plainland's birds protection standards	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.12; R.14; R.19; R.20; R.21; R.22; R.23; R.31; R.33	Yes
RD19_O14_U16_HA - Agri-environmental and Climate Measure (AECM) payments - unit amount of zonal grassland — with mountain and hilly bird species protection standards	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.12; R.14; R.19; R.20; R.21; R.22; R.23; R.31; R.33	Yes
RD19_O14_U17_HA - Agri-environmental and Climate Measure (AECM) payments - unit amount of zonal grassland — with butterfly protection standards	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.12; R.14; R.19; R.20; R.21; R.22; R.23; R.31; R.33	Yes
RD19_O14_U18_HA - Agri-environmental and Climate measure (AECM) payments - grassland for zonal water protection — inland water sensitive area delimitation	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.12; R.14; R.19; R.20; R.21; R.22; R.23; R.31	Yes

Explanation and justification related to the value of the unit amount

RD19_O14_U01_HA - Horizontal arable land unit amount under the Agri-environmental and Climate Measure payments (AECM)

— Background calculations drawn up by an independent expert body shall confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

The 'horizontal arable land unit amount for agri-environmental management payments (AKG)' is based on the aid amount of the attached document 'RD19_G01_AEC_70 – AKG_background calculation' of the 'Horizontal arable land category'.

RD19_O14_U02_HA - Horizontal grassland unit amount under the Agri-environmental and Climate Measure payments (AECM)

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the

unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

The ‘Agri-environmental management payments (AKG) horizontal grassland unit amount’ is based on the aid amount of the attached document ‘RD19_G01_AEC_70 – AKG_background calculation’ of the ‘Horizontal grassland land use category’.

RD19_O14_U03_HA - Horizontal plantations (pome fruits) unit amount under the Agri-environmental and Climate Measure payments (AECM)

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

The ‘Agri-Environmental Management Payments (AKG) horizontal unit amount – pome fruits’ is based on the aid amount of the attached document ‘RD19_G01_AEC_70 – AKG_background calculation’, ‘Horizontal plantation land use category – pome fruits’.

RD19_O14_U04_HA - Horizontal plantations (other fruits) unit amount under the Agri-environmental and Climate Measure payments (AECM)

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

The ‘Agri-environmental management payments (AKG) horizontal plantation unit amount – other orchards’ is based on the aid amount of the attached document ‘RD19_G01_AEC_70 – AKG_background calculation’, ‘Horizontal plantation land use category – OTHER FAFFER’.

RD19_O14_U05_HA - Horizontal plantations (grapes) - unit amount under the Agri-environmental and Climate Measure payments (AECM)

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

The ‘Agri-environmental management payments (AKG) horizontal unit amount of vineyards – vines’ is based on the aid amount of the document ‘RD19_G01_AEC_70 – AKG_background calculation’, ‘Horizontal plantation land use category – ORG’.

RD19_O14_U06_HA - Horizontal reed - unit amount under the Agri-environmental and Climate Measure payments (AECM)

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant

amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

‘Horizontal reed unit amount for agri-environmental management payments (AKG)’ is based on the aid amount of the attached document ‘RD19_G01_AEC_70 – AKG_background calculation’ for the ‘Horizontal reed land category’.

RD19_O14_U07_HA - Zonal arable land with great bustard - unit amount under the Agri-environmental and Climate Measure payments (AECM)

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

The ‘Agri-environmental management payments (AKG) per unit amount of zonal livestock arable land – with hostage protection standards’ is based on the aid amount of the document ‘RD19_G01_AEC_70 – AKG_background calculation’, ‘High natural area demarcation, arable land category, hostage protection standards (Zonal)’.

RD19_O14_U08_HA - Zonal arable land with great bustard protection - unit amount under the Agri-environmental and Climate Measure payments (AECM)

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set

of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

The 'Agri-Environmental Management Payments (AKG) zonal area of arable land – Blue bloom with protection standards' is based on the aid amount of the document 'RD19_G01_AEC_70 – AKG_background calculation', 'High Natural Definition, arable land use category, blue bowl protection standards (Zonal)'.

RD19_O14_U09_HA - Zonal cropland with Plainland's birds protection - unit amount under the Agri-environmental and Climate Measure payments (AECM)

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

The 'Agri-environmental management payments (AKG) zonal livestock arable land area – Land bird protection standards' is based on the aid amount of the document 'RD19_G01_AEC_70 – AKG_background calculation', 'High Natural Lite Area Definition, arable land use category, lowland bird protection standards (Zonal)'.

RD19_O14_U10_HA - Agri-environmental and Climate Measure payments (AECM) - unit amount of zonal cropland with mountain and hill bird protection

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant

amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

The ‘Agri-Environmental Management Payments (AKG) zonal arable land area – Mountain and hilly bird protection standards’ is based on the aid amount of the document ‘RD19_G01_AEC_70 – AKG_background calculation’, ‘High natural area delimitation, arable land category, mountain and hilly bird protection standards (Zonal)’.

RD19_O14_U11_HA - Agri-environmental and climate Measure payments (AECM) unit amount of arable land for zonal water protection — Erosion-sensitive area demarcation

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

The ‘Agri-environmental management payments (AKG) per unit amount of zonal cropland for water protection – with a risk-sensitive area delineation’ is based on the aid amount of the document ‘RD19_G01_AEC_70 – AKG_background calculation’, ‘Category land use category erosion with sensitive area delineation (zonal)’.

RD19_O14_U12_HA - Agri-environmental and climate Measure (AECM) payments - unit amount for zonal arable land conservation — inland water sensitive area delimitation

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

The ‘Agri-Environmental Management Payments (AKG) per unit amount of zonal arable land for water protection – with inland water sensitive area delimitation’ is based on the aid amount of the document ‘RD19_G01_AEC_70 – AKG_background calculation’, ‘Category land use category with sensitive inland water delineation (zonal)’.

RD19_O14_U13_HA - Agri-environmental and Climate Measure (AECM) payments - unit amount of arable land for zonal water protection — drought sensitive area delimitation

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

The ‘Agri-environmental management payments (AKG) per unit amount of zonal cropland for water protection – With a fibre sensitive area delineation’ is based on the aid amount of the document ‘RD19_G01_AEC_70 – AKG_background calculation’, ‘Integrated land use category with sensitive area delineation (zonal)’.

RD19_O14_U14_HA - Agri-environmental and Climate Measure (AECM) payments - unit amount of zonal grassland — with great bustards protection standards

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those

commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

The ‘Agri-environmental management payments (AKG) per unit amount of zonal grassland – with hostage protection standards’ is based on the aid amount of the document ‘RD19_G01_AEC_70 – AKG_background calculation’, ‘High natural value area delimitation, grassland land use category, hostage protection standards (Zonal)’.

RD19_O14_U15_HA - Agri-environmental and Climate Measure (AECM) payments - unit amount of zonal grassland — with Plainland's birds protection standards

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

The ‘Agri-Environmental Management Payments (AKG) zonal grassland unit amount – Land bird protection standards’ is based on the aid amount of the document ‘RD19_G01_AEC_70 – AKG_background calculation’, ‘High Natural Lite Area Demarcation, grassland land use category, lowland bird protection standards (Zonal)’.

RD19_O14_U16_HA - Agri-environmental and Climate Measure (AECM) payments - unit amount of zonal grassland — with mountain and hilly bird species protection standards

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount

measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

The 'Agri-Environmental Management Payments (AKG) zonal grassland unit amount – Mountain and hilly bird protection standards' is based on the aid amount of the document 'RD19_G01_AEC_70 – AKG_background calculation', 'Magas Natural Literature delimitation, grassland land use category, mountain and hilly bird protection standards (Zonal)'.

RD19_O14_U17_HA - Agri-environmental and Climate Measure (AECM) payments - unit amount of zonal grassland — with butterfly protection standards

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

The 'Agri-Environmental Management Payments (AKG) zonal MTÉT grassland unit amount – Daily Lepidol with protection standards' is based on the aid amount of the document 'RD19_G01_AEC_70 – AKG_background calculation', 'High natural area delimitation, grassland land use category, day butterfly protection standards (Zonal)'.

RD19_O14_U18_HA - Agri-environmental and Climate measure (AECM) payments - grassland for zonal water protection — inland water sensitive area delimitation

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount

category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

‘Agri-environmental management payments (AKG) zonal grassland for water protection – with inland water sensitive area delimitation’ is based on the aid amount of the document ‘RD19_G01_AEC_70 – AKG_background calculation’, ‘Gyep land use category with sensitive inland water delineation (zonal)’.

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029
RD19_O14_U01_HA - Horizontal arable land unit amount under the Agri-environmental and Climate Measure payments (AECM) (Grant - Uniform)	Planned unit amount (Total Public Expenditure in EUR)	0.00	338.00	338.00	0.00	0.00	0.00	0.00

RD19a_G01_AEC_70 - AGRI-environmental management payments (AKG)

Intervention Code (MS)	RD19a_G01_AEC_70
Intervention Name	AGRI-environmental management payments (AKG)
Type of Intervention	ENVCLIM(70) - Environmental, climate-related and other management commitments
Common Output Indicator	O.14. Number of hectares (excluding forestry) or number of other units covered by environmental or climate-related commitments going beyond mandatory requirements
Contributing to ringfencing requirement for/on	Generational Renewal: No Environment: Yes ES rebate system: Yes LEADER: No

1 Territorial scope and, if relevant, regional dimension

Territorial scope: **National**

Code	Description
HU	Magyarország

Description of the Territorial Scope

On the territory of Hungary

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description	Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold
SO4 Contribute to climate change mitigation and adaptation, including by reducing greenhouse gas emission and enhancing carbon sequestration, as well as promote sustainable energy	
SO5 Foster sustainable development and efficient management of natural resources such as water, soil and air, including by reducing chemical dependency	
SO6 Contribute to halting and reversing biodiversity loss, enhance ecosystem services and preserve habitats and landscapes	
SO9 Improve the response of Union agriculture to societal demands on food and health, including high quality, safe, and nutritious food produced in a sustainable way, the reduction of food waste, as well as improving animal welfare and combatting antimicrobial resistances	

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
4.1.1	Improving the carbon sequestration capacity of soils and ecosystems	1	Yes
5.1.1	Developing soil and nutrient management at farm level	1	Yes
5.1.2	Reducing nutrient losses, preventing nutrient leaching	1	Yes
5.1.3	Restoring degraded soils and improving their water management	1	Yes
5.2.1	Sustainable use of surface and groundwater	1.	Yes
5.3.1	Promoting water retention in soil and landscape	1	Yes
5.4.1	Reducing emissions of air pollutants and particulate matter of agricultural origin	3	Yes
5.4.2	Reducing ammonia emissions from agriculture	2	Yes
5.5.2	Integrated environmentally friendly pest management	1	Yes
6.1.2	Maintenance or improvement	1	Yes

	of the natural condition of high nature value sites		
6.1.3	Maintenance and development of grasslands in good ecological status and species richness	2	Yes
6.4.1	Developing up-to-date data collection and monitoring systems for measuring biodiversity	1	Partially
9.2.1	Promote the use of a rational, predictive targeted pesticide	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description	Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold
R.12	Share of utilised agricultural area (UAA) under supported commitments to improve climate adaptation
R.14	Share of utilised agricultural area (UAA) under supported commitments to reduce emissions or to maintain or enhance carbon storage (including permanent grassland, permanent crops with permanent green cover, agricultural land in wetland and peatland)
R.19	Share of utilised agricultural area (UAA) under supported commitments beneficial for soil management to improve soil quality and biota (such as reducing tillage, soil cover with crops, crop rotation included with leguminous crops)
R.20	Share of utilised agricultural area (UAA) under supported commitments to reduce ammonia emission
R.21	Share of utilised agricultural area (UAA) under supported commitments for the quality of water bodies
R.22	Share of utilised agricultural area (UAA) under supported commitments related to improved nutrient management
R.23	Share of utilised agricultural area (UAA) under supported commitments to improve water balance
R.24	Share of Utilised Agricultural Area (UAA) under supported specific commitments which lead to a sustainable use of pesticides in order to reduce risks and impacts of pesticides, such as pesticides leakage
R.31	Share of utilised agricultural area (UAA) under supported commitments for supporting biodiversity conservation or restoration including high-nature-value farming practices
R.33	Share of total Natura 2000 area under supported commitments
R.34	Share of utilised agricultural area (UAA) under supported commitments for managing landscape features, including hedgerows and trees

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

5.1. The objectives of the intervention are:

—encouraging the ***sustainable development of rural areas by supporting agricultural practices based on the environmentally conscious use of natural*** resources and encouraging the use of long-term sustainable farming systems (renewal farming);

— ***preserving and improving the state of the environment*** by supporting the development of cultivation techniques and crop structures that take into account the site characteristics, needs and natural handicaps of the area concerned;

— ***reducing environmental pressures from agriculture***, preventing the use of agricultural inputs (reducing the use of plant protection products and fertilisers) and supporting extensive livestock farming;

— ***preserving and enhancing biodiversity through the*** creation and conservation of habitats and the development of species-rich sowing structures;

—promoting ***quality food production*** by encouraging environmentally sound farming practices;

— ***reducing the negative impacts of climate change*** through a change in production structure and land use adapted to climate change.

5.2. Content and structure of the intervention:

Agri-environmental payments are a voluntary payment scheme in which programme participants undertake to carry out additional farming activities in order to achieve agri-environmental management objectives. The grant is conditional on compliance with the activities undertaken for the duration of the commitment.

The intervention builds on specific, verifiable standards that achieve the objectives set by the intervention through their direct or indirect effect.

In the case of *arable land, grasses, vine and fruit plantations and cane cultivation, which* may be covered by the programme.

In order to ensure that the practices undertaken by the beneficiaries are targeted and reinforce each other's effects, the activities that may be selected under the Programme (hereinafter: commitments) to thematic groups, so- *called Thematic Standards Groups (further: TECS) has* been settled. One TECS is optional for a given area. This ensures the territorial focus of the pledges, which increases the effectiveness and efficiency of the pledges.

TECSs are divided into the following two main groups, depending on the area to be selected.

—*Horizontal*

—*Zonal*

Horizontal TECSs are optional throughout the country.

Zonal TECS manage a natural area (natura 2000) or protect a highly protected species (tuzzes, blue blood chicks, etc.), so that these TECSs can only be selected in the areas concerned. The areas concerned, where the zonal TECS is optional, have been delineated in the Agricultural Parcel Identification System (LPIS).

The zonal TECSs concern the following two delineations:

High Natural Value Areas (SAA)

Natura 2000 sites.

The intervention contains the following 10 TECSs.

	Branch of cultivation	Territorial scope	Delineation	Name of TECS
1.	arable land	horizontal	—	<i>Horizontal arable land</i>
2.	arable land	horizontal	—	<i>Land-renewal farming</i>
3.	arable land	zonal	Natura 2000 arable land	<i>Natura 2000 arable land</i>
4.	arable land	zonal	MTÉT	<i>Greases for the protection of hostages</i>
5.	arable land	zonal	MTÉT	<i>MTÉT Protecting arable land</i>
6.	arable land	zonal	MTÉT	<i>MTÉT Blue blood thick protection arable</i>
7.	turf	horizontal	—	<i>Horizontal grassland</i>
8.	turf	zonal	MTÉT	<i>Habitat grassland</i>
9.	plantation	horizontal	—	<i>Horizontal plantation</i>

10.	reeds	horizontal	—	Horizontal cane

Based on the nature of eligibility, the commitments can be divided into three groups:

- Basic commitments (A)**: the converging commitment in the respective TECS.
- Mandatory commitments (JUs)**: the commitment to be selected close to the relevant TECS.
- Optional pledges (V)** an optional pledge within a given TECS.

In addition to the commitments of the TECS Fund, in the case of TECSs where there is a mandatory commitment, the beneficiary must choose 1 binding undertaking. In addition, beneficiaries must undertake a minimum of 2 optional commitments for TECS where there are at least 2 optional pledges. In addition to the minimum commitment, the beneficiary may choose an optional number of commitments.

The grant for the respective TECS Fund's commitments is fixed as a single amount, whereas each commitment has a separate grant amount in the case of optional commitments;

Based on their involvement with TECS, the **basic commitments (A)** can be subdivided into the following sub-types:

- Horizontal Funding Pledge (HA)**: can be found in all TECSs of the given cultivation line
- Zonal basic pledge (ZA)**: available in all zonal TECS
- Basic commitment (MA)**: all MSY can be found in TECS
- TECS Specific Fund Pledge (TA)**: only the undertaking in the respective TECS

Structure of pledging TECS pledges, number of pledges:

Name of TECS	Horizontal arable land	Land-renewal farming	Natura 2000 arable land	WORK for the protection of hostages	MTÉT for the protection of birds	MTÉT Blue dog protection
Type of undertaking						
IF	10	9	10	10	10	10
ZA			6	6	6	6
TODAY				6	6	6
TA		1	2	4	2	3
KV		2				
V	12	11	12	8	8	6

5.3. Selection criteria

Farmers are selected on the basis of a scoring system, which favours those who make greater environmental commitments to their areas. TECSs, mandatory and optional commitments each have a separate numeric value expressing the environmental added value of the TECS or standard, which differs from one area category to another. Pledges with higher environmental added value are higher, while pledges leading to lower environmental improvements are given a lower score. Environmental added value is a key element in the selection criteria, i.e. farms with a higher environmental impact are prioritised in the allocation of resources.

Territorial focus is an important criterion for selection, so environmentally sensitive areas, such as Natura

2000 sites or nitrate vulnerable zones, are prioritised in the selection.

There are commitments that have a long-term positive impact on the environment, so that priority is given to farmers who have already participated in previous programmes. The evaluation does not exclude new entrants, but only favours those who already have a higher environmental value. The aim of the programme is to promote the highest environmental value possible.

Based on the above, the selection criteria include the following elements:

- environmental added value of commitments;
- environmental sensitivity of affected areas (Natura 2000 areas, nitrate vulnerable zones);
- the total area of the holding;
- the proportion of the area of the holding in a given land use category covered by the aid application;
- existing livestock;
- participation in former AKG grants.

5.4. Relationship with relevant legislation and other interventions

The commitments are designed to go beyond:

- minimum requirements for keeping arable land, permanent grassland and land under permanent crops in a state suitable for cultivation or grazing,
- statutory management requirements (SMR),
- on the standards for good agricultural and environmental condition of land (GAEC), and
- other binding requirements (NJSZ) laid down in national legislation.

Commitments include Natura 2000 grasslands 269/2007. The land-use requirements laid down in Government Decree (X. 18.) (X. 18.). To compensate for these standards, aid may be claimed *for the intervention RD23_G06_NAG_72 – Compensatory payments on Natura 2000 agricultural areas* (hereinafter: Natura 2000 grassland support). In order to avoid double funding, AKG payments in Natura 2000 grassland areas will be reduced by the aid amount set out in the Natura 2000 grassland intervention. Support for Natura arable areas will be integrated into the AKG in the form of a separate TECS. There is no risk of double financing due to the installation.

The technical content of the commitments largely overlaps with the requirements to be complied with in organic farming, *therefore the intervention RD20a_G02_ORT_70 – Support for organic farming* (hereinafter: Eco) is not eligible for AEM support.

Commitments have been drafted which overlap, in whole or in part, *with the intervention DP17_G01_ECOS_16 – Agro-ecological Programme* (hereinafter: AÖP) in some of its practices. If the beneficiary has opted for a commitment that overlaps with an AÖP practice, it cannot choose the relevant AA practice.

RD21_G04_LCI_73 – *Agro-ecological non-productive investments intervention* (hereinafter: NTB Investment Aid) shall not be taken into account when fulfilling the AKG commitment.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

5.5. Beneficiaries (Eligible Beneficiaries)

The beneficiaries of the intervention are farmers

5.6. Eligibility Criteria

Eligibility criteria for aid:

- The area covered by the aid is at least 1 ha for each TECS.

- The minimum size of the plate concerned shall be 0.25 ha.
- In the case of vineyards, the age of the plantation imported for aid may not exceed 26 years in the year in which the application is submitted, except for walnuts, chestnuts and vines.
- In the case of vineyards, a minimum number of vines is set for both extensive and intensive plantations.
- The farmer is only entitled to apply a zonal requirement in respect of areas defined at the physical block level – in the area indicated in the LPIS – that meet the area criteria.

At the same time, the contiguous area covered by the commitment included in the agri-environmental payment support cannot be included in the ÖKO aid.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

5.7. Commitments

The beneficiaries must undertake the following commitments.

- Participation in ***compulsory training*** related to the aid.
- Keeping relevant worksheets in the Management Log.***
- ***Respect all the basic, mandatory and freely chosen commitments*** of the respective TECS.

The commitments of each TECS are presented in a separate table, which is uploaded as an annex.

Compared to previous programmes, the current system of pledges has a significantly higher level of ambition. The ambition increase will be achieved by:

- Making previously optional pledges as a basis: the scope of the basic pledges has been extended by the commitment to “*apply crop protection forecast*” for the Horizontal arable TECS, while for horizontal grassland, the commitment to apply “bird-friendly mowing (forcing mowing, game alarm chain, cutting width up to 4 m, speed up to 8 km/h)” has been extended.
- New TECS were introduced: Soil renewal management, Natura 2000 cropland.
- Optional pledges have been broadened.
- The territorial scope of the Drought and Erosion Protection Pledges has been extended by moving from the zonal TECSs to horizontal TECSs, so that these commitments can be implemented in a larger area.

Recent drought years have highlighted the importance of water on agricultural land. The approach towards inland water has changed. The aim is now to disincentivise inland waters instead of draining them. Accordingly, the prohibition of the deduction of inland waters as a basic commitment in the horizontal TECS instead of the former inland TECS.

85.	A	Tilos hígtrágya kijuttatása		
86.	A	A tematikus előírás csoport teljes területén - az élő szálaspillangós takarmánynövények, zöldgúgar és méhlegelő kivételével - a táblák maximális mérete 20 ha.		
87.	A	Tilos az öntözés.		
88.	A	Március 1. és július 31. között napnyugtától napkelteig gépi munkavégzés tilos.		
89.	A	Fokozottan védett, földön fészkelő madarak fészkeinek, fiókáinak megtalálása esetén, azt haladéktalanul jelenteni kell a működése szerint érintett nemzeti park igazgatóságának. A megtalált fészkek körül min. 1 ha védőzóna kialakítása.		
90.	A	Szálaspillangós takarmánynövények, zöldgúgar, illetve méhlegelő betakarítása során madárbarát kaszálás (kiszorító kaszálás, vadriasztó lánc, max. 4 méter vágáshősség, max. 8 km/h sebesség) alkalmazása.	421	nr.
91.	A	Szálaspillangós takarmánynövények, zöldgúgar, illetve méhlegelő betakarítása során táblánként kaszálatlan területet kell hagyni 5-10 % termétkben, a tábla szélel érintkezően legalább 6 méter szélességben.		
92.	A	Szálaspillangós takarmánynövények, zöldgúgar, illetve méhlegelő esetén a július 31-e előtt végzett betakarítás megkezdése előtt legalább 5 munkanappal elektronikus úton be kell jelenteni a betakarítás pontos helyét és tervezett kezdési időpontját.		
93.	A	A tábla szélein 6 méteres sávban tilos növényvédőszer használni.		
94.	A	A tematikus előírás csoporttal érintett teljes területen szálaspillangós takarmánynövény, zöldgúgar és/vagy méhlegelő termesztése, vagy a következő vetésszerkezet betartása fővetésű növények tekintetében: legalább 20 % kalászos gabona, legalább 20 % szálaspillangós takarmánynövény vagy azok keveréke, legalább 20 % zöldgúgar és/vagy méhlegelő, legfeljebb 25 % egyéb kultúra.		
95.	A	Tápanyag-utánpótlás során a kijuttatott N hatóanyag mértéke nem haladhatja meg a 90 kg/ha/év értéket.		
96.	A	Rágcsálóirtó, rovarölő és talajfertőtlenítő szerek alkalmazása tilos.		
97.	A	Szálaspillangós takarmánynövények, zöldgúgar vagy méhlegelő betakarításának legkorábbi időpontja július 1., kivéve az élő szálaspillangós takarmánynövények telepítését követő első kaszálást, mely a működése szerint érintett nemzeti park igazgatóság írásos hozzájárulása alapján korábbi időpontban is elvégezhető.		
98.	A	A talajfelszín megsértésével járó gépi munkavégzés április 1. és július 15. között nem végezhető, kivéve a betakarítás utáni tarlóhántást.		
99.	A	Növényvédőszer és műtrágya kijuttatása április 1. és július 15. között nem megengedett.		
100.	A	Repce esetén a működése szerint érintett nemzeti park igazgatóság madarak téli táplálékának biztosítása érdekében téli hőeltakarítást írhat elő a teljes repceterület legfeljebb 10 %-án.		

101.	V	Kötelezettségvállalási időszak minden évében zöldugar és/vagy méhlegelő táblaszegély fenntartása legalább 6 méter, legfeljebb 20 méter szélességben az adott kötelezettségvállalással érintett egybefüggő terület legalább 5 %-kával megegyező terület nagyságban.		33	6
102.	V	A vállalással érintett teljes területen - az évelő szálas pillangós takarmánynövények, zöldugar, illetve méhlegelő kivételével - a táblák maximális mérete 5 ha.		33	5
103.	V	Tápanyagutánpótlás során a kijuttatott N hatóanyag mértéke nem haladhatja meg a 50 kg/ha/év értéket.		33	5
104.	V	Szálas pillangós takarmánynövények, zöldugar, illetve méhlegelő betakarítása során táblánként kaszálatlan területet kell hagyni 10-15 % térmértékben, a tábla szélével érintkezően legalább 6 méter szélességben.		22	6
105.	V	Szálas pillangós takarmánynövények, zöldugar, illetve méhlegelő betakarítása során legalább 10 cm tarlómagasság meghagyása szükséges.		15	2
106.	V	Szálas pillangós takarmánynövények, zöldugar, illetve méhlegelő betakarításának legkorábbi időpontja július 15., kivéve az évelő szálas pillangós takarmánynövények telepítését követő első kaszálást, mely a működése szerint érintett nemzeti park igazgatóság írásos hozzájárulása alapján korábbi időpontban is elvégezhető.	A 106. és a 107. vállalások együtt nem választhatók egy válláláscsomagban.	22	6
107.	V	Szálas pillangós takarmánynövények, zöldugar, illetve méhlegelő betakarításának legkorábbi időpontja augusztus 15., kivéve az évelő szálas pillangós takarmánynövények telepítését követő első kaszálást, mely a működése szerint érintett nemzeti park igazgatóság írásos hozzájárulása alapján korábbi időpontban is elvégezhető. O14 What area is eligible?

- ☒ Agricultural area defined for the CAP plan
☐ Agricultural land including and beyond agricultural area
☐ Non-agricultural land

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations

under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

List of relevant GAEC and SMR

Code	Description
GAEC01	Maintenance of permanent grassland based on a ratio of permanent grassland in relation to agricultural area at national, regional, sub-regional, group-of-holdings or holding level in comparison to the reference year 2018. Maximum decrease of 5% compared to the reference year.
GAEC02	Protection of wetland and peatland
GAEC03	Ban on burning arable stubble, except for plant health reasons
GAEC05	Tillage management, reducing the risk of soil degradation and erosion, including consideration of the slope gradient
GAEC06	Minimum soil cover to avoid bare soil in periods that are most sensitive
GAEC07	Crop rotation in arable land, except for crops growing under water
GAEC08	Retention of landscape features. Ban on cutting hedges and trees during the bird breeding and rearing season. As an option, measures for avoiding invasive plant species
GAEC09	Ban on converting or ploughing permanent grassland designated as environmentally-sensitive permanent grasslands in Natural 2000 sites
SMR01	Directive 2000/60/EC of 23 October 2000 of the European Parliament and of the Council establishing a framework for Community action in the field of water policy: Article 11(3), point (e), and point (h), as regards mandatory requirements to control diffuse sources of pollution by phosphates
SMR02	Council Directive 91/676/EEC of 12 December 1991 concerning the protection of waters against pollution caused by nitrates from agricultural sources: Articles 4 and 5
SMR03	Directive 2009/147/EC of the European Parliament and of the Council of 30 November 2009 on the conservation of wild birds: Article 3(1), Article 3(2), point (b), Article 4(1), (2) and (4)
SMR04	Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild flora and fauna: Article 6(1) and (2)
SMR07	Regulation (EC) No 1107/2009 of the European Parliament and of the Council of 21 October 2009 concerning the placing of plant protection products on the market and repealing Council Directives 79/117/EEC and 91/414/EEC: Article 55, first and second sentence
SMR08	Directive 2009/128/EC of the European Parliament and of the Council of 21 October 2009 establishing a framework for Community action to achieve the sustainable use of pesticides: Article 5(2) and Article 8(1) to (5); Article 12 with regard to restrictions on the use of pesticides in protected areas defined on the basis of Directive 2000/60/EC and Natura 2000 legislation; Article 13(1) and (3) on handling and storage of pesticides and disposal of remnants

List of relevant mandatory national standards

In accordance with Article 70(3) of Regulation (EU) 2021/2115, all standards must comply with the relevant Community or national requirements. The requirements relating to the Good Agricultural and Environmental Conditions (GAEC) and the requirements of the statutory management requirements (SMRs) have been transposed into the national legislation on the basis of the compatibility shown in the following table.

Code	National legislation
SMR01	Act CXXIX of 2007 on the protection of productive land, Sections 36, 49 and 53 16/2024. (IV. Section 38 of the Decree of the Minister for Agriculture on the conditions applicable to the use of grants under the Common Agricultural Policy Strategic Plan
SMR02	59/2008. (IV. Decree No 29.) of the Minister for Agriculture and Rural Development on the detailed rules of the action programme necessary for the protection of waters against pollution caused by nitrates from agricultural sources and on the procedures for the provision of data and records. SECTIONS 4, 5, 6 AND 10
SMR03-04	275/2004. Section 9 of Government Decree No 487/2015 of 8 October 2004 on nature conservation areas of European Community importance, 269/2007. Section 3, Section 4 and Section 5 of Government Decree No 487/2015 of 18 October 2000 on land use rules for the maintenance of NATURA 2000 grassland.
SMR07-08	43/2010. (IV. (23) Decree of the Minister for Agriculture and Rural Development on plant protection activities, Sections 5, 6, 16, 27, 29 and 32-36
HMKÁ01-09	16/2024. (IV. Articles 9 to 37 of the Decree of the Minister for Agriculture on the conditions applicable to the use of grants under the Common Agricultural Policy Strategic Plan
Minimum activities	15/2024. (IV. Decree No 9/1999 of the Minister for Agriculture paragraph 16 of the procedural rules for certain agricultural subsidies that may be applied for in a single application

Link between GAEC, SMR and national standards with the intervention

All commitments are designed to go beyond the GAEC and SMR requirements above, as well as the minimum activities. The list has been uploaded as an annex to the programme

7 Form and rate of support/amounts/calculation methods

☒ IACS

☐ Non-IACS

IACS section

Type of payment

☒ unit cost based on additional costs and income foregone

☒ transaction cost included

☐ one off payment

☐ lump sum

Range of support at beneficiary level

The aid intensity is 100 %.

Maximum grant amount at TECS level:

Branch of cultivation	Name of TECS		Maximum grant amount (EUR/ha/year)
Arable land	Horizontal arable land		400
	Land-renewal farming		451
	Natura 2000 arable land		410
	Greases for the protection of hostages		597
	MTÉT Protecting arable land		558
	MTÉT Blue blood thick protection arable		526
Turf	Horizontal grassland		303
	Habitat grassland		517
Plantation	Horizontal plantation	Intensive fruit plantation	866
		Extensive fruit plantation	724
		grapes	1045
Reeds	Horizontal cane		105

Ineligible costs for the intervention:

activities of the Rural Development Programme 2014-2020 under ongoing commitment

Calculation method

The determination of the aid amounts for each standard was based on an objective source of data. When determining the aid amounts, several data sources were taken into account together.

1. Test Plant System of the Institute of Agricultural Economics:

In the first place, data on the production value and the costs of certain crops at sector level were taken into account in the test plant system. The test plant system collects sectoral data on the most important crops each year for more than 90 % of farmland, which are an important basis for background calculations, both in arable, grass, vegetable and plantation crops. Sectoral results may vary due to the weather of the growing season or other economic reasons (e.g. inflation, etc.).

2. Determination of agricultural machinery costs:

Three data sources were used in relation to the cost of agricultural machinery

—Research results of the Institute for Agricultural Promotion of the National Centre for Agricultural Research and Innovation for 2020;

— Current market farm labour service fees 2023;

—expert calculations.

A 15 % correction of the average of the two different sources of data has been used to determine the background database for machine work, which contains the most important machine work operations arising during the grant. For some complex specifications (e.g. the construction of bee pastures, greenugars), a number of operational costs are presented, which have been calculated taking into account a complete technological process and determined with the involvement of experts.

3. Performance of the squeeze area pro rata:

As there are significant differences in revenue and cultivation costs for arable, vegetable and plantation crops at sector level, it is justified to proportional the aggregate figures to the area. In the case of crop area ratios, the average of the 2019 national crop structure data is the basis for the calculation correction. The crop structure data of the Agricultural Economic Institute were used in the calculation. All agricultural crops sown in Hungary have been included in the sowing area calculation, which together cover

4 300 000 hectares of agricultural land, thus adequately representing the sectoral proportions of current national agriculture. The resulting value has been corrected for the data from the test run system.

4.Determination of agronomic effects:

The agri-environmental payment is considered to be a compensatory payment under EU legislation, so that the amount of aid intended to compensate for the additional costs incurred and the loss of profits was determined individually for each standard with the involvement of an expert. With regard to agronomic aspects, the expected impacts have been determined taking into account the aid calculation experience of previous grant periods.

The calculation shall be based on the determination of the additional costs incurred by the standards and the extent of the loss of income. When calculating the aid amount, the expected income development of compliant farmers is compared with farms where the AEM rules are not applied. This ensures that, in practice, farming practices are not subsidised, but only the increased standards are the basis for compensation.

For each standard, income-determining inputs and costs are grouped into 4 categories:

- Expected loss of income
- Expected revenue increase
- Expected additional costs
- Expected cost reduction

Additional explanation

The detailed background calculation of the agri-environmental intervention is also provided in the annexes.

The structure of the agri-environmental payment is based on management standards, which makes it possible to determine the level of support on the basis of the measurable, verifiable and expected agronomic effects of each standard. There are overlaps between the different TECs, on the basis of which a background structure has been established to ensure, on the one hand, that TECs are comparable and, on the other hand, that a standard is indicated (within one crop) with an amount of aid.

Determination of the value of the compensation:

The calculation was determined separately for each standard using available data sources and expert estimates from previous periods. As the payment is made on an annual and per hectare basis, a correction was applied when determining the level of compensation. In such cases, the costs were fixed in equal proportions per year.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

- ☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

What are the models of the commitment(s) in the intervention?

- ☐ result based (with possibility to pick and choose)
☒ management based (with possibility to pick and choose)
☐ hybrid (management and result based)

Please explain the obligations/possibilities for beneficiaries in relation to the commitments set out in the intervention

An agri-environmental payment is a voluntary payment scheme in which:
participants undertake to carry out additional activities in their farming in order to achieve agri-environmental objectives. The grant shall be subject to compliance by the beneficiary with the commitments set out in the Thematic Groups of Specifications for the entire duration of the commitment.

Presentation of commitments: see Chapter 5.7.

On the basis of the commitments, the beneficiary may submit an annual payment request on the basis of which it may receive an annual payment in the event of implementation of the commitments.

According to Article 102(5) (Planned Unit Amounts and planned outputs) of Regulation (EU) 2021/2115 establishing rules on support for strategic plans to be drawn up by Member States under the Common Agricultural Policy (CAP Strategic Plans) and financed by the European Agricultural Guarantee Fund (EAGF) and by the European Agricultural Fund for Rural Development (EAFRD) and repealing Regulations (EU) No 1305/2013 and (EU) No 1307/2013, the output of the hectares covered by the Thematic Groups of Specifications is aggregated annually for all unit amounts.

What is the duration of contracts?

In the AKG, the grant relationship is established by means of a grant document. For the agri-environmental management programme starting from 2025, the support period for all thematic groups *of standards shall run from 1 January 2025 to 31 December 2029*.

10 WTO compliance

Green Box

Paragraph 12 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy programme complies with the WTO Green Box as it fully follows the conditions referred to in point 12 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(3)(b) - 70 - Payments under Article 70	50.00%	20.00%	80.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?

Explanation and justification related to the value of the unit amount

RD19a_O14_U01_HA - Agricultural Environmental Management Payments (AEM) Horizontal Crop Unit Amount

The background calculation is based on the aid amount specified in the attached documents (word and excel) entitled 'AKG_unit

amount_KAP_ST_20241113’.

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

RD19a_O14_U02_HA - Unit amount of agri-environment payments (AKG) for land renewal

The background calculation is based on the aid amount specified in the attached documents (word and excel) entitled ‘AKG_unit amount_KAP_ST_20241113’.

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

RD19a_O14_U03_HA - Natura 2000 arable land unit amount for agri-environmental management (AEM) payments

The background calculation is based on the aid amount specified in the attached documents (word and excel) entitled ‘AKG_unit amount_KAP_ST_20241113’.

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those

commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

RD19a_O14_U04_HA - Agricultural Environmental Management Payments (AEM) SUPPORT Footwear

The background calculation is based on the aid amount specified in the attached documents (word and excel) entitled ‘AKG_unit amount_KAP_ST_20241113’.

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

RD19a_O14_U05_HA - Agricultural Environmental Management Payments (AEM) Amount of arable land for farmland

The background calculation is based on the aid amount specified in the attached documents (word and excel) entitled ‘AKG_unit amount_KAP_ST_20241113’.

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set

of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

RD19a_O14_U06_HA - Agricultural Environmental Management Payments (AKG) Amount of protective arable land for blue blood shoots

The background calculation is based on the aid amount specified in the attached documents (word and excel) entitled 'AKG_unit amount_KAP_ST_20241113'.

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

RD19a_O14_U07_HA - AGRI-environmental payments (AKG) Horizontal grassland unit amount

The background calculation is based on the aid amount specified in the attached documents (word and excel) entitled 'AKG_unit amount_KAP_ST_20241113'.

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

RD19a_O14_U08_HA - Unit amount of agri-environmental management payments (AKG) for habitat conservation grassland

The background calculation is based on the aid amount specified in the attached documents (word and excel) entitled ‘AKG_unit amount_KAP_ST_20241113’.

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. This method ensures that the output determined on a hectare basis and the unit amount per hectare are consistent with the amount of resources available for support. The unit amount shall indicate the extent to which those commitments may be made and the maximum amount of aid that can be obtained under the specific commitment category.

The uniform unit amount represents the maximum value of the specifications in a given thematic set of specifications. There is therefore a separate grant amount for each set of thematic standards. The amount of the payment is different for each farmer, as the amount depends on the design of each thematic set of requirements and packages. The final amount consists of two items: the basic package, which contains the optional elements, and the amount of aid per standard after the optional requirements. The amount of the basic package is a lump sum as the joint commitment of each commitment is set at a binding and aggregate amount. The payment amount depends on the number of standards chosen and the amount of payment allocated to them. The maximum is therefore the maximum amount available for a given set of thematic specifications.

RD19a_O14_U09_HA - AGRI-environmental management payments (AKG) Horizontal plantation – Intensive fruit plantation unit amount

The background calculation is based on the aid amount specified in the attached documents (word and excel) entitled ‘AKG_unit amount_KAP_ST_20241113’.

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. 7 for each Unit Amount category. The methodology referred to in chapter (Form of grant) has been applied, considering that for each set of thematic specifications, the unit Amount measure is the same as the unit amount calculated in the background calculation. RD20_G02_ORT_70 - Support to organic farming

Intervention Code (MS)	RD20_G02_ORT_70
Intervention Name	Support to organic farming
Type of Intervention	ENVCLIM(70) - Environmental, climate-related and other management commitments
Common Output Indicator	O.17. Number of hectares or number of other units benefitting from support for organic farming
Contributing to ringfencing requirement for/on	Generational Renewal: No Environment: Yes ES rebate system: Yes LEADER: No

1 Territorial scope and, if relevant, regional dimension

Territorial scope: **National**

Code	Description
HU	Magyarország

Description of the Territorial Scope

Area of intervention Hungary

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description	Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold
SO4 Contribute to climate change mitigation and adaptation, including by reducing greenhouse gas emission and enhancing carbon sequestration, as well as promote sustainable energy	
SO5 Foster sustainable development and efficient management of natural resources such as water, soil and air, including by reducing chemical dependency	
SO6 Contribute to halting and reversing biodiversity loss, enhance ecosystem services and preserve habitats and landscapes	
SO9 Improve the response of Union agriculture to societal demands on food and health, including high quality, safe, and nutritious food produced in a sustainable way, the reduction of food waste, as well as improving animal welfare and combatting antimicrobial resistances	

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
4.1.1	Improving the carbon sequestration capacity of soils and ecosystems	1	Yes
5.1.1	Developing soil and nutrient management at farm level	1	Yes
5.1.2	Reducing nutrient losses, preventing nutrient leaching	1	Yes
5.1.3	Restoring degraded soils and improving their water management	1	Yes
5.2.1	Sustainable use of surface and groundwater	1.	Yes
5.4.1	Reducing emissions of air pollutants and particulate matter of agricultural origin	3	Yes
5.4.2	Reducing ammonia emissions from agriculture	2	Yes
5.5.2	Integrated environmentally friendly pest management	1	Yes
6.4.1	Developing up-to-date data collection and monitoring systems for measuring biodiversity	1	Partially

6.7.1	Increasing the area under organic cultivation	2	Yes
9.1.1	Meeting animal welfare requirements and meeting the natural needs of farm animals	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.14 Share of utilised agricultural area (UAA) under supported commitments to reduce emissions or to maintain or enhance carbon storage (including permanent grassland, permanent crops with permanent green cover, agricultural land in wetland and peatland)
R.19 Share of utilised agricultural area (UAA) under supported commitments beneficial for soil management to improve soil quality and biota (such as reducing tillage, soil cover with crops, crop rotation included with leguminous crops)
R.20 Share of utilised agricultural area (UAA) under supported commitments to reduce ammonia emission
R.21 Share of utilised agricultural area (UAA) under supported commitments for the quality of water bodies
R.24 Share of Utilised Agricultural Area (UAA) under supported specific commitments which lead to a sustainable use of pesticides in order to reduce risks and impacts of pesticides, such as pesticides leakage
R.29 Share of utilised agricultural area (UAA) supported by the CAP for organic farming with a split between maintenance and conversion
R.31 Share of utilised agricultural area (UAA) under supported commitments for supporting biodiversity conservation or restoration including high-nature-value farming practices
R.43 Share of livestock units (LU) concerned by supported actions to limit the use of antimicrobials (prevention/reduction)
R.44 Share of livestock units (LU) covered by supported actions to improve animal welfare

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

The aim of the intervention is to encourage the conversion of conventional areas into organic farming and to maintain the farming method on organic areas. Organic farming contributes to maintaining or enhancing biodiversity, strengthens natural self-regulation processes, protects and improves the biological status of the soil, reduces negative environmental impacts from improper use of plant protection products and poor nutrient management, and contributes to food safety.

A farmer eligible for support under an intervention shall be managed in accordance with the requirements of organic farming for a minimum period of five years or, in the case of a commitment until 31 December 2024, for a minimum period of 6 years.

Principles governing the establishment of selection criteria, which may be partially applied (selection criteria):

In order to achieve the area increase specified in the national eco-management action plan, the aim is to involve all beneficiaries applying for an intervention in the programme. However, if the rate of application exceeds the amount of funding allocated to the intervention, a scoring system shall be established.

The scoring system shall be designed taking into account the following principles:

- Proof of land use for the areas under intervention for at least the entire duration of the commitment, depending on the proportion of areas concerned.
- Consideration of site sensitivity – Natura2000, ATA and protected sites of national importance;
- Other criteria – other criteria qualifying a farmer, such as eco-farming experience, participation in support of young farmers, employment of special advisers, organic livestock farming.

Support for agri-environmental management payments and organic farming has been developed in conjunction with and in line with the Basic Agri-ecological Programme. In the course of each of the provisions, Hungary has taken particular care to increase the environmental impact of the individual aid schemes. Each commitment has been defined in such a way that it fully covers cultivated areas and where

one aid can no longer be present, the other can be involved and farmers can manage it accordingly.

Link to other interventions:

RD58_A01_TRA_78 – Support for training and demonstration facilities

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible Beneficiaries:

– farmers

Eligibility criteria

- The minimum size of the field concerned shall be 0.25 ha.
- The area concerned is a minimum of 1.0 ha for each land use category.
- The area is under control during the programme period in accordance with Council Regulations (EC) No 834/2007 and 2018/848.
- The beneficiary must have a contract for the areas covered by the intervention with a national accredited certification body for the entire duration of the aid.
 - At the same time, the area under organic farming support cannot be included in agri-environmental support.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments (commitments):

- The beneficiary is managed in accordance with domestic legislation in accordance with Council Regulations (EC) No 834/2007 and 2018/848.
- The beneficiary participates in compulsory training on intervention in organic farming if they have only areas in transition to organic farming. The aid applicant shall be exempted from the training obligation if it has already been completed within the 5 years preceding the date of submission of the aid application.
- Management of a management log

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

List of relevant GAEC and SMR

Code	Description
GAEC01	Maintenance of permanent grassland based on a ratio of permanent grassland in relation to agricultural area at national, regional, sub-regional, group-of-holdings or holding level in comparison to the reference year 2018. Maximum decrease of 5% compared to the reference year.
GAEC02	Protection of wetland and peatland
GAEC03	Ban on burning arable stubble, except for plant health reasons
GAEC04	Establishment of buffer strips along water courses
GAEC05	Tillage management, reducing the risk of soil degradation and erosion, including consideration of the slope gradient
GAEC06	Minimum soil cover to avoid bare soil in periods that are most sensitive
GAEC07	Crop rotation in arable land, except for crops growing under water
GAEC08	Retention of landscape features. Ban on cutting hedges and trees during the bird breeding and rearing season. As an option, measures for avoiding invasive plant species
GAEC09	Ban on converting or ploughing permanent grassland designated as environmentally-sensitive permanent grasslands in Natural 2000 sites

SMR01	Directive 2000/60/EC of 23 October 2000 of the European Parliament and of the Council establishing a framework for Community action in the field of water policy: Article 11(3), point (e), and point (h), as regards mandatory requirements to control diffuse sources of pollution by phosphates
SMR02	Council Directive 91/676/EEC of 12 December 1991 concerning the protection of waters against pollution caused by nitrates from agricultural sources: Articles 4 and 5
SMR03	Directive 2009/147/EC of the European Parliament and of the Council of 30 November 2009 on the conservation of wild birds: Article 3(1), Article 3(2), point (b), Article 4(1), (2) and (4)
SMR04	Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild flora and fauna: Article 6(1) and (2)
SMR05	Regulation (EC) No 178/2002 of the European Parliament and of the Council of 28 January 2002 laying down the general principles and requirements of food law, laying down procedures in matters of food safety: Articles 14 and 15, Article 17(1) and Articles 18, 19 and 20
SMR07	Regulation (EC) No 1107/2009 of the European Parliament and of the Council of 21 October 2009 concerning the placing of plant protection products on the market and repealing Council Directives 79/117/EEC and 91/414/EEC: Article 55, first and second sentence
SMR08	Directive 2009/128/EC of the European Parliament and of the Council of 21 October 2009 establishing a framework for Community action to achieve the sustainable use of pesticides: Article 5(2) and Article 8(1) to (5); Article 12 with regard to restrictions on the use of pesticides in protected areas defined on the basis of Directive 2000/60/EC and Natura 2000 legislation; Article 13(1) and (3) on handling and storage of pesticides and disposal of remnants
SMR09	Council Directive 2008/119/EC of 18 December 2008 laying down minimum standards for the protection of calves: Articles 3 and 4

List of relevant mandatory national standards

— 34/2013. Decree No 14 of 14 May 2007 of the Minister for Rural Development on the certification, production, marketing, labelling and control of agricultural products and foodstuffs in accordance with organic farming requirements;

National Action Plan for the Development of Ecological Farming

Link between GAEC, SMR and national standards with the intervention

The eligible costs are intended to compensate for the additional costs incurred and the loss of profit incurred by the requirements in accordance with Council Regulation (EC) No 834/2007, Regulation (EU) 2018/848 of the European Parliament and of the Council and Commission Regulation (EC) No 889/2008, which requires the farmer to operate in accordance with the legislation.

☒ IACS

☐ Non-IACS

IACS section

Type of payment

☒ unit cost based on additional costs and income foregone

☒ transaction cost included

☐ one off payment

☐ lump sum

Range of support at beneficiary level

In the case of conversion to organic farming, the amount of aid shall be:

Arable			
Grant rate	EUR/ha/year		458
Vegetables			
Grant rate	EUR/ha/year		1.097
Apples			
Grant rate	EUR/ha/year		1.840
Grape			
Grant rate	EUR/ha/year		1.132
Other fruits			
Grant rate	EUR/ha/year		1.762
Grassland management – grazing and mowing ≥ 0.2 LU/ha/year			
Grant rate	EUR/ha/year		204

In the case of maintenance of organic farming, the amount of aid shall be:

Arable			
Grant rate	EUR/ha/year		349
Vegetables			
Grant rate	EUR/ha/year		664
Apples			
Grant rate	EUR/ha/year		1.136
Grape			
Grant rate	EUR/ha/year		1.097
Other fruits			
Grant rate	EUR/ha/year		967
Grassland management – grazing and mowing ≥ 0.2 LU/ha/year			
Grant rate	EUR/ha/year		204

Calculation method

Organic farming intervention background calculation: Use of the testing system of the Institute of Agricultural Economics was the starting point. Data on the production value and the costs of certain crops at sectoral level were taken into account in the first line from the test scheme. The test scheme collects sectoral data on the most important crops each year for more than 90 % of farmland, which is an important basis for background calculations, in arable land, grassland, vegetables and plantation crops. Industry results may change due to the weather of the growing season or for other economic reasons (e.g. inflation, etc.), but the analysis of the data for the last three years showed a steady increase in both production value

and costs, so a 10 % correction of 2019 data in the background calculation is justified for the period 2022-2025. The calculation is based on the determination of the additional cost incurred by the standards and the level of loss of income. When calculating the amount of aid, the expected income development of compliant farmers is compared to conventional farming practices. This ensures that the forms of farming that are common in practice are not supported, but only the higher standards form the basis for compensation. In all cases, the costs of verification/certification are included in the calculations. For each standard, the premiums and costs determining income are grouped into 4 categories. 1. Expected loss of revenue 2. Expected revenue increase 3. Expected incremental cost 4. Expected cost reduction. Determination of compensation is determined separately for each requirement using the data sources and expert estimates described above. The calculations include the costs of verification/certification for each category.

Additional explanation

- Rural Development Programme activities concerned by ongoing commitments 2014-2020

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

What are the models of the commitment(s) in the intervention?

- ☒ result based (with possibility to pick and choose)
- ☒ management based (with possibility to pick and choose)
- ☒ hybrid (management and result based)

Please explain the obligations/possibilities for beneficiaries in relation to the commitments set out in the intervention

Commitments:

- The beneficiary's farming is in accordance with national legislation in accordance with Council Regulations (EC) No 834/2007 and 2018/848.
- The beneficiary participates in mandatory training on organic farming intervention if it has only areas in conversion to organic farming. The aid applicant shall be exempt from the training requirement if he or she has completed it within 5 years prior to the submission of the aid application.
- Management of the Farm Log

Output of areas under organic farming (in transition and subject to a maintenance period) 2021/2115 establishing rules on support for strategic plans to be drawn up by Member States and financed by the European Agricultural Guarantee Fund (EAGF) and by the European Agricultural Fund for Rural Development (EAFRD) and repealing Regulations (EU) No 1305/2013 and (EU) No 1307/2013 Pursuant to paragraph 5 of Article 102 (Planned unit amounts and planned outputs) of Regulation (EU) No 575/2013, annual planned outputs for all unit amounts are aggregated on an annual basis.

What is the duration of contracts?

5 years, 6 years in the case of a commitment period until 31 December 2024, which may be divided into a conversion and maintenance period. If a farmer has been producing in accordance with the rules of organic farming for several years, the conversion period is less. As a general rule, stranded support may be granted for a maximum period of 3 years.

10 WTO compliance

Green Box

Paragraph 12 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 12 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(3)(b) - 70 - Payments under Article 70	50.00%	20.00%	80.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD20_O17_U01_HA - Conversion to organic farming — unit amount of arable land	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.19; R.21; R.24; R.29; R.31	No
RD20_O17_U02_HA - Conversion to organic farming — Unit amount of vegetables	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.19; R.20; R.21; R.24; R.29; R.31	No
RD20_O17_U03_HA - Conversion to organic farming — unit amount for pome fruits	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.19; R.20; R.21; R.24; R.29; R.31	No
RD20_O17_U04_HA - Conversion to organic farming — Unit amount of grapes	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.19; R.20; R.21; R.24; R.29; R.31	No
RD20_O17_U05_HA - Conversion to organic farming — Unit amount of other fruit	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.19; R.20; R.21; R.24; R.29; R.31	No
RD20_O17_U06_HA - Conversion to organic farming — grass farming — grazing and mowing of at least 0.2 LU/ha/year unit amount	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.14; R.20; R.29; R.31; R.43; R.44	No
RD20_O17_U07_HA - Maintenance of organic farming — unit amount of arable land	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.19; R.21; R.24; R.29; R.31	No
RD20_O17_U08_HA - Maintenance of organic farming — Vegetable unit amount	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.19; R.20; R.21; R.24; R.29; R.31	No
RD20_O17_U09_HA - Maintenance of organic farming — unit amount for pome fruits	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.19; R.20; R.21; R.24; R.29; R.31	No
RD20_O17_U10_HA - Maintenance of organic farming — Unit amount of grapes	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.19; R.20; R.21; R.24; R.29; R.31	No
RD20_O17_U11_HA - Maintenance of organic farming — Unit amount of other fruit	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.19; R.20; R.21; R.24; R.29; R.31	No
RD20_O17_U12_HA - Maintenance of organic farming — grass farming — grazing and mowing of at least 0.2 LU/ha/year unit amount	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.14; R.20; R.29; R.31; R.43; R.44	No

Explanation and justification related to the value of the unit amount

RD20_O17_U01_HA - Conversion to organic farming — unit amount of arable land

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD20_O17_U02_HA - Conversion to organic farming — Unit amount of vegetables

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention.

The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD20_O17_U03_HA - Conversion to organic farming — unit amount for pome fruits

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD20_O17_U04_HA - Conversion to organic farming — Unit amount of grapes

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD20_O17_U05_HA - Conversion to organic farming — Unit amount of other fruit

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD20_O17_U06_HA - Conversion to organic farming — grass farming — grazing and mowing of at least 0.2 LU/ha/year unit amount

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD20_O17_U07_HA - Maintenance of organic farming — unit amount of arable land

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD20_O17_U08_HA - Maintenance of organic farming — Vegetable unit amount

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD20_O17_U09_HA - Maintenance of organic farming — unit amount for pome fruits

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD20_O17_U10_HA - Maintenance of organic farming — Unit amount of grapes

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention.

The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD20_O17_U11_HA - Maintenance of organic farming — Unit amount of other fruit

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD20_O17_U12_HA - Maintenance of organic farming — grass farming — grazing and mowing of at least 0.2 LU/ha/year unit amount

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029
RD20_O17_U01_HA - Conversion to organic farming — unit amount of arable land (Grant - Uniform)	Planned unit amount (Total Public Expenditure in EUR)	0.00	458.00	458.00	0.00	0.00	0.00	0.00

RD20a_G02_ORT_70 - Support for organic farming

Intervention Code (MS)	RD20a_G02_ORT_70
Intervention Name	Support for organic farming
Type of Intervention	ENVCLIM(70) - Environmental, climate-related and other management commitments
Common Output Indicator	O.17. Number of hectares or number of other units benefitting from support for organic farming
Contributing to ringfencing requirement for/on	Generational Renewal: No Environment: Yes ES rebate system: Yes LEADER: No

1 Territorial scope and, if relevant, regional dimension

Territorial scope: **National**

Code	Description
HU	Magyarország

Description of the Territorial Scope

Entire country

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO4 Contribute to climate change mitigation and adaptation, including by reducing greenhouse gas emission and enhancing carbon sequestration, as well as promote sustainable energy
SO5 Foster sustainable development and efficient management of natural resources such as water, soil and air, including by reducing chemical dependency
SO6 Contribute to halting and reversing biodiversity loss, enhance ecosystem services and preserve habitats and landscapes
SO9 Improve the response of Union agriculture to societal demands on food and health, including high quality, safe, and nutritious food produced in a sustainable way, the reduction of food waste, as well as improving animal welfare and combatting antimicrobial resistances

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
4.1.1	Improving the carbon sequestration capacity of soils and ecosystems	1	Yes
5.1.1	Developing soil and nutrient management at farm level	1	Yes
5.1.2	Reducing nutrient losses, preventing nutrient leaching	1	Yes
5.1.3	Restoring degraded soils and improving their water management	1	Yes
5.2.1	Sustainable use of surface and groundwater	1.	Yes
5.4.1	Reducing emissions of air pollutants and particulate matter of agricultural origin	3	Yes
5.4.2	Reducing ammonia emissions from agriculture	2	Yes
5.5.2	Integrated environmentally friendly pest management	1	Yes
6.4.1	Developing up-to-date data collection and monitoring systems for measuring biodiversity	1	Partially

6.7.1	Increasing the area under organic cultivation	2	Yes
9.1.1	Meeting animal welfare requirements and meeting the natural needs of farm animals	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.14	Share of utilised agricultural area (UAA) under supported commitments to reduce emissions or to maintain or enhance carbon storage (including permanent grassland, permanent crops with permanent green cover, agricultural land in wetland and peatland)
R.19	Share of utilised agricultural area (UAA) under supported commitments beneficial for soil management to improve soil quality and biota (such as reducing tillage, soil cover with crops, crop rotation included with leguminous crops)
R.20	Share of utilised agricultural area (UAA) under supported commitments to reduce ammonia emission
R.21	Share of utilised agricultural area (UAA) under supported commitments for the quality of water bodies
R.24	Share of Utilised Agricultural Area (UAA) under supported specific commitments which lead to a sustainable use of pesticides in order to reduce risks and impacts of pesticides, such as pesticides leakage
R.29	Share of utilised agricultural area (UAA) supported by the CAP for organic farming with a split between maintenance and conversion
R.31	Share of utilised agricultural area (UAA) under supported commitments for supporting biodiversity conservation or restoration including high-nature-value farming practices
R.43	Share of livestock units (LU) concerned by supported actions to limit the use of antimicrobials (prevention/reduction)
R.44	Share of livestock units (LU) covered by supported actions to improve animal welfare

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

The aim of the intervention is to encourage the organicisation of conventional areas and to maintain farming methods in organic areas. Organic farming contributes to the maintenance or enhancement of biodiversity, strengthens natural self-regulatory processes, protects and improves the biological status of soil, reduces negative environmental impacts from the misuse of plant protection products and poor nutrient management, and contributes to food safety.

The farmer eligible for the intervention shall be managed in accordance with organic farming for a minimum of five years.

Principles governing the establishment of selection criteria, which may be partially applied (selection criteria):

In order to achieve the territorial increase set out in the Hungarian eco-management action plan, the aim is to involve all beneficiaries applying for the intervention in the programme. However, if the size of the application exceeds the amount of funding intended for intervention, a scoring system will be applied.

The scoring system shall be designed taking into account the following principles:

- Territorial sensitivity of the aided area – Natura2000, MTEA, Nitrate Vulnerable Areas.
- Other aspects: provide additional incentives for farmers to increase the share of their land use category in organic farming. Holdings also engaged in livestock farming.

Agro-environmental management payments and support for organic farming have been designed together with and in line with the basic programme for agro-ecology. In the course of the various provisions, Hungary has taken particular care to strengthen the environmental impact of each aid scheme. The individual pledges are defined so that they fully cover the cultivated areas and where one aid can no longer be present, the other can connect and farmers can manage accordingly.

Relationship with other interventions:

RD58_A01_TRA_78 – Support for training and demonstration facilities

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiaries:

— farmers

Eligibility criteria

- The minimum size of the plate concerned is 0.25 ha.
- The area concerned is a minimum of 1.0 ha for each land use category.
- The area is under control during the entire commitment period in accordance with Regulation (EU) 2018/848 of the European Parliament and of the Council.
- The beneficiary must have a contract with a nationally accredited certification body for the areas covered by the intervention for the entire duration of the aid.
- The area covered by the commitment for organic farming cannot also be included in agri-environmental support.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments:

- The beneficiary's management complies with Regulation (EU) 2018/848 of the European Parliament and of the Council, its implementing regulations and the relevant domestic legislation (34/2013. (Decree No V.14) of the Minister for Rural Development).
- The beneficiary participates in mandatory training on organic farming intervention.
- Keeping a farming log.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

List of relevant GAEC and SMR

Code	Description
GAEC01	Maintenance of permanent grassland based on a ratio of permanent grassland in relation to agricultural area at national, regional, sub-regional, group-of-holdings or holding level in comparison to the reference year 2018. Maximum decrease of 5% compared to the reference year.
GAEC02	Protection of wetland and peatland
GAEC03	Ban on burning arable stubble, except for plant health reasons
GAEC04	Establishment of buffer strips along water courses
GAEC05	Tillage management, reducing the risk of soil degradation and erosion, including consideration of the slope gradient
GAEC06	Minimum soil cover to avoid bare soil in periods that are most sensitive
GAEC07	Crop rotation in arable land, except for crops growing under water
GAEC08	Retention of landscape features. Ban on cutting hedges and trees during the bird breeding and rearing season. As an option, measures for avoiding invasive plant species
GAEC09	Ban on converting or ploughing permanent grassland designated as environmentally-sensitive permanent grasslands in Natural 2000 sites
SMR01	Directive 2000/60/EC of 23 October 2000 of the European

	Parliament and of the Council establishing a framework for Community action in the field of water policy: Article 11(3), point (e), and point (h), as regards mandatory requirements to control diffuse sources of pollution by phosphates
SMR02	Council Directive 91/676/EEC of 12 December 1991 concerning the protection of waters against pollution caused by nitrates from agricultural sources: Articles 4 and 5
SMR03	Directive 2009/147/EC of the European Parliament and of the Council of 30 November 2009 on the conservation of wild birds: Article 3(1), Article 3(2), point (b), Article 4(1), (2) and (4)
SMR04	Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild flora and fauna: Article 6(1) and (2)
SMR05	Regulation (EC) No 178/2002 of the European Parliament and of the Council of 28 January 2002 laying down the general principles and requirements of food law, laying down procedures in matters of food safety: Articles 14 and 15, Article 17(1) and Articles 18, 19 and 20
SMR07	Regulation (EC) No 1107/2009 of the European Parliament and of the Council of 21 October 2009 concerning the placing of plant protection products on the market and repealing Council Directives 79/117/EEC and 91/414/EEC: Article 55, first and second sentence
SMR08	Directive 2009/128/EC of the European Parliament and of the Council of 21 October 2009 establishing a framework for Community action to achieve the sustainable use of pesticides: Article 5(2) and Article 8(1) to (5); Article 12 with regard to restrictions on the use of pesticides in protected areas defined on the basis of Directive 2000/60/EC and Natura 2000 legislation; Article 13(1) and (3) on handling and storage of pesticides and disposal of remnants
SMR09	Council Directive 2008/119/EC of 18 December 2008 laying down minimum standards for the protection of calves: Articles 3 and 4

List of relevant mandatory national standards

— 34/2013. Decree of 14 May 2013 of the Minister for Rural Development on the certification, production, marketing, labelling and control of agricultural products and foodstuffs in accordance with organic farming requirements;

National Action Plan for the Development of Organic Farming (2022-2027)

Link between GAEC, SMR and national standards with the intervention

The eligible costs are intended to compensate for the additional costs incurred by standards in accordance with Regulation (EU) 2018/848 of the European Parliament and of the Council and Commission Regulation (EU) 2021/279, as well as foregone benefits, under which the operator is required to operate in accordance with the legislation.

7 Form and rate of support/amounts/calculation methods

☒ IACS

☐ Non-IACS

IACS section

Type of payment

☒ unit cost based on additional costs and income foregone

☒ transaction cost included

☐ one off payment

☐ lump sum

Range of support at beneficiary level

In the case of **conversion** to organic farming, the amount of aid shall be:

Arable			
Grant rate	EUR/ha/year		491
Vegetables			
Grant rate	EUR/ha/year		1.097
Intensive fruit plantation			
Grant rate	EUR/ha/year		1.801
Grapes			
Grant rate	EUR/ha/year		1.132
Extensive fruit plantation			
Grant rate	EUR/ha/year		1.562
Grassland farming – grazing and mowing at least 0.2 LU/ha/year			
Grant rate	EUR/ha/year		225

Where organic farming is **maintained**, the amount of aid shall be:

Arable			
Grant rate	EUR/ha/year		382
Vegetables			
Grant rate	EUR/ha/year		664
Intensive fruit plantation			
Grant rate	EUR/ha/year		1.117
Grapes			
Grant rate	EUR/ha/year		1.097
Extensive fruit plantation			
Grant rate	EUR/ha/year		879
Grassland farming – grazing and mowing at least 0.2 LU/ha/year			
Grant rate	EUR/ha/year		225

Calculation method

Background calculation of organic farming intervention:

The starting point was the use of the Test Plant System of the Institute of Agricultural Economics. The test plant system mainly took into account data on the production value and the costs of certain crops at sectoral level. The test plant system collects sectoral data on the most important crops each year for more than 90 % of farmland, which are an important basis for background calculations, both in arable, grass, vegetable and plantation crops. The sector's results may vary due to the weather of the growing season, as well as other economic reasons (e.g. inflation, etc.), but the analysis of the data for the last three years showed a steady increase in both production value and costs, therefore a correction of 10 % of the 2019 figures in the background calculation is justified for the period 2022-2025.

The calculation shall be based on the determination of the additional costs incurred by the standards and the extent of the loss of income. When calculating the aid amount, the expected income development of compliant farmers is compared to conventional farming practices. This makes it possible to ensure that, in practice, the types of farming that are common are not subsidised, but only the increased standards are the basis for the compensation. In all cases, the calculation shall include the costs of the inspection/certification.

For each standard, the enrolments and costs determining income are grouped into 4 categories.

1. Expected revenue shortfall
2. Expected revenue growth
3. Expected Additional Costs
4. Expected cost reduction

Determination of the value of the compensation

The calculation was determined separately for each specification using the data sources and expert estimates described above.

Additional explanation

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

What are the models of the commitment(s) in the intervention?

- ☒ result based (with possibility to pick and choose)
☒ management based (with possibility to pick and choose)
☒ hybrid (management and result based)

Please explain the obligations/possibilities for beneficiaries in relation to the commitments set out in the intervention

In accordance with Article 102(5) (Planned unit amounts and planned outputs) of Regulation (EU) 2021/2115 establishing rules on support for strategic plans (CAP Strategic Plans) to be drawn up by Member States and financed by the European Agricultural Guarantee Fund (EAGF) and by the European Agricultural Fund for Rural Development (EAFRD) and repealing Regulations (EU) No 1305/2013 and (EU) No 1307/2013, the output of the organic farming area (in transition and covered by the maintenance period) is presented in a consolidated year for all unit amounts.

What is the duration of contracts?

5 years, divided into periods of transition and maintenance. If a farmer has been using organic farming for several years, the conversion period is less for him. In principle, transitional support may be granted for a maximum of 3 years.

10 WTO compliance

Green Box

Paragraph 12 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The scheme complies with the conditions of the WTO Green Box as it fully follows the conditions referred to in point 12 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(3)(b) - 70 - Payments under Article 70	50.00%	20.00%	80.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD20a_O17_U01_HA - Conversion to organic farming – arable land unit amount	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.19; R.21; R.24; R.29; R.31	No

RD20a_O17_U11_HA - Maintenance of organic farming – Extensive fruit plantation unit amount	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.19; R.20; R.21; R.24; R.29; R.31	No
RD20a_O17_U12_HA - Organic farming maintenance – grassland farming – grazing and mowing of at least 0.2 LU/ha/year	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.14; R.20; R.29; R.31; R.43; R.44	No

Explanation and justification related to the value of the unit amount

RD20a_O17_U01_HA - Conversion to organic farming – arable land unit amount

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD20a_O17_U02_HA - Conversion to organic farming – Vegetable unit amount

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention.

The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD20a_O17_U03_HA - Conversion to organic farming – Intensive fruit plantation unit amount

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD20a_O17_U04_HA - Conversion to organic farming – Unit amount for grapes

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD20a_O17_U05_HA - Conversion to organic farming – Extensive fruit plantation unit amount

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD20a_O17_U06_HA - – Conversion to organic farming – grassland farming – grazing and mowing of at least 0.2 LU/ha/year

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD20a_O17_U07_HA - Maintenance of organic farming – unit amount of arable land

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD20a_O17_U08_HA - Maintenance of organic farming – Unit Vegetables

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD20a_O17_U09_HA - Maintenance of organic farming – Unit amount for intensive fruit plantations

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD20a_O17_U10_HA - Maintenance of organic farming – Unit amount for grapes

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention.

The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD20a_O17_U11_HA - Maintenance of organic farming – Extensive fruit plantation unit amount

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD20a_O17_U12_HA - Organic farming maintenance – grassland farming – grazing and mowing of at least 0.2 LU/ha/year

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029
RD20a_O17_U01_HA - Conversion to organic farming – arable land unit amount (Grant - Uniform)	Planned unit amount (Total Public Expenditure in EUR)				491.00	491.00			
	Maximum planned average unit amount (where applicable) (EUR)								
	O.17 (unit: Hectares)								
RD20a_O17_U02_HA - Conversion to organic farming – Vegetable unit amount (Grant - Uniform)	Planned unit amount (Total Public Expenditure in EUR)				1,097.00	1,097.00

RD22_G05_LCP_70 - Payment to encourage agro-ecological land use change

Intervention Code (MS)	RD22_G05_LCP_70
Intervention Name	Payment to encourage agro-ecological land use change
Type of Intervention	ENVCLIM(70) - Environmental, climate-related and other management commitments
Common Output Indicator	O.14. Number of hectares (excluding forestry) or number of other units covered by environmental or climate-related commitments going beyond mandatory requirements
Contributing to ringfencing requirement for/on	Generational Renewal: No Environment: Yes ES rebate system: Yes LEADER: No

1 Territorial scope and, if relevant, regional dimension

Territorial scope: **National**

Code	Description
HU	Magyarország

Description of the Territorial Scope

The area of implementation of the intervention is Hungary

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO4 Contribute to climate change mitigation and adaptation, including by reducing greenhouse gas emission and enhancing carbon sequestration, as well as promote sustainable energy

SO5 Foster sustainable development and efficient management of natural resources such as water, soil and air, including by reducing chemical dependency

SO6 Contribute to halting and reversing biodiversity loss, enhance ecosystem services and preserve habitats and landscapes

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
4.1.1	Improving the carbon sequestration capacity of soils and ecosystems	1	Yes
4.4.2	Review of the use of arable land at the boundary of economics	2	Yes
4.4.3	Improving the water retention capacity of soils and ecosystems by encouraging land-use change	1	Yes
5.1.3	Restoring degraded soils and improving their water management	1	Yes
5.1.4	Protection of arable land by agroforestry systems	2	Yes
5.2.1	Sustainable use of surface and groundwater	1.	Yes
5.2.2	Appropriate vegetation (invasive species, background pollution)	2	Yes
5.2.3	Rehabilitation of type-dependent zoning in the coastal zone of waters, establishment of a buffer zone	2	Yes
5.3.1	Promoting water retention in soil and landscape	1	Yes

6.1.1	Conservation or improvement of the natural condition of Natura 2000 farmland habitats	1	Yes
6.1.2	Maintenance or improvement of the natural condition of high nature value sites	1	Yes
6.1.3	Maintenance and development of grasslands in good ecological status and species richness	2	Yes
6.2.3	Ensuring ecological interoperability and biodiversity between cultivated areas by means of intermediate zones	1	Yes
6.4.1	Developing up-to-date data collection and monitoring systems for measuring biodiversity	1	Partially

4 Result indicator(s)

RESULT INDICATORS Code + Description	Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold
R.12	Share of utilised agricultural area (UAA) under supported commitments to improve climate adaptation
R.14	Share of utilised agricultural area (UAA) under supported commitments to reduce emissions or to maintain or enhance carbon storage (including permanent grassland, permanent crops with permanent green cover, agricultural land in wetland and peatland)
R.19	Share of utilised agricultural area (UAA) under supported commitments beneficial for soil management to improve soil quality and biota (such as reducing tillage, soil cover with crops, crop rotation included with leguminous crops)
R.21	Share of utilised agricultural area (UAA) under supported commitments for the quality of water bodies
R.31	Share of utilised agricultural area (UAA) under supported commitments for supporting biodiversity conservation or restoration including high-nature-value farming practices
R.34	Share of utilised agricultural area (UAA) under supported commitments for managing landscape features, including hedgerows and trees

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Agricultural land and associated habitats and landscape features are a crucial part of ecosystem systems and have a significant capacity to provide ecosystem services. They influence, for example, climate conditions, rainfall, soil and landscape water balances due to their regulatory effect. But they support soil protection, nutrient cycling and habitat, and can serve as feeding grounds for many agricultural-related and beneficial plant and animal species, such as pollinators, birds of prey, etc.

However, in recent decades, these habitats, which are part of the green infrastructure network, have been largely eradicated and disappeared with the transformation of landscape use, due to the growth of greenfield investments and the intensification of agricultural production. The restoration and development of grass roots, hedgerows, sheltered forest strips, tree rows, woody pastures, woody meadows and other semi-natural elements have become essential in order to combat pollination or pests, improve the water balance of agricultural areas, protect the quality of surface and groundwater, protect soil, improve local climatic conditions and increase the reduction of GHG emissions by agricultural means.

In order to protect our natural resources as a result of the increase in drought periods and changes in the intensity and distribution of precipitation and the rise in erosion phenomena, the preservation of excess water in the areas concerned for as long as possible and the establishment of certain erosion control facilities and buffer zones for watercourses are crucial. These activities make a major contribution to

balancing small-scale climatic conditions in agricultural areas and carbon sequestration (SO4), protecting soil stocks and reducing nutrient loads and pollution in their waters (SO5), but the resulting habitats also contribute to the protection of biodiversity and the protection and improvement of landscape features (SO6).

The re-diversification of habitats and the restoration of landscape features, as well as the creation of elements to protect water and control erosion, will therefore help to mitigate and adapt to adverse climatic changes caused by agriculture, to protect biodiversity but also to protect soil, water and air, and to preserve and restore landscape features. At the same time, these activities do not ‘only’ serve environmental and conservation interests, but also – perhaps primarily in the eyes of farmers – sustainable agricultural production. Stability of yields, greater crop security, conservation and restoration of natural resources for production.

These objectives can be achieved by non-productive investments and their long-term maintenance which do not directly affect the value of farms or their ability to generate income, but which greatly increase their natural and public welfare value and the ability to provide ecosystem services, but are designed and maintained in a way that represents a small amount of income and cost increases and requires additional activity from farmers.

It is also necessary to support the maintenance of newly developed habitats and crops in an appropriate way to encourage land-use change, which is desirable due to the agro-ecological transition. The payment incentivising agro-ecological land use change is a voluntary payment in which programme participants maintain non-productive crops and landscape features constituting land-use change in the context of agro-ecological non-productive investments for a number of years for the purpose of agro-ecological conversion and commit to carry out additional activities beyond the conditionality system of the relevant fund conditionality.

Areas of intervention:

Within the scope of the intervention, support for non-productive investments shall be available for activities listed in the following target areas:

A.a.) Maintenance of perennial crops for protection of newly planted biodiversity

The objective of the aid is to ensure the maintenance of perennial crops for the protection of biodiversity in the context of non-productive agro-ecological investments, to compensate for the additional costs and income foregone resulting from the maintenance commitments undertaken.

Commitment period: 7 years

A.b.) Maintenance of newly planted grasslands for soil protection purposes

The objective of the aid is to ensure the maintenance of grasslands for soil protection in the context of agro-ecological non-productive investments, to compensate for the additional costs and income foregone resulting from the maintenance commitments undertaken.

Commitment period: 7 years

A.c.) Maintenance of newly planted semi-natural grasslands

The objective of the aid is to ensure the maintenance of semi-natural grasslands in the context of agro-

ecological non-productive investments, to compensate for the additional costs and income foregone resulting from the maintenance commitments undertaken.

Commitment period: 7 years

A.d.) Maintenance of newly developed grassy, scrub strips

The objective of the aid is to ensure the maintenance of the grassland and scrub strips developed in the context of non-productive agro-ecological investments, to compensate for the additional costs and income foregone resulting from the maintenance commitments undertaken.

Commitment period: 7 years

B.a.) Reservation of newly developed tree rows for plant protection

The purpose of the aid is to ensure the maintenance of tree lines developed in the context of agro-ecological non-productive investments and to compensate for the additional costs and income foregone resulting from the maintenance obligations undertaken.

Commitment period: 7 years

B.b.) Upgrading of newly developed protective forest strips

The purpose of the aid is to ensure the maintenance of crop protection forest lines developed in the context of non-productive agro-ecological investments, to compensate for the additional costs and income foregone resulting from the maintenance obligations undertaken.

Commitment period: 7 years

B.c.) Reservation of newly planted wooded pastures and crasas

The purpose of the aid is to ensure the maintenance of wooded pastures or meadows developed in the context of agro-ecological non-productive investments, to compensate for the additional costs and income foregone resulting from the maintenance commitments undertaken.

Commitment period: 7 years

(C.a) Maintenance of a newly established coastal water buffer zone

The objective of the aid is to ensure the maintenance of the coastal water buffer zone in the context of agro-ecological non-productive investments, to compensate for the additional costs and income foregone resulting from the maintenance commitments undertaken.

Commitment period: 7 years

C.b.) Maintenance of newly established wetland

The objective of the aid is to ensure the maintenance of wetlands created in the context of agro-ecological

non-productive investments, to compensate for the additional costs and income foregone resulting from the maintenance commitments undertaken.

Commitment period: 7 years

Selection criteria:

We do not intend to introduce a scoring assessment when selecting aid applications, as only newly created habitats under the agro-ecological non-productive investments RD21_G04_LCI_73 are eligible for support.

Link to other CAP ST measures:

- The non-productive areas maintained under this intervention shall not be eligible during the commitment period for the fulfilment of the relevant requirement of the DP17_G01_ECOS_16 – Agro-ecological programme.
- Under this intervention, only non-productive elements established under target areas RD21_G04_LCI_73 Agro-ecological non-productive investments A.a, A.c, Ad, Ba, Bb, Bc) and C/I.a and C/I.b. may be claimed under this intervention.

Link to other legislation:

- Act CXXIX of 2007 on the protection of arable land
- Act LIII of 1996 on nature protection
- 1155/2016. (III. Government Decision of 31 December 2006 on the revised 2015 river basin management plan of Hungary
- 23/2018. (X.31) OGY Resolution on the Second National Climate Change Strategy 2018-2030 with a 2050 perspective

Review clause:

For operations carried out under the intervention, where mandatory standards, requirements or obligations (reference elements) are amended, the beneficiary may decide not to accept the adjustment/modification and the commitment concerned shall cease to be valid and the farmer shall not be required to repay the aid in respect of the period of validity of the commitment.

Timing of the grant

This intervention builds on intervention RD21_G04_LCI_73: farmers receive support for setting up under measure RD21_G04_LCI_73 – Agro-ecological non-productive investments in the year of the investment, while they can subsequently apply for support under this measure for the nursing period (B.a, B.b., B.c) or the maintenance period.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligibility criteria:

Agricultural producer

In the case of target areas A to C, the farmer shall be entitled to receive the aid if, in the year preceding the application, he has made an agro-ecological non-productive investment in that area corresponding to the target area under intervention RD21_G04_LCI_73 Agro-ecological non-productive investments.

In the case of target area B, the farmer is entitled to receive the aid if, in the year preceding the application, he has made an agro-ecological non-productive investment in that area corresponding to the target area under the intervention D21_G04_LCI_73_U03 Agro-ecological non-productive investments or an agro-forestry system under operation VP5-8.2.1 and is no longer eligible for payment for the maintenance period.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Type of aid:

Non -repayable support on the basis of a calculation of unit costs per hectare or per piece or linear metre.

General Commitment:

- Management of the Farming Log except in Target Areas Ba, Bb, B.c.

Specific eligibility conditions and commitments for each target area:

A.a.) Maintenance of perennial crops for protection of newly planted biodiversity

Eligibility condition:

In order to be eligible for support, a farmer must have planted a perennial crop for the protection of biodiversity in the year preceding the application under agro-ecological non-productive investment.

Commitments:

- The use of plant protection products and fertilisers is not allowed during the commitment period.
- In the first year
 - after 15 June, a cleaning mowing is mandatory when the entire area can be discarded;
 - the second mowing shall take place after 30 September, leaving 10 to 20 % of the area unmown;
- From the second year, one mowing per year is mandatory, to be carried out after 30 September, leaving 10-20 % of the area unmown.
- In the event of the appearance of invasive and alien plant species or dangerous weeds in the area, their establishment and spread shall be prevented by mechanical control or specific application of plant protection products.
- During mowing, a stubble must be left 10 cm high.
- From sunset to sunrise, all work is forbidden.
- Mowing shall be carried out in a bird-friendly manner, using a game alarm device.
- During the commitment period, the re-seeding of the bee grazing culture shall be permitted once with the species authorised for planting.

The duration of the commitment is 7 years.

A.b) Maintenance of newly planted grasslands for soil protection

Eligibility condition:

In order to be eligible for support, it must have planted grasslands in the relevant area under non-productive agro-ecological investment in the year preceding the application.

Commitments:

- Grasslands shall be used for grazing or mowing.
- Any mechanical work on water-saturated soil is prohibited.
- Inland water/periodic water stopping is prohibited.
- From sunset to sunrise, machine work is prohibited.
- Bird-friendly mowing (use of displacement mowing, use of game alarm chain and equipment, speed of up to 8 km/h) is mandatory, with a minimum stubble height of 10 centimetres.
- The use of baler silo foil during mowing is prohibited.
- In grassland, the storage of coarse fodder is forbidden for more than 30 days after mowing.
- The establishment and spread of invasive and alien plant species shall be prevented by mechanical control or specific application of plant protection products.
- It is permitted to overtake the grass once during the seven years of the commitment period with a mixture of controlled, sealed seeds of domestic grass and butterfly species suitable for utilisation.
- In the course of farming activities, damage to the grassland surface is prohibited.

- Grassland-friendly grazing, taking into account undergrazing and overgrazing.
- Only cattle, sheep, goats, asses, horses, mules and buffalo may be grazed on grassland.

The duration of the commitment is 7 years.

A.c.) Maintenance of newly planted semi-natural grasslands

Eligibility condition:

In order to be eligible for support, it must have planted grasslands in the relevant area under non-productive agro-ecological investment in the year preceding the application.

Commitments:

- Grasslands shall be used for grazing or mowing.
- Any mechanical work on water-saturated soil is prohibited.
- The use of slurry, sewage, sewage sludge, compost containing sewage sludge is prohibited.
- Nutrient restocking may only come from faeces excreted by grazing animals, manure spreading is prohibited.
- Irrigation of grassland is prohibited.
- Inland water/periodic water stopping is prohibited.
- From sunset to sunrise, machine work is prohibited.
- A minimum of 10 % and a maximum of 15 % of the area shall be left unmown per field. The minimum width of unmown areas shall be 6 m.
- Bird-friendly mowing (use of displacement mowing, use of game alarm chain and equipment,

speed of up to 8 km/h) is mandatory, with a minimum stubble height of 10 centimetres.

- The use of baler silo foil during mowing is prohibited.
- In grassland, the storage of coarse fodder is forbidden for more than 30 days after mowing.
- The establishment and spread of invasive and alien plant species shall be prevented by mechanical control or specific application of plant protection products.
- In the course of farming activities, damage to the grassland surface is prohibited.
- If nests and branches of specially protected birds nesting on the ground are found, this must be reported immediately to the relevant National Park Directorate. At least 1 ha of protection zone around the found nests.
- Electric shepherds, fences and pens may be established or used in a protected natural area and a Natura 2000 site only on the basis of a prior written declaration from the competent National Park Directorate.
- At least 5 working days before the start of mowing, the exact location and planned start date of mowing must be notified in writing or electronically (customer gateway, e-mail) to the relevant National Park Directorate in a protected site and Natura 2000 site.

Mandatory standards in the case of grazing:

- Grassland-friendly grazing, taking into account undergrazing and overgrazing.
- Only cattle, sheep, goats, asses, horses, mules and buffaloes may be grazed on grassland.

The duration of the commitment is 7 years.

B.a. and B.b) Newly, in the case of maintenance of rows and strips of plant protection forests developed with support RD21 G04 LCI 73 U03

Eligibility condition:

To be eligible for support, you must have created in the year preceding the claim an agro-ecological non-productive investment that has created a tree line or a protected forest strip in the area concerned.

Commitments:

- Replacement of trees – the deficiency must not exceed 30 %.
- Keeping a 10 m strip without weed in the case of wood rows by mechanical means,
- In the case of forest strips, keeping 2 620 metres strips without weed by mechanical means;
- For specific target area B.a) replacement of individual primary protection
- Keeping of agro-forestry logs
-

The duration of the commitment is 7 years.

B.c.) Reservation of woodland newly planted with support RD21 G04 LCI 73 U03

Eligibility condition:

To be eligible for support, it must have created wooded pasture or hay in the area under the agro-ecological non-productive investment in the year preceding the application.

Commitments:

1. Replacement of trees, – the deficiency must not exceed 30 % in any year
2. The planted individuals must be prevented from growing from the corner or seed, and the area must not have juveniles of more than 100 specimens/ha above that number, or above that number if the maximum number of trees has been set by the nature conservation authority, in groups over 2 years of age on the site.
3. Keeping an area of at least 1.0 m in diameter around trees without weed by mechanical means
4. Repair, if necessary, of specific strain protection or microfence
5. Keeping of agro-forestry logs
6. Grasslands shall be used for grazing or mowing.

Mandatory standards in the case of grazing:

- Grassland-friendly grazing, taking into account undergrazing and overgrazing.
- Only cattle, sheep, goats, asses, horses, mules and buffalo may be grazed on grassland.

The duration of the commitment is 7 years.

C.a.) Maintenance of a newly established coastal water protection buffer zone

Eligibility condition:

In order to be eligible for support, it must have established a coastal water protection buffer zone in the area concerned as part of an agro-ecological non-productive investment in the year preceding the application.

Commitments:

- The land can only be used by mowing.
- The establishment and spread of invasive and alien plant species shall be prevented by mechanical control or specific application of plant protection products.
- The application of fertilisers, organic fertilisers and the use of plant protection products shall be prohibited, except for the specific application of plant protection products against invasive and alien plant species;
- Bird-friendly mowing (use of displacement mowing, use of game alarm chain and equipment, speed of up to 8 km/h) is mandatory, with a minimum stubble height of 10 centimetres.

Mandatory requirements for protection areas with grass scrub:

- specific mechanical protection of the tree planted in the area shall be ensured
- care work on the tree planted in the area must be carried out
- provision should be made for the restocking of the trees planted in the area.

The duration of the commitment is 7 years.

C.b.) Maintenance of newly established wetland

Eligibility condition:

To be eligible for support, you must have created a wetland on the land under the non-productive agro-ecological investment in the year preceding the claim.

Commitments:

- The area must ensure that emerging water is preserved for as long as possible, drainage and drainage are not allowed;
- The establishment and spread of invasive and alien plant species shall be prevented by mechanical control or specific application of plant protection products.
- The application of fertilisers, organic fertilisers and the use of plant protection products shall be prohibited, except for the specific application of plant protection products against invasive and alien plant species;
- Grazing and mechanical work can only be carried out under sufficiently dry soil conditions;
- Bird-friendly mowing (use of displacement mowing, game alarm chain and equipment, speed up to 8 km/h) is mandatory.
- During mowing, a stubble must be left at least 15 cm high;

The duration of the commitment is 7 years.

O14 What area is eligible?

- ☒ Agricultural area defined for the CAP plan
☐ Agricultural land including and beyond agricultural area
☐ Non-agricultural land

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

List of relevant GAEC and SMR

Code	Description
GAEC01	Maintenance of permanent grassland based on a ratio of permanent grassland in relation to agricultural area at national, regional, sub-regional, group-of-holdings or holding level in comparison to the reference year 2018. Maximum decrease of 5% compared to the reference year.
GAEC02	Protection of wetland and peatland
GAEC04	Establishment of buffer strips along water courses
GAEC05	Tillage management, reducing the risk of soil degradation and erosion, including consideration of the slope gradient
GAEC06	Minimum soil cover to avoid bare soil in periods that are most sensitive
GAEC08	Retention of landscape features. Ban on cutting hedges and trees during the bird breeding and rearing season. As an option, measures for avoiding invasive plant species
GAEC09	Ban on converting or ploughing permanent grassland designated as environmentally-sensitive permanent grasslands in Natural 2000 sites
SMR01	Directive 2000/60/EC of 23 October 2000 of the European

	Parliament and of the Council establishing a framework for Community action in the field of water policy: Article 11(3), point (e), and point (h), as regards mandatory requirements to control diffuse sources of pollution by phosphates
SMR02	Council Directive 91/676/EEC of 12 December 1991 concerning the protection of waters against pollution caused by nitrates from agricultural sources: Articles 4 and 5
SMR03	Directive 2009/147/EC of the European Parliament and of the Council of 30 November 2009 on the conservation of wild birds: Article 3(1), Article 3(2), point (b), Article 4(1), (2) and (4)
SMR04	Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild flora and fauna: Article 6(1) and (2)

List of relevant mandatory national standards

NJSZ– Sections 6(2), 7(1), 8(1), 16(1), 17(1) and 17(1) of Act LIII of 1996 on nature protection

The conservation of wild organisms, their populations and communities must go hand in hand with the conservation of their habitats, that all activities must be carried out in a manner that preserves natural values and areas in order to preserve the habitats of wild organisms and their biodiversity, as well as to ensure sustainable use, including sustainability, the use of nature-friendly methods and the protection of biodiversity. It is also necessary to preserve the natural and semi-natural condition of the landscape and to ensure that the natural assets, natural systems and specific landscape features that determine the aesthetic features of the landscape and its nature are maintained, taking into account historically established nature-friendly uses.

NJSZ – *Section 23(2) of Act LIII of 1996 on nature protection*

All bogs are protected by law of national importance. Shanks are defined as land that is permanently or intermittently exposed to water or which is temporarily saturated with water, and a significant proportion of the land is living in bogs and is characterised by varying levels of peat content and peat formation processes.

NJSZ – *Sections 35-42 of Act CXXIX of 2007 on the protection of agricultural land.*

The land user shall carry out soil conservation farming or activities adapted to the ecological conditions of the place of production as follows:

On arable land at risk of erosion by the land user, cultivate crops for soil cover in order to prevent water and wind erosion and implement a cultivation method that promotes the release of rainwater into the soil and/or the cultivation of contours by protecting soil structure, preventing and eliminating soil compaction;

Link between GAEC, SMR and national standards with the intervention

Regulation	Related reference regulation (SMR, GAEC specifications)	Relationship between the reference regulation and the requirements
A.a.) Maintenance of perennial crops for protection of newly planted biodiversity		
The use of plant protection products and fertilisers is not allowed during the commitment period.	SMR 8 – National legislation on the sustainable use of plant protection products	The reference rules allow the use of authorised plant protection products without further restrictions.
After 15 June of the first year, a cleaning mowing is mandatory when the entire area can be discarded; the second mowing	NJSZ – Sections 6(2), 7(1), 8(1) 16(1), (4) 17(1), 17(1) and (3) of Act LIII of 1996 on nature protection	The reference regulation does not contain any requirements as to the time of mowing or the abandonment of the unmown area.

shall take place after 30 September, leaving 10 to 20 % of the area unmown;		In practice, farmers do not leave unmown areas, and the choice of mowing date is not based on conservation criteria.
From the second year, one mowing per year is mandatory, to be carried out after 30 September, leaving 10-20 % of the area unmown.	The conservation of wild organisms, their populations and communities must be ensured in conjunction with the conservation of their habitats and that all activities must be carried out with the welfare of natural assets and areas in order to protect the habitats of wild organisms and their biodiversity, as well as sustainable use, including sustainability, the use of environmentally sound methods and the protection of biodiversity. It is also necessary to preserve the natural and semi-natural state of the landscapes and to ensure the preservation of the natural values, natural systems and unique landscape values that determine the aesthetic features and nature of the landscapes, taking into account historically developed environmentally friendly uses.	
In the event of the appearance of invasive and alien plant species or dangerous weeds in the area, their establishment and spread shall be prevented by mechanical control or specific application of plant protection products.	NJSZ – Sections 6(2), 7(1), 8(1), 16(1) and (4) of Act LIII of 1996 on nature protection SMR 8 – National regulations on the sustainable use of plant protection products. Minimum requirements for the maintenance of agricultural area SPR Article 4(2)	The reference regulation does not provide that, in the event of the appearance of invasive and non-local plant species or dangerous weeds, protection can only be carried out by mechanical control or specific application of plant protection products; in practice, full pesticide treatment is typical in such a case.
During mowing, a stubble must be left 10 cm high.	NJSZ – Sections 6(2), 7(1), 8(1) 16(1), (4) 17(1), 17(1) and (3) of Act LIII of 1996 on nature protection	The reference regulation does not provide for a minimum stubble height, a lower stubble height is maintained during the exercise
Mowing shall be carried out in a bird-friendly manner, using a game alarm device.	NJSZ – Sections 6(2), 7(1), 8(1) 16(1), (4) 17(1), 17(1) and (3) of Act LIII of 1996 on nature protection	The reference regulation does not contain any requirement as to the method of mowing. In practice, there is no use of bird-friendly mowing methods in bee pasture areas.
During the commitment period, the re-seeding of the bee grazing culture shall be permitted once with the species authorised for	NJSZ – Sections 6(2), 7(1), 8(1) 16(1), (4) 17(1), 17(1) and (3) of Act LIII of 1996 on nature protection	The reference rules do not require the replanting of bee pastures.

planting.		

7 Form and rate of support/amounts/calculation methods

☒ IACS

☐ Non-IACS

IACS section

Type of payment

☒ unit cost based on additional costs and income foregone

☐ transaction cost included

☐ one off payment

☐ lump sum

Range of support at beneficiary level

The aid intensity is 100 %.		
Objective 1	Unit cost	
A.a) Maintenance of newly planted biodiversity conservation perennial crops		
arable land	EUR 537/ha/year	
in permanent cultures	EUR 108/ha/year	
A.b) Maintenance of newly planted grasslands for soil protection		
arable land	EUR 708/ha/year	
in permanent cultures	EUR 108/ha/year	
A.c) Maintenance of newly developed grass, scrub strips	EUR 109/100m/year	
A.d) Maintenance of newly installed close-to-nature grasslands	EUR 833/ha/year	
B.a) Maintenance, maintenance and loss of agricultural income	EUR 4.75/year	
B.b) Maintenance, maintenance and replacement of newly planted sheltered forest strips for agricultural income	EUR 2 per linear metre/year	
B.c) Care of newly planted wooded pastures or meadows	EUR 3/year	
C.a) Maintenance of a newly developed coastal buffer zone	EUR 911/ha	
C.b) Maintenance of newly developed wetland	EUR 911/ha	

Calculation method

Background calculation of the unit costs of the Agro-ecological Land Use Change Incentive Programme Intervention:

The calculation methodology prepared by the independent expert body was based on the use of the Test Operating System (FADN) of the Institute of Agricultural Economics (FADN), the databases of the Central Statistical Office (HCSO) and expert estimates. From the test scheme, data on production value

and the costs of certain crops at sectoral level have been taken into account in particular. The test scheme collects sectoral data on the most important crops each year for more than 90 % of farmland, which is an important basis for background calculations, in arable land, grassland, vegetables and plantation crops.

The calculation shall be based on the determination of the additional costs incurred by complying with the requirements and the amount of loss of income. In calculating the aid amount, the expected income development of compliant farmers is compared to previous farming practices without making any investment. For each standard, the expected loss of revenue and the expected additional costs are taken into account. The value of the compensation was determined by aggregating the expected revenue losses and the expected additional costs under each provision.

For agro-forestry systems, the development of unit cost categories of support is a separate annexed "CAP Strategic Plan Hungary 2023-2027 Simplified cost options prepared by the Institute of Forest Sciences of the University of Sopron as an expert organisation independent of AM: unit costs).

Additional explanation

Not relevant

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☐ No ☒ Mixed

Explanation of support activities falling outside the scope of Art. 42 TFEU

In view of the objective of the intervention set out in point 5, the competition rules are generally applicable.

Type of state aid instrument to be used for clearance:

☐ Notification ☐ GBER ☒ ABER ☐ de minimis

State Aid case number

SA.112038

Additional information:

☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.

☐ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.

☒ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

What are the models of the commitment(s) in the intervention?

☐ result based (with possibility to pick and choose)

☒ management based (with possibility to pick and choose)

☐ hybrid (management and result based)

Please explain the obligations/possibilities for beneficiaries in relation to the commitments set out in the intervention

The beneficiary of the aid must continue its activities in the areas covered by the commitment according to the commitments defined by the target area.

Some of the commitments include bans, such as a ban on working on water-saturated soil, while others provide for specific management methods, e.g. by leaving the unmown part of the land.

Specific commitments are set out in Chapter 5 by target area.

What is the duration of contracts?

5 years for the target area A.a) and 7 years for the other target areas.

10 WTO compliance

Green Box

Paragraph 12 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The support under the aid clearly serves climate, environmental and nature conservation objectives. The aid is intended solely to compensate for the additional costs and income foregone resulting from compliance with the obligations.

Explanation and justification related to the value of the unit amount

RD22_O14_U01_HA - Agro-ecological land use change incentive scheme Newly planted biodiversity maintenance perennial crops on arable land

The unit amount was determined on the basis of the unit costs of each target area. See the methodology for the calculation of unit costs in point 7.

RD22_O14_U02_HA - Agro-ecological land use change incentive scheme for Newly planted grasslands for soil protection on arable land

The unit amount was determined on the basis of the unit costs of each target area. See the methodology for the calculation of unit costs in point 7.

RD22_O14_U03_HA - Agro-ecological Land Use Change Incentive Programme Maintenance of newly planted semi-natural grasslands

The unit amount was determined on the basis of the unit costs of each target area. See the methodology for the calculation of unit costs in point 7.
RD22_O14_U04_HA - Agro-ecological Land Use Change Incentive Programme Maintenance of newly established rows of conservation trees
The unit amount was determined on the basis of the unit costs of each target area. See the methodology for the calculation of unit costs in point 7.
RD22_O14_U05_HA - Agro-ecological Land Use Change Incentive Programme Maintenance of newly developed protective forest strips
The unit amount was determined on the basis of the unit costs of each target area. See the methodology for the calculation of unit costs in point 7.
RD22_O14_U06_HA - Agro-ecological land use change incentive programme to maintain newly planted woody pastures or meadows
The unit amount was determined on the basis of the unit costs of each target area. See the methodology for the calculation of unit costs in point 7.
RD22_O14_U07_HA - Agro-ecological Land Use Change Incentive Programme Maintenance of a newly established coastal water buffer zone
The unit amount was determined on the basis of the unit costs of each target area. See the methodology for the calculation of unit costs in point 7.
RD22_O14_U08_HA - Agro-ecological Land Use Change Incentive Programme Maintenance of newly created wetlands
The unit amount was determined on the basis of the unit costs of each target area. See the methodology for the calculation of unit costs in point 7.
RD22_O14_U09_HA - — Agro-ecological land-use change incentive scheme Newly planted biodiversity conservation perennial crops in permanent crops
The unit amount was determined on the basis of the unit costs of each target area. See the methodology for the calculation of unit costs in point 7.
RD22_O14_U10_HA - Agro-ecological Land Use Change Incentive Scheme to maintain Newly planted grasslands for soil protection in permanent crops
The unit amount was determined on the basis of the unit costs of each target area. See methodology for the calculation of unit costs in point 7
RD22_O14_U11_HA - Agro-ecological land use change incentive scheme to maintain newly established grassland, scrub strips
The unit amount was determined on the basis of the unit costs of each target area. See methodology for the calculation of unit costs in point 7

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029

RD24_G07_GAX_70 - Ex situ conservation and technical support of animal genetic resources

Intervention Code (MS)	RD24_G07_GAX_70
Intervention Name	Ex situ conservation and technical support of animal genetic resources
Type of Intervention	ENVCLIM(70) - Environmental, climate-related and other management commitments
Common Output Indicator	O.19. Number of operations or units supporting genetic resources
Contributing to ringfencing requirement for/on	Generational Renewal: No Environment: Yes ES rebate system: Yes LEADER: No

1 Territorial scope and, if relevant, regional dimension

Territorial scope: **National**

Code	Description
HU	Magyarország

Description of the Territorial Scope

Area of intervention Hungary

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO6 Contribute to halting and reversing biodiversity loss, enhance ecosystem services and preserve habitats and landscapes

XCO Cross-cutting objective of modernising the sector by fostering and sharing of knowledge, innovation and digitalisation in agriculture and rural areas, and encouraging their uptake

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
6.6.1	Genetic conservation and land use in climate adaptive agriculture and forestry	2	Yes
CCO.1.2	Raising farmers' knowledge	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.25 Share of livestock units (LU) under supported commitments to improve environmental sustainability

R.28 Number of persons benefitting from advice, training, knowledge exchange, or participating in European Innovation Partnership (EIP) operational groups supported by the CAP related to environmental or climate-related performance

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Support for ex situ gene conservation:

Support the preservation of male animals (except poultry) under an approved breeding programme for protected native, endangered agricultural breeds and farm breeds undergoing restocking in an ex situ environment other than the original rearing and feeding conditions.

Provision of technical support:

Explain to breeders the breeding and genetic conservation tasks that help preserve protected native, vulnerable agricultural animal breeds and farm breeds undergoing breed reconstruction, and provide professional support. Description, creation and promotion of exploitation opportunities.

In different farming systems, high genetic value plant species and animal breeds, which are often

threatened with extinction/genetic erosion, are highly supported. The conservation of these varieties is a priority for the maintenance of biodiversity. The purpose of genetic conservation is the conservation and breeding of the genetic resources of native agricultural animal breeds under threat of agricultural and varietal reconstruction, within the framework of mandatory legislation on the conservation of the genetic stock and on breeding programmes ensuring the survival of those breeds, as well as the ex situ and in situ conservation, characterisation, collection and utilisation of genetic resources of species of particular importance in agriculture and nutrition.

The context of certain interventions supporting the conservation of genes: In the case of in situ gene conservation, we support the conservation of female and mixed female herds in the case of poultry. Male breeding animals necessary for breeding, i.e. the maintenance of the breed, are supported in ex situ conservation, and reproductive material obtained from breeding animals and genetic material are supported in the intervention of in vitro gene conservation. Thus, these three interventions together form one unit. Our aim is to preserve these valuable varieties that are threatened with extinction, that are displaced from farming by the breeds of commers and are backwards.

Principles governing the establishment of selection criteria, which may be partially applied (selection criteria):

- inclusion of several species and varieties in the genetic conservation measure
- maintenance of small numbers of lines, families;
- maintenance of small, rare lines of high genetic value, families;
- breeding of rare and/or valuable hereditary properties;
- the proportion of native animals in the holding;
- professional qualifications;
- environmental, climate and adaptation aspects;
- animal welfare;
- organic farming
- qualification of breeding work,
- length of membership of a breed society,
- carrying out special pairs,
- breeding of breeds with a critical or a threat level to be protected according to threat levels determined on the basis of the number of females entered in the main section of the herd book.

Presentation of the environmental ambition level for the three animal genes conservation:

The interventions aim to conserve genetic resources in agriculture to support the conservation of plant species, micro-organisms and animal breeds of high genetic value and often threatened with extinction/genetic erosion. We also expect an increase in claims for items already supported under the Rural Development Programme, and in order to increase the level of environmental ambition, Hungary has already planned significant changes from the transitional period onwards:

- In the case of conservation of animal genetic resources, for ex situ, in situ and in vitro conservation, the range of previously supported breeds will be extended to include black mangalica, akhal camels, breeds under construction and Hungarian giant rabbit breeds, and in the case of in vitro gene conservation, embryonic cells and sexual organ tissues are also eligible as new elements.

List of varieties supported:

Protected native breeds	
Species	Breed
Bovine	Hungarian grey cattle
	Hungarian house buffalo

	Hungariantarca cattle
Horse	gidran
	hucul
	low-wage semi-blood
	Lipicai
	Furioso-northstar
	Nonicus
	Hungarian cold-blooded
	shagya Arab
Donkey	Hungarian Palagias
Pigs	oak mangalica
	syringe-bellied mangalica
	red mangalica
	black mangalica
Sheep	Hortobágyi (Hungarian) rough
	Gyimesi racka
	dairy cigas
	ciga
	cyclatics
Goat	Hungarian Palagic goats
Hen	yellow Hungarian hens
	hemp-seed Hungarian fowl
	white Hungarian hens
	partridge-coloured Hungarian fowls
	white abrasion neck hens
	black Transylvania worn-necked hens
	hemp-seed abrasion neck hens
Guineafowl	Hungarian guinea fowl
Geese	Hungarian geese with curled pens
	Hungarian geese
Duck	white Hungarian ducks
	Tarka Hungarian ducks
Türkiyes	bronze turkey
	turkey copper
Rabbit	Hungarian giant rabbit
Endangered agricultural animal breeds	
Species	Breed
Sheep	Hungarian merino
Horse	achovy
Breeds of agricultural animals subject to breed reconstruction	
Species	Breed
Bovine	Carpathian borers
Horse	inter mura
	Székely horse
	Kunfakó horse
	Tranian horse

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible Beneficiaries: Natural and legal persons engaged in the conservation of genes

Eligibility criteria

For ex situ gene conservation:

-Conservation in an ex-situ environment of the genetic stock of animals specified in the legislation containing the list of protected native and endangered agricultural breeds and of animals implementing an approved breeding programme for agricultural breeds undergoing breed reconstruction

Compliance with the rules on marking and registration of the species and the registration of the holding; at least 1 pure-bred breeding animal and certified by the breed society responsible for the maintenance of the breed or rearing of a registered male breeding animal for breeding purposes; the applicant must be registered in the Farming Information System (TIR) as an animal holder for breeding animals or breeding projectiles;

In the case of professional support:

breed societies or their association responsible for the maintenance of the breed.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments:

For ex situ gene conservation:

compliance with the breeding programme of the breed society responsible for the maintenance of the breed in question during the commitment period

- compliance with the minimum and maximum holding time in culture;

- the marking and registration of each species in accordance with the ENAR and the National Livestock Database, as well as compliance with the TIR register

the keeper is obliged to keep or rear a breeding animal listed in a breeding book and designated by a breed society for the maintenance of the breed in question in an ex situ holding;

In the case of professional support:

professional support activities shall:

—it must cover the provision of at least 10 professional support per month

for a period of at least 11 months per year

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

List of relevant GAEC and SMR

Code	Description

List of relevant mandatory national standards

Not relevant.

Link between GAEC, SMR and national standards with the intervention

Not relevant.

7 Form and rate of support/amounts/calculation methods

☒ IACS

IACS section

Type of payment

☒ unit cost based on additional costs and income foregone

☒ transaction cost included

- ☐ one off payment
- ☐ lump sum

Range of support at beneficiary level

Aid for ex-situ gene conservation:

Subject of aid/Minimum and maximum eligible period (days) for keeping a given breeding animal in a candidate breeding animal over 5 years/Level of support

Rearing of Hungarian giant rabbit breeding babies/18-540 days/EUR 1.5 forint/animal/day

Central rearing of Magyartarka cattle bulls/18-210 days/EUR 15.72 HUF/animal/day

Rearing of Hungarian grey cattle bull and Carpát Borzderes bovine animals equivalent to HUF/180-900 days/day per animal/day

Rearing of a Hungarian domestic buffalo bull (HUF amount equivalent to EUR/18-365 days/animal/day)

Placing Hungarian tarka cattle bulls at a pre-expected bull or artificial insemination station/forint amount equivalent to EUR 30 to 825 days/EUR 10.5 forint/animal/day

Central rearing of pig boars/18-300 days/EUR 1.92 HUF/animal/day

Central rearing of ram and goat babies/18-550 days/forint amount equivalent to EUR/2.6 per animal/day

Rearing of horses and asses/forints equivalent to 180-1095 days/EUR/4.4 per animal/day

Rearing of horses and asses at artificial insemination stations or cane cover stations of HUF/180-1825 days/EUR 8,4 equivalent to HUF/animals/day

Calculation method

Methodology Revision of current unit costs for measures to be announced in the new support cycle for the conservation in-situ and ex-situ of the genetic stock of protected indigenous and endangered agricultural breeds and farm animal breeds undergoing reconstruction is set out in 1381/2013. (VI. The Őshonoses Animals Gene Resources Council (Hungarian Resources Council) set up pursuant to Government Decision (27) Government Decision, which is involved in the preparation of the Government's decisions on protected indigenous agricultural animal breeds and endangered agricultural animal breeds. ŐHGT) and the state-recognised breed societies responsible for the maintenance of the respective breeds. The new cost calculations were compiled by the Central Statistical Office on the evolution of the price index for changes in the costs of keeping each breed, data on the gross average monthly earnings of full-time employed persons, broken down by aggregate sections, grassland rents and NAIK-PÁIR feed prices, they were based on detailed cost calculations prepared by the breed societies responsible for the maintenance of the breed, accompanied by detailed technical justifications. The breed societies included in the cost calculations both the additional costs associated with the genetic conservation activities of protected autochthonous and endangered agricultural breeds, as well as the costs of compensating for the loss of profit resulting from the competitive disadvantage suffered by modern breeds during the maintenance of those breeds. The biological characteristics of the respective breeds, the length of their generational interval, their average production levels, costs and profitability levels, the effects of the COVID-19 pandemic and the expected reduction in the capacity of extensive grasslands due to climate change in grazing animals have also been taken into account. For the intervention, the background calculation includes information on support for the granting of professional support. Overall, support professionals

have many years of professional experience, in many cases even decades, and very specific expertise in animal gene conservation. Although those persons performing support activities also perform other tasks, it should be pointed out that the amount of aid is only a fraction of the salaries of those professionals. It is important to emphasise that the aid is not intended to fully cover the gross wages of those providing professional support, but mainly their expertise and professional assistance. Cost calculations are based on the annual average euro exchange rates set by the National Bank of Hungary for the years 2014-2020. For the proposed aid amounts, the euro/forint exchange rate was calculated at the planning rate at HUF 350/EUR.

Non-IACS section

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

☐ reimbursement of eligible costs actually incurred by a beneficiary

☒ unit costs

☐ lump sums

☐ flat-rate financing

Basis for the establishment

The calculation of the 'unit cost' used in the intervention is 'Article 83 Forms of grants' (1) (b) unit costs of the CAP Strategic Plans Regulation; and (2)(a)', according to which the applicable amount for the form of support was established on the basis of a fair, equitable and verifiable calculation method, based on statistical data, other objective information or expert opinion. In the case of professional support activities, taking into account the significantly increased salary and material expenditure and the calculations of the breed societies independent of the Managing Authority and each other, the Institute for Agricultural Economics was drawn up.

Range of support at beneficiary level

For the provision of professional support:

HUF equivalent to EUR 1108 per month/person performing professional support activities

Additional explanation

Genetic resources in agriculture, in particular maintaining a viable breeding population of in situ breeds of protected native and endangered and endangered breed breeds, or mixed in the case of poultry, in situ conditions similar to the original rearing and feeding conditions. As part of the conservation of the in-vitro gene, the collection of genetic material of these breeds, preparation for deep-frozen storage, storing them under laboratory conditions by means other than the original husbandry and feeding conditions, as well as in the context of conservation of the ex-situ gene, are placed in a protected indigenous and endangered situation and undergoing reconstructing, preservation in the ex situ environment. Therefore, it is justified to keep breeders aware of the breeding and genetic conservation tasks that have been put in a protected autochthonous and endangered situation and the conservation of farm animal breeds under rebuilding, as well as to provide practical advice on implementation and to help create conditions for genetic exploitation. In view of the above, it is necessary to update the measures to be published for the new support cycle and to revise the current unit costs.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

What are the models of the commitment(s) in the intervention?

☒ result based (with possibility to pick and choose)

☒ management based (with possibility to pick and choose)

☒ hybrid (management and result based)

Please explain the obligations/possibilities for beneficiaries in relation to the commitments set out in the intervention

Commitments:

For ex situ gene conservation:

— compliance with the breeding programme of the breed society responsible for maintaining the breed during the commitment period

- compliance with minimum and maximum holding times;

- marking and registration of each species according to the ENAR or the National Livestock Database and compliance with the TIR register

— the keeper shall keep or raise a breeding animal in an ex situ holding site designated by a breed society for the maintenance of that breed and entered in a breeding book;

Where professional support is granted:

professional support activities

— it must cover the provision of at least 10 professional support per month

— for a period of at least 11 months per year

What is the duration of contracts?

5 years commitment period

10 WTO compliance

Green Box

Paragraph 12 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 12 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(3)(b) - 70 - Payments under Article 70	50.00%	20.00%	80.00%

Explanation and justification related to the value of the unit amount

RD24_O19_U01_DY - Unit amount for the central rearing of Magyartarka bovine bulls

Methodology for the calculation of the unit amount: Based on the calculation provided by the Institute of Agricultural Economics:

HUF amount corresponding to EUR 180-210 days/15.72 per animal per day of central rearing of Hungarian cattle bulls per 5 years

Based on the calculation provided by the Agricultural Economic Research Institute, the unit amount is equal to the value in the calculation. Each cost element and type can be found in chapter 7 of the interventions.

RD24_O19_U02_DY - Unit sum for the rearing of Hungarian grey cattle and Carpathian borzderes bulls

Methodology for the calculation of the unit amount: Based on the calculation provided by the Institute of Agricultural Economics:

Hungarian grey cattle bull and carpathian borer cattle rearing per 5 years HUF 180-9 000 days/EUR 6/animal/day

Based on the calculation provided by the Agricultural Economic Research Institute, the unit amount is equal to the value in the calculation. Each cost element and type can be found in chapter 7 of the interventions.

RD24_O19_U03_DY - Unit amount for rearing Hungarian buffalo buffalo bulls

Methodology for the calculation of the unit amount: Based on the calculation provided by the Institute of Agricultural Economics:

Hungarian domestic buffalo bull raised per 5 years in HUF 180-365 days/EUR 6/animal/day

Based on the calculation provided by the Agricultural Economic Research Institute, the unit amount is equal to the value in the calculation. Each cost element and type can be found in chapter 7 of the interventions.

RD24_O19_U04_DY - Unit amount for the placement of Magyartarka bovine bulls at impending bulls or artificial insemination centres

Methodology for the calculation of the unit amount: Based on the calculation provided by the Institute of Agricultural Economics:

Housing of Hungarian tarca cattle bulls in waiting traditional bull farms or artificial insemination stations per 5 years in HUF 30-1 825 days/EUR 10.5/animal/day

Based on the calculation provided by the Agricultural Economic Research Institute, the unit amount is equal to the value in the calculation. Each cost element and type can be found in chapter 7 of the interventions.

RD24_O19_U05_DY - Unit amount for central rearing of pig boars

Methodology for the calculation of the unit amount: Based on the calculation provided by the Institute of Agricultural Economics:

Central rearing of pigs in 5 years 180-300 days/EUR 1.92 in HUF/animal/day

Based on the calculation provided by the Agricultural Economic Research Institute, the unit amount is equal to the value in the calculation. Each cost element and type can be found in chapter 7 of the interventions.

RD24_O19_U06_DY - Unit amount for central rearing of male sheep and goats

Methodology for the calculation of the unit amount: Based on the calculation provided by the Institute of Agricultural Economics:

Amount of HUF equivalent to 180-550 days/2.6 per animal per day for central rearing of rams and goats per 5 years

Based on the calculation provided by the Agricultural Economic Research Institute, the unit amount is equal to the value in the calculation. Each cost element

and type can be found in chapter 7 of the interventions.

RD24_O19_U07_DY - Unit sum for rearing horses and donkey stallions

Methodology for the calculation of the unit amount: Based on the calculation provided by the Institute of Agricultural Economics:

Amount of HUF 180-1 095 days/4.4 for horses and asses rearing/animal/day

Based on the calculation provided by the Agricultural Economic Research Institute, the unit amount is equal to the value in the calculation. Each cost element and type can be found in chapter 7 of the interventions.

RD24_O19_U08_DY - Unit sum of the holding of horses and donkey stallions at artificial insemination or cane cover stations

Methodology for the calculation of the unit amount: Based on the calculation provided by the Institute of Agricultural Economics:

Holding of horses and asses at an artificial insemination station or mare-feeding station per 5 years, equivalent to 180 to 825 days/EUR 8.4 in HUF/animal/day

Based on the calculation provided by the Agricultural Economic Research Institute, the unit amount is equal to the value in the calculation. Each cost element and type can be found in chapter 7 of the interventions.

RD24_O19_U09_DY - Unit amount of Hungarian giant rabbit breeding bays

Methodology for the calculation of the unit amount: Based on the calculation provided by the Institute of Agricultural Economics:

HUF amount equivalent to 180-540 days/EUR 1.5 per animal/day for rearing Hungarian giant rabbits per 5 years

Based on the calculation provided by the Agricultural Economic Research Institute, the unit amount is equal to the value in the calculation. Each cost element and type can be found in chapter 7 of the interventions.

RD24_O19_U10_PS - Person providing professional support

The unit cost of technical advice was calculated by the AKI and uploaded as an annex.

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029

RD25_G08_GAI_70 - Conservation in situ of animal genetic resources

Intervention Code (MS)	RD25_G08_GAI_70
Intervention Name	Conservation in situ of animal genetic resources
Type of Intervention	ENVCLIM(70) - Environmental, climate-related and other management commitments
Common Output Indicator	O.19. Number of operations or units supporting genetic resources
Contributing to ringfencing requirement for/on	Generational Renewal: No Environment: Yes ES rebate system: Yes LEADER: No

1 Territorial scope and, if relevant, regional dimension

Territorial scope: **National**

Code	Description
HU	Magyarország

Description of the Territorial Scope

Area of intervention Hungary

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO6 Contribute to halting and reversing biodiversity loss, enhance ecosystem services and preserve habitats and landscapes

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
6.6.1	Genetic conservation and land use in climate adaptive agriculture and forestry	2	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.25 Share of livestock units (LU) under supported commitments to improve environmental sustainability

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

In situ gene conservation support:

Support the maintenance of breeds under in situ conditions similar to the original rearing and feeding conditions of females and, in the case of poultry, mixed females implementing an approved breeding programme for protected native breeds and breeds under vulnerable agricultural and breed reconstruction with a low number of animals.

In different farming systems, high genetic value plant species and animal breeds, which are often threatened with extinction/genetic erosion, are highly supported. The conservation of these varieties is a priority for the maintenance of biodiversity. The purpose of genetic conservation is the conservation and breeding of the genetic resources of native agricultural animal breeds under threat of agricultural and varietal reconstruction, within the framework of mandatory legislation on the conservation of the genetic stock and on breeding programmes ensuring the survival of those breeds, as well as the ex situ and in situ conservation, characterisation, collection and utilisation of genetic resources of species of particular importance in agriculture and nutrition.

The context of certain interventions supporting the conservation of genes: In the case of in situ gene conservation, we support the conservation of female and mixed female herds in the case of poultry. Male

breeding animals necessary for breeding, i.e. the maintenance of the breed, are supported in ex situ conservation, and reproductive material obtained from breeding animals and genetic material are supported in the intervention of in vitro gene conservation. Thus, these three interventions together form one unit. Our aim is to preserve these valuable varieties that are threatened with extinction, that are displaced from farming by the breeds of commers and are backwards.

Principles governing the establishment of selection criteria, which may be partially applied (selection criteria):

- the inclusion of multiple species and varieties in gene conservation;
- maintenance of small numbers of lines, families;
- maintenance of small, rare lines of high genetic value, families;
- breeding of rare and/or valuable hereditary properties;
- the proportion of native animals in the holding;
- professional qualifications;
- horn, climate and adaptation aspects;
- animal welfare;
- organic farming
- qualification of breeding work,
- length of membership of a breed society,
- performance of special pairs
- breeding of breeds with a critical or a threat level to be protected according to threat levels determined on the basis of the number of females entered in the main section of the herd-book
- Participation in the work of the Test Plant Information Network (Test Plant System)

Presentation of the environmental ambition level for the three animal genes conservation:

The interventions aim to conserve genetic resources in agriculture to support the conservation of plant species, micro-organisms and animal breeds of high genetic value and often threatened with extinction/genetic erosion. We also expect an increase in claims for items already supported under the Rural Development Programme, and in order to increase the level of environmental ambition, Hungary has already planned significant changes from the transitional period onwards:

— In the case of conservation of animal genetic resources, for ex situ, in situ and in vitro conservation, the range of previously supported breeds will be expanded to include black mangalica, akhal tekea breeds and Hungarian giant rabbit breeds, and in the case of in vitro gene conservation, embryonic cells and sexual organ tissues will also be supported as a new element.

List of eligible varieties:

Protected native breeds	
Species	Breed
Bovine	Hungarian grey cattle
	Hungarian house buffalo
	Hungariantarca cattle
Horse	gidran
	hucul
	low-wage semi-blood
	Lipicai
	Furioso-northstar
	Nonicus

	Hungarian cold-blooded
	shagya Arab
Donkey	Hungarian Palagias
Pigs	oak mangalica
	syringe-bellied mangalica
	red mangalica
	black mangalica
Sheep	Hortobágyi (Hungarian) rough
	Gyimesi racka
	dairy cigas
	ciga
	cyclatics
Goat	Hungarian Palagic goats
Hen	yellow Hungarian hens
	hemp-seed Hungarian fowl
	white Hungarian hens
	partridge-coloured Hungarian fowls
	white abrasion neck hens
	black Transylvania worn-necked hens
	hemp-seed abrasion neck hens
Guineafowl	Hungarian guinea fowl
Geese	Hungarian geese with curled pens
	Hungarian geese
Duck	white Hungarian ducks
	Tarka Hungarian ducks
Türkiyes	bronze turkey
	turkey copper
Rabbit	Hungarian giant rabbit
Endangered agricultural animal breeds	
Species	Breed
Sheep	Hungarian merino
Horse	achovy
Breeds of agricultural animals subject to breed reconstruction	
Species	Breed
Bovine	Carpathian borers
Horse	inter mura
	Székely horse
	Kunfakó horse
	Tranian horse

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiaries: Natural and legal persons engaged in the conservation of genes

Eligibility criteria:

- conservation of the breeds of animals specified in the legislation containing the list of protected native and endangered agricultural animal breeds and the genetic stock of agricultural animal breeds undergoing breed reconstruction.

- the existence of a progeny inspection contract for the Hungarian bovine breed;
- compliance with the requirements of the relevant regulations and with the rules on marking and registration of the species and on the registration of the holding
- keeping females which are purebred, registered and certified by a breed society responsible for the maintenance of the breed or, in the case of poultry, mixed sex;
- number of animals corresponding to or exceeding the minimum number of registered females specified for the species concerned:

—

—

For bovine and equine animals by breed: 1 animal,

For sheep, goats and pigs by breed: 10 animals,

In the case of poultry, by species: 20 Head

In the case of rabbits, the minimum number of females is 3

- • keeping subsidised animals in Hungary (except exhibitions, demonstrations, competitions)

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments (commitments):

compliance with the breeding programme of the breed society responsible for maintaining the breed during the commitment period

- themarking and registration of each species in accordance with the ENAR and the national animal breeding database and compliance with the TIR register; provision for the use of a father animal in accordance with the provisions of the Government Decree on animal production

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

List of relevant GAEC and SMR

Code	Description

List of relevant mandatory national standards

Not relevant.

Link between GAEC, SMR and national standards with the intervention

Not relevant.

7 Form and rate of support/amounts/calculation methods

☒ IACS

☐ Non-IACS

Type of payment

☒ unit cost based on additional costs and income foregone

☒ transaction cost included

☐ one off payment

☐ lump sum

Range of support at beneficiary level

Amount of aid (EUR HUF/individual/year):

Bovine animals: Hungarian grey cattle, Carpathian border cattle, Hungarian domestic buffalo: 500

Bovine Magyartarka cattle: 700

Horse: 700

Asses: 400

Pigs: 300

Sheep: 77

Goats: 77

Rabbits: 35

Hens: 35

Guinea fowl: 39

Ducks: 53

Türkiyes: 68

Geese: 77

Calculation method

Methodology Revision of the current unit costs for measures to be announced in the new support cycle for the conservation in-situ and ex-situ of the genetic stock of protected indigenous and endangered agricultural animal breeds and farm animal breeds under reconstruction is set out in 1381/2013. (VI. The Öshonoses Animals Gene Resources Council (Hungarian Resources Council) set up pursuant to Government Decision (27) Government Decision, which is involved in the preparation of the Government's decisions on protected indigenous agricultural animal breeds and endangered agricultural animal breeds. ÖHGT) and the state-recognised breed societies responsible for the maintenance of the respective breeds. The new cost calculations were compiled by the Central Statistical Office on the evolution of the price index for changes in the costs of keeping each breed, data on the gross average monthly earnings of full-time employed persons, broken down by aggregate sections, grassland rents and NAIK-PÁIR feed prices, they were based on detailed cost calculations prepared by the breed societies responsible for the maintenance of the breeds, accompanied by detailed technical justifications. The breed societies included in the cost calculations both the additional costs associated with the genetic conservation activities of the protected indigenous and endangered agricultural breeds and the costs of compensating for the loss of profit resulting from the competitive disadvantage suffered by modern breeds during the maintenance of those breeds. The biological characteristics of the respective breeds, the length of their generation interval, their average production levels, costs and profitability levels, the effects of the COVID-19 pandemic and the expected reduction in the livestock capacity of extensive grasslands due to climate change have also been taken into account. Cost calculations are based on the annual average euro exchange rates set by the National Bank of Hungary for the years 2014-2020. For the proposed aid amounts, the euro/forint exchange rate was calculated at the planning rate at HUF 350/EUR.

Additional explanation

In the case of in-situ and ex-situ aids for the conservation, sustainable use and development of genetic resources in agriculture, including protected indigenous and endangered agricultural breeds and farm animal breeds under rebuilding, it is of utmost importance to maintain the continuity of support and to revise the level of support per aid cycle and, if necessary, to increase the amount of aid. These measures

will ensure that the breeds are kept by breeds of protected indigenous breeds and endangered agricultural breeds and agricultural breeds undergoing reconstructing and reconstructed female breeds, including mixed sexes in the case of poultry. to maintain a viable breeding population under in situ conditions, such as feeding conditions, to conserve genetic material of these breeds, prepare them for deep-frozen storage, store them in laboratory conditions by means of deep-freezing, carry out genetic tests and, in the context of conservation of the ex-situ gene, breeds of agricultural breeds of animal breeds that are in a protected indigenous and endangered situation in the context of conservation of the ex-situ gene, and to keep the nominees of fathers in an ex situ environment other than the original rearing and feeding conditions. In view of the above, it is appropriate to keep breeders aware of the breeding and genetic conservation tasks that help to preserve the breeds of animals of the agricultural breeds undergoing rearing and genetic reconstructing, to provide practical advice on implementation and to help create conditions for genetic exploitation. In view of the above, it is necessary to update them in the case of measures to be published for the new support cycle and to revise the current unit costs.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

What are the models of the commitment(s) in the intervention?

- ☒ result based (with possibility to pick and choose)
- ☒ management based (with possibility to pick and choose)
- ☒ hybrid (management and result based)

Please explain the obligations/possibilities for beneficiaries in relation to the commitments set out in the intervention

Commitments:

- compliance with the breeding programme of the breed society responsible for maintaining the breed during the commitment period
- themarking and registration of each species according to the ENAR or the National Livestock Database and compliance with the TIR register; taking care of the use of fathers in accordance with the provisions of the Government Decree on animal husbandry

What is the duration of contracts?

5 years commitment

10 WTO compliance

Green Box

Paragraph 12 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 12 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(3)(b) - 70 - Payments under Article 70	50.00%	20.00%	80.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?

RD25_O19_U13_HD - Hungarian giant rabbit unit amount	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.25	No

Explanation and justification related to the value of the unit amount

RD25_O19_U01_HD - Unit sum of hens

Based on the calculation provided by the Institute of Agricultural Economics:

Annual aid amount for hens EUR 35/head/year

Based on the calculation provided by the Agricultural Economic Research Institute, the unit amount is equal to the value in the calculation. Each cost element

and type can be found in chapter 7 of the interventions.

RD25_O19_U02_HD - Unit amount of ducks

Based on the calculation provided by the Institute of Agricultural Economics:

Annual aid amount for ducks EUR 53/head/year

Based on the calculation provided by the Agricultural Economic Research Institute, the unit amount is equal to the value in the calculation. Each cost element and type can be found in chapter 7 of the interventions.

RD25_O19_U03_HD - Unit amount of geese

Based on the calculation provided by the Institute of Agricultural Economics:

The annual aid amount for geese is EUR 77/head/year

Based on the calculation provided by the Agricultural Economic Research Institute, the unit amount is equal to the value in the calculation. Each cost element and type can be found in chapter 7 of the interventions.

RD25_O19_U04_HD - Turkey unit amount

Based on the calculation provided by the Institute of Agricultural Economics:

Annual aid amount for turkeys EUR 68/head/year

Based on the calculation provided by the Agricultural Economic Research Institute, the unit amount is equal to the value in the calculation. Each cost element and type can be found in chapter 7 of the interventions.

RD25_O19_U05_HD - Unit sum of guinea fowls

Based on the calculation provided by the Institute of Agricultural Economics:

Annual guinea fowl aid amount EUR 39/head/year

Based on the calculation provided by the Agricultural Economic Research Institute, the unit amount is equal to the value in the calculation. Each cost element and type can be found in chapter 7 of the interventions.

RD25_O19_U06_HD - Sheep unit amount

Based on the calculation provided by the Institute of Agricultural Economics:

Annual sheep premium amount EUR 77/head/year

Based on the calculation provided by the Agricultural Economic Research Institute, the unit amount is equal to the value in the calculation. Each cost element and type can be found in chapter 7 of the interventions.

RD25_O19_U07_HD - Amount of goats per unit

Based on the calculation provided by the Institute of Agricultural Economics:

Annual goat premium amount EUR 77/head/year

Based on the calculation provided by the Agricultural Economic Research Institute, the unit amount is equal to the value in the calculation. Each cost element and type can be found in chapter 7 of the interventions.

RD25_O19_U08_HD - Horse unit amount

Based on the calculation provided by the Institute of Agricultural Economics:

Annual aid amount for horses EUR 700/head/year

Based on the calculation provided by the Agricultural Economic Research Institute, the unit amount is equal to the value in the calculation. Each cost element and type can be found in chapter 7 of the interventions.

RD25_O19_U09_HD - Per unit amount of donkey

Based on the calculation provided by the Institute of Agricultural Economics:

Annual aid amount as of EUR 400/head/year

Based on the calculation provided by the Agricultural Economic Research Institute, the unit amount is equal to the value in the calculation. Each cost element and type can be found in chapter 7 of the interventions.

RD25_O19_U10_HD - Unit sum of pigs

The unit amounts were calculated as follows:

Based on the calculation provided by the Institute of Agricultural Economics:

Annual aid amount for pigs EUR 300/head/year

Based on the calculation provided by the Agricultural Economic Research Institute, the unit amount is equal to the value in the calculation. Each cost element and type can be found in chapter 7 of the interventions.

RD25_O19_U11_HD - Unit amount of Hungarian grey cattle, buffalo and borzderes cattle

The unit amounts were calculated as follows:

Based on the calculation provided by the Institute of Agricultural Economics:

Annual aid amount of EUR 500 per head/year for Hungarian grey, buffalo, Surpathian borzder

Based on the calculation provided by the Agricultural Economic Research Institute, the unit amount is equal to the value in the calculation. Each cost element and type can be found in chapter 7 of the interventions.

RD25_O19_U12_HD - Unit amount of Magyartarka

The unit amounts were calculated as follows:

Based on the calculation provided by the Institute of Agricultural Economics:

The annual aid amount for Hungariantarka cattle is EUR 700/head/year

Based on the calculation provided by the Agricultural Economic Research Institute, the unit amount is equal to the value in the calculation. Each cost element and type can be found in chapter 7 of the interventions.

RD25_O19_U13_HD - Hungarian giant rabbit unit amount

The unit amounts were calculated as follows:

Based on the calculation provided by the Institute of Agricultural Economics:

Annual aid amount for Hungarian giant rabbits EUR 35/head/year

Based on the calculation provided by the Agricultural Economic Research Institute, the unit amount is equal to the value in the calculation. Each cost element and type can be found in chapter 7 of the interventions.

RD26_G09_GAV_70 - In vitro conservation of animal genetic resources

Intervention Code (MS)	RD26_G09_GAV_70
Intervention Name	In vitro conservation of animal genetic resources
Type of Intervention	ENVCLIM(70) - Environmental, climate-related and other management commitments
Common Output Indicator	O.19. Number of operations or units supporting genetic resources
Contributing to ringfencing requirement for/on	Generational Renewal: No Environment: Yes ES rebate system: Yes LEADER: No

1 Territorial scope and, if relevant, regional dimension

Territorial scope: **National**

Code	Description
HU	Magyarország

Description of the Territorial Scope

Area of intervention Hungary

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO6 Contribute to halting and reversing biodiversity loss, enhance ecosystem services and preserve habitats and landscapes

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
6.6.1	Genetic conservation and land use in climate adaptive agriculture and forestry	2	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.27 Number of operations contributing to environmental sustainability and the achievement of climate mitigation and adaptation goals in rural areas

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Support for in vitro gene conservation:

Support the collection of genetic material (semen, ova, embryonic cell, embryonic tissue, sexual organ tissue) of specimens implementing an approved breeding programme for protected native, endangered agricultural animal breeds and under breed reconstruction, preparation for deep-frozen storage, storage in laboratory conditions by deep-frozen processes, and genetic testing of specimens implementing an approved breeding programme for protected native, endangered agricultural breeds and agricultural breeds under breed reconstruction.

In different farming systems, high genetic value plant species and animal breeds, which are often threatened with extinction/genetic erosion, are highly supported. The conservation of these varieties is a priority for the maintenance of biodiversity. The purpose of genetic conservation is the conservation and breeding of the genetic resources of native agricultural animal breeds under threat of agricultural and varietal reconstruction, within the framework of mandatory legislation on the conservation of the genetic stock and on breeding programmes ensuring the survival of those breeds, as well as the ex situ and in situ

conservation, characterisation, collection and utilisation of genetic resources of species of particular importance in agriculture and nutrition.

The context of certain interventions supporting the conservation of genes: In the case of in situ gene conservation, we support the conservation of female and mixed female herds in the case of poultry. Male breeding animals necessary for breeding, i.e. the maintenance of the breed, are supported in ex situ conservation, and reproductive material obtained from breeding animals and genetic material are supported in the intervention of in vitro gene conservation. Thus, these three interventions together form one unit. Our aim is to preserve these valuable varieties that are threatened with extinction, that are displaced from farming by the breeds of commers and are backwards.

Principles governing the establishment of selection criteria, which may be partially applied (selection criteria):

gene conservation of genetic material of multiple species or varieties;

— maintenance of a small number of lines, families' genetic material;

— maintenance of small, rare, high genetic value lines, families' genetic material;

— maintenance of genetic material of rare and/or valuable hereditary properties;

— the maintenance of genetic material of breeds with a critical or threat level to be protected according to threat levels determined on the basis of the number of females entered in the main section of the herd-book;

professional qualifications;

Presentation of the environmental ambition level for the three animal genes conservation:

The interventions aim to conserve genetic resources in agriculture to support the conservation of plant species, micro-organisms and animal breeds of high genetic value and often threatened with extinction/genetic erosion. We also expect an increase in claims for items already supported under the Rural Development Programme, and in order to increase the level of environmental ambition, Hungary has already planned significant changes from the transitional period onwards:

— In the case of conservation of animal genetic resources, for ex situ, in situ and in vitro conservation, the range of previously supported breeds will be extended to include black mangalica, akhal camels, breeds under construction and Hungarian giant rabbit breeds, and in the case of in vitro gene conservation, embryonic cells and sexual organ tissues are also eligible as new elements.

List of eligible varieties:

Protected native breeds	
Species	Breed
Bovine	Hungarian grey cattle
	Hungarian house buffalo
	Hungariantarca cattle
Horse	gidran

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiaries: Natural and legal persons engaged in the conservation of genes

Eligibility criteria:

a contract concluded with a breeding authority;

appropriate professional, human and technical background

if the aid applicant is not the recognised breed society, an attestation by the recognised breed society that the quantity and genetic quality of the semen, ova, embryo, sex tissue to be stored is consistent with the preservation programme established by the breed society.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments (commitments):

— the aid applicant shall collect an average of at least 50 genetic samples per year during the commitment

period, prepare for storage in deep-frozen storage, qualify and preserve it by deep-freezing under laboratory conditions.

- embryo production is eligible only for bovine species. During the commitment period, the collection, preparation for deep-frozen and deep-frozen preservation of up to 20 embryos from a donor mother shall be eligible.

provision of data to the National Animal Breeding Database;

to carry out the necessary genetic tests on specimens or lines defined by the breed society;

for embryonic cell preservation and sex tissue preservation: The aid applicant must prepare, classify and preserve under laboratory conditions the embryonic cell or sex tissue for deep-frozen storage by a deep-freezing process.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

Not relevant

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

What are the models of the commitment(s) in the intervention?

- ☒ result based (with possibility to pick and choose)
- ☒ management based (with possibility to pick and choose)
- ☒ hybrid (management and result based)

Please explain the obligations/possibilities for beneficiaries in relation to the commitments set out in the intervention

Commitments:

— the aid applicant shall collect on average at least 50 genetic samples per year during the commitment period, prepare for deep-frozen storage, qualify and preserve it under laboratory conditions by means of a deep-frozen process.

- embryo production is only eligible for bovine species. During the commitment period, the collection, preparation for deep-frozen and deep-frozen preservation of no more than 20 embryos from a donor mother shall be eligible.

— provision of data to the National Livestock Database;

— carrying out the necessary genetic tests for the specimens or lines determined by the breed society;

- embryonic cell preservation and sex tissue preservation: Applicants for aid must prepare, qualify and keep the embryonic cell or sexual organ tissue for deep-frozen storage under laboratory conditions by means of a deep-frozen process.

What is the duration of contracts?

5 years commitment

10 WTO compliance

Green Box

Paragraph 12 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 12 of Annex II.

Explanation and justification related to the value of the unit amount

RD26_O19_U01_IT - Deep-frozen conservation of bovine genetic material (artificial straw)

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD26_O19_U02_IT - Unit amount for the deep-frozen preservation of bovine embryos (embryos)

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD26_O19_U03_IT - Unit amount for the preservation of pig genetic material under deep-frozen conditions (artificial straw)

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD26_O19_U04_IT - Unit amount for deep-frozen preservation of the genetic material of sheep and goats (artificial straw)

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD26_O19_U05_IT - Unit amount for deep-frozen preservation of equine genetic material (artificial straw)

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD26_O19_U06_IT - Deep-frozen conservation of poultry genetic material (artificial straw/ampoule)

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD26_O19_U07_HD - Unit amount of genetic test

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD26_O19_U08_IT - Unit amount of rabbit genetic material deep-frozen (artificial straw)

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD26_O19_U09_IT - Unit amount for the preservation of embryonic cells in poultry

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD26_O19_U10_IT - Unit amount for the preservation of sexual tissues of poultry

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

4.7.1	Development and use of climate-additive and climate-adaptive plant and animal breeds	1	Yes
6.6.1	Genetic conservation and land use in climate adaptive agriculture and forestry	2	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.27 Number of operations contributing to environmental sustainability and the achievement of climate mitigation and adaptation goals in rural areas

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Ex situ protection of plant genetic resources and micro-organisms of rare and endangered plant species and varieties:

It supports the protection and maintenance of landscape varieties, home gardens, species excluded from cultivation and other crops, their wild and relative trees and micro-organisms.

Plant species and animal varieties of high genetic value and often threatened with extinction/genetic erosion are given special support in different farming systems. The preservation of these varieties is essential for the maintenance of biodiversity. The purpose of genetic conservation is the conservation and

breeding of native endangered agricultural animal breeds and breeds, within the framework of mandatory legislation on the conservation of genetic stock and breeding programmes to ensure the survival of those breeds, and the ex situ and in situ conservation, characterisation, collection and utilisation of genetic resources of plant species which play a key role in agriculture and food.

Landscape varieties of plant species for agricultural and food purposes, házikerti varieties, varieties excluded from cultivation and other crops ecotypes, their wild and relative trees and micro-organisms shall be classified as endangered categories, as they disappear without reservation or conservation.

One of the most effective methods for their conservation is ex situ conservation, outside the place of production, the methods and techniques of which are detailed in the International Genetic Bank standard. Breeds benefit from variety maintenance and are therefore less or not at risk.

In the case of micro-organisms, the preservation and long-term maintenance of micro-organisms (viruses, bacteria, yeasts, moulds and other fungi, including cultivable magnobs), which are beneficial and harmful in the areas of crop production, livestock farming, food industry, forestry, soil protection, water management, etc., while maintaining their genetic properties in the same state.

Due to the nature of current agricultural practice, the problem of gene conservation is not generally addressed by the participants and it is therefore necessary to support and subsequently monitor such gene conservation activities in order to preserve, maintain and develop the current ex situ collections.

Principles governing the establishment of selection criteria, which may be partially applied (selection criteria):

- o the quantity of items retained;
- o professional qualifications;
- o the agricultural, cultural and genetic value of the collection,
- o Technical and technical competence of the applicant
- o Participation in the work of the Test Plant Information Network (Test Plant System)

An increase in ambition:

The annual output target of interventions is 94131 items for ex situ gene conservation, 150 breeds and 30 260 ha for in situ gene conservation. Interventions are aimed at the conservation of genetic resources in agriculture, with the aim of supporting the conservation of agronomically valuable plant species and micro-organisms that have high genetic value and are often threatened by extinction/genetic erosion. There is also an increase in the applications for items already supported under the Rural Development Programme, and in order to increase the level of environmental ambition, Hungary plans to make significant changes from the Strategic Plan period, as the intervention “RD28_G11_GPI_70 – In situ conservation of plant genetic resources” will be introduced as a new element.

In the period 2014-2022, the Rural Development Programme provided an average of EUR 2832876 per year to support the conservation of plant genes, whereas under the CAP Strategic Plan, EUR 5479452 per year is planned by the Member State to support the promotion of plant gene conservation.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible Beneficiaries: Natural and legal persons engaged in the conservation of genes

Eligibility criteria

- the collection has a National Gene Bank registration number and the items retained therein have been registered in the National Genebank Database;
- Existence of a technical opinion issued by the Council of Plant Gene Banks.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments (commitments):

For plant varieties/species:

—promoting collection, characterisation and utilisation of specified species;

the multiplication and maintenance of the lots collected and the ex situ conservation and description of genetic resources of seeded species, conservation and description of the genetic resources of vegetatively propagated species in plantations and in vitro methods;

preservation of items in accordance with the International Gene Bank Standard.

Preservation of existing biological bases

For micro-organisms:

Preservation and long-term maintenance of isolated/collected non-commercial micro-organisms by modern deep-freezing (cryopreservation) or freeze-drying (liophilisation).

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

☐ IACS

☒ Non-IACS

Non-IACS section

Form of support

☒ Grant

☐ Financial instrument

Type of payment

☐ reimbursement of eligible costs actually incurred by a beneficiary

☒ unit costs

☐ lump sums

☐ flat-rate financing

Basis for the establishment

The payment shall be made in accordance with Article 83(1)(b) and 2(a)(i) of the STR.

The payments in the intervention relate to the preservation, maintenance or multiplication of each genetic item by the beneficiary. These activities have costs and have been used as a basis for determining the aid amount and its rate per item. All cost items can be found in the document 'RD27_G10_GPX_70 – Plant gene ex situ_background calculation' and form the basis for determining the aid amount.

Range of support at beneficiary level

—the aid is 100 % intensities

For plant varieties/species and micro-organisms, the aid amounts are given in the table below.

Ineligible costs for the intervention:

activities of the Rural Development Programme 2014-2020 covered by the ongoing commitment

For plant varieties/species and micro-organisms:

	Article item	Amount of aid in HUF equivalent to EUR/item/year (EUR)
	self-fertilisers	41
	Seed-produced one-year-old	wind-powdered foreign-fertilisation
		48
		insect propagated by non-fertilisation
		59
	Seeds propagated sowings	breeding garden reservation
		55
		maintained by seed storage
		41
	Vegetative propagation herbaceous plants	63
	Maintenance of perennial woody plants in plantations	trees
		70
		shrubs
	Maintenance in mersystem cultures	37
	Micro-organisms	Cryopreservation
		42
		Lyophilisation
		40

Additional explanation

Method 2: The functioning of gene banking structures, the options for solutions and the extent of the sub-tasks are as diverse as the totality of the preserved crops. For gene banks operating on large operating surfaces, i.e. large taxa and batch-numbered collections, a particularly complex task is to establish a cost claim and a standard of support in this respect. (Developed for this purpose in 2010. Decision support software is only suitable for the introduction of 20 plant species, as opposed, for example, to the National Centre for Biodiversity and Gene Conservation (hereinafter: NBGK) conserved with more than 1000 species) (Horna, 2010). I.e. the more species-rich the collection, the more difficult it is to put specific cost factors on a species-by-species basis. There are many components of the task that make it very difficult, if not impossible, to approach costs and aid norms through individual cases. The variability of these factors ultimately leads to different input efficiency ratios in different gene banks. (Koo at all. 2004) Assessment of results: As can be seen at a later stage in the case of NBGK, three-quarters of the expenditure comes from the need for live work. According to some surveys, permanent storage itself represents only 17 % of the cost claims. The most costly operations are the establishment of viability (germination), breeding garden multiplication, seed purification, batch description and delivery. (Pepijn at all., 2014) At the same time, it can be demonstrated that the cost requirements for these operations may vary very widely between the different species of culture and, possibly, their lots. Examples include isolation related to multiplication. In order to preserve the integrity of gene banking items, i.e. to prevent foreign pollination, the costs of isolation (spatial, sub tent or manual operations) differ in magnitude. Therefore, it is justifiable or possible to start by breaking down the cost factors of the operating unit dealing only with this core task. In our national circumstances, with 51000 unidentified items (variety, landscape, etc.) of more than a thousand species of almost 300 plant genera, and the NBGK with 110 thousand sub-samples of these can be considered as a source of data and guidance in this respect. NBGK has a full gene banking activity for arable and vegetable crops. This includes the collection, multiplication, description, permanent storage, documentation and dissemination of gene reserves. At the same time, the NBGK maintains working, active and base collections (more recently a geographically segregated security repository) and carries out

GMB operations in accordance with the international standard. The NBGK has 150 ha of arable land for the necessary gene propagation and is equipped with normal and specialised equipment and equipment necessary for the tasks. Although most of the collections retained here have a so-called orthodox core suitable for seed banking storage, in order to ensure full activity there is conservation in plantations and in-vitro storage.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

What are the models of the commitment(s) in the intervention?

- ☒ result based (with possibility to pick and choose)
☒ management based (with possibility to pick and choose)
☒ hybrid (management and result based)

Please explain the obligations/possibilities for beneficiaries in relation to the commitments set out in the intervention

Commitments:

For plant varieties/species:

- collection, characterisation and promotion of the utilisation of specified species;
- multiplication and maintenance of harvested lots and ex situ conservation and description of genetic resources of seed-bred species, conservation and description of genetic resources of vegetatively propagated species in plantations and by in vitro methods;
- conservation of items in accordance with the International Gene Bank Standard.

Conservation of existing biological funds

For micro-organisms:

- Preservation and long-term maintenance of isolated/collected non-commercial micro-organisms by modern deep freezing (cryopreservation) or freeze-drying (lyophilisation).

What is the duration of contracts?

5 years commitment

10 WTO compliance

Green Box

Paragraph 12 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 12 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(3)(b) - 70 - Payments under Article 70	50.00%	20.00%	80.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD27_O19_U01_IT - Annuals propagated by seed — unit sum of self-fertilization	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.27	No
RD27_O19_U02_IT - Perennials with seeds — unit amoiant of wind-pollinated external fertilization	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.27	No
RD27_O19_U03_IT - Perennials with seeds — unit amoiant of insect-pollinated external fertilization	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.27	No
RD27_O19_U04_IT - Seeded perennials — unit amount of breeding garden maintainance	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.27	No
RD27_O19_U05_IT - Seed multiplied perennials — maintained by seed storage — unit amount	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.27	No
RD27_O19_U06_IT - Unit sum of vegetative herbaceous plants	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.27	No

RD27_O19_U08_IT - Maintenance of perennial woody plants in plantations — unit amount of shrubs	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.27	No
RD27_O19_U09_IT - Unit amount of maintenance in meristemic cultures	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.27	No
RD27_O19_U10_IT - Micro-organisms — Unit sum of cryopreservation	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.27	No
RD27_O19_U11_IT - Micro-organisms — Unit Lyophilisation	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.27	No

Explanation and justification related to the value of the unit amount

RD27_O19_U01_IT - Annuals propagated by seed — unit sum of self-fertilization

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD27_O19_U02_IT - Perennials with seeds — unit amoiant of wind-pollinated external fertilization

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD27_O19_U03_IT - Perennials with seeds — unit amoiant of insect-pollinated external fertilization

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD27_O19_U04_IT - Seeded perennials — unit amount of breeding garden maintenance

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD27_O19_U05_IT - Seed multiplied perennials — maintained by seed storage — unit amount

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD27_O19_U06_IT - Unit sum of vegetative herbaceous plants

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD27_O19_U07_IT - Maintenance of perennial woody plants in plantations — unit amount of trees

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD27_O19_U08_IT - Maintenance of perennial woody plants in plantations — unit amount of shrubs

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD27_O19_U09_IT - Unit amount of maintenance in meristemic cultures

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD27_O19_U10_IT - Micro-organisms — Unit sum of cryopreservation

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD27_O19_U11_IT - Micro-organisms — Unit Lyophilisation

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029

RD28_G11_GPI_70 - Conservation in situ of plant genetic resources

Intervention Code (MS)	RD28_G11_GPI_70
Intervention Name	Conservation in situ of plant genetic resources
Type of Intervention	ENVCLIM(70) - Environmental, climate-related and other management commitments
Common Output Indicator	O.19. Number of operations or units supporting genetic resources
Contributing to ringfencing requirement for/on	Generational Renewal: No Environment: Yes ES rebate system: Yes LEADER: No

1 Territorial scope and, if relevant, regional dimension

Territorial scope: **National**

Code	Description
HU	Magyarország

Description of the Territorial Scope

The area of intervention is Hungary.

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO4 Contribute to climate change mitigation and adaptation, including by reducing greenhouse gas emission and enhancing carbon sequestration, as well as promote sustainable energy

SO6 Contribute to halting and reversing biodiversity loss, enhance ecosystem services and preserve habitats and landscapes

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
4.7.1	Development and use of climate-additive and climate-adaptive plant and animal breeds	1	Yes
6.4.1	Developing up-to-date data collection and monitoring systems for measuring biodiversity	1	Partially
6.6.1	Genetic conservation and land use in climate adaptive agriculture and forestry	2	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.12 Share of utilised agricultural area (UAA) under supported commitments to improve climate adaptation

R.27 Number of operations contributing to environmental sustainability and the achievement of climate mitigation and adaptation goals in rural areas

R.31 Share of utilised agricultural area (UAA) under supported commitments for supporting biodiversity conservation or restoration including high-nature-value farming practices

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

In situ conservation of plant genetic resources:

It supports the preservation of the diversity of plant species for agricultural and food purposes in use (on-farm), the cultivation of sized stands of landscape varieties, home garden varieties and varieties excluded

from cultivation, as well as the preservation of crops ecotypes and wild related species in situ habitats, the production and use of their reproductive material.

Plant species and animal varieties of high genetic value and often threatened with extinction/genetic erosion are given special support in different farming systems. The preservation of these varieties is essential for the maintenance of biodiversity. The purpose of genetic conservation is the conservation and breeding of native endangered agricultural animal breeds and breeds, within the framework of mandatory legislation on the conservation of genetic stock and breeding programmes to ensure the survival of those breeds, and the ex situ and in situ conservation, characterisation, collection and utilisation of genetic resources of plant species which play a key role in agriculture and food.

It supports the preservation of the diversity of plant species for agricultural and food purposes in use (on-farm), the cultivation of sized stands of landscape varieties, home garden varieties and varieties excluded from cultivation, as well as the preservation of crops ecotypes and wild related species in situ habitats, the production and use of their reproductive material.

Principles governing the establishment of selection criteria, which may be partially applied (selection criteria):

Technical opinion of the Plant Genetic Board;

— the agricultural, cultural and genetic value of the species in the case of the varieties/natural flora applied for;

— professional qualifications;

— the technical opinion of the National Park Directorate with territorial competence in the case of wild related species and ecotypes;

- environmental, climate and adaptation aspects, site protection, National Park, Natura 2000;

— continuation of organic farming is an advantage in selection

— Participation in the work of the Test Plant Information Network (Test Plant System)

promotion of an increase in the level of charge:

The annual output target of interventions is 94131 items for ex situ gene conservation, 150 breeds and 30 260 ha for in situ gene conservation. Interventions are aimed at the conservation of genetic resources in agriculture, with the aim of supporting the conservation of agronomically valuable plant species and micro-organisms that have high genetic value and are often threatened by extinction/genetic erosion. There is also an increase in the applications for items already supported under the Rural Development Programme, and in order to increase the level of environmental ambition, Hungary plans to make significant changes from the Strategic Plan period, as the intervention “RD28_G11_GPI_70 – In situ conservation of plant genetic resources” will be introduced as a new element.

In the period 2014-2022, the Rural Development Programme provided an average of EUR 2832876 per year to support the conservation of plant genes, whereas under the CAP Strategic Plan, EUR 5479452 per year is planned by the Member State to support the promotion of plant gene conservation.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible Beneficiaries: Natural and legal persons engaged in the conservation of genes

Eligibility criteria

· in the case of crops grown, a brief description (based on simplified descriptors) of the variety (land variety, home garden variety, non-cultivated variety) and the origin of the variety, the duration of its maintenance/production by the applicant

· in the case of wild related species and ecotypes, the stock is included in the document or database of the protected or Natura 2000 site of national importance;

· the existence of a collection permit for the collection of natural flora elements

Existence of a technical opinion issued by the Plant Gene Bank Council.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments (commitments):

For cultivated species

To be retained (registered) (e.g.: (landscape/domestic) varieties, keeping and promoting the use of a population of a minimum size to prevent genetic erosion;

In the case of arable crops, the minimum parcel size shall be 0.25 ha per variety (land variety, home garden variety, non-cultivated variety)

In the case of vegetable production, the minimum area shall be 50 m² varieties

In the case of fruit production, at least 2 animals per variety

For the production of grapes and berries, at least 5 animals per variety

For the production of herbaceous perennials, at least 15 m² per variety

In case of maintenance of wild related species, ecotypes, wild flora habitat:

Continuous conservation of natural populations of wild related species and ecotypes in their original habitat

Minimum 0.25 ha of natural wild flora if habitat is maintained

In the case of cultivation of natural flora elements, the minimum surface area is 100-1 000 m² depending on the species

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

List of relevant GAEC and SMR

Code	Description

List of relevant mandatory national standards

Not relevant.

Link between GAEC, SMR and national standards with the intervention

Not relevant.

7 Form and rate of support/amounts/calculation methods

☒ IACS

☐ Non-IACS

IACS section

Type of payment

☒ unit cost based on additional costs and income foregone

☒ transaction cost included

☐ one off payment

☐ lump sum

Range of support at beneficiary level

EUR 350/ha for arable crops

For vegetable species EUR 30/variety/50 m² above 0.25 ha EUR 350/ha

EUR 30/variety/15 m² for perennial herbaceous species, EUR 650/ha above 0.25 ha

In the case of plantations (grapes and fruits), EUR 20/variety per 2 fruit trees or 5 vines or berries below 0.25 ha, EUR 1000/ha

Grasslands outside Natura 2000 areas EUR 500/ha

Production of propagating material for natural flora elements EUR 500 per species

Collection of propagating material for herbaceous components of natural flora EUR 500/species)

Calculation method

The unit amount (unit amount) is equal to the aid amount of the respective aid units. The aid amounts are included in Chapter 7 of the intervention, based on a calculation prepared by an independent expert body.

Additional explanation

Not relevant.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

What are the models of the commitment(s) in the intervention?

- ☒ result based (with possibility to pick and choose)
☒ management based (with possibility to pick and choose)
☒ hybrid (management and result based)

Please explain the obligations/possibilities for beneficiaries in relation to the commitments set out in the intervention

Commitments:

For cultivated species

To be preserved (registered) (e.g.: landscape varieties/householding varieties, maintaining a minimum size of herd to prevent genetic erosion and promoting their utilisation;

For arable crops the minimum parcel size is 0.25 ha per variety (land variety, domestic garden variety, variety excluded from cultivation)

For the production of vegetables, the minimum area is 50 m^{for} each variety

In the case of fruit production, at least 2 individuals per variety

For the production of grapes and berries, at least 5 individuals per variety

At least 15 m² per variety in the case of herbaceous biennial cultivation

In case of maintenance of wild related species, ecotypes, wild flora habitat:

Continuous conservation of natural populations of wild related species and ecotypes in their original habitat

If natural wild flora habitat is maintained, at least 0.25 ha

For the cultivation of natural flora elements, the minimum area, depending on the species, is between 100 and 1 000 m²

What is the duration of contracts?

5 years commitment period

10 WTO compliance

Green Box

Paragraph 12 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 12 of Annex II.

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD28_O19_U01_HA - Unit amount of arable crop production	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.12; R.31	No
RD28_O19_U02_HA - Unit sum of vegetable species	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.12; R.31	No
RD28_O19_U03_HA - Unit sum of perennial herbaceous species	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.12; R.31	No
RD28_O19_U04_HA - Unit sum of plantations (grape and fruit)	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.12; R.31	No
RD28_O19_U05_HA - Unit sum of grasslands outside Natura 2000 sites	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.12; R.31	No
RD28_O19_U06_SP - Unit amount for the production (cultivation) of propagating material of elements of natural flora	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.27	No
RD28_O19_U07_SP - Unit sum of the collection of herbaceous elements of natural flora	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.27	No

Explanation and justification related to the value of the unit amount

RD28_O19_U01_HA - Unit amount of arable crop production

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD28_O19_U02_HA - Unit sum of vegetable species

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD28_O19_U03_HA - Unit sum of perennial herbaceous species

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD28_O19_U04_HA - Unit sum of plantations (grape and fruit)

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD28_O19_U05_HA - Unit sum of grasslands outside Natura 2000 sites

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD28_O19_U06_SP - Unit amount for the production (cultivation) of propagating material of elements of natural flora

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

RD28_O19_U07_SP - Unit sum of the collection of herbaceous elements of natural flora

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029

RD29_G12_AWC_70 - Animal welfare aid in the small ruminants sector

Intervention Code (MS)	RD29_G12_AWC_70
Intervention Name	Animal welfare aid in the small ruminants sector
Type of Intervention	ENVCLIM(70) - Environmental, climate-related and other management commitments
Common Output Indicator	O.18. Number of livestock units (LU) benefitting from support for animal welfare, health or increased biosecurity measures
Contributing to ringfencing requirement for/on	Generational Renewal: No Environment: Yes ES rebate system: Yes LEADER: No

1 Territorial scope and, if relevant, regional dimension

Territorial scope: **National**

Code	Description
HU	Magyarország

Description of the Territorial Scope

The area under which the intervention is implemented is Hungary.

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO9 Improve the response of Union agriculture to societal demands on food and health, including high quality, safe, and nutritious food produced in a sustainable way, the reduction of food waste, as well as improving animal welfare and combatting antimicrobial resistances

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
9.1.1	Meeting animal welfare requirements and meeting the natural needs of farm animals	1	Yes
9.1.2	Improving general hygiene and biosecurity conditions, increasing food safety	1	Yes
9.1.3	Prevention of animal health problems, development/development of forecasting systems	1	Partially

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.44 Share of livestock units (LU) covered by supported actions to improve animal welfare

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

The purpose of the intervention is to:

The intervention aims to improve animal husbandry by providing support for the implementation of strict animal welfare, hygiene and feeding conditions to the benefit of the animals.

The rearing of farm animals has changed significantly in recent decades. These changes in breeding, rearing and feeding techniques have an impact on the health status of the animals and their fitness properties. It is therefore appropriate to support livestock farmers who undertake to provide animals with stricter hygiene, feeding and rearing conditions.

The preventive health measures and treatments included in the support aim to improve the overall health

and hygiene of livestock, which require further measures to reduce the number of diseases and thus significantly reduce the need for medical treatment. It is also necessary to incorporate new commitments leading to a reduction in the use of antimicrobials.

Animal welfare subsidies were available for the first time for the small ruminant sector as of 2019, which could help, inter alia, transform milk production and address acute capital shortages. The aim of the intervention is to promote animal welfare conditions by supporting farmers to meet high hygiene and feed standards to the benefit of the animals.

Principles governing the establishment of selection criteria, which may be partially applicable (selection criteria):

- Farmer's skills
- Continuation of organic farming
- Participation in cooperation with public recognition
- The applicant is responsible for animal welfare in his or her holding and is certified
- Participation in the work of the Test Plant Information Network (Test Plant System)

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible Beneficiaries:

Farmers meeting eligibility criteria:

Natural persons

Enterprises with legal personality (business companies+cooperatives (in particular social cooperatives))

Non-profit organisations with legal personality (Church legal persons, foundations, non-profit companies)

Eligibility criteria:

The aid applicant keeps eligible animals in its holding registered in the Farming Information System.

The holdings of the aid applicant fully comply with the animal welfare standards in force.

Compliance with the rules on species marking and registration and on the registration of the holding.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments (commitments):

- Technologically built nail care under this standard, aid applicants must carry out nail care at least 2 times a year in supported holdings on all animals covered by the aid.
- Control of infection with Endoparasita (internal parasites). Faeces samples shall be collected and sent to the laboratory at least 2 times a year according to the procedure specified by the testing laboratory. Small ruminants should be treated with a substance and dose according to the instructions of the treating veterinarian, if necessary, based on the result of faeces testing.
- Control of ectoparasites (external parasites) and flies, mosquitoes, mucilages. Those seeking support should reduce the fly and mosquito stock, which should be carried out in the months most exposed to the invasion of fly and mosquito. The herd must be treated against external parasites within two months of shearing in sheep and 31 May of a given year in the case of goats.
- Use of mineral supplement. The aid applicant shall ensure and keep records of adequate and continuous access to the supplement to the selenium mineral during feeding.

Eligible costs for the intervention:

- Compensation for additional costs and income foregone resulting from the commitments made
- The additional cost of labour and contributions for carrying out nail care and the cost of materials for the disinfectant used.

- The additional cost of labour and contributions to control the infection, the additional cost of laboratory testing and the cost of materials used for medical treatment.
- Additional cost of material and labour for the thinning of external parasites and flies of mosquitoes and scapels.
- Additional cost of continuous access to the supplement to the Széles mineral.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

List of relevant GAEC and SMR

Code	Description
SMR11	Council Directive 98/58/EC of 20 July 1998 concerning the protection of animals kept for farming purposes: Article 4

List of relevant mandatory national standards

- 119/2007. (X. 18.) FVM on the national registration system for enclosures, holdings and certain related data;
 Council Directive 98/58/EC of 20 July 1998 concerning the protection of animals kept for farming purposes;
 Regulation (EC) No 853/2004 of the European Parliament and of the Council of 29 April 2004 laying down specific hygiene rules for food of animal origin;
 - 32/1999. (III. Ministry of Agriculture and Rural Development on animal protection rules for the keeping of farm animals;
 - 182/2009. FVM Decree (XII. 30.) on the Uniform Registration and Identification System for ovine and caprine animals.
 — 188/2019. Government Decree No 487/2015 of 30 July 2008 on animal husbandry;
 Act LVI of 2019 on the statutory provisions necessary for the regulation of animal husbandry
 - 41/1997. Decree of 28 May 2008 of the Minister for Agriculture on the issue of the Animal Health Code

Link between GAEC, SMR and national standards with the intervention

Detailed justification of the commitments (how it goes beyond EU mandatory standards):

nail care built into technology

As animal welfare rules (EU and national) were originally designed specifically for enclosed species and husbandry systems, these proposals for intervention are not (yet) reproduced verbatim in the legislation in force, but can be deduced from the traditional five freedoms (5 freedoms).

In addition to nail care built into the technology, we propose that the animal keeper concerned (applicant for support) should be provided annually with an additional nail care facility for all animals covered by the aid. In Hungary, small ruminants are mainly reared in extensive systems based on pasture. As sheep and goats spend a significant part of the day by grazing and looking for pasture grass, the health status of the feet is of paramount importance, as the weight of the animals rests on the nails, and leg diseases caused by the neglect of the jigs or the absence of nail care may even be culling causes, affecting both the economy of the sector and the welfare of animals, and the importance of nail care and circling cannot be overstated.

control of infection with Endoparasita (internal parasites)

control of ectoparasites (external parasites) and fly, mosquitoes, rabbits

Point 12 of the Annex to Council Directive 98/58/EC of 20 July 1998 concerning the protection of animals kept for farming purposes, entitled 'Animals not kept in buildings', provides that: 'Animals not kept in a building shall, where necessary and possible, be protected against adverse weather effects, predators and health risks.' The control of Endo and Ecto parasites goes beyond these Directives.

The control of endo- and ectoparasites is easier, as their presence is visible and would fail on a regular and

seasonal basis. They need to be sensed because, in addition to disturbing the animals, they play a role in the development of a wide range of diseases that can cause severe disease to the animals.

The detection of endoparasites by sensory testing is often not possible, and we therefore require laboratory tests, as the substances that may be used to eradicate them can also burden the animals and should therefore be avoided in any case. Thanks to targeted treatments, animal health and thus their welfare and comfort can be restored

Due to the different nature of the control of endo and ectoparasites, we treat it as a separate obligation, but in general, the presence of parasites in herds is associated with a deterioration in the comfort, health, fertility and production indicators of the animals. It is therefore a priority for operators in the sector. This is a repeated example of the fact that maintaining animal welfare and health is closely linked to the economy of the sector and, in many cases, cannot be technically separated.

application of a supplement to mineral material

Point 18 of the Annex to Council Directive 98/58/EC of 20 July 1998 concerning the protection of animals kept for farming purposes, Feeding, water and other objects, provides: Substances other than those administered for therapeutic or prophylactic purposes or for zootechnological treatment as defined in Article 1(2)(c) of Directive 96/22/EC (1) shall not be administered to animals unless it is demonstrated, on the basis of scientific knowledge or practical experience relating to animal welfare, that the effects of that substance are not harmful to animal health or welfare.' The provision of the required levels of minerals (one of the most importantly selenium) and vitamins is of direct benefit to animal health and welfare, while increasing the life performance of individual animals. As a result of the longer life performance, the economy of the farmers concerned is increasing, thus indirectly increasing the result of the small ruminant sector in Hungary as a whole, which may also lead to voluntary compliance with animal welfare standards in the long term.

7 Form and rate of support/amounts/calculation methods

☒ IACS

☐ Non-IACS

IACS section

Type of payment

☒ unit cost based on additional costs and income foregone

☒ transaction cost included

☐ one off payment

☐ lump sum

Range of support at beneficiary level

Undertaking	The maximum aid rate is HUF equivalent to EUR/LU/year
Nail care built into technology.	40,44
Control of infection with Endoparazita (internal parasites)	52,72
Control of ectoparasites (external parasites) and flies, mosquitoes, mucilages.	75,42
Use of mineral supplement	39,6

The maximum rate of reimbursement of transaction costs is HUF 7 per unit cost per year (lump sum).

Calculation method

Background calculation of animal welfare interventions in the small ruminant sector: The planned measure will contribute to the continuous improvement and improvement of animal health and welfare, thereby maintaining the positive environmental impacts associated with the sector. The introduction of animal welfare aid for sheep/goats is necessary to continuously improve animal and health protection in the sheep/caprine sector by improving animal welfare conditions and requiring farmers to go beyond the relevant mandatory standards in order to improve the animal welfare standards of the Hungarian sheep population; furthermore, the effective support for animal welfare is well integrated into the sectoral support structure. Preventive health measures included in the support scheme, treatments lead to an improvement in the overall health and hygiene status of livestock, which reduces the number of diseases and thus the need for medical treatment and thus reduces the risk of drug resistance. It will also increase the efficiency of the procedures used, reduce the amount of chemicals released into the environment, improve animal welfare and well-being. This support scheme is in particular Article 33 of Regulation (EU) No 1305/2013; and be designed in accordance with European regulations supporting rural development support. This measure will provide targeted support for animal welfare areas that can be identified as contributing significantly to the welfare of sheep and goats, with regard to the domestic production systems and the environment in which the sheep and goats are reared in Hungary. The background calculation includes the compensation for commitments made in the technology for nail care, the control and control of endoparasita (inner parasites), Ectoparasites (external parasites) and flies, mosquitoes and herbs, the use of the Minerals Supplement.

Additional explanation

Not relevant

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

What are the models of the commitment(s) in the intervention?

- ☒ result based (with possibility to pick and choose)
☒ management based (with possibility to pick and choose)
☒ hybrid (management and result based)

Please explain the obligations/possibilities for beneficiaries in relation to the commitments set out in the intervention

Commitments:

- Nail care built into technology. Under this requirement, aid applicants must carry out nail care on all the animals covered by the aid at least 2 times a year in supported holdings.
- Control of endoparasita (internal parasites). Faecal samples shall be collected and sent to the laboratory at least 2 times a year, according to the procedure specified by the testing laboratory. Small ruminants should be treated, if necessary, with the substance and dose as instructed by the treating veterinarian, on the basis of the faecal test result.
- Control of ectoparasites (external parasites) and flies, mosquitoes and heals. The aid applicant should throw the fly and mosquito stock to be carried out in the months most exposed to the fire and mosquito invasion. The herd must be treated against external parasites and must be treated within two months of shearing in the case of sheep and by 31 May of a given year in the case of goats.
- Use of a mineral supplement. The aid applicant shall ensure adequate and continuous access to the supplementation of selenium mineral during feeding and shall keep a record thereof.

What is the duration of contracts?

5 years commitment

10 WTO compliance

Green Box

Paragraph 12 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 12 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(3)(b) - 70 - Payments under Article 70	50.00%	20.00%	80.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD29_O18_U01_LU - Animal welfare aid unit cost of intervention in the small ruminant sector	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.44	No

Explanation and justification related to the value of the unit amount

RD29_O18_U01_LU - Animal welfare aid unit cost of intervention in the small ruminant sector

The unit amount (unit amount) is equal to the aid amount for the aid units concerned. The grant amounts are set out in Chapter 7 of the intervention, based on a calculation by an independent expert body.

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029

Description of the Territorial Scope

The area under which the intervention is implemented is Hungary.

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO4 Contribute to climate change mitigation and adaptation, including by reducing greenhouse gas emission and enhancing carbon sequestration, as well as promote sustainable energy

SO9 Improve the response of Union agriculture to societal demands on food and health, including high quality, safe, and nutritious food produced in a sustainable way, the reduction of food waste, as well as improving animal welfare and combatting antimicrobial resistances

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
4.1.2	Reduction of GHG and ammonia emissions through technological development of livestock farming	2	Yes
9.1.1	Meeting animal welfare requirements and meeting the natural needs of farm animals	1	Yes
9.1.2	Improving general hygiene and biosecurity conditions, increasing food safety	1	Yes
9.1.3	Prevention of animal health problems, development/development of forecasting systems	1	Partially

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.13 Share of livestock units (LU) under supported commitments to reduce emissions of greenhouse gases and/or ammonia, including manure management

R.44 Share of livestock units (LU) covered by supported actions to improve animal welfare

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

The purpose of the intervention is to:

The general welfare and living conditions of domestic dairy cattle are determined by husbandry technology and animal nutrition, so animal welfare obligations and commitments are particularly warranted in these two areas, which substantially improve the living conditions of the animals in terms of rearing and feeding, and overall. One of these factors is animal density for dairy cattle, which, in addition to fundamentally determining the animals' potential living space and living conditions, is also a matter of economy. Accordingly, the implementation of a lower livestock density entails a significant loss of income, which should be compensated for as lost income in the event of a commitment to that effect. The technological system in which animals ultimately live their lives is very crucial for ensuring animal welfare, so it is very important that the technology includes elements that increase animal welfare and a sense of comfort. (prevention, prediction of species-specific animal health problems, obligation to carry out preventive interventions, respect of milking technology and obligation to ensure natural conditions, including the possibility of grazing). Another key element of rearing conditions is the provision of animal feed, in particular the supply of minerals, which helps to prevent the development of disease shortages and thus significantly improve animal welfare. A number of technological, feed, animal health and behavioural problems can be detected and addressed in a timely manner by requiring greater care supervision, thus directly serving animal welfare. It is therefore appropriate to support livestock farmers who undertake to comply with strict animal welfare obligations.

Reducing the use of chemicals and preventing the development of antimicrobial resistance is a priority and it is therefore necessary to include new commitments leading to a reduction in the use of antimicrobials.

Animal welfare of dairy cattle

Principles governing the establishment of selection criteria, which may be partially applicable (selection criteria):

- Farmer's skills
- Disease control related activities.
- Participation in cooperation with public recognition
- The applicant has an animal welfare manager during the commitment period
- Participation in the work of the Test Plant Information Network (Test Plant System)

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible Beneficiaries:

Farmers meeting eligibility criteria:

Natural persons

Enterprises with legal personality (business companies+cooperatives (in particular social cooperatives))

Non-profit organisations with legal personality (Church legal persons, foundations, non-profit companies)

Eligibility criteria:

The FELIR (Food Chain Control Information System) of the aid applicant has an identifier and keeps eligible animals in its holding registered in the Farming Information System.

The holdings of the aid applicant fully comply with the animal welfare standards in force.

Compliance with the rules on species marking and registration and on the registration of the holding.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments (commitments):

Animal welfare of dairy cattle:

Mandatory requirements:

- Livestock density obligation – Maximum livestock stock may be kept at the enclosure of 0,24 per square

metre

- Carer's supervision obligation –by checking milk-producing cattle at least twice a day
- Obligation for preventive interventions and milking technology – prevention, prediction of species-specific animal health problems – provision of mortal care and information on the content of the milking code
- Feed obligation – ensure hygiene and regular monitoring of feed and drinking water, and ensure adequate mineral supplies.

Optional standard:

Obligation to provide natural conditions The Animal Welfare Regulation (32/1999) (III. (Decree No 31) of the Minister for Agriculture and Rural Development)

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

List of relevant GAEC and SMR

Government Decree No 87/2012 on animal health rules for the domestic transport of live animals (VIII. Decree No 27/2015 of the Minister for Rural Development
- Decree No 128/2009 on veterinary medicinal products. Ministry of Agriculture and Rural Development Decree (X. 6.)

Link between GAEC, SMR and national standards with the intervention

Animal welfare 32/1999. (III. In addition to the provisions of Decree No 31/1999 of the Minister for Agriculture and Rural Development, the animal welfare requirements for the dairy sector have been

designed in line with changes in consumer demand.

The form of aid established in Hungary during the 2007-2013 and the 2014-2020 budget period has also produced demonstrable results in increasing domestic consumption of domestic milk and milk products. The success of the programme can therefore be measured primarily in the transformation of consumer behaviour.

The table below shows the baseline requirements and activities going beyond the baseline:

Obligation	Legal basis	Mandatory standard	Additional commitment beyond mandatory standards
Livestock density requirement	32/1999. Minister for Agriculture and Rural Development (III.31.)	In the case of individual or group housing: The space for the animals shall be such that they are suitable for the species, breed, age, sex, physiological condition of the animal and the animal has access to the resting, feeding, watering and manure space and can see others. It is based on the need for a 150 kg calf (0.4 LU) of 1.5 m² seats, which is 3.75 m² for 1 LU, i.e. 0.27 LU/m² for the animals.	A maximum of 0.24 AE/m ² is needed in a given enclosure for each age group, i.e. an average maximum of 0.24 AE/m ² , corresponding to 4.17 m ² places.
Carer's supervision obligation	32/1999. Annex I, line 8 of Decree No 31/1999 of 31 March 2009 of the Minister for Agriculture and Rural Development	<u>For calves:</u> The keeper shall check each housed calf kept individually or in groups at least twice a day and at least once a day.	At least one inspection of animals per day
	32/1999. Section 12(1) of Ministry of Agriculture and Rural Development (III.31.)	<u>For heifers and cows:</u> The animals should be checked as necessary and at least once a day.	
	32/1999. Section 11 of Ministry of Agriculture and Rural Development (III.31.)	<u>Effectiveness of supervision:</u> In the case of animals kept in groups, an appropriate number of staff shall be employed for the care and supervision of the	

		animals. The care and supervision of animals shall be entrusted only to persons who have sufficient theoretical and practical knowledge of the species, breed, age group and husbandry technology used to be able to recognise the importance of changes in the behaviour of the animals and whether the animals are healthy, and to judge the significance of changes in technological conditions. The person responsible for the care and supervision of the animals shall be provided with the necessary instructions and guidance and shall be made aware of the provisions governing the keeping of farm animals.	
Obligation to use milking technology and preventive interventions	Annex III, Section IX, Chapter I, point 2(a), (b), (c) of Regulation (EC) No 853/2004	<u>Milking technology:</u> Milking must be carried out hygienically, in particular by ensuring that the teats, teats and surrounding parts are clean prior to the start of milking.	Preparation for and use of good milking operations and preventive interventions (treatment of horns, nails).
	32/1999. Section 3(b) of Decree No 31/1999 of the Minister for Agriculture and Rural Development	<u>Preventive interventions:</u> In keeping the animal, the keeper shall, on the basis of sound scientific evidence and experience, meet the environmental needs of the animal by developing appropriate husbandry technology, taking into account the species, breed, age, development, adaptability, degree of domesticisation, physiological condition	

		and ethological needs of the animal.	
Obligation to provide natural conditions	32/1999. Section 5(1)-(2) of Decree No 31/1999 of the Minister for Agriculture and Rural Development	The freedom of movement appropriate to the breed of the animal should not be restricted in such a way as to cause unnecessary suffering or injury to the animal. If an animal is permanently or regularly tethered, or its movement is restricted by other means, it must also – in order to allow it greater freedom of movement and meet its physiological and behavioural needs in accordance with established experience and scientific knowledge – be provided with sufficient space to lie down, stand up and groom without hindrance.	Ensure the possibility of grazing under the given husbandry conditions.
Feed obligation	32/1999. Section 4(2) of Ministry of Agriculture and Rural Development (III.31.)	The keeper shall ensure that the feed and fluid supplied to the animal do not contain any material which may cause suffering or pain. The animal may be given feed which, according to the current state of scientific knowledge, does not adversely affect its welfare.	An average feeding of excess hay of 1 kg/day/LU compared to previous farming practices.

GOVERNMENT DECREE NO 32/1999 Decree No 31/1999 of 31 March 2009 of the Minister for Agriculture and Rural Development serves to ensure compliance with the following EU legal acts:
Council Directive 98/58/EC of 20 July 1998 concerning the protection of animals kept for farming purposes,
Council Directive 99/74/EC of 19 July 1999 laying down minimum standards for the protection of laying hens,
Council Directive 2007/43/EC of 28 June 2007 laying down minimum rules for the protection of chickens kept for meat production,
Council Directive 2008/119/EC of 18 December 2008 laying down minimum standards for the protection of calves,
Council Directive 2008/120/EC of 18 December 2008 laying down minimum standards for the protection of pigs.

Carer's supervision obligation		8
Obligation for preventive interventions and milking technology obligation		11
Feed obligation	21	
Optional standard:		
Obligation to provide natural conditions	85	
The maximum rate of reimbursement of transaction costs shall be HUF 3 per unit cost per year (lump sum).		

Calculation method

Background calculation of animal welfare interventions in the dairy cattle sector:

Additional explanation

The output is derived from the livestock unit values in the background document.RD30_G13_AWC_70 – Animal welfare premiums in the cattle sector are paid exclusively in livestock units. When checking the animal density standard, the square metre mentioned in the description only counts whether it has actually been achieved that an animal has been given more space than the minimum space required by the legislation. The commitment is not linked to land.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

- ☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

What are the models of the commitment(s) in the intervention?

- ☒ result based (with possibility to pick and choose)
☒ management based (with possibility to pick and choose)
☒ hybrid (management and result based)

Please explain the obligations/possibilities for beneficiaries in relation to the commitments set out in the intervention

Commitments:

Animal welfare of dairy cattle:

Mandatory requirements:

- Animal density obligation – Maximum 0.24 AE per square metre of enclosure
- Obligation to supervise carers –inspection of dairy cattle at least twice a day
- Obligation to carry out preventive interventions and milking technology – preventing, predicting species-specific animal health problems – ensuring boot care and
- By raising awareness of the content of the milking rules
- Feed obligation – ensuring hygiene conditions for feed and drinking water and regular monitoring, ensuring adequate mineral supply.

Optional specification:

- Obligation to provide natural conditions in the Animal Welfare Regulation (32/1999. (III. (31) (Decree No 31) of the Minister for Agriculture and Rural Development) providing for the possibility of grazing in the given livestock conditions

What is the duration of contracts?

5 years commitment

10 WTO compliance

Green Box

Paragraph 12 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 12 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(3)(b) - 70 - Payments under Article 70	50.00%	20.00%	80.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD30_O18_U01_LU - Animal welfare aid in the cattle sector – unit amount of dairy cattle for all pledges for cows	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.13; R.44	No
RD30_O18_U02_LU - Animal welfare aid in the cattle sector – Unit amount of dairy cattle for cows without an optional standard	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.13; R.44	No
RD30_O18_U03_LU - Animal welfare aid in the cattle sector – Unit amount of dairy cattle for all pledges – heifers and calves	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.13; R.44	No
RD30_O18_U04_LU - Animal welfare aid in the cattle sector – Unit amount of dairy cattle without the optional requirement – heifers, calves	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.13; R.44	No

Explanation and justification related to the value of the unit amount

RD30_O18_U01_LU - Animal welfare aid in the cattle sector – unit amount of dairy cattle for all pledges for cows

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD30_O18_U02_LU - Animal welfare aid in the cattle sector – Unit amount of dairy cattle for cows without an optional standard

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD30_O18_U03_LU - Animal welfare aid in the cattle sector – Unit amount of dairy cattle for all pledges – heifers and calves

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD30_O18_U04_LU - Animal welfare aid in the cattle sector – Unit amount of dairy cattle without the optional requirement – heifers, calves

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

Description of the Territorial Scope

Hungary

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO4 Contribute to climate change mitigation and adaptation, including by reducing greenhouse gas emission and enhancing carbon sequestration, as well as promote sustainable energy

SO9 Improve the response of Union agriculture to societal demands on food and health, including high quality, safe, and nutritious food produced in a sustainable way, the reduction of food waste, as well as improving animal welfare and combatting antimicrobial resistances

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
4.1.2	Reduction of GHG and ammonia emissions through technological development of livestock farming	2	Yes
9.1.1	Meeting animal welfare requirements and meeting the natural needs of farm animals	1	Yes
9.1.2	Improving general hygiene and biosecurity conditions, increasing food safety	1	Yes
9.1.3	Prevention of animal health problems, development/development of forecasting systems	1	Partially

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.13 Share of livestock units (LU) under supported commitments to reduce emissions of greenhouse gases and/or ammonia, including manure management

R.44 Share of livestock units (LU) covered by supported actions to improve animal welfare

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

The purpose of the intervention is to: Beef cattle in Hungary are almost entirely pasture-based and

extensive (extensive). During the intervention, we also aim to ensure that all female bovine animals over 7 months of age listed in a public register as meat breeders, other meat breeders or dual-purpose breeders (hereinafter: cattle) are eligible to participate in the measure.

The preventive health measures, treatments and needs covered will improve the overall reproductive, health, hygiene and condition of beef cattle herds, while reducing the specific environmental burden of livestock (less pharmaceutical use, more efficient production), which is in line with the objectives of the EU Green Deal, the Methane Strategy and the Farm to Fork Strategy.

Based on the feedback received from livestock keepers and an analysis of good practices, it can be concluded that substantial improvements in the welfare of domestic cattle herds can be achieved through accurate documentation of living space, caregivers' supervision and interventions, maintaining good health and hygiene status, extending the grazing period and providing mineral supplementation.

In addition to improving the housing, feeding and health conditions of animals, these additional commitments will improve the biodiversity of grasslands and increase their carbon sequestration capacity, leading to a reduction in GHG emissions.

The additional animal welfare commitments of beef producers go beyond the provisions of Government Decree No 32/1999 on animal protection rules for farm animals (III). In line with the requirements of Decree No 31/2000 of the Minister for Agriculture and Rural Development and in line with changing consumer needs.

Principles governing the establishment of selection criteria, which may be partially applicable (selection criteria):

- Farmer's skills
- Activities related to disease control.
- Participation in state-recognised cooperation
- The applicant has an animal welfare officer during the commitment period
- Complexity
- Participation in the work of the Test Plant Information Network (Test Plant System)

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible Beneficiaries:

Farmers meeting eligibility criteria:

Natural persons

Enterprises with legal personality (economic associations+cooperatives (particularly social cooperatives))

Non-profit organisations with legal personality (ecclesiastical legal persons, foundations, non-profit companies)

Eligibility criteria:

The applicant has the identification FELIR (Food Chain Surveillance Information System) and keeps an eligible animal in the holding registered in the Farm Information System.

The holdings applying for aid comply fully with the animal welfare standards in force.

Compliance with species marking and registration rules and registration rules for the holding.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments:

Animal welfare of cattle for meat:

Mandatory requirements:

1. Ensuring more caregivers

In addition to the requirements of Decree No 32/1999 of 31 March 1999 of the Minister for Agriculture and Rural Development, compliance with the obligation to carry out checks on the meat cattle applying for aid must be carried out at least twice a day and the farm's working day shall be kept on a daily basis.

2. Control and professional control of infestation with internal parasite (endoparazita)

Infection with Endoparazita (internal parasites) shall be monitored at least 2 times a year, before and after spreading to pasture. Investigator

faeces samples shall be collected and sent to the laboratory according to a procedure specified by the laboratory. Beef cattle should be treated with a product and dose according to the instructions of the treating veterinarian on the basis of the results of the faeces test.

3. External parasites and flies, mosquitoes and hemsps

Veterinary treatment (in injection form) against external parasites (ectoparasites) must be carried out twice a year by animal keepers (in the form of pour on) four times a year, so that a total of 6 interventions per year are required in order to effectively control external parasites, flies, mosquitoes and sheaths.

Optional specifications:

1. Use mineral supplementation

During feeding, the applicant for aid shall be obliged to ensure continuous access to a targeted mineral supplement based on the results of laboratory tests, going beyond the requirements of Section 3(c) of Decree No 32/1999 of 31 March 1999 of the Minister for Agriculture and Rural Development.

2. Supply care

In addition to the requirements of Section 3(d) of Decree No 32/1999 of 31 March 1999 of the Minister for Agriculture and Rural Development, the applicant for aid must provide each animal involved in the aid scheme each year, in addition to the cartilage built into the technology, in order to prevent foot-end diseases in beef cattle.

3. Provision of additional bedding

In addition to the provisions of Decree No 32/1999 (III.31) of the Minister for Agriculture and Rural Development, the applicant for aid is obliged to provide additional bedding, outside the grazing period, which must be at least 5 kg of litter/day/LU.

4. Providing more living spaces and pastures

In addition to the provisions of Section 5(4) of Decree No 32/1999 of 31 March 1999 of the Minister for Agriculture and Rural Development, the applicant is obliged to provide a number of rest areas, outside the grazing period which must reach a minimum of 8 m²/LU in free-rangerearing. Cattle covered by the measure must graze for at least 150 days a year

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

☒ IACS

☐ Non-IACS

IACS section

Type of payment

☒ unit cost based on additional costs and income foregone

☒ transaction cost included

☐ one off payment

☐ lump sum

Range of support at beneficiary level

Commitments	The maximum amount of aid is HUF equivalent to EUR/LU/year
Obligation of carer supervision	28,1
Control and professional control of internal parasite (endoparasita) infection	39,8
Control of external parasites (ectoparasites) and fly, mosquitoes, rabbits	54,6
Use of mineral supplement	50,7
Provision of baby care	5,5
Provision of excess littering	39,3
Providing more living spaces and pastures	40,5

Calculation method

Background calculations drawn up by an independent expert body confirm the level of compensation for the costs incurred. In the case of any excess, unit costs were determined using a fair, equitable and verifiable method. The fees for veterinary services were set by the expert organisation according to the latest recommendation of the Chamber of Veterinary Surgeons (2023). The relevant HCSO database was used to calculate the additional fee for carer supervision and the cost of more litter straw. As there is no central nationwide database on the costs of the additional costs (administration, capture, handling, inspection, other additional work) carried out by livestock keepers, the numbers of the survey carried out by the Association of Hungarian Livestock Breeders (which can be regarded as an expert opinion) were used to calculate these costs, as well as the costs of products (e.g. anti-parasites) and mineral supplements. We note that the cost of domestic beef is heterogeneous and the values of each cost element are very dispersed. There are relatively few cattle-only farms and cattle farms are very diverse in size (one with 10-20 cows and hundreds or thousands of cows).

Additional explanation

The output is derived from the livestock unit values in the background document. For the intervention "Animal welfare premiums in the beef cattle sector", the payment is made exclusively in livestock units. When checking the animal density standard, the square metre mentioned in the description only counts whether it has actually been achieved that an animal has been given more space than the minimum space required by the legislation. The commitment is not linked to land.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

What are the models of the commitment(s) in the intervention?

- ☒ result based (with possibility to pick and choose)
- ☒ management based (with possibility to pick and choose)
- ☒ hybrid (management and result based)

Please explain the obligations/possibilities for beneficiaries in relation to the commitments set out in the intervention

Commitments:

Animal welfare of cattle for meat production:

1. Ensuring more caretaker supervision

In order to comply with the obligation to supervise carers, in addition to the provisions of Decree No 32/1999 of 31 March 1999 of the Minister for Agriculture and Rural Development, the applicant for aid must check the meat cattle at least twice a day and keep the farm's working logbook on a daily basis.

In the domestic practice of beef cattle, one animal receives less and less caretaker supervision. This is mainly because the labour force is costly. There are no more surveillance than outdoor animals once a day, except in cases where there are birth difficulties or where veterinary intervention or treatment is required.

In addition to domestic practice, the farmer undertakes to inspect his animals at least twice a day and to keep a holding daily. The legislation in force (Section 4(3) of Act XXVIII of 1998) requires at least one daily inspection.

The farm worksheet shall contain, in the enclosure (including on pasture), the acts relating to the care of the cattle, the date on which the acts were carried out and the name of the person who carried out the act. The farmer is required to check the cattle at least twice a day and keep the farm's working day on a daily basis.

2. Control and proper control of internal parasite (endoparasitic) infection

In the case of infestation with parasites, the animals are unable to produce according to their physiological potential, the reproductive and calf-raising characteristics may deteriorate, calf mortality may increase, the conditions of the animals are inadequate, and the quality of the animals intended for sale is below the desired level.

Cattle keepers are aware of the problem of infestation, but less so. Parasite control is often done only on a case-by-case basis and is not preceded by laboratory testing to detect infection, and therefore inappropriate treatment is often chosen.

Faecal testing to assess the infestation of the herd is necessary to select a substance and treatment with an appropriate spectrum. Single treatment is not effective in the long term, even when the appropriate product has been used. In order to achieve lasting results, we need to recognise the persistence of the medicine they use and to carry out checks and faeces testing at appropriate intervals on the condition of the herd.

The commitment goes beyond current practice because today cattle keepers do not systematically and systematically control internal parasites.

3. Control of external parasites (ectoparasites), flies, mosquitoes, mushrooms

Control of external parasites (ectoparasites), flies, mosquitoes and mushrooms is carried out in order to prevent the spread of various diseases and pathogens and to reduce the disturbance of the good.

In addition to the damage to animal health, there is little mention of damage to external parasites, flies and mosquitoes, resulting in a significant reduction in comfort for animals, reducing feed and water intake and forcing the good to move continuously.

Primarily by mechanical and chemical control, we reduce damage to external parasites, flies and mosquitoes. Mechanical control means the elimination and reduction of breeding sites. Chemical control can achieve a greater effect.

Veterinary treatment (injected) against external parasites (ectoparasites) must take place twice a year and treatments (pour on) by livestock farmers against flies, mosquitoes and ticks must take place four times a year, with a total of 6 interventions per year to ensure effective control of external parasites, flies, mosquitoes and ticks.

4. Use of mineral supplementation

In the course of animal nutrition, the applicant for aid must ensure continuous access to the supplement of mineral substances, based on the results of laboratory tests, which goes beyond the requirements of Section 3(c) of Decree No 32/1999 of 31 March 1999 of the Minister for Agriculture and Rural Development.

The addition of mineral substances is an inevitable factor in current state-of-the-art beef-rearing practices, which is true for both calves and fattening farms, but in practice it is under-used mainly because of its costs.

Our animals lack mineral content because our soils do not contain sufficient quantities of micronutrients (selective, manganese, copper) or because the micro- and macro-nutrients in the soil are not incorporated in the fodder crops in sufficient quantities (this occurs during winter feed). The required amount of macro- and micronutrients and their relative ratio are important for the proper development of the good and thus for economic production. The production areas in Hungary have a diverse soil structure and soil composition, making them varied and, more importantly, their content of micronutrients and macronutrients varies.

The basis for the replacement of minerals is to be aware of the mineral content of our soils and feedstuffs. This needs to be matched by the needs of the animals, so we can determine what we need to replace and how much we need to do.

5. Provision of foot care

In addition to the requirements of Section 3(d) of Decree No 32/1999 of the Minister for Agriculture and Rural Development of 31 March 1999 of the Minister for Agriculture and Rural Development, in order to prevent foot-end diseases of the meat cattle, the applicant for aid must provide, on an annual basis, an additional foot care and rounding for all animals included in the aid scheme.

6. Extra bedding

In addition to the provisions of Decree No 32/1999 (III.31) of the Minister for Agriculture and Rural Development, the applicant is obliged to provide extra bedding outside the grazing period, which must be at a level of 5 kg litter/day/LU.

As an additional commitment, the farmer provides the animals kept outdoors (in particular those rearing the calves and suckling calves) with the appropriate comfort zone and, in the case of housed housing, a suitable dry rest area by maintaining the rest humps created by the provision of sufficient bedding, in accordance with the provisions of the legislation. Substantiate the presence of the necessary bedding by means of a farming logbook or invoice proving that the bedding has been produced on its own territory. Have up-to-date bedding records showing the use of bedding.

7. Providing more living spaces and pastures

In addition to the provisions of Section 5(4) of Decree No 32/1999 of 31 March 1999 of the Minister for Agriculture and Rural Development, the applicant is obliged to provide several rest areas outside the grazing period, the extent of which must be at least 8 m²/LU in free-range farming.

The farmer shall be obliged to use the pasture taken into account for the purposes of fulfilling the obligation in accordance with Government Decree No 50/2008. (IV. Keep in the condition laid down in Decree No 24 of the Minister for Agriculture and Rural Development. Cattle must graze for at least 150 days per year

The farmer shall keep a record of grazing by enclosure as specified in the farming logbook.

What is the duration of contracts?

5 years of commitment

10 WTO compliance

Green Box

Paragraph 12 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The aid scheme fulfils the conditions of the WTO green box as it fully follows the conditions referred to in point 12 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(3)(b) - 73 - Support for non-productive investments referred to in Article 73	50.00%	20.00%	80.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?

RD32_G15_AWC_70 - Animal welfare aid in the poultry sector

Intervention Code (MS)	RD32_G15_AWC_70
Intervention Name	Animal welfare aid in the poultry sector
Type of Intervention	ENVCLIM(70) - Environmental, climate-related and other management commitments
Common Output Indicator	O.18. Number of livestock units (LU) benefitting from support for animal welfare, health or increased biosecurity measures
Contributing to ringfencing requirement for/on	Generational Renewal: No Environment: Yes ES rebate system: Yes LEADER: No

1 Territorial scope and, if relevant, regional dimension

Territorial scope: **National**

Code	Description
HU	Magyarország

Description of the Territorial Scope

The area under which the intervention is implemented is Hungary.

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO9 Improve the response of Union agriculture to societal demands on food and health, including high quality, safe, and nutritious food produced in a sustainable way, the reduction of food waste, as well as improving animal welfare and combatting antimicrobial resistances

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
9.1.1	Meeting animal welfare requirements and meeting the natural needs of farm animals	1	Yes
9.1.2	Improving general hygiene and biosecurity conditions, increasing food safety	1	Yes
9.1.3	Prevention of animal health problems, development/development of forecasting systems	1	Partially

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.44 Share of livestock units (LU) covered by supported actions to improve animal welfare

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

The purpose of the intervention is to:

The intervention aims to improve animal husbandry by providing support for the implementation of strict animal welfare, hygiene and feeding conditions to the benefit of the animals.

The general welfare and living conditions of poultry populations are determined by husbandry technology and animal nutrition, and it is therefore appropriate to apply animal welfare obligations and commitments in these two areas that substantially improve the rearing and feeding conditions of the animals. One of

these factors is animal density, which, in addition to fundamentally determining the potential living space and living conditions of animals, is also a matter of economy in all sectors, in particular in the poultry sector. The BAT guidance document (Guide to determine BAT in the authorisation of intensive rearing activities for poultry) provides an accurate description of the typical production structure, the planting density, for several poultry species and production directions. However, it should be noted that both technological developments and the production capabilities of individual animal species are changing and evolving. Taking this development into account, the proposed obligations regarding planting density have been developed. The Hungarian poultry sector is one of the most coloured species and uses in the EU area. As this is not the case in other EU countries, European legislation does not cover all species and uses and age groups (currently only the broiler Directive for slaughter chicks and table egg production flocks (egg-producing hens) have such rules).

The implementation of a lower livestock density entails a significant loss of income, which must be compensated for as lost income in the event of a commitment to that effect. Another determinant element of housing conditions is mechanical injuries due to rearing technology, which also deserve attention and can significantly improve animal welfare by providing appropriate tools and housing conditions. The mycotoxin content of feed and the quality of water are general problems in feed, which vary widely in practice. Therefore, reducing the mycotoxin content in feed and ensuring drinking-quality water can significantly improve the living conditions of the animals in terms of improving feeding conditions.

Reducing the use of chemicals and preventing the development of antimicrobial resistance is also a priority in the poultry sector, and it is therefore necessary to include new commitments leading to a reduction in the use of antimicrobials.

Principles governing the establishment of selection criteria, which may be partially applicable (selection criteria):

- Farmer's skills
- Disease control related activities.
- Participation in cooperation with public recognition.
- The applicant has an animal welfare officer during the commitment period.
- Participation in the work of the Test Plants Information Network (Test Plant System)

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible Beneficiaries:

Farmers meeting eligibility criteria:

Natural persons

Enterprises with legal personality (business companies+cooperatives (in particular social cooperatives))

Non-profit organisations with legal personality (Church legal persons, foundations, non-profit companies)

Eligibility criteria:

The FELIR (Food Chain Control Information System) of the aid applicant has an identifier and keeps eligible animals in its holding registered in the Farming Information System.

The holdings of the aid applicant fully comply with the animal welfare standards in force.

Compliance with the rules on species marking and registration and on the registration of the holding.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments (commitments):

Target area: Livestock density requirement: In order to comply with the obligation, the beneficiary must provide 10 % more space than required for the stocks covered by the aid, taking into account the technological specificities used.

(B) target area: Prevention of mechanical injury: It is necessary to ensure that injuries are avoided by

providing species-specific requirements that go beyond the legal requirements (e.g.: provision of more feeding and drinking facilities, longer perch, temperature, humidity, light specifications, etc.).

(C) target area: Supply of drinking water for animal feed (e.g.: Measures to improve water quality and the use of various water purification facilities)

(D) target area: Feeding poultry flocks with low toxin compound feed – for breeding animals: The beneficiary shall provide laying feed with a maximum deoxynivalenol content of 2.5 mg/kg for breeding poultry species. Feed with low mycotoxin content contributes to improving the overall welfare of animals and even to improving the quantity of eggs and the quality and health of the offspring of animals and to reducing mortality in the breeding population.

(E) target area: Feeding poultry flocks with low toxin compound feed – for commodity flocks: The beneficiary must provide laying feed containing a maximum deoxynivalenol content of 2.5 mg/kg for commodity poultry species. Feed with low mycotoxin content contributes to improving the overall welfare of animals and even to improving the quality and quantity of eggs.

Apply non-cage farming methods for all target areas and farming modes by the end of year 4.

Eligible costs for the intervention:

- loss of turnover due to declining livestock;
- the cost of additional labour;
- the cost of additional work and administration, materials needed for preventive interventions;
- preventive intervention obligation, extra asset and cost of material and labour
- cost of additional material, equipment and labour to prevent, predict and predict species-specific animal health problems
- extra cost of carrying out the necessary tests

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

List of relevant GAEC and SMR

In cases where there is no EU standard, business practices, technology descriptions may form baseline values

(B) Mechanical injury prevention area

Baseline requirements:

- Council DIRECTIVE 1999/74/EC of 19 July 1999 laying down minimum standards for the protection of laying hens
- Council DIRECTIVE 2007/43/EC of 28 June 2007 laying down minimum rules for the protection of chickens kept for meat production

Details of how the standard goes beyond EU mandatory standards:

	EU regulation requirement	Requirement expected in the context of this intervention
Hens – juvenile rearing	not defined	Per pullet
		·a minimum feeding surface of 4.1 cm shall be provided, and
		·A maximum of 13 young people may be installed on a drinking valve to ensure the appropriate growth of the animal.
Hens – juvenile rearing	not defined	Appropriate age-related light, temperature and humidity are measured in mortality and balance. The conditions are ensured at less than 3 % mortality and uniformity above 80 % or at CV % (live weight balance) of less than 10 %.
Hens – egg production period	—	alternative, free and organic feeding for 1 hens:
	10 cm straight feeder, or per animal	·direct: 10.5 cm
	at least 4 cm of circular feeding per hen	·circular shape: 4.5 cm

		alternative, free and organic drinking watering
	continuous: 2.5 cm/h	·continuous: 3 cm/h
	circular shape: 1 cm/h	·circular shape: 1.5 cm/h
	valve: 10 hens/valves or cups	·valve: 9 hens/valves or cups
	watering point: 2 cup (v) valve contact/hens	·tight point: hens/2.5 cups v. availability of valve
		alternative, free and organic farming
	perch not less than 15 cm/h	·perch rod for 1 hens 15.5 cm
		enriched cage
	perch: 15 cm/h	·perch: 15.5 cm/h
	feeding trucks: 12 cm	·feeding: 12.5 cm/h
	valve: at least 2 cups v. valves per hens	·valve: hen/2 cup v. valve
	either continuous drinking troughs providing 2.5 cm per hen or circular drinking troughs providing 1 cm per hen.	·tight point: contact details
	In addition, if a valve or damp is used, there shall be at least one valve or damp for each 10 hens.	
	not defined	At the outside temperature above 30 °C in the shadow, the internal temperature does not exceed the external temperature by more than 3 °C.
	not defined	At the outside temperature below 10 °C, the average relative humidity measured in the house over 48 hours shall not exceed 70 %.
	Illumination should follow a daily rhythm of 24 hours and, according to the instructions, include an undisturbed dark period of approximately one third of the day to allow laying hens to rest in order to avoid ocular disorders and loss of resistance. Provision should also be made for an appropriate half-blind period during which hens can rest smoothly and calmly without being damaged.	Shed illumination: an uninterrupted rest period of at least 8 hours without artificial lighting shall be provided. A luminous intensity of 5-20 Lux shall be provided according to the daily rhythm of

		24 hours
Juvenile chicken and pearls	No 2007/43/EC Feed must be available either continuously or at doses and prohibited from chickens more than 12 hours before the expected slaughter time	Feeding tray
		·65 poultry/feeding
		Roof trough
		·10 cm/poultry
	2007/43/EC Drinkers must be positioned and kept in such a way as to minimise drainage	Waterer
		·harang 100 poultry/tighters
		Watering valve/small dish
		·12 poultry/tighters
		Drinking trough
		·1 cm/poultry
	not defined	At the outside temperature above 30 °C in the shadow, the internal temperature does not exceed the outside temperature by more than 3 °C
	not defined	At ambient temperatures below 10 °C, the average relative humidity measured in the house over 48 hours shall not exceed 70 %.
		brightness/duration:
For turkeys	not defined	Türkiye pre-raising
		·In 95 birds, 1 breaming or 3 drips are required, and
		·a maximum of 65 birds per roof.
		In order to achieve the objectives set out in this item, additional heating and extra ventilation are also necessary.
	not defined	Türkiye after rearing
		·55 turkey/feeding
	not defined	Türkiye after rearing Teacher
		·harang 80 turkeys/tighters
	not defined	Türkiye after rearing
		At the outside temperature above 30 °C in the shadow,

		the internal temperature does not exceed the external temperature by more than 3 °C.
	not defined	Türkiye after rearing At ambient temperatures below 10 °C, the average relative humidity measured in the house over 48 hours shall not exceed 70 %.
	not defined	Türkiye after rearing light: Maintaining a 4000 K light spectrum. Birds should have a dark period of 8 hours per day
For Pecsény, juvenile ducks:	not defined	Roof length
		0.8 cm/kg to day 1-18
		· 0.4 cm/kg from 19 days
	not defined	Waterer
		trough (transit)
		Until 1-3 weeks of age 0.5 cm/poultry
		· 3-4 weeks 1 cm/poultry
		4. · 7 cm/poultry
		valve drinker
		· 20 poultry/valves for 1 to 5 days
		· 15 poultry/valves for 6-18 days
		· 10 poultry/valves from 19 days

		shall be provided with a luminous intensity of 20 lux.

In cases where there is no EU standard, business practices, technology descriptions may form baseline values

(C) provision of drinking water quality for feed

Baseline requirements:

· Council Directive 98/58/EC concerning the protection of animals kept for farming purposes
· 32/1999. Ministry of Agriculture and Rural Development Decree (III.31.) This Decree is intended to comply with the following EU legal acts:

(a) Council Directive 98/58/EC of 20 July 1998 concerning the protection of animals kept for farming purposes,

(b) Council Directive 99/74/EC of 19 July 1999 laying down minimum standards for the protection of laying hens,

(C) Council Directive 2007/43/EC of 28 June 2007 laying down minimum rules for the protection of chickens kept for meat production,

(D) Council Directive 2008/119/EC of 18 December 2008 laying down minimum standards for the protection of calves,

(e) Council Directive 2008/120/EC of 18 December 2008 laying down minimum standards for the protection of pigs.

Details of how the standard goes beyond EU mandatory standards:

Council Directive 98/58/EC 14. Feed, water and other materials: Animals must be fed a wholesome diet which is appropriate to their age and species and which is fed to them in sufficient quantity to maintain them in good health and satisfy their nutritional needs. No animal shall be provided with food or liquid in a manner, nor shall such food or liquid contain any substance, which may cause unnecessary suffering or injury.

32/1999. Section 4(2) of Decree No 31/2000 of the Minister for Agriculture and Rural Development, the animal keeper shall ensure, within the scope of his own activity and responsibility, that the feed and liquid supplied to the animal do not contain any material likely to cause suffering or pain. With the exception of substances administered for therapeutic, prophylactic or zootechnical purposes, animals shall only be fed which, according to the current state of scientific knowledge, does not adversely affect its welfare.

(D) the feeding of poultry flocks with compound feed with low toxin content – in the case of breeding animals

Baseline requirements:

· Council Directive 98/58/EC 14. Feed, water and other materials: Animals must be fed a wholesome diet which is appropriate to their age and species and which is fed to them in sufficient quantity to maintain them in good health and satisfy their nutritional needs. No animal shall be provided with food or liquid in a manner, nor shall such food or liquid contain any substance, which may cause unnecessary suffering or injury.

· Commission Recommendation 2006/576/EC on the presence of deoxynivalenol, zearalenone, ochratoxin A, T-2, HT-2 and fumonisins in products intended for animal feeding

32/1999. Ministry of Agriculture and Rural Development Decree (III.31.) This Decree is intended to comply with the following EU legal acts:

- (a) Council Directive 98/58/EC of 20 July 1998 concerning the protection of animals kept for farming purposes,
- (b) Council Directive 99/74/EC of 19 July 1999 laying down minimum standards for the protection of laying hens,
- (C) Council Directive 2007/43/EC of 28 June 2007 laying down minimum rules for the protection of chickens kept for meat production,
- (D) Council Directive 2008/119/EC of 18 December 2008 laying down minimum standards for the protection of calves,
- (e) Council Directive 2008/120/EC of 18 December 2008 laying down minimum standards for the protection of pigs.

Details of how the standard goes beyond EU mandatory standards:

The maximum target value of 2.5 mg/kg of deoxynivalenol set out in Commission Recommendation 2006/576/EC for compound feedingstuffs represents a significant improvement from the target value of not more than 5 mg/kg for compound feedingstuffs. In the case of the scheme, a specific laboratory test must prove and prove that the title is fulfilled.

Section 4(2) of Decree No 32/1999 of 31 March 1999 of the Minister for Agriculture and Rural Development, the animal keeper shall ensure that the feed and liquid supplied to the animal do not contain any material likely to cause suffering or pain. With the exception of substances administered for therapeutic, prophylactic or zootechnical purposes, animals shall only be fed which, according to the current state of scientific knowledge, does not adversely affect its welfare.

(E) feed of poultry flocks with low-toxin compound feed – in the case of commodity flocks

Baseline requirements:

Details of how the standard goes beyond EU mandatory standards:

The maximum target value of 2.5 mg/kg of deoxynivalenol set out in Commission Recommendation 2006/576/EC for compound feedingstuffs represents a significant improvement from the target value of not more than 5 mg/kg for compound feedingstuffs. In the case of the scheme, a specific laboratory test must prove and prove that the title is fulfilled.

Section 4(2) of Decree No 32/1999 of 31 March 1999 of the Minister for Agriculture and Rural Development, the animal keeper shall ensure that the feed and liquid supplied to the animal do not contain any material likely to cause suffering or pain. With the exception of substances administered for therapeutic, prophylactic or zootechnical purposes, animals shall only be fed which, according to the current state of scientific knowledge, does not adversely affect its welfare.

Calculation method

Additional animal welfare contribution in the poultry sectorThe poultry sector at EU level as an intensive livestock sector – has animal welfare legislation in place for a number of product paths that has already gone beyond other parts of the world. Examples include broiler chickens and table egg production, where EU standards are today the highest in terms of animal welfare. It should be noted that meeting these

expectations will entail additional costs and typically reduce efficiency and increase costs. One of the cardinal points in the rearing of farm animals is kg of live weight or a piece of live weight held on a surface of 1 m². In most cases, this parameter is a measure of animal welfare, although it is a much more complex concept. At the same time, we understand that this is undoubtedly a well-measured and defined number that can be clearly identified and verified by the monitoring and documentation systems used in the poultry sector.

Additional explanation

Not relevant

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

What are the models of the commitment(s) in the intervention?

- ☒ result based (with possibility to pick and choose)
☒ management based (with possibility to pick and choose)
☒ hybrid (management and result based)

Please explain the obligations/possibilities for beneficiaries in relation to the commitments set out in the intervention

Commitments:

(A) target area: In order to comply with the obligation of livestock density, the beneficiary must, taking into account the technological characteristics used, provide for more than 10 % of the number of herds covered by the aid.

(B) target area: Preventing mechanical damage must be ensured by providing species-specific requirements that go beyond the legal requirements (e.g. more feeding and drinking areas, longer perch, temperature, humidity, light specifications, etc.).

(C) target area: Provision of drinking water for animal nutrition

The beneficiary shall be obliged to comply with the provisions of Government Decree No 41/1997. The use of drinking water – in accordance with national legislation – to feed the poultry herd beyond the requirements laid down in Decree (V. 28.) of the Minister for Agriculture.

(D) target area: Feeding of poultry flocks with compound feed with low toxin content – for breeding animals

The beneficiary shall provide laying feed for breeding poultry species with a maximum content of 2.5 mg/kg of deoxynivalenol.

The beneficiary shall ensure that compound feed with a low mycotoxin content is purchased and fed.

(E) target area: Feeding of poultry flocks with compound feed with low toxin content – for commodity flocks

The beneficiary shall provide laying feed with a maximum content of 2.5 mg/kg of deoxynivalenol to the producing poultry species. The beneficiary shall ensure that compound feed with a low mycotoxin content is purchased and fed.

What is the duration of contracts?

5 years commitment

10 WTO compliance

Green Box

Paragraph 12 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 12 of Annex II.

RD32_O18_U32_LU - Animal welfare aid in the poultry sector — Feed with low toxin compound feed — commodity poultry — hens — unit amount for egg production	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.44	No

Explanation and justification related to the value of the unit amount

RD32_O18_U01_LU - Animal welfare aids in the poultry sector — animal density — broiler and guinea fowls unit costs

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U02_LU - Animal welfare aid in the poultry sector — animal density — Unit amount of turkeys (young)

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U03_LU - Animal welfare aids in the poultry sector — animal density — Unit amount of turkeys (adult)

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U04_LU - Animal welfare aid in the poultry sector — animal density — Unit amount of young geese

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U05_LU - Animal welfare aid in the poultry sector — animal density — Unit amount of young geese

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U06_LU - Animal welfare aid in the poultry sector — animal density — unit amount of roast ducks

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U07_LU - Animal welfare aid in the poultry sector — animal density — Unit amount for young ducks

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U08_LU - Animal welfare aid in the poultry sector — animal density — unit amount for laying hens for food and breeding

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U09_LU - Animal welfare aid in the poultry sector — animal density — unit amount of eggs for consumption and hatching eggs of hens

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U10_LU - Aid in the poultry sector mechanical injury prevention — unit amount for broiler chicken and guinea fowls

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U11_LU - Animal welfare aid in the poultry sector — Prevention of Mechanical Injury — Unit amount for turkeys (pre-rearing)

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U12_LU - Animal welfare - prevention of mechanical injury — unit amount of turkeys (after-rearing)

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U13_LU - Animal welfare aid in the poultry sector — Prevention of Mechanical Injury — Unit amount of young geese

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U14_LU - Animal welfare aid in the poultry sector — Prevention of Mechanical Injury — Unit amount of female geese

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U15_LU - Animal welfare aid in the poultry sector — Mechanical injury prevention — unit amount for roast ducks

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U16_LU - Animal welfare aid in the poultry sector — Prevention of mechanical injury — Unit amount for growing ducks

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U17_LU - Animal welfare aid in the poultry sector — Prevention of Mechanical Injury — Unit amount for laying hens for food and breeding

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U18_LU - Animal welfare aid in the poultry sector — Prevention of Mechanical Injury — Unit amount of production of hens for consumption and hatching eggs

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U19_LU - Animal welfare aid in the poultry sector — supply of drinking water for feed — broiler and guinea fowls

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U20_LU - Animal welfare aid in the poultry sector — provision of drinking water for feed — unit amount of turkeys (rearing juveniles)

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U21_LU - Animal welfare subsidies in the poultry sector — provision of drinking water for feed — unit amount of turkeys (late stage rearing)

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U22_LU - Animal welfare aid in the poultry sector — provision of drinking water for feed — Unit amount of young geese

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U23_LU - Animal welfare aid in the poultry sector — provision of drinking-quality water for feed — Unit amount of dairy geese

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U24_LU - Animal welfare aid in the poultry sector — supply of drinking water for feed — unit amount of roast ducks

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U25_LU - Animal welfare aid in the poultry sector — provision of drinking water for feed — unit amount of rearing juvenil ducks

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U26_LU - Animal welfare aid in the poultry sector — provision of drinking-quality water for feed — Unit amount for laying hens for food and breeding

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U27_LU - Aid in the poultry sector — provision of drinking-quality water for feed — unit amount of laying hens for consumption and hatching eggs

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U28_LU - Animal welfare aid in the poultry sector — Feed with low toxin compound feed — breeding poultry — hens — breeding unit amount

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U29_LU - Animal welfare aid in the poultry sector — Feed with low toxin compound feed — breeding poultry — Unit amount of breeding turkeys

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U30_LU - Animal welfare aid in the poultry sector — Feed with low toxin compound feed — breeding poultry — Unit amount of breeding ducks

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U31_LU - Animal welfare aid in the poultry sector — Feed with low toxin compound feed — breeding goose — Unit amount of livestock

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

RD32_O18_U32_LU - Animal welfare aid in the poultry sector — Feed with low toxin compound feed — commodity poultry — hens — unit amount for egg production

The determination of the unit amount based on the unit costs determined in the background calculation is based on a background calculation by independent experts. The unit amounts are therefore equal to the value of the unit cost. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The amounts in the table compensate beneficiaries for some or all of the additional costs and income foregone resulting from the commitments entered into.

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029

RD33_G16_ANB_70 - Animal welfare aid in the apiculture sector

Intervention Code (MS)	RD33_G16_ANB_70
Intervention Name	Animal welfare aid in the apiculture sector
Type of Intervention	ENVCLIM(70) - Environmental, climate-related and other management commitments
Common Output Indicator	O.18. Number of livestock units (LU) benefitting from support for animal welfare, health or increased biosecurity measures
Contributing to ringfencing requirement for/on	Generational Renewal: No Environment: Yes ES rebate system: Yes LEADER: No

1 Territorial scope and, if relevant, regional dimension

Territorial scope: **National**

Code	Description
HU	Magyarország

Description of the Territorial Scope

The area under which the intervention is implemented is Hungary.

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO6 Contribute to halting and reversing biodiversity loss, enhance ecosystem services and preserve habitats and landscapes

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
6.5.3	Ensuring stability of Pollination systems	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.35 Share of beehives supported by the CAP

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

The purpose of the intervention is to:

The intervention aims to improve the capacity of bee colonies to provide ecosystem services by providing support to ensure hygiene, animal protection conditions and conditions for the welfare of bees. By promoting the health, balanced development and quiet of bee colonies, the bee colonies can be more resistant to diseases and thus enhance the ecosystem service of a healthy bee colonies.

The health of bee colonies is served by the compulsory abandonment of honey by not utilising the nutrients of their own bodies or using artificial food free of vitamins and minerals to rear brood, so that the individuals remain healthier and their lifespan is not reduced. The use of comb replacement and construction frame is also a health-preserving intervention due to the systematic removal of pathogens and varroa mite.

Over the past period, climate change and the deterioration of economic conditions have continued to negatively affect the performance of beekeeping in the sector. Furthermore, in addition to healthy food, sustainability and animal welfare have been highlighted by consumers, but the additional costs of these are difficult to realise in finished products. It is therefore appropriate to support beekeepers who undertake to provide bee colonies with more favourable hygiene, feeding and rearing conditions.

Principles governing the establishment of selection criteria, which may be partially applicable (selection criteria):

- Agricultural attainment,
- A producer group recognised in apiculture is a member of a producer group or a member of a recognised producer organisation,
- Drawing up an animal welfare plan;
- The duration of beekeeping registered in the Farming Information System,
- Periodic application of the building frame as a mechanical varroa mite thinning method,
- Number of bee colonies,
- Certified organically certified beekeeping.
- Participation in the work of the Test Plant Information Network (Test Plant System)

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Farmers fulfilling eligibility criteria:

— Natural persons

Registered beekeepers

Eligibility criteria:

— The applicant is listed in the Farming Information System (TIR) as the keeper of bee colonies.

— The holding(s) of the applicant and the hives fully comply with the animal welfare standards in force.

— The applicant is a member of the valid Hungarian Apiculture Association (OMME)

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments (commitments):

- In order to comply with the obligation to abandon honey, the aid applicant must give up 4 kg of honey once a year in the subsidised apiary, per bee colony and at the time of honey collection (drying). The legislation on beekeeping does not impose an obligation to abandon it and therefore compliance can be considered as an additional commitment. In addition to the rest of the bees, compliance with the obligation to abandon honey can be verified by the existence of a stock of food.

Eligible costs for the intervention:

- loss of income due to honey abandonment
- the abandonment of honey frames in the nest reduces the extent of brooding, thus negatively affecting population development, causing a loss of production at the next brood peak. The maintenance and development of bee colonies requires the abandonment of frames containing at least 4 kg of honey. The beekeeper has the possibility to decide, taking into account the environment of the holding, the period of time that best justifies the abandonment of the excess honey from bee colonies in a given year.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

List of relevant GAEC and SMR

Code	Description

List of relevant mandatory national standards

- 119/2007. Ministry of Agriculture and Rural Development (X. 18.) on the national registration system for enclosures, holdings and certain data relating thereto;
- Regulation (EC) No 853/2004 of the European Parliament and of the Council of 29 April 2004 laying down specific hygiene rules for food of animal origin;
- 70/2003. (VI. Decree No 27/1999 of the Minister for Agriculture and Rural Development on the protection of bee populations and the prevention and control of certain honeybee diseases;
- 15/1969. (XI. 6)MÉM of the Minister for Agriculture and Rural Development on beekeeping;
- 41/1997. Decree No 28 of 28 May 2007 of the Minister for Agriculture on the publication of the Animal Health Code.
- Act LVI of 2019 on statutory provisions necessary to regulate animal production
- 81/2009. (VII. Decree No 10/1999 of the Minister for Agriculture and Rural Development on the rules for carrying out checks falling within the scope of cross-compliance and the application of legal consequences.

Link between GAEC, SMR and national standards with the intervention

Detailed justification of commitments (how they go beyond EU mandatory standards):

The Hungarian and EU legislation on beekeeping does not impose any obligation to abandon honey, so compliance can be regarded as an additional commitment and, from the animal welfare point of view, the introduction of an obligation to abandon honey in domestic apiculture practices is justified in any event for the reasons set out above.

Range of support at beneficiary level

Undertaking	Maximum rate of support (HUF equivalent in euro/bee family/year)
Obligation to withstand honey	30

Calculation method

Background calculations prepared by an independent expert body confirm the level of compensation of the costs incurred. Loss of revenue resulting from a reduction in the quantity of honey that can be sold. The loss of income was calculated on the basis of the average market price of the honey producers.

Additional explanation

Not relevant.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

What are the models of the commitment(s) in the intervention?

- ☒ result based (with possibility to pick and choose)
- ☒ management based (with possibility to pick and choose)
- ☒ hybrid (management and result based)

Please explain the obligations/possibilities for beneficiaries in relation to the commitments set out in the intervention

Commitments:

- In order to comply with the obligation to leave the honey, the applicant for aid must leave 4 kg of honey per bee colony in the supported beekeeping once a year at the time of harvesting (grapping). The legislation on beekeeping does not provide for an obligation to abandon it and can therefore be considered as an additional commitment. Compliance with the obligation to abandon honey, outside the rest period of the bees, can be verified by having a stock of food.

What is the duration of contracts?

5 years commitment

10 WTO compliance

Green Box

Paragraph 12 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 12 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(3)(b) - 70 - Payments under Article 70	50.00%	20.00%	80.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD33_O18_U01_LU - Animal welfare aid unit cost of intervention in the apiculture sector	Grant	91(3)(b) - 70-HU-50.00%	Uniform		R.35	No

Explanation and justification related to the value of the unit amount

RD33_O18_U01_LU - Animal welfare aid unit cost of intervention in the apiculture sector

—The underlying calculations drawn up by an independent expert body confirm the level of compensation for the costs incurred. When determining the unit amount, the honey abandonment was determined on the basis of the aid period, thus creating the uniform unit amount that can be claimed for all beneficiaries. The output of the eligible livestock unit was determined depending on the unit amount and available resources.

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029
RD33_O18_U01_LU - Animal welfare aid unit cost of intervention in the apiculture sector (Grant - Uniform)	Planned unit amount (Total Public Expenditure in EUR)	0.00	0.00	0.00	150.00	150.00	0.00	0.00	
	Maximum planned average unit amount (where applicable) (EUR)	0.00	0.00	0.00	0.00	0.00	0.00	0.00	
	O.18 (unit: Livestock units)	0.00	0.00	0.00	49,315.07	49,315.07	0.00	0.00	Sum: 98,630.14 Max: 49,315.07
TOTAL	O.18 (unit: Livestock units)	0.00	0.00	0.00	49,315.07	49,315.07	0.00	0.00	Sum: 98,630.14 Max: 49,315.07
	Annual indicative financial allocation (Total public expenditure in EUR)	0.00	0.00	0.00	7,397,260.50	2,250,246.35	0.00	0.00	9,647,506.85
	Annual indicative financial allocation (Union Contribution in EUR)	0.00	0.00	0.00	3,698,630.25	1,125,123.18	0.00	0.00	4,823,753.43

	Out of which needed to reach the minimum financial allocation set out in Annex XII (applicable to article 95(1) under article 73 and 75) (Total public expenditure in EUR)								
	Out of which needed to reach the minimum financial allocation set out in Annex XII (Union Contribution in EUR)								

RD33b_G17_AMR_70 - Compensation payment for the fight against antimicrobial resistance

Intervention Code (MS)	RD33b_G17_AMR_70
Intervention Name	Compensation payment for the fight against antimicrobial resistance
Type of Intervention	ENVCLIM(70) - Environmental, climate-related and other management commitments
Common Output Indicator	O.18. Number of livestock units (LU) benefitting from support for animal welfare, health or increased biosecurity measures
Contributing to ringfencing requirement for/on	Generational Renewal: No Environment: Yes ES rebate system: Yes LEADER: No

1 Territorial scope and, if relevant, regional dimension

Territorial scope: **National**

Code	Description
HU	Magyarország

Description of the Territorial Scope

The area under which the intervention is implemented is Hungary.

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO9 Improve the response of Union agriculture to societal demands on food and health, including high quality, safe, and nutritious food produced in a sustainable way, the reduction of food waste, as well as improving animal welfare and combatting antimicrobial resistances

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
9.1.1	Meeting animal welfare requirements and meeting the natural needs of farm animals	1	Yes
9.1.2	Improving general hygiene and biosecurity conditions, increasing food safety	1	Yes
9.1.3	Prevention of animal health problems, development/development of forecasting systems	1	Partially
9.2.2	Rational use of antibiotics in livestock farming	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.43 Share of livestock units (LU) concerned by supported actions to limit the use of antimicrobials (prevention/reduction)

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

The purpose of the intervention is to:

The spread of pathogens resistant to various antimicrobials is causing increasing health and economic damage worldwide. Antimicrobial resistance (AMR) concerns both animal and human health.

A new priority, based on international and EU expectations, is to ensure the financing of measures to protect against AMR.

In view of the above, it is necessary, **in line with relevant international, EU and domestic professional endeavours, strategies and recommendations**, to promote the responsible sustainable use of antimicrobials, in particular antibiotics, in domestic livestock farming, and in particular to reduce the use of critical agents for human health. According to the ESVAC report, Hungary has the 5th highest data in Europe on antimicrobial fitments per animal unit, and AMR monitoring data shows a significant prevalence of resistant zoonotic and commensalistic pathogens in tissues from food-producing animals.

The support scheme shall compensate **for additional costs for food-producing livestock resulting from commitments to reduce antimicrobial resistance going beyond the requirements established at Union and national level.**

Principles governing the establishment of selection criteria, which may be applied in part (selection criteria):

- Qualifications of the farmer
- Activities related to disease control
- Participation in public-recognised cooperation
- Complexity
- Participation in the work of the Test Plant Information Network (Test Plant System)

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible Beneficiaries:

Farmers meeting eligibility criteria:

Natural persons

Enterprises with legal personality (business companies + cooperatives (in particular social cooperatives)

Non-profit organisations with legal personality (Church legal persons, foundations, non-profit companies)

Eligibility criteria:

The aid applicant has an FELIR identification number and an active holding code

The aid applicant keeps eligible animals in its holding registered in the Farming Information System.

The enclosures of the aid applicant with the identifiers of the declared active establishment fully comply with the animal welfare standards in force.

Compliance with the rules on marking and registration for the animal species concerned and the registration of the holding.

- The aid applicant has a valid written contract with a veterinarian providing veterinary services for the veterinary supervision of animals.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments:

- Performing sampling and resistance testing for pigs, poultry, cattle, large livestock holdings
- Develop an antibiotic reduction plan for pigs, poultry, cattle, large livestock holdings and a biannual review of the plan, with a documented on-site visit to a veterinarian.
- Use of an electronic data collection system for pigs, poultry, cattle, large livestock holdings

.

Eligible costs for the intervention:

- additional cost of carrying out bacteriological sampling, laboratory bacteriological and susceptibility tests
- cost of additional labour needed to implement the supported measures;
- cost of materials needed for interventions;
- additional costs of using an electronic data collection system.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

List of relevant GAEC and SMR

Code	Description
SMR09	Council Directive 2008/119/EC of 18 December 2008 laying down minimum standards for the protection of calves: Articles 3 and 4
SMR10	Council Directive 2008/120/EC of 18 December 2008 laying down minimum standards for the protection of pigs: Articles 3 and 4
SMR11	Council Directive 98/58/EC of 20 July 1998 concerning the protection of animals kept for farming purposes: Article 4

List of relevant mandatory national standards

- Council Directive 98/58/EC of 20 July 1998 concerning the protection of animals kept for farming purposes;
- Regulation (EU) 2016/429 of the European Parliament and of the Council of 9 March 2016 on transmissible animal diseases and amending and repealing certain acts in the area of animal health ('Animal Health Law')
- Regulation (EU) 2017/625 of the European Parliament and of the Council of 15 March 2017 on official controls and other official activities performed to ensure the application of food and feed law, rules on animal health and welfare, plant health and plant protection products
- Regulation (EU) 2019/6 of the European Parliament and of the Council of 11 December 2018 on veterinary medicinal products and repealing Directive 2001/82/EC
- Regulation (EU) 2019/4 of the European Parliament and of the Council of 11 December 2018 on the manufacture, placing on the market and use of medicated feed, amending Regulation (EC) No 183/2005 of the European Parliament and of the Council and repealing Council Directive 90/167/EEC
- Act LVI of 2019 on statutory provisions for the regulation of animal husbandry;
- Act XLVI of 2008 on the food chain and its official supervision
- 578/2020. (XII. Government Decree No. 14) on the operation of the food chain inspection information system
- 128/2009. Ministry of Agriculture and Rural Development Decree (X. 6.) on veterinary medicinal products
- 65/2012. (VII. Decree of the Minister for Rural Development on certain rules on the production, placing on the market and use of feed
- 41/1997. Decree No 28 of 28 May of the Minister for Agriculture on the publication of the Animal Health Code
- 32/1999. (III. Decree No 31) of the Minister for Agriculture and Rural Development on animal protection rules for the keeping of farm animals
- 119/2007. Ministry of Agriculture and Rural Development (X. 18.) on the national registration system for enclosures, holdings and certain data relating thereto;
- 45/2019. (IX. Decree No 25/1999 of the Minister for Agriculture laying down detailed rules on animal production;
- 99/2002. (XI. Decree No 5/1999 of the Minister for Agriculture and Rural Development on the marking of cattle species, and
- A common registration and identification system;
- 83/2015. (XII. Decree No 16) of the Minister for Agriculture on the marking of pigs and the Uniform Register
- and its identification system;
- 120/2007. Ministry of Agriculture and Rural Development Decree (X. 18.) on the establishment of the Poultry Information System and

- the way in which it is operated;
- Its registration and identification system;
- 188/2019. (VII. Government Decree No. 30) on animal production;

Link between GAEC, SMR and national standards with the intervention

(A) target area: Performance of resistance test

Baseline:

- Regulation (EU) 2019/6 OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 11 December 2018 on veterinary medicinal products and repealing Directive 2001/82/EC
- On veterinary medicinal products, 128/2009. Decree (X. 6.) of the Minister for Agriculture and Rural Development

Details of how the standard goes beyond the EU mandatory standards:

Regulation (EU) 2019/6 does not require the performance of resistance testing prior to each antimicrobial treatment.

Government Decree No 128/2009 on veterinary medicinal products. Section 76(13) of the Decree of the Minister for Agriculture and Rural Development (X. 6.) of the Minister for Agriculture and Rural Development lays down the obligation to carry out a laboratory examination on a sample of the case before treatment with a medicinal product with an active substance of major importance for human health or the obligation to carry out regular colony examinations, while the result of one of the tests is sufficient for the treatment. In the case of an active substance other than those active substances, it does not contain any obligation to carry out a sensitivity test.

On the basis of the above, it is a commitment on the part of the livestock farm going beyond the national legislation to take into account the results of the laboratory tests before regular colony resistance testing and treatments with non-critical active substances are carried out.

Target area: Development of an antibiotic reduction plan

Baseline:

- Regulation (EU) 2019/6 OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 11 December 2018 on veterinary medicinal products and repealing Directive 2001/82/EC
- On veterinary medicinal products, 128/2009. Decree (X. 6.) of the Minister for Agriculture and Rural Development

Details of how the standard goes beyond the EU mandatory standards:

Regulation (EU) 2019/6 does not require the establishment of a plant reduction plan.

National legislation, 128/2009. Section 76(14) of the Decree of the Minister for Agriculture and Rural Development (X. 6.) provides that *'The veterinarian supplying livestock holdings shall draw up a compulsory reduction plan for antibiotic use to reduce the use of antibiotics in large livestock holdings on the basis of the guidelines on minimum requirements for the treatment of antibiotics issued by the NFCSO and published on its website, which he is required to review in the context of an annual self-monitoring. The implementation of the antibiotic reduction plan shall be supervised by the supplying veterinarian.'*

The aim of the aided measure is to ensure that the reduction plan and its implementation are checked by the veterinarian on a documented basis and every six months and must be linked to an on-site visit.

Target area: Use of an electronic data collection system

Baseline

- Regulation (EU) 2019/6 OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 11

December 2018 on veterinary medicinal products and repealing Directive 2001/82/EC

- Commission REGULATION (EU) 2021/578 supplementing Regulation (EU) 2019/6 of the European Parliament and of the Council with regard to requirements for the collection of data on the volume of sales and use of antimicrobials in animals
- Commission IMPLEMENTING REGULATION (EU) 2022/209 of 16 February 2022 establishing the format of the data to be collected and reported in accordance with Regulation (EU) 2019/6 of the European Parliament and of the Council to determine the volume of sales and the use of antimicrobial medicinal products in animals
- On veterinary medicinal products, 128/2009. Decree (X. 6.) of the Minister for Agriculture and Rural Development

Details of how the standard goes beyond the EU mandatory standards:

Regulation (EU) 2019/6 and its implementing Regulations (EU) 2021/578 and (EU) 2022/209 lay down that Member States collect and provide data on the use of antimicrobials in animals to the European Medicines Agency from 2024.

In order to prepare for the fulfilment of this obligation, an amendment to the national decree published in August 2021 introduced mandatory data reporting on antibiotic active substances used in food-producing animals into the electronic system of the National Food Chain Safety Office (NFCSO) from 28 January 2022.

However, neither the EU regulation nor the national regulation prescribes how the collection and storage of data is to be carried out at the level of livestock holdings and by which technology.

The collection of the desired data in livestock establishments in an electronic system, the use of suitable software and farm management systems are an additional commitment on the part of the keeper, with additional costs, which will also facilitate the collection of data and the provision of data to the authority.

7 Form and rate of support/amounts/calculation methods

EUR 1643,8/site/year

Unit amounts are capped and may be redistributed in case of over-declaration

Calculation method

—The underlying calculations drawn up by an independent expert body confirm the level of compensation for the costs incurred.

Basis for calculations

On the basis of NFCSO data, rounded livestock data for the species to which the CAP Strategic Plan applies. Animal health rules provide in certain cases for measures linked to the number of animals, so it is necessary to separate small and large holdings.

Additional explanation

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

What are the models of the commitment(s) in the intervention?

- ☐ result based (with possibility to pick and choose)
☒ management based (with possibility to pick and choose)
☐ hybrid (management and result based)

Please explain the obligations/possibilities for beneficiaries in relation to the commitments set out in the intervention

Commitments:

- Perform sampling and resistance testing

IN ACCORDANCE WITH PARAGRAPH 27/2021. (VIII.) Government Decree No 128/2009 on veterinary medicinal products, as amended by Decree No 128/2009 of the European Parliament and of the Council of 11 November 2009 on veterinary medicinal products. Decree (X. 6.) of the Minister for Agriculture and Rural Development provides, inter alia, that veterinary medicinal products containing the

active substances cephalosporin, colistin and fluoroquinolone generation 3 and 4 for medical treatment and metaphylaxis in food-producing animals may be used if justified by a susceptibility test carried out on a sample of dead or sick animals in the relevant livestock population or by an on-farm resistance test carried out on a monthly basis for that animal holding. In order to develop the most appropriate targeted medication, it is particularly important to carry out laboratory susceptibility testing at least in an accredited animal health laboratory or operating an internal quality assurance system prior to the use of active substances of critical importance for human health. Targeted therapy with the active substance that has been shown to be effective reduces the risk of development of resistance and the zoonotic hazards of animal disease. Laboratory resistance tests to detect the resistance of pathogens that endanger animal health will allow better targeted treatment of certain bacterial diseases, thereby reducing the spread of resistance and reducing the use of antimicrobials of major importance for human health (European Medicines Agency AMEG B).

The beneficiaries undertake to have resistance tests carried out at least on a monthly basis by the veterinarian administering the livestock establishment in order to establish an on-farm resistance map and/or to perform susceptibility tests in individual cases, and that any treatment of antibiotics will be determined taking into account these test results.

The aid covers laboratory testing for bacteriological and resistance testing and related veterinary sampling.

- Develop an antibiotic reduction plan

Government Decree No 128/2009, as amended, On the basis of the Decree of the Minister for Agriculture and Rural Development, large livestock farms are required to draw up an antibiotic reduction plan from 28 January 2022, which they must review in the context of an annual self-assessment. According to the legislation, the plan is drawn up by the service veterinarian responsible for the premises. It is about rethinking the technologies and control measures used on the site in order to ensure that antibiotics are used only when justified.

Beneficiaries shall review their reduction plan and the effectiveness of the measures contained therein in a documented six-monthly manner by the supplying veterinarian, in particular in the light of on-site antibiotic use data, and where necessary amend them.

- Use of an electronic data collection system

DECISION NO 128/2009 OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL OF 25 SEPTEMBER Decree No 27/2021 of 6 October 2021 of the Minister for Agriculture and Rural Development amending Decree No 27/2021 (VIII.) Regulation AM of 11) provides for the collection and reporting of data on antimicrobials used in food-producing animals, in line with the obligation to collect and report data on antimicrobials used in food-producing animals, as established by Regulation (EU) 2019/6, which applies from 28 January 2022. In order to facilitate the collection and reporting of data, it is necessary to support the use of electronic colony management systems in livestock holdings to enable the monitoring of treatments with antimicrobials, thus contributing to the collection of the desired data.

The use of the electronic data collection system is not a legal obligation, but a voluntary commitment going beyond what constitutes an additional cost for the animal keeper.

The beneficiaries operate and implement an electronic data collection system and colony management software at the livestock establishment that allows for up-to-date monitoring of treatments and facilitates the provision of data to the central authority and the performance of official controls, and is able to communicate with the authority. Electronic data collection also facilitates the preparation of the plant reduction plan and the monitoring of its implementation.

What is the duration of contracts?

5 and 4 years commitment

10 WTO compliance

Green Box

Paragraph 12 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 12 of Annex II.

Explanation and justification related to the value of the unit amount

RD33b_O18_A01_LU - Performance of resistance test: Pig unit amount

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_A02_LU - Performance of resistance test: Unit amount of poultry

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_A03_LU - Performance of resistance test: Unit amount for bovine animals

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to

the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_A04_LU - Development of an antibiotic reduction plan: Pig unit amount

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_A05_LU - Development of an antibiotic reduction plan: Unit amount of poultry

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_A06_LU - Development of an antibiotic reduction plan: Unit amount for bovine animals

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_A07_LU - Use of an electronic data collection system: Pig unit amount

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_A08_LU - Use of an electronic data collection system: Unit amount of poultry

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_A09_LU - Use of an electronic data collection system: Unit amount for bovine animals

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_U01_LU - Performance of resistance test: Unit amount of swine

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_U02_LU - Performance of resistance test: Unit amount of poultry

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to

the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_U03_LU - Performance of resistance test: unit amount for bovine

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_U04_LU - Development of an antibiotic reduction plan: Unit amount of swine

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_U05_LU - Development of an antibiotic reduction plan: Unit amount of poultry

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_U06_LU - Development of an antibiotic reduction plan: Bovine unit amount

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_U07_LU - Use of preventive products: Unit amount of broilers

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_U08_LU - Use of preventive products: Unit sum of free range chickens

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_U09_LU - Use of preventive products: Unit sum of hens

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_U10_LU - Use of preventive products: Unit amount of rearing juvenile turkey

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to

the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_U11_LU - Preventive products: Unit amount of roasting geese

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_U12_LU - Preventive products: Unit amount of juvenile geese

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_U13_LU - Preventive products: Unit amount of young geese

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_U14_LU - Use of preventive products: Unit amount of roast ducks

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_U15_LU - Preventive products: Unit amount of young ducks

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_U16_LU - Preventive products: Unit amount of young turkey

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_U17_LU - Use of preventive products: Per unit amount of pullets

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_U18_LU - Use of an electronic data collection system: Unit sum of pigs

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to

the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_U19_LU - Use of an electronic data collection system: Unit amount of poultry

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

RD33b_O18_U20_LU - Use of an electronic data collection system: Bovine unit amount

The underlying calculations prepared by an independent expert body confirm the level of compensation for the costs incurred. The unit amounts are equal to the aid amount for the aid units concerned. The individual unit costs are defined as detailed in Chapter 7 of the intervention. The attached document 'RD_33b_G17_AMR_70 – AMR Background calculation' supports the certification of aid units

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029
RD33b_O18_A01_LU - Performance of resistance test: Pig unit amount (Grant - Average)	Planned unit amount (Total Public Expenditure in EUR)				2.18	2.18			
	Maximum planned average unit amount (where applicable) (EUR)								
	O.18 (unit: Livestock units)								
RD33b_O18_A02_LU - Performance of resistance test: Unit amount of poultry (Grant - Average)	Planned unit amount (Total Public Expenditure in EUR)				7.41	7.41			
	Maximum planned average unit amount (where applicable) (EUR)								
	O.18 (unit: Livestock units)

RD35_F02_FEC_70 - Forest multi-annual commitments (Multiannual Commitments)

Intervention Code (MS)	RD35_F02_FEC_70
Intervention Name	Forest multi-annual commitments (Multiannual Commitments)
Type of Intervention	ENVCLIM(70) - Environmental, climate-related and other management commitments
Common Output Indicator	O.15. Number of hectares (forestry) or number of other units covered by environmental or climate-related commitments going beyond mandatory requirements
Contributing to ringfencing requirement for/on	Generational Renewal: No Environment: Yes ES rebate system: Yes LEADER: No

1 Territorial scope and, if relevant, regional dimension

Territorial scope: **National**

Code	Description
HU	Magyarország

Description of the Territorial Scope

The whole territory of Hungary.

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO6 Contribute to halting and reversing biodiversity loss, enhance ecosystem services and preserve habitats and landscapes

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
6.3.2	Increasing the share of forest land under forest management with continuous cover	1	Yes
6.3.3	Improve forest structure, age composition, encourage reforestation	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.30 Share of forest land under commitments to support forest protection and management of ecosystem services

R.33 Share of total Natura 2000 area under supported commitments

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Objectives:

Encouraging a shift to cultivation methods that ensure continuous forest cover and that better protect forest biodiversity, in addition to strengthening forest biodiversity, improves the quality of other forest protection and public welfare services. Ensuring the sustainability of forest management is resource-friendly in the long term, and voluntary forest management surplus commitments can also significantly increase the public amenity and recreational role of forests.

The intervention offers a significantly wider choice for forest managers compared to the VP and also offers new incentives for forest management and management modes to be followed by the new EU Forest Strategy for 2030.

Content:

Multi-annual incentives based on commitments going beyond legal obligations can achieve a meaningful uptake of multiannual management methods and methods in forest management that can adequately respond to the impacts of climate change and to the growing ecological/ecosystem service expectations.

Targeted support:

The different sub-measures provide opportunities for forest managers in all their diversity to undertake additional environmental or climate-related management activities in their forests, in line with the circumstances and ambitions of their forests, from simple elements of biodiversity protection to operational change.

In particular, it aims (by favouring) to engage farmers in NATURA 2000 and domestically protected forest areas in closer-to-nature forest management practices, in particular improving the habitat quality of stocks of 9110, 9130, 9150, 9180, 91E0, 91F0, 91G0, 91H0, 91I0, 91K0, 91L0, 91M0, 91N0.

Sub-measures:

1: Promotion of a continuous forest cover cultivation method:

Conversion to heritable cultivation method and maintenance or conversion to non-timber production method (10 years)

The Evt. According to Section 29(1), the mode of operation is a comprehensive system of forestry and tree stand management methods and procedures to be used in the management of forest stands, in accordance with the forest's natural status principle, its intended uses and the limits on forest management. The Evt. According to Section 29(2)(b), (c) and (d), the transitional, inherited and non-productive mode of operation is intended for continuous forest cover. Support shall be granted on the basis of a 10-year legacy conversion or inheritance maintenance plan.

2: Continuous improved renovation or continuous restructuring (5-10 years) In the reforestation, the improved renovation or restructuring shall be carried out without clear-cutting over a period of 5 to 10 years. Support shall be granted in cutting-edge forests on the basis of the more favourable structure of the target stock for reforestation included in the forest plan.

3. Control of alien species (5 years) Intervention specifically for habitat protection purposes, control of alien native tree and shrub species,

4: Reconstructing cleansing (5 years): restoration and maintenance of cleansing in the area of natural forests registered as cleansing in the National Forest Stock Data Repository but started

5: Manual work with special needs (1+ 4 years): The Environmental Protection Act does not lay down any specific professional rules on the maintenance of forest regeneration. The Evt. Vhr. Section 36(1) specifies when reforestation is to be completed for each target stock, i.e. to bring it to a sufficiently viable condition. Hand-held work can be used to ensure that natural afforestation and forest structure conversions, in the interests of biodiversity, develop and maintain appropriate care during renovations.

6: Natural handling (5 years): use of e.g. horses, irons, slides, cableways approaching bicycles. The Evt. Section 63(1) provides: the forest manager shall ensure the protection of the forest soil against erosion and compaction in the course of its forest management activities. This obligation goes beyond the voluntary commitment that can be made during the supported activity in order to protect the humic top level of the soil and the stem of the remaining trees.

7: Modular – small-scale ecosystem services (5 years): small-scale forest management commitments, optional for each component: smaller-scale management elements that can be undertaken in accordance with the specific nature of the stock in question. These are: Conservation of 1 microhabitat (e.g. small water surface, very old/biotop trees, wetlands, grassland stains, bushes, standing or lying dead trees, shrub groups); 2: secondment; 3: macot setting and filling/year; 4: water – grassland – shrub (TN) – BIOTOP trees 5. conservation of sporadic blends, rare mixture; 6: damage forecast; 7 maintenance of public amenity infrastructure. Cannot be claimed with other sub-measures.

Selection criteria:

- Priority will be given to Natura 2000 habitats, in particular habitats 9110, 9130, 9150, 9180, 91E0,

91F0, 91G0, 91H0, 91K0, 91L0, 91M1, 91N0.

- Intended for protection or public amenity
- High naturality category
- Total forest management activity area
- Site conservation
- Touristic activity in the area

Relevant legislation:

Act XXXVII of 2009 on forests, forest protection and forestry

61/2017. Decree (XII.21.) of the Minister for Agriculture on the implementation of Act XXXVII of 2009 on forests, forest protection and forestry

Government Decree No 383/2016 of 2 December 2016 on the designation of bodies performing official and administrative functions in the field of agriculture

Consistency with other interventions: in the case of a new sub-measure and aided, compulsory training and continuous availability of knowledge transfer and advice are necessary for the implementation of the sub-measures to be of sufficient quality.

— RD58_A01_TRA_78 – Training and demonstration facility aid

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiary:

· eligible forest manager with a forest plan

The forest manager conducts sustainable forest management, i.e. its management complies with Act XXXVII of 2009 on forests, forest protection and forestry and the district forest plan, and is not subject to forest protection or nature conservation sanctions.

Minimum eligible area: 0.5 ha with a forest environmental management plan broken down by year for the respective sub-measure and duration

Whereas this measure falls outside the scope of Article 42 TFEU (see point 8), with the exception of de minimis aid, **no aid may be granted** to a beneficiary on the basis of Commission Regulation (EU) No 702/2014

- it is a firm in difficulty (the concept of a firm in difficulty is defined in Article 37/2011 on the procedure for State aid within the meaning of EU competition law and on the regional aid map. (III. Section 6(4a) and (4b) of Government Decree No 273/2007) or
- it failed to comply with the European Commission's decision to repay State aid within the meaning of EU competition law addressed to Hungary.

Specific eligibility criteria:

1. In the case of conversion or maintenance to Ö röker forest, the forest section in the National Forest Stock Data Repository is a transitional or hereditary forest (previously known as: (fibre) is in or transits to an operational operation and has a transformation plan. In the case of conversion to a non-wood production mode, the forest section is switched to a plantation not producing timber in the National Forest Stock Data Repository. In the case of State-owned or municipally owned forests, aid may only be granted for forests classified in continuous forest cover modes in addition to the mandatory share laid down by law and

- included in the programme. The forest section shall not be subject to a reforestation obligation.
2. Continuous improved renovation or continuous restructuring: The forest section is in cutting mode in the National Forest Stock Data Repository. The forest section is mature. The method of reforestation is not clear-cut reforestation. The length of the reforestation period, from the first demolition to final cutting, exceeds 5 growing seasons.
 3. The fact and extent of infestation with foreign native tree species that spread intensively is recorded in the National Forest Stock Data Repository.
 4. Other details of the area concerned recorded as cleansing in the National Forest Stock Data Repository and the fact and extent of natural scrubbing or foresting have been recorded
 5. The holder has restructured the current forest stands or reforested with natural seed after harvesting.
 6. The tree use option under the forest plan is implemented in the forest. No aid shall be granted for cleaning and, with the exception of split cutting, end-slaughtering and end-slaughtering of the strand, handling of material carried out during final-use logging, except in the case of Evt. Section 7(1)(d), (e) and (f) in the case of forest sections registered with the natural nature category of transitional forest, cultivated forest or tree plantation, provided that the forest section concerned is also intended for protection purposes.
 7. Lto undertake more than 3 elements, with a total value of at least EUR 50/ha – up to a maximum of EUR 100/ha.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Form of the aid: unit cost/hectare and other additional elements

Joint commitments:

- keeping a forest-environmental log documenting the supported management standards undertaken
- participation in a compulsory training course per year in the first two years of the commitment

Sub-measure specific commitments:

1. maintaining the outcome of the intervention for a further 10 years after the last aid payment, i.e. the method of cultivation cannot be changed to a (back) non-continuous forest cover. An up-to-date record of forest management activities in the forest environmental log in the case of conversion to or maintenance and non-timber production mode.
2. During reforestation, the beneficiary shall restructure or increase its mix and climate resilience in the forest section (improved renovation).
3. ReducingI degenonous individuals every year, recording the impact on natural values in the forest environmental log
4. Tmaintenance of cleansing and recording of the impact on natural values in the forest-environmental log
5. How to care for manual work, the free development of the regenerative stock must be continuously ensured by hand care, that intensively transmitted alien tree and shrub species must be reduced, the proportion of blends appropriate to the target stock must be maintained and rare blends must be retained.
6. Before the protection of soil humus and upper levels, as well as enhanced protection of remaining tree strains, with the aided tools
7. Compliance with the activity or conservation elements undertaken, recording the impact on natural values in the forest-environmental log

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

List of relevant GAEC and SMR

Code	Description

List of relevant mandatory national standards

Relevant legislation:

Act XXXVII of 2009 on forests, forest protection and forest management

Act LIII of 1996 on nature protection

61/2017. (XII. Decree No 21 of the Minister for Agriculture on the implementation of Act XXXVII of 2009 on forests, forest protection and forest management

Government Decree No 383/2016 (XII. On the designation of bodies performing official and administrative tasks in the field of agriculture

Link between GAEC, SMR and national standards with the intervention

The voluntary commitments included in the intervention do not form part of the management requirements laid down in the legislation or in the 10-year forest plans, nor of the management requirements established on the basis of the Natura maintenance plan relevant to the site in question, i.e. it contains in all cases an additional voluntary management commitment going beyond the mandatory requirements.

7 Form and rate of support/amounts/calculation methods

☒ IACS

☐ Non-IACS

IACS section

Type of payment

☒ unit cost based on additional costs and income foregone

☐ transaction cost included

☐ one off payment

☐ lump sum

Range of support at beneficiary level

The background calculation was prepared by the Forest Science Institute at the University of Sopron for the CAP Strategic Plan in 2021.

The calculated unit cost subsidy exceeds EUR 200/ha (or other unit) for several target areas. Reasons for this: all of the high-value forest-environmental commitments were already part of previous agri-rural development programmes or further developed.

There is a lively and continuous interest in forest-environmental opportunities. In particular, the cost of improving or improving the forest structure or changing the way in which forests are managed is very high when it comes to improving the chances of success in climate adaptation.

These are long-term and very costly, knowledge- and labour-intensive procedures. As a result of reimbursing additional costs and creating incentives, a large number of private forest managers have already been involved in previous programmes with several years of commitments to improve the ecological and climatic condition of forests.

1/Modernity transition and maintenance

Switch to heritable mode (1 year)	1	236
Hereditary forest after conversion	9	208
reservation Years 2-10		

Metal fencing, gradient of more than 10 degrees	8 but up to EUR 1600/ha.
Electric fence energisers	5 but not exceeding EUR 518/ha
Bench, cloak, tree trunk for gradients above 10 degrees	17/100 metres, but not exceeding EUR 749/ha

Additional activities represent a one-off payment during the commitment period.

Maintenance of heritable mode 1/b (1-10): 50 % taking into account aid intensities

Hereditary maintenance	10	104

1/c Transition to non-wood production mode (10th year):

Total maintenance of non-wood production mode, rounded	10	79

2/a Continuous forest structure conversion:

Operations of supported action (5-10 years)	
	Unit cost of grants (euro/ha)
First export: Oak, beech and other hard foliage	3 427
1st year nursing costs	356
First export: Other soft bedding	2 392
1st year nursing costs	328
Care costs from year 2 up to and including 10 years	(euro/ha/year)
Oak, beech and other hard foliage	356
Other soft bedding	328

2/b Restructuring with restocking by understocking (10 years):

Operations of supported action (5-10 years)	Grant rate (euro/ha/year)
Average unit cost per year (rounded):	487

2/c Continuous improved renovation by increasing blending (5-10 years)

Operations of supported action (5-10 years)	Unit cost of support (euro/ha/year)
Average unit cost of support: ha/year (rounded):	487

Additional elements for operations 2a, 2/b, 2/c:

installation of a fence of EUR 8/fm up to a maximum of EUR 1600/ha.

- electric shepherds: EUR 5 per linear metre, up to EUR 518/ha

- bench, steam line for gradients above 10 degrees: EUR 17/100 linear metre up to a maximum of EUR 749/ha

—Restructuring from type of target acacia stock + 10 %

3.Intensively spread of alien tree species

annual corner depression and logging (5 years): EUR 249/ha/year

Additional one-off operation (if applicable): trunk EUR 156/ha

4.Recording and maintenance of cleansing with logs (5 years) EUR 208/ha/year**5. Manual work in natural renovation (1+ 4 years):**

1st year: EUR 466/ha

In years 2 to 5: EUR 137/ha/year

6. Natural handling (5 years):

Unit Cost of Grants in EUR	EUR 18/m³
Up to 50 m³/ha with capping	EUR 900/ha

7. Modular: small-scale ecosystem services (5 years):

1.conservation of micro-habitats (e.g. deadwood, blooms, Telma): 5/ha

Secondment: 1/ha

3.mounting and filling of trays: 1/kg/ha,

4.Habitat conservation: water – grassland – shrubs (TN) – BIOTOP trees:5 pieces/ha

5.spray preservation: rare mixture: 1db/ha, other mixture: 10/ha

6th Damage Forecast Reporting: 1 per year

7.maintenance of the public welfare and forest information route: route 1: 100 m (= 1 ha of compliance)

The unit cost for each modular element is set at EUR 10 per unit for the additional cost and incentive of the commitment.

Aid amount minimum EUR 50/ha/year, maximum EUR 100/ha/year

And (modular): Mandatory activity for all pledges, with the involvement of specialists: one-off technical planning and map marking and keeping a forest-environmental logbook: **EUR 36/ha/year**

Calculation method

The unit cost calculation was carried out by the Forest Science Institute of the University of Sopron based on the facts of previous years as well as its own data collection and analysis methodology. The development of the grant unit cost categories is a separate annexed "CAP Strategic Plan Hungary 2023-2027 Symplified cost options prepared by the Forest Science Institute of Sopron University as an expert organisation independent of AM: unit costs).

Additional explanation

Not relevant.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☒ Yes ☐ No ☐ Mixed

Explanation of support activities falling outside the scope of Art. 42 TFEU

Aid to the forestry sector falls outside the scope of Article 42 TFEU, so that the competition rules (State aid rules) apply to this intervention.

Type of state aid instrument to be used for clearance:

☐ Notification ☐ GBER ☒ ABER ☐ de minimis

State Aid case number

SA.112038

Additional information:

☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.

☐ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.

☒ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

What are the models of the commitment(s) in the intervention?

☐ result based (with possibility to pick and choose)

☒ management based (with possibility to pick and choose)

☐ hybrid (management and result based)

Please explain the obligations/possibilities for beneficiaries in relation to the commitments set out in the intervention

Eligible forest managers can choose between seven different sub-measures. In particular, sub-measures 2, 3, 4, 5 and 6 are result-oriented, while sub-measure 7 provides for specific management (management practice) commitments. The objective of sub-measure 1 is also to set out a result (change of operation), but due to the nature of the commitment, the result cannot be achieved even during the 10-year commitment period, and the farmer starts with a change in management towards a permanent forest cover result, which may take up to 30 years.

What is the duration of contracts?

Sub-measure 1: 10 years
Target 2: 5-10 years (depending on herd)
3. Sub-measure 4: 5 years
Sub-measure 5: 1+ 4 years
Sub-measures 6-7: 5 years

10 WTO compliance

Green Box

Paragraph 12 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

Under the present intervention, aid may be granted to pursue environmental objectives which are based on conditions clearly defined by the State as having an environmental objective, and the payment is subject to compliance with the conditions and management methods laid down.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(3)(b) - 70 - Payments under Article 70	50.00%	20.00%	80.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD35_O15_A01_HA - Hectares of forest supported for an environmental commitment	Grant	91(3)(b) - 70-HU-50.00%	Average		R.30; R.33	Yes

Explanation and justification related to the value of the unit amount

RD35_O15_A01_HA - Hectares of forest supported for an environmental commitment

The unit amount (UA) is determined on an 'average' basis, based on the experience numbers of the VP 2014-2021.

Aspects affecting the calculation of the average unit amount per hectare supported for the period 2023-2028:

On 19 June 2022, Rural Development Programme experience numbers: EUR 37197348 was committed and 9 418 hectares were committed.

At the same time, for the period from 2023 onwards, the target group, content and expected results of the intervention change significantly, affecting the target and average unit amount calculation.

Amending aspects:

(a) the addition of new elements, in particular target area 7 for farmers in the smallest forest areas with no high environmental value, which is a basis for closer-to-nature forest management, which is widely feasible, including by a lay forest manager, and serves educational purposes.

(b) emergence of new target groups: in addition to private forest managers, public forest holdings and national park directorates

(D) valorisation of unit costs: increase of unit costs for grants by reflecting the increase in costs

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029
RD35_O15_A01_HA - Hectares of forest supported for an environmental commitment (Grant - Average)	Planned unit amount (Total Public Expenditure in EUR)			198.00	198.00	198.00	198.00	198.00	
	Maximum planned average unit amount (where applicable) (EUR)			736.00	736.00	736.00	736.00	736.00	
	O.15 (unit: Hectares)			50,000.00	80,000.00	80,000.00	80,000.00	80,000.00	Sum: 370,000.00 Max: 80,000.00
TOTAL	O.15 (unit: Hectares)			50,000.00	80,000.00	80,000.00	80,000.00	80,000.00	Sum: 370,000.00 Max: 80,000.00

	Annual indicative financial allocation (Total public expenditure in EUR)			6,082,317.00	9,940,000.00	9,940,000.00	9,940,000.00	9,741,483.00	45,643,800.00
	Annual indicative financial allocation (Union Contribution in EUR)			3,041,158.00	4,970,000.00	4,970,000.00	4,970,000.00	4,870,742.00	22,821,900.00
	Out of which carry-over (Total public Expenditure in EUR)			1,000,000.00	1,000,000.00	1,000,000.00	500,000.00		3,500,000.00
	Out of which carry-over (Union contribution in EUR)			500,000.00	500,000.00	500,000.00	250,000.00		1,750,000.00
	Out of which needed to reach the minimum financial allocation set out in Annex XII (applicable to article 95(1) under article 73 and 75) (Total public expenditure in EUR)								
	Out of which needed to reach the minimum financial allocation set out in Annex XII (Union Contribution in EUR)								

RD36_F03_GEN_70 - Multi-annual commitments for forest genetics

Intervention Code (MS)	RD36_F03_GEN_70
Intervention Name	Multi-annual commitments for forest genetics
Type of Intervention	ENVCLIM(70) - Environmental, climate-related and other management commitments
Common Output Indicator	O.19. Number of operations or units supporting genetic resources
Contributing to ringfencing requirement for/on	Generational Renewal: No Environment: Yes ES rebate system: Yes LEADER: No

1 Territorial scope and, if relevant, regional dimension

Territorial scope: **National**

Code	Description
HU	Magyarország

Description of the Territorial Scope

The whole territory of Hungary.

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO6 Contribute to halting and reversing biodiversity loss, enhance ecosystem services and preserve habitats and landscapes

SO8 Promote employment, growth, gender equality, including the participation of women in farming, social inclusion and local development in rural areas, including the circular bio-economy and sustainable forestry

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
6.6.1	Genetic conservation and land use in climate adaptive agriculture and forestry	2	Yes
8.6.2	Production of forest reproductive material to increase forest stands and to adapt them to climate change	2	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.30 Share of forest land under commitments to support forest protection and management of ecosystem services

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Objectives: Climate change projections show that, from a forest management perspective, the speed of displacement of climate zones exceeds the natural capacity of forest stands to adapt. The key issue for the long-term sustainability of forests is therefore, in the first place, the provision of material that is resilient to or adapted to the effects of climate change, while preserving the necessary genetic diversity. This is only possible if both in-situ and ex-situ gene conservation and development tools are exploited and developed.

Content:

The conservation of our native tree species should primarily be based on **in situ** methods. The essence of

these is that the stock of genes intended to be preserved is maintained in its original environment, so that the processes affecting and shaping the gene pool can continue to apply without hindrance. Their use is subject to the condition that the population in question can be maintained and renewed using natural methods in the original or similar place of production or habitat. The forest gene reserve network consists of in situ conservation units in which the populations of the target tree species are adapted to the place of production, are of local origin, are well representative of the local gene stock of the species(s), and their survival is ensured in the long term.

Where the gene source cannot be safely maintained at its original location (e.g. in the event of low fertility, habitat threats, extreme changes in the site of production, environmental damage, pathogens, pest action, possibility of crossing with related species or cultural forms), the genotypes to be preserved shall be placed *inex situ* collections. The subsequent utilisation of conservation genetic material may result in synthetic populations of the specimens thus archived. They can henceforth serve as a source of propagating material for forestry interventions for climate protection and nature conservation purposes.

Principles for selection: not relevant

Link to other interventions: knowledge transfer requires the sharing and transfer of knowledge and good practices in these projects: Sharing of RDI results, demonstration plant, training of specialist consultants, publications, AKIS networking). It is of particular importance (a) to raise farmers' awareness of the importance of purchasing certified material domestically, as opposed to cheap import material, even from unsuitable areas; (b) raising awareness and professional assistance of the (north) export potential of propagating material production.

— RD58_A01_TRA_78 – Training and demonstration support

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiaries:

– eligible (registered) forest manager

other bodies governed by public law,

— growers of forest nurseries and nurseries registered in accordance with Decree No 110/2003 of 21 October 2003 of the Minister for Agriculture and Rural Development

The forest manager is engaged in sustainable forest management, i.e. it is managed in accordance with Act XXXVII of 2009 on forests, forest protection and forest management and in the district forest plan, and is not subject to forest protection or conservation sanctions.

As this measure falls outside the scope of Article 42 TFEU (see point 8), with the exception of de minimis aid, **no aid may be granted** to a beneficiary under Commission Regulation (EU) No702/2014

- it qualifies as a firm in difficulty (the concept of firm in difficulty is referred to in Decree 37/2011 on the procedure for State aid for the purposes of EU competition law and on the regional aid map. (III. Specified in Section 6(4a) and (4b) of Government Decree No 22/2015) and
- the decision of the European Commission addressed to Hungary requiring the repayment of State aid within the meaning of EU competition law has not been complied with.

Specific eligibility criteria:

has a management plan for the forest genetic target area

— forest manager or manager of a gene reserve, a stock designated for seed production, a forest gene collection or a central stock plantation in the eligible or planned area.

Moreover:

A/in situ sub-measure:

the forest section concerned is registered in the National Forest Stock Data Repository for the purpose of producing a forest gene reserve or propagating material

- the forest used for the forest gene reserve is 95/2003 (VIII. Included in the data register of the plant production authority specified in the Decree of the Minister for Agriculture and Rural Development or plans to establish such a herd

— the forest intended for seed-growing stands is included in the data register of the plant production authority specified in Decree No 110/2003 of 21 October 2003 of the Minister for Agriculture and Rural Development or plans to establish such a stock

B/ex situ sub-measure:

the beneficiary has or plans to set up a forest gene collection which is part of the national genetic asset and is registered by the crop management authority

the beneficiary is in possession of the official authorisations required for the performance of the task

- in the case of a stock plantation: the beneficiary has, or plans to create, a forest gene collection which is part of the national genetic asset and is registered by the crop management authority, and: Of the stock nurseries, only cloned varieties and seed-growing plantations (plants) in accordance with the requirements of Decree No 110/2003 of 21 October 2003 of the Minister for Agriculture and Rural Development with Hungarian State varietal recognition or equivalent economic performance testing for forestry purposes are eligible.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Forest genetic pledges (7 years)

A/in situ scheme:

— creation and maintenance or existing maintenance of gene reserves

— establishment and maintenance or existing maintenance of stock stands designated for seed production

B/ex situ scheme:

— creation and maintenance or existing maintenance of forest gene collections

establishment and maintenance of central stock plantations

Support in this intervention shall not be granted for activities to convert propagating material into commercial products (e.g. harvesting, preparation, storage, packaging) or forest management activities resulting from the obligation of forest managers under the legislation in force.

Commitments:

— keeping a forest genetic log documenting committed and supported management standards

— creation and maintenance of supported stocks and adequate care

— maintenance and maintenance of existing stocks

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

List of relevant GAEC and SMR

Construction cost of fences	meters	20	—
Cost of molecular genetic testing	genotype	80	—

Additional explanation

Not relevant.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☒ Yes ☐ No ☐ Mixed

Explanation of support activities falling outside the scope of Art. 42 TFEU

As the forestry sector falls within the scope of Article 42 TFEU, competition rules (State aid rules) apply to this measure.

Type of state aid instrument to be used for clearance:

☐ Notification ☐ GBER ☒ ABER ☐ de minimis

State Aid case number

SA.112038

Additional information:

☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.

☒ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.

☐ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

What are the models of the commitment(s) in the intervention?

- ☐ result based (with possibility to pick and choose)
- ☐ management based (with possibility to pick and choose)
- ☒ hybrid (management and result based)

Please explain the obligations/possibilities for beneficiaries in relation to the commitments set out in the intervention

Beneficiaries can choose between four different sub-measures. In particular, the creation of a new pool shall be result-oriented both in the case of in-situ establishment and ex-situ; in-situ or ex-situ maintenance sub-measures are typically management-based interventions.

What is the duration of contracts?

7 years

10 WTO compliance

Green Box

Paragraph 12 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

Under the present intervention, aid may be granted to pursue environmental objectives which are based on conditions clearly defined by the State as having an environmental objective, and the payment is subject to compliance with the conditions and management methods laid down.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD36_O19_A01_ON - Number of hectares for the conservation and development of forest genetic resources	Grant	91(3)(b) - 70-HU-50.00%	Average		R.30	No

Explanation and justification related to the value of the unit amount

RD36_O19_A01_ON - Number of hectares for the conservation and development of forest genetic resources

The UA is determined in a ‘average’ manner. The calculation is based on the implementation status of the Rural Development Programme: commitment figures (19 June 2022): 50 projects were committed for a total of 3.3 million euro of which a simple arithmetic average: EUR 56.000/application. However, factors affecting the planned targets and unit amounts from 2023 onwards:

—the intervention has been restructured: instead of 1-year and 7-year go-to areas, there will be a 7-year commitment for each target area.

—unit costs of grants have been valorised;

—new entrants are also expected.

Thus, the expected average size of an application (operation): EUR 200.000.

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029
RD36_O19_A01_ON - Number of hectares for the conservation and development of forest genetic resources (Grant - Average)	Planned unit amount (Total Public Expenditure in EUR)	0.00	200,000.00	200,000.00	200,000.00	200,000.00	200,000.00	200,000.00

	Out of which needed to reach the minimum financial allocation set out in Annex XII (Union Contribution in EUR)								

RD39_F06_AFM_70 - Maintenance of investments in afforestation and support for income replacement

Intervention Code (MS)	RD39_F06_AFM_70
Intervention Name	Maintenance of investments in afforestation and support for income replacement
Type of Intervention	ENVCLIM(70) - Environmental, climate-related and other management commitments
Common Output Indicator	O.16. Number of hectares or number of other units under maintenance commitments for afforestation and agroforestry
Contributing to ringfencing requirement for/on	Generational Renewal: No Environment: Yes ES rebate system: Yes LEADER: No

1 Territorial scope and, if relevant, regional dimension

Territorial scope: **National**

Code	Description
HU	Magyarország

Description of the Territorial Scope

The whole territory of Hungary.

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO4 Contribute to climate change mitigation and adaptation, including by reducing greenhouse gas emission and enhancing carbon sequestration, as well as promote sustainable energy

SO8 Promote employment, growth, gender equality, including the participation of women in farming, social inclusion and local development in rural areas, including the circular bio-economy and sustainable forestry

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
4.2.2	Reduction of GHG and atmospheric load gases emissions using forestry tools	2	Yes
4.4.2	Review of the use of arable land at the boundary of economics	2	Yes
4.4.3	Improving the water retention capacity of soils and ecosystems by encouraging land-use change	1	Yes
8.6.1	Increase the scope and added value of forest benefits, improve profitability	3	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.30 Share of forest land under commitments to support forest protection and management of ecosystem services

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Objective: A change in land use through afforestation with a very costly and long pay-back period will only be attractive to land users if nursing work is supported until completion, as well as compensation for

lost agricultural income.

Content: Maintenance tasks of forest planted with EAFRD support and compensation for lost agricultural income

Target selection procedure: depending on the different costs of nursing forest stands defined in the four target stock groups, the unit costs for nursing support and the time intervals for the grant of the support also differ.

Selection principles: not relevant

Relevant legislation:

Act XXX VII of 2009 on forests, forest protection and forest management

61/2017. (XII. Decree No 21 of the Minister for Agriculture on the implementation of Act XXXVII of 2009 on forests, forest protection and forest management

Government Decree No 383/2016 (XII. On the designation of bodies performing official and administrative tasks in the field of agriculture

Complementarity: information, training and advice needed for new forest managers

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiary:

- Eligible forest manager

Other eligibility criteria:

- Forest that has benefited from EAFRD support for investment in afforestation, with a minimum eligible area of: 0.5 ha
- Whereas this measure falls outside the scope of Article 42 TFEU (see point 8), with the exception of de minimis aid, **no aid may be granted** to a beneficiary on the basis of Commission Regulation (EU) No 702/2014
- it is a firm in difficulty (the concept of a firm in difficulty is defined in Article 37/2011 on the procedure for State aid within the meaning of EU competition law and on the regional aid map. (III. Section 6(4a) and (4b) of Government Decree No 273/2007) or
- the European Commission failed to comply with the decision addressed to Hungary to repay State aid within the meaning of EU competition law.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Form of the aid: per hectare of unit cost

Commitments:

1. subsidised nursing activities must be carried out,
2. at the latest before payment of the last care allowance, official certificate declaring the forest to be completed
3. The stand is included in the forest stock repository

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

List of relevant GAEC and SMR

Code	Description

List of relevant mandatory national standards

Act XXX VII of 2009 on forests, forest protection and forest management

61/2017. (XII. Decree No 21 of the Minister for Agriculture on the implementation of Act XXXVII of

2009 on forests, forest protection and forest management
Government Decree No 383/2016 (XII. On the designation of bodies performing official and administrative tasks in the field of agriculture

Link between GAEC, SMR and national standards with the intervention

Not relevant.

7 Form and rate of support/amounts/calculation methods

☒ IACS

☐ Non-IACS

IACS section

Type of payment

☒ unit cost based on additional costs and income foregone

☐ transaction cost included

☐ one off payment

☐ lump sum

Range of support at beneficiary level

Treatment costs: depending on the type of target deployed, differentiated unit costs of support have been established at different time intervals. We used the RDP unit costs valorised in 2019 and 2020. The calculation is made without industrial plantations to be planted (no income replacement support). Depending on the type of target stock to ensure the existence and success of afforestation, the first export care allowance may be financed for a period of 5 to 11 years, and income support may be financed for 12 years for all target stocks. The replacement of agricultural income foregone is set at a single average amount if agricultural production took place on the area in question in the previous year(s).

Aid amounts (unit amount/ha/year):

For all four target groups, the replacement of income foregone is EUR 432/ha/year. The period of income support shall be 12 years for each target stock type group.

Target stock type group	Forestation	
	Average unit cost for care from year 2 onwards	
	period of care (year)	average cost of nursing (euro/ha/year)
Oak, beech and other hard foliage	11	605
Other soft foliage and pine	8	328
Acacia	5	320
Noble mink	5	320

Calculation method

We used the RDP unit costs valorised in 2019 and 2020.

Additional explanation

Not relevant.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☒ Yes ☐ No ☐ Mixed

Explanation of support activities falling outside the scope of Art. 42 TFEU

The forestry sector is a sector outside the scope of Article 42 TFEU, so that the aid granted to it is subject to the competition rules (State aid rules).

Type of state aid instrument to be used for clearance:

☐ Notification ☐ GBER ☒ ABER ☐ de minimis

State Aid case number
SA.112038

Additional information:

- ☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.
- ☐ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.
- ☒ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

What are the models of the commitment(s) in the intervention?

- ☐ result based (with possibility to pick and choose)
- ☒ management based (with possibility to pick and choose)
- ☐ hybrid (management and result based)

Please explain the obligations/possibilities for beneficiaries in relation to the commitments set out in the intervention

The beneficiary must perform the forest care tasks, as a result of which the forestry authority takes over the forest as completed at the latest before the last payment.

What is the duration of contracts?

Nursing: depending on the target population group: From 5 to 11 years
Replacement of lost agricultural income: (if the applicant is entitled to it) 12 years uniformly

10 WTO compliance

Green Box

Paragraph 11 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

Under the present intervention, aid may be granted to pursue environmental objectives which are based on conditions clearly defined by the State as having an environmental objective, and the payment is subject to compliance with the conditions and management methods laid down.

Contributing to ringfencing requirement for/on	Generational Renewal: No Environment: Yes ES rebate system: Yes LEADER: No

1 Territorial scope and, if relevant, regional dimension

Territorial scope: **National**

Code	Description
HU	Magyarország

Description of the Territorial Scope

The area of implementation of the intervention is Hungary

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO1 Support viable farm income and resilience of the agricultural sector across the Union in order to enhance long-term food security and agricultural diversity as well as to ensure the economic sustainability of agricultural production in the Union

SO6 Contribute to halting and reversing biodiversity loss, enhance ecosystem services and preserve habitats and landscapes

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
1.1.1	Predictable basic income for farmers	2	Yes
6.1.1	Conservation or improvement of the natural condition of Natura 2000 farmland habitats	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.4 Share of utilised agricultural area (UAA) covered by income support and subject to conditionality

R.7 Percentage of additional support per hectare in areas with higher needs (compared to average)

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Purpose of the intervention

The Natura 2000 network ensures the conservation of biodiversity through the protection of natural habitat types and species of wild fauna and flora of Community interest and helps to maintain or restore their favourable conservation status.

Payments for Natura 2000 grasslands are intended to compensate farmers and other land users

1. Council Directive 2009/147/EC of 30 November 2009 on the conservation of wild birds

(hereinafter: Birds Directive) and

2. Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (hereinafter: Habitats Directive)

additional costs and revenue foregone resulting from its implementation.

Content of the intervention

Land use in different fields contributes to varying degrees to the maintenance of the living and species of Natura 2000 sites and to the conservation of biodiversity, and therefore the conservation of grassland and forest areas in Hungary has been laid down for these two types of land at the time the compensatory aid is paid, including the mandatory legislation and the district fortress plans for these two types of land. Compensation payments for Natura 2000 forest areas will be developed as a separate intervention (RD23_G06_NAG_72 – *Compensation payments for Natura 2000 agricultural areas*).

No 269/2007 on land **use rules for the maintenance of Natura 2000 grasslands for grassland areas** in the Natura network. Government Decree (X. 18.) (hereinafter: Natura 2000 Land Use Regulation (Natura 2000 Land Use Regulation)) applies uniform land use standards for, inter alia, the following practices:

1. protection of the grassland surface, prevention of damage;
2. nutrient supply regulation;
3. the conservation of grassland-related wildlife;
4. preventing the spread of invasive and off-farm plant species;
5. avoidance of abandonment.

The compensatory allowance shall be determined on the basis of the additional costs resulting from compliance with the above legal provisions, as well as the loss of income, in order to compensate them, which farmers who meet the eligibility criteria may claim each year in the form of non-repayable support.

Given that, at the moment of submission of the CAP Strategic Plan, there is no legislation in force that would impose uniform binding land use standards on agricultural land other than grasslands (e.g. arable land), it is not possible to grant compensatory payments for land under other agricultural use. If the legislation on which the compensation is based is enacted and enters into force, the conditions for compensatory support will also be available and, if necessary, the compensatory allowance may be introduced by amending the CAP Strategic Plan and ensuring an appropriate financial envelope.

Continuation or further development of measure 213 of the New Hungary Rural Development Programme developed and operated during the 2007-2013 period and sub-measure M 12.1 of the Rural Development Programme 2014-2022.

In order to preserve and improve the favourable nature status of the Natura 2000 network, we wish to maintain the three-tier system established in previous periods which delivers the right results both in terms of preserving agricultural diversity in line with Gothenburg's aspirations and in terms of social acceptance of the Natura 2000 network:

1. Level 1: No 275/2004 on areas of conservation of *European Community importance*. Government Decree (X.8) contains the rules on the demarcation of Natura 2000 sites and the basic requirements in accordance with the Directives, compliance with which is mandatory in all designated Natura 2000 sites, irrespective of the way in which they are used. The purpose of the regulation is to preserve the extent of the designated Natura 2000 sites, to reduce the use for purposes other than those carried out at the time of designation (e.g. installation, grassland breakage) and to preserve the basic conditions of the network. In particular, the Government Decree regulates activities which could, where appropriate, jeopardise the natural condition on which the delimitation of Natura 2000 sites is based. The scope of the Decree extends to all Natura 2000 sites regardless of their use and, as requirements 3 and 4 of the SMR, are part of the system of conditionality. Compensation payments for compliance with these requirements cannot be granted, as compliance

with them does not result in direct increases in costs or loss of income affecting agricultural activities.

2. Level 2 a: The regulation of nature conservation land use of grasslands with the highest natural value of the agricultural cultivation and the operation of a payment system to compensate for it. No269/2007 on land use rules for the maintenance of *Natura 2000 grasslands*. *Government Decree* (X. 18.) and the purpose of the compensation is to achieve and preserve the favourable nature status of *Natura 2000* grasslands. The land use specifications are later.
3. Level 2b: In the case of *Natura 2000* areas in forestry, forest managers are eligible for aid to compensate for loss of income and additional costs resulting from compliance with the restrictions in the binding forest plan decisions issued for each forest area (Measure RD23_G06_NAG_72)
4. Level 3: Development type measures – The *Natura 2000* maintenance plans for each *Natura 2000* site include the proposed interventions and conservation management practices for the conservation of habitats and species. These proposals are not legally binding, they are not mandatory and therefore cannot constitute a basis for compensation, but some of the proposed activities can be claimed under the agri-environmental and climate change measures available to land users under a voluntary scheme (RD19_G01_AEC_70), the Forest Environment Programme (RD35_F02_FEC_70) and the agro-ecological non-productive investments and their maintenance for nature conservation (RD21_G04_LCI_73 and RD22_G05_LCP_70). The purpose of these measures is to compensate for habitat development and conservation requirements that improve the natural condition.

Link to other CAP ST interventions:

1. The land use standards for *Natura 2000* grasslands and the *grassland management standards of the DP17_G01_ECOS_16* - Agro-ecological programme (AÖP) partially overlap. In order to avoid overcompensation, compliance with the cost-related requirements in both places can only be compensated under one of the aids. If the farmer intends to apply for both types of aid for the same area, it would be doubled to support the same standards, so the overlapping provisions (see description of the AÖP measure) cannot be selected in *Natura 2000* grasslands when applying for AÖP support.

1. The land use standards for *Natura 2000* grasslands and the AKG grassland management standards overlap in whole or in part. If a farmer wishes to benefit from both types of aid in the same area, it would receive double support for compliance with the same standards. In order to avoid overcompensation, compliance with the cost-related requirements in both areas can only be compensated within the framework of one aid scheme, so in the case of the use of *Natura 2000* grassland aid, the amount of AKG aid for the same area will be reduced by the sub-aid for the “common” standards.

• RD58_A01_TRA_78 – Training and demonstration support

Selection criteria:

We do not plan to introduce a scoring assessment when selecting grant applications.

Any other relevant information:

Given that, at the moment of the submission of the CAP Strategic Plan, there is no legislation in force that would constitute an appropriate basis for the so-called VKI (WFD) compensatory allowance under Article 72(3)(c) and (5)(b) of the STR Regulation, it is not possible to grant compensatory aid for the agricultural areas affected by the river basin management plan. IN POINT 3. The National River Basin Management Plan was adopted on 28 April 2022, but it still does not contain binding land use standards that could form the basis for a WFD compensatory payment. If the legislation on which the compensation is based is enacted and enters into force, the conditions for compensatory support will also be available and, if necessary, the WFD compensatory allowance may be introduced by amending the CAP Strategic Plan and

ensuring an appropriate funding framework.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligibility criteria:

- Farmer who is covered by Decree 275/2004 on nature protection areas of European Community importance Manages Natura 2000 grassland, including temporary grasslands and wooded meadows and pastures, designated on the basis of Gov. Decree (X. 8.) and delimited in the LPIS
- The area covered by the aid shall be at least 1.0 ha of grassland or arable land with a minimum size of 0.25 ha eligible for support.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Type of aid:

- The aid intensity of the intervention is 100 %.
- Payment shall be made annually per hectare of eligible area.
- Compensation for additional costs and income foregone resulting from the implementation of the Birds Directive and the Habitats Directive, in the amount of the payment per hectare, shall be considered eligible expenditure for the intervention.
- Farmers applying for aid are guaranteed to receive compensation if they meet the eligibility criteria.
- No regional differentiation will be applied in the context of the intervention.
- No scoring system will be introduced during the assessment of applications and applications will not be rejected on the grounds of lack of resources.
- In order to avoid overcompensation, farmers in Natura 2000 grassland areas receive a reduced amount under AEM sub-measures compared to non-Natura 2000 grassland farmers because of the higher baseline requirements for AEM in Natura grasslands.
- In determining the level of compensation, we first defined the land use standards and their agronomic effects, then assessed the impact of the factors causing loss of income/increase or cost reduction/increase, and finally, by summarising the effects of the aforementioned factors, the level of compensation was established.

Liabilities:

- The aid applicant must comply with
 - the requirements laid down in the relevant Natura 2000 Land Use Regulation;
 - Annex III to the Strategic Plan Decree;
 - minimum requirements for the maintenance of the agricultural area.
- The aid applicant must take part in a training course on Natura 2000 grassland.
- Mandatory keeping of the Farming Log for grasslands.
- Tolerance of biodiversity impact monitoring activities under the National Biodiversity Monitoring System.

Land use rules for the maintenance of Natura 2000 grasslands (a. 269/2007. Government Decree No 487/2015 of 18 October 2004 On the basis of a decree – as in force on 19 May 2022)

Section 3(1) grassland shall be used by grazing or mowing.

(2) Only cattle, sheep, goats, asses, horses and buffaloes may be grazed on grassland.

(3) Over-grazing of grassland is prohibited.

(4) Permanent damage to the grassland surface during farming activities is prohibited.

(5) The supply of nutrients may only come from faeces which have died by grazing animals, and manure spreading is prohibited.

Section 4 (1) At least 5 %, up to a maximum of 10 % of the area, including land subject to ad hoc restrictions imposed by an administrative decision in the interest of nature conservation, shall be left unmown in a place varying according to mowing.

(2) Drainage of inland water from grassland and irrigation of grassland is prohibited.

(3) Mechanical work is prohibited from sunset to sunrise.

(4) Natura 2000 grasslands designated as protected natural areas of local importance on Natura 2000 grasslands are subject to authorisation from the notary of the municipality, the chief notary in the capital, which is issued in the exercise of the authority of the nature conservation authority:

(a) for the eradication of reeds, and
grazing from 31 October to 23 April.

(5) The construction of game management facilities and equipment is subject to authorisation from the hunting authority. An application may be submitted to the hunting authority by means of an electronic form.

Section 5(1) The mowing shall be carried out starting from the centre of the area to be mown or at the edge of the table, without limiting the animals living there to the enclosure. During mowing, the use of a wild repellent chain is mandatory.

(2) The establishment and spread of invasive and extraterritorial plant species should be prevented, their herd reduced by mechanical control or specific pesticide application, the use of chemicals in addition to this technology should be prohibited.

(3) The planned mowing date must be notified in writing by the land user to the National Park Directorate of the area of operation at least five working days before the start of the activity. If, during the protection referred to in paragraph (2), the land user is unable to comply with the 5 % limit laid down in Section 4(1), it shall notify this to the National Park Directorate of the area of operation at the same time as the prior notification of the date of mowing.

(4) The storage of fibrous fodder on grassland shall be prohibited more than 30 days after mowing.

O13 What area is eligible?

☒ Natura 2000 agricultural area

☐ Natura 2000 forest area

☐ Other delimited nature protection areas with environmental restrictions applicable to farming or forests which contribute to the implementation of Article 10 of Directive 92/43/EEC

☐ Agricultural areas included in river basin management plans (Water Framework Directive)

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

List of relevant GAEC and SMR

Code	Description
GAEC01	Maintenance of permanent grassland based on a ratio of permanent grassland in relation to agricultural area at national, regional, sub-regional, group-of-holdings or holding level in comparison to the reference year 2018. Maximum decrease of

	5% compared to the reference year.
GAEC09	Ban on converting or ploughing permanent grassland designated as environmentally-sensitive permanent grasslands in Natural 2000 sites

List of relevant mandatory national standards

NJSZ– Sections 6(2), 7(1), 8(1), 16(1), 17(1) and 17(1) of Act LIII of 1996 on nature protection

The conservation of wild organisms, their populations and communities must go hand in hand with the conservation of their habitats, that all activities must be carried out in a manner that preserves natural values and areas in order to preserve the habitats of wild organisms and their biodiversity, as well as to ensure sustainable use, including sustainability, the use of nature-friendly methods and the protection of biodiversity. It is also necessary to preserve the natural and semi-natural condition of the landscape and to ensure that the natural assets, natural systems and specific landscape features that determine the aesthetic features of the landscape and its nature are maintained, taking into account historically established nature-friendly uses.

Link between GAEC, SMR and national standards with the intervention

Land use rules for the maintenance of NATURA 2000 grasslands (269/2007. Government Decree No 487/2015 of 18 October 2004 Regulation)	Related reference regulation (SMR – statutory economic operator requirements or NJSZ – Other binding requirements laid down in national legislation and GAEC requirements)	Relationship between the reference regulation and the AÖP specifications
Section 3(1) grassland shall be used by grazing or mowing.	NJSZ – Sections 6(2), 7(1), 8(1), 16(1), 17(3) of Act LIII of 1996 on nature protection	The relevant reference elements do not require use by grazing or mowing
(2) Only cattle, sheep, goats, asses, horses and buffaloes may be grazed on grassland.		The relevant reference elements do not require grazing species
(3) Over-grazing of grassland is prohibited.	The conservation of wild organisms, their populations and communities must go hand in hand with the conservation of their habitats, that all activities must be carried out in a manner that preserves natural values and areas in order to preserve the habitats of wild organisms and their biodiversity, as well as to ensure sustainable use, including sustainability, the use of nature-friendly methods and the protection of biodiversity. It is also necessary to preserve the natural and semi-natural condition of the landscape and to ensure that the natural assets, natural systems and specific landscape features that determine the aesthetic features of the landscape and its nature are maintained, taking into account historically established nature-friendly uses.	The relevant reference elements do not address the issue of overgrazing
(4) Permanent damage to the		The relevant reference elements do not

grassland surface during farming activities is prohibited.		address the issue of grass surface damage
(5) The supply of nutrients may only come from faeces which have died by grazing animals, and manure spreading is prohibited.	GAEC 1 – Maintenance of the ratio of permanent grassland at Member State level	The relevant reference elements do not prescribe nutrient management rules.
Section 4 (1) At least 5 %, up to a maximum of 10 % of the area, including land subject to ad hoc restrictions imposed by an administrative decision in the interest of nature conservation, shall be left unmown in a place varying according to mowing.		The relevant reference elements do not impose mowing restrictions.
(2) Drainage of inland water from grassland and irrigation of grassland is prohibited.	GAEC 9 – Prohibition of conversion or ploughing of grassland designated as environmentally sensitive permanent grassland in Natura 2000 sites	The relevant reference elements do not impose restrictions on the drainage of inland water.
(3) Mechanical work is prohibited from sunset to sunrise.		The relevant reference elements do not impose restrictions on night work.
(4) * In the case of Natura 2000 grasslands designated as protected natural areas of local importance, the authorisation of the notary of the municipality and the chief notary in the capital is required by the local authority, which is issued in the exercise of its powers of nature conservation authority:	Minimum requirements for the maintenance of agricultural land pursuant to Article 4(2) of the SPR Regulation:	The relevant reference elements do not contain specifications for the different authorisations.
(a) for the eradication of reeds, and	Permanent grassland shall be considered to be maintained in good condition if it does not have any deterioration (overgrazing) of permanent grassland resulting from an inappropriate grazing method in which the grass becomes thinned in patches as a result of short chewing and adhesion of herbaceous grasses and where at least 50 % of the soil surface is uncovered, and the permanent grassland, if there is no agricultural	

	production in the reference year, predominates grassy grass species, other than cane, and forage crops, and there is no increment remaining in the vegetation period preceding the reference year for which the propagation formulae have been opened.	
grazing from 31 October to 23 April.		
(5) * The construction of hunting facilities and equipment is subject to authorisation from the hunting authority. An application may be submitted to the hunting authority by means of an electronic form.		The relevant reference elements do not contain specifications for the different authorisations.
Section 5(1) The mowing shall be carried out starting from the centre of the area to be mown or at the edge of the table, without limiting the animals living there to the enclosure. During mowing, the use of a wild repellent chain is mandatory.		The relevant reference elements do not impose mowing restrictions.
(2) The establishment and spread of invasive and extraterritorial plant species should be prevented, their herd reduced by mechanical control or specific pesticide application, the use of chemicals in addition to this technology should be prohibited.		The relevant reference elements do not prohibit the use of chemicals and do not constrain the methods of control against invasive and non-domestic plant species to mechanical control or specific pesticide application.
(3) The planned mowing date must be notified in writing by the land user to the National Park Directorate of the area of operation at least five working days before the start of the activity. If, during the protection referred to in paragraph (2), the land user is unable to comply with the 5 % limit laid down in Section 4(1), it shall notify this to the National Park Directorate of the area of operation at the same time as		The relevant reference elements do not impose mowing restrictions.

the prior notification of the date of mowing.		
(4) The storage of fibrous fodder on grassland shall be prohibited more than 30 days after mowing.		The relevant reference elements do not impose restrictions on the storage of fibrous feed.

7 Form and rate of support/amounts/calculation methods

Type of payment

- ☒ unit cost based on additional costs and income foregone
- ☐ transaction cost included
- ☐ one off payment
- ☐ lump sum

Range of support at beneficiary level

The aid intensity is 100 %.

The unit cost shall be EUR 115/ha per year.

Calculation method

Calculation method:

- Compensation for additional costs incurred and income foregone resulting from the implementation of the Birds Directive and the Habitats Directive, in the amount of the payment per hectare, shall be considered eligible costs for the intervention. The payment shall be made annually, per hectare of eligible area.
- In determining the level of compensation, we first determined the agronomic effects of land use standards, then assessed the impact of the factors causing loss of income/increase and/or cost reduction/increase, and finally determined the level of compensation by summarising the effects of the aforementioned factors.
- In order to assess the agronomic impact, data from the Test Plant System (FADN) of the Institute of Agricultural Economics (FADN) on the production value and the costs of certain crops at sectoral level, as well as the research results of the Institute for Agricultural Training of the National Centre for Agricultural Research and Innovation, the current farm labour service fees and expert calculations, were assessed as data sources for the assessment of agronomic impact.
- The calculation shall be based on the determination of the additional costs incurred by the standards and the extent of the loss of income. When calculating the aid amount, the expected income development of compliant farmers is compared with farms where Natura 2000 standards are not applied. This makes it possible to ensure that, in practice, the types of farming that are common are not subsidised, but only the increased standards are the basis for the compensation.
- Foreach standard, the enrolments and costs determining income are grouped into 4 categories.

1. Expected revenue shortfall

2. Expected revenue growth

3. Expected Additional Costs

4. Expected cost reduction

- The calculation was determined separately for each specification using the data sources and expert estimates described above. Where it is not possible to attribute a uniformly identifiable cost increase or loss of revenue to the standard, the compensation of the standard shall be zero. These requirements typically cover restrictions that may occur, which may not affect all areas or farmers, such as the ban on drainage, so that it is not possible to establish a single cost increase or loss of income for all farmers. Requirements that do not generate cost increases or revenue losses are also requirements e.g. reporting obligations.
- In all cases, it is important that, since the payment is made on an annual and per hectare basis, a correction has been applied when determining the level of compensation. As an example, costs

related to livestock fertilisation or soil sampling are carried out once every 3 years and once in the last 5 years. In such cases, the costs were fixed in equal proportions per year.

- The intervention does not apply regional differentiation.

The level of compensation was determined as follows (the detailed calculation methodology is attached as an annex):

Land use rules for maintaining NATURA 2000 grassland (269/2007. Government Decree No 487/2015 of 18 October 2013 On the basis of a Regulation)	Cost increase	Loss of revenue	Total compensation for standard (EUR/ha)
Section 3(1) The grassland shall be used by grazing or mowing.	Cost increase cannot be attributed to the standard	Loss of revenue cannot be attributed to the standard	0
(2) Only cattle, sheep, goats, asses, horses and buffaloes may be grazed on grassland.	Cost increase cannot be attributed to the standard	Loss of revenue cannot be attributed to the standard	0
(3) Overgrazing of grassland is prohibited.	Cost increase cannot be attributed to the standard	Loss of revenue cannot be attributed to the standard	0
(4) Permanent damage to the grassland surface during farming activities shall be prohibited.	Cost increase cannot be attributed to the standard	Loss of revenue cannot be attributed to the standard	0
(5) Nutrient fertilisation may only come from excrements dead by grazing animals, manure spreading is prohibited.	Cost increase cannot be attributed to the standard	reduction of hay yield due to restrictions on nutrient application	62
Section 4 (1) A minimum of 5 % and a maximum of 10 % of the area, including land subject to ad hoc restrictions in the interest of nature conservation imposed by an administrative decision, shall be left unmown in varying places per mowing.	Cost increase cannot be attributed to the standard	decrease in yield due to mowing restriction	41
(2) Drainage of inland water from grassland and irrigation of grassland is prohibited.	Cost increase cannot be attributed to the standard	Loss of revenue cannot be attributed to the standard	0
(3) From sunset to sunrise, mechanical work is prohibited.	Cost increase cannot be attributed to the standard	Loss of revenue cannot be attributed to the standard	0
(4) * In the case of Natura 2000 grasslands classified as protected areas of local importance, Natura 2000 grassland is subject to authorisation by the local authority's notary and the notary in the capital, in accordance with its powers as nature conservation authority: (a) for the destruction of the reed, and (b) grazing between 31 October and 23 April.	Cost increase cannot be attributed to the standard	Loss of revenue cannot be attributed to the standard	0
(5) * For the construction of farming facilities	Cost increase cannot	Loss of revenue	0

and equipment, authorisation by the hunting authority is required. The application may be submitted to the hunting authority by means of an electronic form.	be attributed to the standard	cannot be attributed to the standard	
Section 5(1) The mowing shall be carried out either from the centre of the area to be mown or from the edge of the plate, without limiting the animals living there to the cover area. The use of a wild repellent chain during mowing is mandatory.	Higher unit cost of machinery	Loss of revenue cannot be attributed to the standard	12
(2) The establishment and spread of invasive and off-site plant species must be prevented, their populations must be reduced by mechanical control or special pesticide application, and the use of chemicals other than this technology is prohibited.	Cost increase cannot be attributed to the standard	Loss of revenue cannot be attributed to the standard	0
(3) The planned date of mowing shall be notified in writing by the land user to the National Park Directorate of the operational area at least five working days before the start of the activity. If, during the protection referred to in paragraph (2), the land user is unable to comply with the 5 % limit laid down in Section 4(1), he shall notify the national park directorate of the operational area at the same time as his prior notification of the date of mowing.	Cost increase cannot be attributed to the standard	Loss of revenue cannot be attributed to the standard	0
(4) On grassland, the storage of forage is prohibited for more than 30 days after mowing.	Cost increase cannot be attributed to the standard	Loss of revenue cannot be attributed to the standard	0
Total			115

Additional explanation

In order to avoid overcompensation, farmers in Natura 2000 grassland areas will receive a reduced amount under the AKG sub-measures compared to farmers in non-Natura 2000 grasslands because the baseline requirements for AKG in Natura grasslands are higher.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

N/A

10 WTO compliance

Green Box

Paragraph 12 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The aid granted under the aid is clearly intended for nature conservation purposes. The aid is intended solely to compensate for the additional costs and income foregone resulting from compliance with the obligations.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(3)(b) - 72 - Payments under Article 72	50.00%	20.00%	80.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD23_O13_U01_HA - Natura 2000 agricultural land compensation	Grant	91(3)(b) - 72-HU-50.00%	Uniform		R.4; R.7	No

Explanation and justification related to the value of the unit amount

RD23_O13_U01_HA - Natura 2000 agricultural land compensation

In determining the level of compensation, we first determined the land use standards and their agronomic effects, then assessed the impact of the factors causing loss/increase or cost reduction/increase, and finally established the level of compensation by summing up the effects of the aforementioned factors.

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029

Description of the Territorial Scope

The area of implementation of the intervention is Hungary

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO1 Support viable farm income and resilience of the agricultural sector across the Union in order to enhance long-term food security and agricultural diversity as well as to ensure the economic sustainability of agricultural production in the Union

SO6 Contribute to halting and reversing biodiversity loss, enhance ecosystem services and preserve habitats and landscapes

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
1.1.1	Predictable basic income for farmers	2	Yes
6.3.1	Conservation or improvement of the natural condition of Natura 2000 and protected forest habitats	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.7 Percentage of additional support per hectare in areas with higher needs (compared to average)

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Targeting: Payments for the Natura 2000 forest network and protected and specially protected forest areas are intended to compensate forest managers under Council Directive 2009/147/EC of 30 November 2009 on the conservation of wild birds (hereinafter: The Birds Directive) and Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (hereinafter: The Habitats Directive) and the additional costs and income foregone resulting from the implementation of Act LIII of 1996 on nature protection.

The application of the intervention is also intended to increase the acceptance of voluntary compliance by forest managers, which can contribute to maintaining and improving the status of habitats and species of community interest or protected status.

The payment of compensation helps to improve habitats, while the absence of payment may lead/may lead to deterioration (if forest managers are not encouraged to comply with conservation measures and other Natura 2000 requirements).

The forest area designated by NATURA in Hungary accounts for 46 % of the total forest area, which, although the country does not have any high mountain regions at all, is twice as high as the European Union average. Hungary's Natura 2000 forest area is 772 008 ha and the area of protected and specially protected forest stands belonging to 1 to 4 naturalness categories is 26 939 ha, or 3.49 %.

Natura 2000 and habitat types of Community interest in protected and specially protected areas (9110 Lime bypass beech forests, 9130 Submontane and montane beech forests, 9150 Szikla beech forests, 9180 Sleeping and supporter gardens, 91E0 softwood geese, alder and ash groves, bogs, 91F0 Hard woody geese, 91G0 Pannonian oak woods, 91H0 Pannonian shoot oaks, 91I0 Euro-Siberian woody woods, 91N0 Pannonian sand junipers, 91K0 Illir beech forests, 91L0 Illir oak oak, 91M0 Pannonian oak oak) and species are sometimes subject to restrictions on forest management activities in order to maintain and maintain favourable conservation status in forests. The relevant provisions shall be laid down by the competent administrative bodies in the district forest plan.

The experience of compensatory support under the CAP to date confirms that it has a very educational effect in private forest management, contributes greatly to voluntary compliance with restrictions and increases the willingness and awareness of the conservation of older, valuable forest stands, and thus of the species and habitats to be protected.

The most common types of farming restrictions are: change of target stock or even mode of operation from cutting to permanent forest cover mode; protection of forest margins; keeping certain tree species intact and maintaining during forest breeding interventions in order to improve the structure and composition of the forest stands; time limits for the use of wood; total or partial restrictions on wood uses; restriction of cleaning, pre-selection thinning; restriction of incrementing thinning in case of stockkeeping use and end use; abandoning and maintaining deadwood; abandoning and maintaining abandonment trees and groups of abandoned trees in the event of end use; removal and maintenance of trees with specific characteristics (breaky, thrust, nesting, etc.).

The competent state administration bodies carried out as a matter of priority the review of the forest plan requirements relating to the area of operation of each forest manager in accordance with the Natura 2000 criteria and Act LIII of 1996 on nature protection. As a result, where Natura 2000 was necessary in a protected or specially protected area, the forest plan requirements were amended and the management activities of the forest manager were restricted.

From 2011 onwards, the competent authority shall draw up a Natura 2000 impact assessment for each district forest plan, taking it into account, and the district forest plan may only be approved. In carrying out their annual forest management activities on the basis of the forest plan requirements, forest managers must therefore ensure, in a manner supervised by the competent authority, the maintenance and maintenance of the favourable conservation status of Natura 2000 and of the habitats and species of Community interest underlying their designation in protected or specially protected forests.

Directives 2009/147/EC and 92/43/EEC and Act LIII of 1996 on nature protection

As a result of the enforcement of Natura 2000 and its provisions on protected or specially protected forest areas, forest management activities can be carried out at different levels of restriction compared to the established practice, resulting in additional costs and income losses for the forest manager. To compensate for this, forest managers receive an area-based compensatory payment.

Selection criteria: not relevant

Relevant legislation:

Act XXXVII of 2009 on forests, forest protection and forest management

Act LIII of 1996 on nature protection

275/2004. Government Decree No 487/2015 of 8 October 2007 on nature protection areas of European Community importance

61/2017. (XII. Decree No 21 of the Minister for Agriculture on the implementation of Act XXXVII of 2009 on forests, forest protection and forest management

Ordinance No 383/2016 (Decree No 383/2016) On the designation of bodies performing official and administrative tasks in the field of agriculture

Link to other measures:

- forest interventions (RD35, RD41 and RD37) to improve the environment or to adapt to the climate (selection criteria) are favoured for stocks protected or specially protected under NATURA 2000 or national legislation
- in the AKIS-type interventions (RD58, RD59, RD60), one of the key areas for knowledge enhancement and knowledge transfer is to raise awareness of climate-resilient and closer-to-nature forest management methods, as well as to raise awareness of the regulatory and monitoring legislative process expected in the EU and to prepare farmers.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiaries:

- registered forest managers
- The forest manager carries out sustainable forest management, i.e. its management complies with Act XXXVII of 2009 on forests, forest protection and forest management and the district forest plan, and is not subject to forest protection or conservation sanctions.

Eligibility criteria:

- the forest section has been designated on the basis of Directive 2009/147/EC or Directive 92/43/EEC as part of the NATURA 2000 network or as part of the NATURA 2000 network, but designated pursuant to Act LIII of 1996 on nature protection, which is natural under Article 7(1)(a)-(d) of Act XXXVII of 2009 and
- the area has a forest plan.
- minimum eligible area 1 ha
- Government Decree No 135/2017 on ligneous plantations is not eligible for aid. (VI. Plantations established on the basis of Government Decree No. 9)

As this measure falls outside the scope of Article 42 TFEU (see point 8), **no aid may be granted** to a beneficiary under Commission Regulation (EU) No 702/2014, with the exception of de minimis aid

- it is considered to be a firm in difficulty (the concept of a firm in difficulty is defined in Decree 37/2011 on the procedure for State aid for the purposes of EU competition law and on the regional aid map. (III. As defined in Section 6(4a) and (4b) of Government Decree No 487/2015, or
- it failed to comply with the decision of the European Commission addressed to Hungary requiring the recovery of State aid within the meaning of EU competition law.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Form of the aid: Unit cost

Obligation: The beneficiary shall comply with the Natura 2000 or protected or highly protected forest management requirements set out in the district forest plan.

O13 What area is eligible?

☐ Natura 2000 agricultural area

☒ Natura 2000 forest area

☒ Other delimited nature protection areas with environmental restrictions applicable to farming or forests which contribute to the implementation of Article 10 of Directive 92/43/EEC

☐ Agricultural areas included in river basin management plans (Water Framework Directive)

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

List of relevant GAEC and SMR

Code	Description

List of relevant mandatory national standards

Act XXXVII of 2009 on forests, forest protection and forest management

Act LIII of 1996 on nature protection

61/2017. (XII. FM Decree on the implementation of Act XXXVII of 2009 on forests, forest protection and forest management

Government Decree No 383/2016 (XII. On the designation of bodies performing official and administrative tasks in the field of agriculture

275/2004. Government Decree No 487/2015 of 8 October 2004 on nature protection areas of European Community importance

Link between GAEC, SMR and national standards with the intervention

For forest stands protected under NATURA 2000 and under national legislation, the content of the protection and the corresponding restrictive or prescriptive provisions going beyond the sustainable forest management requirements laid down in the Forest Act must be included in the mandatory forest planning process every 10 years. In these cases, the competent authorities (nature protection, environment, water) are required to be involved in the planning process.

7 Form and rate of support/amounts/calculation methods

Type of payment

☒ unit cost based on additional costs and income foregone

☐ transaction cost included

☐ one off payment

☐ lump sum

Range of support at beneficiary level

Natura 2000 forest payment in case of crop forest or tree plantation

Tree stock type group by age group	Support rate in euro/ha/year
1.Oak beech, other hard foliage, Hungus other softwood, Other woods in the age group 0-5	51
2.Oak beechs in the age group 6-20	127
3.Other hardwood between 6 and 20 years old	114
4.Other soft foliage 6 to 20 years old	101
5.Other forest age group 6 to 60	88
6.Oak beech age group 21-60	191
7.Other hardwood up to 21-slaughter age	152

8.Other softwood 21 age bracket up to effective end use (VHK)	139
9.Other forest 61 – actual VHK age group	114
10.Oak-bükk 61- effective VHK age group	255
11.Other hardwood age – effective VHK age bracket	215

Natura 2000 forest and protected and specially protected payments for derivatives and transitional forests

Tree stock type group by age group	Support duty euro/ha/year
12.Oak beech, other hard foliage, Hischionous other softwood, Other woods in the age group 0-5	55
13.Oak beechs in the age group 6-20	138
14.Other hardwood between 6 and 20 years old	123
15.Other soft foliage 6 to 20 years old	110
16.Other forest age group 6 to 60	96
17.Oak beech age group 21-60	206
18.Other hardwood up to 21-slaughter age	165
19.Other soft foliage 21 to effective end use (VHK)	151
20.Other forest 61 – actual VHK age group	123
21.Oak oak bükk 61- effective VHK age group	276
22.Other hardwood age – effective VHK age bracket	233

Natura 2000 forest is also protected and specially protected payments for natural and nature-like forests

Tree stock type group by age group	Grant rate euro equivalent /ha/year
23.Oak beech, other hard foliage, Hischionous other softwood, Other woods in the age group 0-5	60
24.Oak beech between 6 and 20 years old	148
25.Other hardwood between 6 and 20 years old	132
26.Other soft foliage 6 to 20 years old	118
27.Other forest age group 6 to 60	103
28.Oak beech age group 21-60	222
29.Other hardwood up to 21-slaughter age group	178
30.Other soft foliage 21 to effective end use (VHK)	163
31.Other forest 61 – actual VHK age group	132
32.Oak-bükk 61- effective VHK age group	297
33.Other hardwood age – effective VHK age bracket	251

Calculation method

In the period starting in 2023, we make use of the possibility provided by Regulation (EU) 2021/2115 of 5 % of compensatory aid for NATURA 2000 sites that are not Natura 2000 but also protected areas. According to the decision of the Ministry of Agriculture, areas of protected but non-Natura 2000 nature are not eligible for support from areas classified as cultural forests and tree plantations, excluding the area of protected or specially protected forests, calculated as 3.49 %. The development of the categories of unit

costs of support is the separate annexed "CAP Strategic Plan Hungary 2023-2027 cost unit costs prepared by the Forest Science Institute of Soproni University as an expert organisation independent of AM: unit costs).

Additional explanation

Not relevant.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☒ Yes ☐ No ☐ Mixed

Explanation of support activities falling outside the scope of Art. 42 TFEU

The competition rules (State aid rules) apply to aid to the forestry sector.

Type of state aid instrument to be used for clearance:

☐ Notification ☐ GBER ☒ ABER ☐ de minimis

State Aid case number

SA.112038

Additional information:

☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.

☒ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.

☐ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

N/A

10 WTO compliance

Green Box

Paragraph 12 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The support concerns forest areas and is therefore not covered by Annex 2 to the WTO Agreement.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(3)(b) - 72 - Payments under Article 72	50.00%	20.00%	80.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD34_O13_U01_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 1	Grant	91(3)(b) - 72-HU-50.00%	Uniform		R.7	No
RD34_O13_U02_HA - Forest NATURA 2000 compensation, unit cost EUR/hectare 2	Grant	91(3)(b) - 72-HU-50.00%	Uniform		R.7	No

Explanation and justification related to the value of the unit amount

RD34_O13_U01_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 1

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached,

"KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U02_HA - Forest NATURA 2000 compensation, unit cost EUR/hectare 2

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U03_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 3

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U04_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 4

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U05_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 5

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U06_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 6

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U07_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 7

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U08_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 8

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U09_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 9

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U10_HA - Forest NATURA 2000 compensation, unit cost per hectare 10

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U11_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 11

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U12_HA - Forest NATURA 2000 compensation, unit cost per hectare 12

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U13_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 13

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U14_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 14

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State

(capping): EUR 500.000/year.

RD34_O13_U15_HA - Forest NATURA 2000 compensation, unit cost per hectare 15

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U16_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 16

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U17_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 17

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U18_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 18

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U19_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 19

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U20_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 20

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U21_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 21

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the

categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U22_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 22

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U23_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 23

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U24_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 24

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U25_HA - Forest NATURA 2000 compensation, unit cost per hectare 25

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U26_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 26

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U27_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 27

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U28_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 28

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U29_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 29

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U30_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 30

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U31_HA - Forest NATURA 2000 compensation, unit cost EUR/ha 31

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U32_HA - Forest NATURA 2000 compensation, unit cost per hectare 32

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

RD34_O13_U33_HA - Forest NATURA 2000 compensation EUR/hectare, unit cost 33

The UA is determined in a uniform manner. Thus, there will be 33 different UAs, which is the same as the aid unit cost categories. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs). In addition, a maximum category of aid has been established for beneficiaries majority-owned by the Hungarian State (capping): EUR 500.000/year.

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029

INVEST(73-74) - Investments, including investments in irrigation

RD01a_E01_FRM_73 - Development of agricultural holdings

Intervention Code (MS)	RD01a_E01_FRM_73
Intervention Name	Development of agricultural holdings
Type of Intervention	INVEST(73-74) - Investments, including investments in irrigation
Common Output Indicator	O.20. Number of supported on-farm productive investment operations or units
Contributing to ringfencing requirement for/on	Generational Renewal: No Environment: No ES rebate system: LEADER: No

1 Territorial scope and, if relevant, regional dimension

Territorial scope: **National**

Code	Description
HU	Magyarország

Description of the Territorial Scope

Entire country

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO2 Enhance market orientation and increase farm competitiveness, both in the short and long term, including greater focus on research, technology and digitalisation

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
2.1.1	Increasing operational and business efficiency of production	1	Yes
2.1.11	Creation of new plantations, refurbishment and modernisation of plantations	2	Yes
2.1.2	Creation of modern generation capacities	2	Yes
2.1.7	Technological transition taking into account stricter phytosanitary requirements	1	Yes
2.1.8	Improvement of cultivation technology	1	Yes
2.1.9	Adaptation and development of husbandry technology	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.9 Share of farmers receiving investment support to restructure and modernise, including to improve resource efficiency

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

The basic objective of the intervention is to increase the competitiveness of farms and the production of added value by supporting the uptake and development of new innovative production, breeding and

production technologies. The intervention contributes to meeting the needs identified in the SWOTs by developing the agricultural sector and improving its competitiveness.

In particular, the intervention shall support the following activities:

- the general modernisation of livestock holdings, including the purchase of technologies to reduce the risk of epizootic diseases on animal holdings, the establishment of new livestock holdings,
- the general modernisation of horticulture plants, the development of horticultural technology involving construction, the purchase of horticultural equipment, planting and modernisation of vineyards, the construction of new horticultural plants,
- installation and modernisation of storage facilities, dryers and cleaners,
- implement farmers' damage prevention investments, including the purchase of technologies and equipment to prevent damage from spring frost damage, rain damage, hail damage.

In order to achieve the cross-action thematic objective (Cross-cutting objective), the independent innovative content or the achievement of an innovation result among the selection criteria ensures that innovation is achieved at the level of intervention.

The needs of each agricultural sector may differ, for example in terms of the activities to be supported or the amounts of support, and therefore separate sector-specific calls for proposals may need to be published in justified cases during the implementation of the intervention.

Principles governing the establishment of selection criteria, which may be partially applied:

Quality of the business plan

Participation in State-recognised cooperation

Cooperation with state recognition of the applicant

Size of the enterprise

Participation in quality schemes

— Regional aspect

– Social enterprises

Development under the Roma inclusion programme

Development with a focus on digitalisation

– Development related to integration

04 04 01 01 – Employment

—Woman applying for support

—Increase space during the investment

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligibility criteria:

- A farmer, or 'CAP Strategic Plan 4.1.5. Young farmer as defined in the chapter:

—in the financial year preceding the submission of the application, has a minimum holding size of at least EUR 10.000 resulting from agricultural activities in accordance with the standard output (standard value) methodology.

—of which at least 40 % of their turnover in the previous year derives from agricultural activities.

In the case of a consortium, all farmers participating in the group must comply with the eligibility criteria set out above.

— A social cooperative must, on its own, meet the eligibility criteria set out above.

A cooperative of which farmers are members must:

in the closed financial year preceding the submission of the application, the SO must have a farm size of at least EUR 10.000 derived from agricultural activities in accordance with the methodology and at least

40 % of its turnover in the previous year, or
 — the turnover of the members participating in the cooperative in the previous year must be calculated and at least 40 % of the total turnover must come from agricultural activities and proof of holding size of at least EUR 10.000 for at least 40 % of the members of the cooperative.
 Cooperation recognised by the State shall be regarded as a farmer even without proof of the conditions laid down.

— An undertaking engaged in the activity of integrator or processing in connection with crop production is entitled to do so without proof of the conditions laid down.

Farmers meeting eligibility criteria:

Natural persons

Enterprises with legal personality (economic associations+cooperatives (particularly social fabric))

Non-profit organisations with legal personality (ecclesiastical legal persons, foundations, non-profit companies)

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Eligible costs for the intervention:

the construction, development and modernisation of a plantation intended for agricultural production activities, the construction, development and modernisation of buildings and structures. (the development of plantations from annual crops is not supported)

(b) Purchase of new machinery and devices, technologies, modernisation of existing machinery and equipment, including information and communication technologies.

general costs related to the abovementioned expenditure, such as architects, engineers, consultation fees, administrative procedural fees, consultancy and project management costs, fees related to advice on environmental and economic sustainability, including feasibility studies.

(D) Intangible investments: acquisition or development of computer software and acquisition of patents, licences, copyrights, trademarks, etc.

the purchase of immovable property required in relation to point (a) up to a maximum of 5 % of the total eligible expenditure of the operation concerned and the value of existing land or real estate essential for the investment shall be eligible as contributions in kind, provided that it does not exceed 5 % of the total eligible expenditure of the operation concerned. Up to 10 % of the investment is eligible for the purchase of new land.

(F) Institutional guarantee with a reduced premium rate

Commitment:

Maintenance obligation for at least 5 years, or at least 3 years for the SME sector

Only costs that are eligible are those incurred by the beneficiary at the earliest on 01/01/2023 or 31.12.2029 at the latest.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

☒ reimbursement of eligible costs actually incurred by a beneficiary

☒ unit costs

☐ lump sums

☐ flat-rate financing

Basis for the establishment

- Str Article 83(1)(a), 1(b) and 2 (a)(i)

(1a): In all cases, except for plantation, a cost-based accounting is made.

1(b): Unit cost for plantation

Range of support at beneficiary level

The basic payment shall be limited to 50 % of eligible costs.

Young farmers may benefit from an increased aid intensity of 15 %.

In the case of an economic grant, the aid intensity may be increased by 15 % compared to the basic payment.

In the case of an applicant for aid producing a product certified as an ÖKO, the aid intensity may be increased by 10 % compared to the basic payment.

In the case of collective investment, an increased aid intensity of 10 % may be granted compared to the basic payment.

In the case of recourse to institutional guarantees at preferential rates, the aid intensity may be increased by 5 % compared to the basic subsidy.

In the case of an interest rate subsidy, the aid intensity may be increased by a maximum of 10 % compared to the basic payment.

The maximum aid rate may be further increased up to a maximum of 100 % of eligible costs where the investment concerns the restoration of agricultural potential following natural disasters, adverse climatic events or catastrophic events or appropriate preventive measures.

Maximum grant amount per project: EUR 15 million

Additional explanation

.Not relevant.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

What is not eligible for support?

The following investments shall not be eligible:

(a) the purchase of agricultural production rights;

(b) purchase of payment entitlements;

(C) the purchase of land for an amount exceeding 10 % of the total eligible expenditure of the operation concerned, excluding the purchase of land for environmental purposes, the purchase of land for the conservation of carbon-rich soil and the purchase of land by young farmers through the use of financial instruments; in the case of financial instruments, that ceiling shall apply to the eligible public expenditure paid to the final recipient, or, in case of guarantees, to the amount of the underlying loan;

(D) the purchase of animals, the purchase of annual plants and the planting of such plants for purposes other than: agricultural or forestry potential following natural disasters, adverse climatic events or catastrophic events, or the protection of livestock against large carnivores or the use of animals in forestry instead of machinery, or the rearing of endangered breeds as defined in point (24) of Article 2 of Regulation (EU) 2016/1012 of the European Parliament and of the Council (45) under the commitments referred to in Article 70; or the conservation of plant varieties threatened with genetic erosion in the framework of the commitments referred to in Article 70;

(e) interest on loans, except in the case of grants in the form of interest rate subsidies or guarantee fee subsidies;

(F) investment in large-scale infrastructures, as defined by Member States in their CAP Strategic Plans, that are not part of the community-led local development strategies set out in Article 32 of Regulation (EU) 2021/1060, with the exception of broadband systems and preventive measures for flood and coastal protection aimed at mitigating the consequences of likely natural disasters, adverse climatic events or catastrophic events;

(g) investments in afforestation that do not meet environmental and climate objectives in line with the principles for sustainable forest management set out in the Pan-European Guidelines for Afforestation and Reforestation.

Does the investment contain irrigation?

☐ Yes ☒ No

Investments in the improvement of existing irrigation installations, what is the potential water saving(s) required (expressed in %)

10 WTO compliance

Green Box

Paragraph 11 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 11 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(2)(d) - Other regions	43.00%	20.00%	43.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD01a_O20_A01_ON - Unit cost of farm development	Grant	91(2)(d)-HU-43.00%	Average		R.9	No

Explanation and justification related to the value of the unit amount

RD01a_O20_A01_ON - Unit cost of farm development

It is based on historical data, based on experience from the previous programming period. When determining the average unit amounts, the aid applications received and approved in response to calls for proposals under measures M04 of the Rural Development Programme 2014-2020 were taken into account, taking into account the funds allocated to the calls for proposals. The unit amount is the ratio between committed funds and subsidised applications, corrected by an inflation coefficient.

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

The objective of the intervention is to enhance the competitiveness and value-added production of young farmers' farms by supporting the uptake and development of new, innovative and cultivation, breeding and production technologies. The intervention contributes to meeting the needs identified in the SWOTs

by developing the agricultural sector and improving its competitiveness.

In order to achieve the cross-action thematic objective (Cross-cutting objective), the independent innovative content or the achievement of an innovation result among the selection criteria ensures that innovation is achieved at the level of intervention.

The needs of each agricultural sector may differ, for example in terms of the activities to be supported or the amounts of support, and therefore separate sector-specific calls for proposals may need to be published in justified cases during the implementation of the intervention.

Principles governing the establishment of selection criteria, which may be partially applied:

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligibility criteria:

“CAP Strategic Plan 4.1.5 A young farmer as defined in Chapter II.’, who fulfils the following conditions:

(a) a natural person aged 18 years or more and up to 40 years of age who:

- State-recognised agricultural know-how;
- keep a holding established for up to 5 years
- have a farm size of 10.000 or more but less than or equal to 50.000 SO.

in the case of a legal person carrying out an agricultural activity not more than 5 years from the date of submission of the application as its main activity:

- the senior official and owner of the legal person is between 18 and 40 years old,
- the chief executive and owner of the legal person have recognised agricultural expertise;
- the juridical person has a plant size of at least 10.000 STE and the manager and owner of the juridical person together have an operating size equal to or less than 50.000 STE.

Maintenance obligation for at least 5 years, or at least 3 years for the SME sector

Farmers meeting eligibility criteria:

Natural persons

– Undertakings having legal personality

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Eligible costs for the intervention:

the construction, development and modernisation of a plantation intended for agricultural production activities, the construction, development and modernisation of buildings and structures. (the development of plantations from annual crops is not supported)

(b) Purchase of new machinery and devices, technologies, modernisation of existing machinery and equipment, including information and communication technologies.

general costs related to the abovementioned expenditure, such as architects, engineers, consultation fees, administrative procedural fees, consultancy and project management costs, fees related to advice on environmental and economic sustainability, including feasibility studies.

(D) Intangible investments: acquisition or development of computer software and acquisition of patents, licences, copyrights, trademarks, etc.

the purchase of immovable property required in relation to point (a) up to a maximum of 5 % of the total eligible expenditure of the operation concerned and the value of existing land or real estate essential for the investment shall be eligible as contributions in kind, provided that it does not exceed 5 % of the total eligible expenditure of the operation concerned. Up to 10 % of the investment is eligible for the purchase of new land.

(F) Institutional guarantee with a reduced premium rate

Commitment:

Maintenance obligation for at least 5 years, or at least 3 years for the SME sector

Only costs that are eligible are those incurred by the beneficiary at the earliest on 01/01/2023 or 31.12.2029 at the latest.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

R.15 Supported investments in renewable energy production capacity, including bio-based (in MW)

R.16 Share of farms benefitting from CAP investment support contributing to climate change mitigation and adaptation, and to the production of renewable energy or biomaterials

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

One of the objectives of the intervention is to increase the energy self-sufficiency of agricultural holdings and reduce energy dependency by supporting the reduction of CO2 emissions and energy use on farms by improving energy efficiency and promoting renewable energy sources. Ecological considerations are taken into account through the use of environmentally friendly technologies and the improvement of

energy efficiency. Reducing energy costs, increasing energy efficiency and prioritising renewable energy sources, biomass-based systems and increased use from the use of biogas from agricultural sources will also contribute to strengthening the competitiveness of the agricultural sector. The intervention will also encourage the implementation of projects that follow a circular biomass economy model based on the use of local biomass resources and the use of by-products (e.g.: soil improvement). The objective, expressed on the basis of the country's geological conditions, is to exploit the geothermal thermal energy potential, to which the intervention contributes by supporting farm developments, for example in relation to the heating of greenhouses.

The intervention covers the reduction of energy use on farms by the sector in order to reduce the environmental impact: it improves the energy efficiency of livestock farms and horticultural plants mainly through renovations and renovations in building energy, technical building and energy supply.

Hungary aims to achieve a share of at least 21 % of renewable energy sources in gross final consumption of energy by 2030. The intervention also contributes to Hungary's objective.

The intervention also aims to support investments that encourage other non-food utilisation of agricultural by-products (e.g.: fibre extraction, biorefining, substitution of fossil feedstocks).

Principles governing the establishment of selection criteria, which may be partially applied:

Quality of the business plan

Participation in State-recognised cooperation

Cooperation recognised by the State

– Size of enterprise

Environmental, climate and adaptation aspects (e.g.: improving input efficiency relevant to the environment, reducing emissions per unit of pollutant; re-use or recycling, organic farming, applying a circular biomass economy model, responding to local needs, replacing fossil feedstocks)

Developments leading to increased energy savings and increased use of renewable energy

Participation in quality schemes

Regional perspective

— Social enterprises

Development is carried out under the Roma Inclusion Programme

Development with a focus on digitalisation

Development linked to integration

Provision of reference data

Woman applying for support

04 04 01 01 – Employment

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligibility criteria:

- Farmer and the CAP Strategic Plan 4.1.5 Young farmer as defined in the chapter:

—in the financial year preceding the submission of the application, has a minimum holding size of at least EUR 10.000 resulting from agricultural activities in accordance with the standard output (standard value) methodology.

—of which at least 40 % of their turnover in the previous year derives from agricultural activities.

In the case of a consortium, all farmers participating in the group must comply with the eligibility criteria set out above.

— A social cooperative must, on its own, meet the eligibility criteria set out above.

A cooperative of which farmers are members must:

in the closed financial year preceding the submission of the application, the SO must have a farm size of at least EUR 10.000 derived from agricultural activities in accordance with the methodology and at least 40 % of its turnover in the previous year, or

— the turnover of the members participating in the cooperative in the previous year must be calculated and at least 40 % of the total turnover must come from agricultural activities and proof of holding size of at least EUR 10.000 for at least 40 % of the members of the cooperative.

Cooperation recognised by the State shall be regarded as a farmer even without proof of the conditions laid down.

— An undertaking engaged in the activity of integrator or processing in connection with crop production is entitled to do so without proof of the conditions laid down.

— Developments related to the use of renewable energy

— Improvements leading to improvements in energy efficiency

Farmers meeting eligibility criteria:

Natural persons

Enterprises with legal personality (economic associations+cooperatives (particularly social fabric))

Non-profit organisations with legal personality (ecclesiastical legal persons, foundations, non-profit companies)

Aid shall not be granted to a beneficiary under Commission Regulation (EU) No 651/2014

- it qualifies as a firm in difficulty (the concept of firm in difficulty is referred to in Decree 37/2011 on the procedure for State aid for the purposes of EU competition law and on the regional aid map. (III. Specified in Section 6(4a) and (4b) of Government Decree No 22/2015) and
- it has not complied with a decision of the European Commission addressed to Hungary requiring the repayment of State aid within the meaning of EU competition law.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Eligible costs for the intervention:

construction, development and modernisation of buildings and structures used to achieve green objectives.

(b) Purchase of new machinery and devices, technologies, modernisation of existing machinery and equipment, including information and communication technologies.

general costs related to the abovementioned expenditure, such as architects, engineers, consultation fees, administrative procedural fees, consultancy and project management costs, fees related to advice on environmental and economic sustainability, including feasibility studies.

(D) Intangible investments: acquisition or development of computer software and acquisition of patents, licences, copyrights, trademarks, etc.

the purchase of immovable property required in relation to point (a) up to a maximum of 5 % of the total eligible expenditure of the operation concerned and the value of existing land or real estate essential for the investment shall be eligible as contributions in kind, provided that it does not exceed 5 % of the total eligible expenditure of the operation concerned. Up to 10 % of the investment is eligible for the purchase of new land.

(F) Institutional guarantee with a reduced premium rate

an increased aid intensity of 15 % may be granted to young farmers.

Only costs that are eligible are those incurred by the beneficiary at the earliest on 01/01/2023 or 31.12.2029 at the latest.

Commitments:

if Anaerobic decomposition (biogas technology) is used, the proportion of cereals used and starch and sugar-containing crops (excluding waste, harvest residues, by-products) shall be less than 50 % of the

input feed.
using Anaerobic digestion or, in case of biorefining, producing and using ferment of quality suitable for soil improvement.
in the case of the use of a biomass-based renewable energy solution of agricultural origin, the feedstock shall only be a by-product of the production and use of Annex I product and Annex I product.
where, in the case of biomass-based energy production of agricultural origin, the primary objective is to produce electricity, at least 25 % of the heat generated above process self-consumption shall be used on the own farm.
maintenance obligation for at least 5 years, or at least 3 years for the SME sector

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

☒ reimbursement of eligible costs actually incurred by a beneficiary

☐ unit costs

☐ lump sums

☐ flat-rate financing

Range of support at beneficiary level

The basic payment shall be at least 50 % and no more than 80 % of eligible costs.

Young farmers may benefit from an increased aid intensity of 15 %.

In the case of recourse to institutional guarantees at preferential rates, the aid intensity may be increased by 5 % compared to the basic subsidy.

In the case of an interest rate subsidy, the aid intensity may be increased by a maximum of 10 % compared to the basic payment.

Maximum grant amount per project: EUR 15 million.

Additional explanation

Not relevant.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☐ No ☒ Mixed

Explanation of support activities falling outside the scope of Art. 42 TFEU

Within this measure, the need to implement EU competition rules should be assessed at the level of individual investments. If the renewable energy and biomass based systems concerned by the investment generate energy beyond the self-consumption of the economy, competition rules (State aid) apply to that investment.

Type of state aid instrument to be used for clearance:

☐ Notification ☒ GBER ☐ ABER ☐ de minimis

State Aid case number

SA.112040

Additional information:

- ☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.
- ☐ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.
- ☒ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

What is not eligible for support?

The following investments shall not be eligible:

(a) the purchase of agricultural production rights;

(b) purchase of payment entitlements;

(C) the purchase of land for an amount exceeding 10 % of the total eligible expenditure of the operation concerned, excluding the purchase of land for environmental purposes, the purchase of land for the conservation of carbon-rich soil and the purchase of land by young farmers through the use of financial instruments; in the case of financial instruments, that ceiling shall apply to the eligible public expenditure paid to the final recipient, or, in case of guarantees, to the amount of the underlying loan;

(D) the purchase of animals, the purchase of annual plants and the planting of such plants for purposes other than: agricultural or forestry potential following natural disasters, adverse climatic events or catastrophic events, or the protection of livestock against large carnivores or the use of animals in forestry instead of machinery, or the rearing of endangered breeds as defined in point (24) of Article 2 of Regulation (EU) 2016/1012 of the European Parliament and of the Council (45) under the commitments referred to in Article 70; or the conservation of plant varieties threatened with genetic erosion in the framework of the commitments referred to in Article 70;

(e) interest on loans, except in the case of grants in the form of interest rate subsidies or guarantee fee subsidies;

(F) investment in large-scale infrastructures, as defined by Member States in their CAP Strategic Plans, that are not part of the community-led local development strategies set out in Article 32 of Regulation (EU) 2021/1060, with the exception of broadband systems and preventive measures for flood and coastal protection aimed at mitigating the consequences of likely natural disasters, adverse climatic events or catastrophic events;

(g) investments in afforestation that do not meet environmental and climate objectives in line with the principles for sustainable forest management set out in the Pan-European Guidelines for Afforestation and Reforestation.

Does the investment contain irrigation?

☐ Yes ☒ No

Investments in the improvement of existing irrigation installations, what is the potential water saving(s) required (expressed in %)

N/A

Details on different potential water savings according to the type of installation or infrastructure (where applicable)

Investments in the improvement of existing irrigation installations (affecting water bodies whose status is less than good) what is/are the requirement(s) for an effective reduction in water use - expressed in %)

RD01c_O20_A01_ON - Specific cost of support for green investments in agricultural holdings	Grant	91(2)(d)-HU-43.00%	Average		R.15; R.16	No

Explanation and justification related to the value of the unit amount

RD01c_O20_A01_ON - Specific cost of support for green investments in agricultural holdings

It is based on historical data, based on experience from the previous programming period. When determining the average unit amounts, the aid applications received and approved in response to calls for proposals under measures M04 of the Rural Development Programme 2014-2020 were taken into account, taking into account the funds allocated to the calls for proposals. The unit amount is the ratio between committed funds and subsidised applications, corrected by an inflation coefficient.

SO5 Foster sustainable development and efficient management of natural resources such as water, soil and air, including by reducing chemical dependency

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
4.1.2	Reduction of GHG and ammonia emissions through technological development of livestock farming	2	Yes
5.4.2	Reducing ammonia emissions from agriculture	2	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.26 Share of farms benefitting from CAP productive and non-productive investment support related to care for the natural resource

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

The objective of the intervention is to support technological development activities that help reduce ammonia emissions on farms, whereby the agricultural sector contributes to the domestic NH₃ emission reduction target. The intervention may, inter alia, support the purchase of manure application technologies for modern injection and immediate incorporation, the modernisation of manure treatment inside and outside the house, the development of in-houses (e.g. flooring, roof insulation, drainage, air washing equipment), the covering of existing manure storage facilities, the construction of new covered manure storage facilities.

Support under the intervention can achieve environmental goals that reduce ammonia and GHG emissions, improve air quality and the pressures on surface and underground waters.

Principles governing the establishment of selection criteria, which may be partially applied (selection criteria):

Environmental, climate and adaptation aspects (e.g.: improving input efficiency relevant to the environment, reducing emissions per unit of pollutant; application of reuse or recycling, continuation of organic farming, development related to the application of BAT precursors, preparation for meeting requirements arising as a result of the amendment of the IED Directive)

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligibility criteria:

- Farmer and the CAP Strategic Plan 4.1.5 Young farmer as defined in the chapter:

—in the financial year preceding the submission of the application, has a minimum holding size of at least EUR 10.000 resulting from agricultural activities in accordance with the standard output (standard value) methodology.

—of which at least 40 % of their turnover in the previous year derives from agricultural activities.

In the case of a consortium, all farmers participating in the group must comply with the eligibility criteria set out above.

— A social cooperative must, on its own, meet the eligibility criteria set out above.

A cooperative of which farmers are members must:

in the closed financial year preceding the submission of the application, the SO must have a farm size of at least EUR 10.000 derived from agricultural activities in accordance with the methodology and at least 40 % of its turnover in the previous year, or

— the turnover of the members participating in the cooperative in the previous year must be calculated and at least 40 % of the total turnover must come from agricultural activities and proof of holding size of at least EUR 10.000 for at least 40 % of the members of the cooperative.

Cooperation recognised by the State shall be regarded as a farmer even without proof of the conditions laid down.

- A maintenance obligation of at least 5 years, or at least 3 years for the SME sector

Farmers meeting eligibility criteria:

Natural persons

Enterprises with legal personality (economic associations+cooperatives (particularly social fabric))

Non-profit organisations with legal personality (ecclesiastical legal persons, foundations, non-profit companies)

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Eligible costs for the intervention:

the construction, development and modernisation of buildings and structures to reduce ammonia

emissions.

(b) Purchase of new machinery and devices, technologies, modernisation of existing machinery and equipment, including information and communication technologies.

general costs related to the abovementioned expenditure, such as architects, engineers, consultation fees, administrative procedural fees, consultancy and project management costs, fees related to advice on environmental and economic sustainability, including feasibility studies.

(D) Intangible investments: acquisition or development of computer software and acquisition of patents, licences, copyrights, trademarks, etc.

the purchase of immovable property required in relation to point (a) up to a maximum of 5 % of the total eligible expenditure of the operation concerned and the value of existing land or real estate essential for the investment shall be eligible as contributions in kind, provided that it does not exceed 5 % of the total eligible expenditure of the operation concerned. Up to 10 % of the investment is eligible for the purchase of new land.

(F) Institutional guarantee with a reduced premium rate

Only costs that are eligible are those incurred by the beneficiary at the earliest on 01/01/2023 or 31.12.2029 at the latest.

Undertaking

- Annual data on the technologies used by the holding and the agricultural NH₃ output of the holding.
- Investments made in a subsidised way under the intervention or new machinery, equipment and technology procured in a subsidised way must go beyond the legal obligations (e.g. good agricultural practice requirements) or normal practices.
- Developments related to manure management must comply with the Directive concerning the protection of waters against pollution caused by nitrates from agricultural sources (91/676/EC) ("the Nitrates Directive") and in national legislation to comply with the Nitrates Directive, in particular 59/2008. Decree No 27/2006 of 29 April 2006 of the Minister for Agriculture and Rural Development (II. Government Decree No 487/2015.
- Maintenance obligation for at least 5 years, or at least 3 years for the SME sector

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

SO9 Improve the response of Union agriculture to societal demands on food and health, including high quality, safe, and nutritious food produced in a sustainable way, the reduction of food waste, as well as improving animal welfare and combatting antimicrobial resistances

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
2.1.1	Increasing operational and business efficiency of production	1	Yes
2.1.2	Creation of modern generation capacities	2	Yes
2.1.9	Adaptation and development of husbandry technology	1	Yes
9.1.2	Improving general hygiene and biosecurity conditions, increasing food safety	1	Yes
9.1.3	Prevention of animal health problems, development/development of forecasting systems	1	Partially

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.43 Share of livestock units (LU) concerned by supported actions to limit the use of antimicrobials (prevention/reduction)

R.9 Share of farmers receiving investment support to restructure and modernise, including to improve resource efficiency

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Support for investment should not only be seen as an essential tool to increase competitiveness, but also as an opportunity for animal keepers to provide reasonable responses to animal health risks, one of the most pressing issues of today. Supporting the improvement of better animal welfare conditions is therefore a priority of the Hungarian CAP Strategic Plan. This is important because in the case of cattle and pigs in particular, but for other utilised agricultural species, there is an increasing process of production (intensification). Through this intervention, farmers receive support for animal welfare investments that go beyond general farm development and go beyond the rules resulting from generally applied practices.

For example, these investments will give animals more leeway and create suitable places and microclimatic conditions in agricultural facilities to improve animal health, reduce the distress condition and avoid the risk of tail biting in pigs, while reducing the risk of epizootic diseases such as ASF.

Improving animal welfare will have a positive impact on the output of production and the quality of the agricultural products subsequently produced from these animals, and thus indirectly on human health. The intervention complements the interventions “RD01a_E01_FRM_73 – Farm development” and “RD30_G13_AWC_70 – Animal welfare support in the beef sector” for cattle.

The intervention also covers the acquisition of technologies, equipment and the construction and development of related buildings to reduce the risk of epizootic diseases on livestock holdings. Indeed, the likelihood of various epizootic diseases occurring on livestock holdings can be reduced by using a number of available technologies.

The intervention includes two target areas:

- Target area: Support for investments in animal holdings for disease control
- Target B: Development of pig farms to reduce tail docking.

Principles governing the establishment of selection criteria, which may be partially applied (selection criteria):

Quality of the business plan

Participation in State-recognised cooperation

Cooperation recognised by the State

– Size of enterprise

Participation in quality schemes

— Social enterprises

Development is carried out under the Roma Inclusion Programme

Development with a focus on digitalisation

Development linked to integration

04 04 01 01 – Employment

Woman applying for support

In the case of pigs, the prevention of tail docking by increasing the space.

- The intervention will mainly contribute to the objective ‘SO9 Improving the response of EU agriculture to societal demands on food and health, including high-quality, safe and nutritious food produced in a sustainable way, reducing food waste, enhancing animal welfare and combating antimicrobial resistance’. In addition, development contributes to the objective of “SO2 Enhance market orientation and increase the competitiveness of economies in the short and long term, including through a stronger focus on research, technology and digitalisation”.

•

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligibility criteria – For all target areas:

- A farmer, or ‘CAP Strategic Plan 4.1.5. Young farmer as defined in the chapter:

—in the financial year preceding the submission of the application, has a minimum holding size of at least EUR 10.000 resulting from agricultural activities in accordance with the standard output (standard value) methodology.

—of which at least 40 % of their turnover in the previous year derives from agricultural activities.
 In the case of a consortium, all farmers participating in the group must comply with the eligibility criteria set out above.
 — A social cooperative must, on its own, meet the eligibility criteria set out above.
 A cooperative of which farmers are members must:
 in the closed financial year preceding the submission of the application, the SO must have a farm size of at least EUR 10.000 derived from agricultural activities in accordance with the methodology and at least 40 % of its turnover in the previous year, or
 — the turnover of the members participating in the cooperative in the previous year must be calculated and at least 40 % of the total turnover must come from agricultural activities and proof of holding size of at least EUR 10.000 for at least 40 % of the members of the cooperative.
 Cooperation recognised by the State shall be regarded as a farmer even without proof of the conditions laid down.

Farmers meeting eligibility criteria – For all target areas:

Natural persons

Enterprises with legal personality (economic associations+cooperatives (particularly social fabric))

Non-profit organisations with legal personality (ecclesiastical legal persons, foundations, non-profit companies)

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Eligible costs for the intervention – for all target areas:

the construction, development and modernisation of buildings and structures used for disease control.

(b) the purchase of new machinery and tools, technologies for disease control, modernisation of existing machinery and equipment, including information and communication technologies.

general costs related to the abovementioned expenditure, such as architects, engineers, consultation fees, administrative procedural fees, consultancy and project management costs, fees related to advice on environmental and economic sustainability, including feasibility studies.

(D) Intangible investments: acquisition or development of computer software and acquisition of patents, licences, copyrights, trademarks, etc.

the purchase of immovable property required in relation to point (a) up to a maximum of 5 % of the total eligible expenditure of the operation concerned and the value of existing land or real estate essential for the investment shall be eligible as contributions in kind, provided that it does not exceed 5 % of the total eligible expenditure of the operation concerned. Up to 10 % of the investment is eligible for the purchase of new land.

(F) Institutional guarantee with a reduced premium rate

For target area A:

Supported activities include, but are not limited to:

Activities related to disease control involving construction, including:

Installation of on-site disinfection gate;

– Layout for on-farm store, hand and foot disinfectant, rubber boot scrubber;

– Connecting plant facilities with a closed corridor;

Construction of a framing system, wheel disinfection pool, animal loader.

Purchase of equipment and machinery to reduce the risk of animal diseases, including:

Purchase of on-site fallen incinerator;

Purchase of disinfectant sprayer, ozone disinfectant, washing equipment, cleaning machines;

Purchase of fogging equipment, UV lamps, air curtains.

For target area B:

Increasing the freedom of movement of pigs by constructing or reconstructing pens to provide more space. Government Decree No 39/2018 on the conditions for granting animal welfare aid to the pig sector (XII. Decree No 7/2015 of the Minister for Agriculture and Decree No 7/2015 on the conditions for receiving animal welfare aid for breeding sows (III. Of 11 December 2008 of the Minister for Agriculture and Rural Development and Council Directive 2008/120/EC laying down minimum standards for the protection of pigs. the provision of at least 20 % more space than required.

or

15 % more space compared to Directive 2008/120/EC, together with at least one of the following commitments:

(a) provision of surplus straw

installation of an air quality and temperature control device,

changes in the composition and method of supply of the feed,

health monitoring,

provision of partly compact flooring.

Maintenance obligation for at least 5 years, or at least 3 years for the SME sector

Only costs that are eligible are those incurred by the beneficiary at the earliest on 01/01/2023 or 31.12.2029 at the latest.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

☒ reimbursement of eligible costs actually incurred by a beneficiary

☐ unit costs

☐ lump sums

☐ flat-rate financing

Range of support at beneficiary level

The basic payment shall be up to 70 % of eligible costs.

Aid may be further increased up to a maximum of 100 % of eligible costs if the investment is aimed at restoring agricultural potential following natural disasters, adverse climatic events or catastrophic events or appropriate preventive measures.

Maintenance obligation of at least 5 years and at least 3 years in the case of the SME sector

The maximum amount of aid that can be claimed for a project is: EUR 85000

Additional explanation

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

What is not eligible for support?

The following investments shall not be eligible for support for all areas targeted:

(a) the purchase of agricultural production rights;

(b) purchase of payment entitlements;

(C) the purchase of land for an amount exceeding 10 % of the total eligible expenditure of the operation concerned, excluding the purchase of land for environmental purposes, the purchase of land for the conservation of carbon-rich soil and the purchase of land by young farmers through the use of financial instruments; in the case of financial instruments, that ceiling shall apply to the eligible public expenditure paid to the final recipient, or, in case of guarantees, to the amount of the underlying loan;

(D) the purchase of animals, the purchase of annual plants and the planting of such plants for purposes other than: agricultural or forestry potential following natural disasters, adverse climatic events or catastrophic events, or the protection of livestock against large carnivores or the use of animals in forestry instead of machinery, or the rearing of endangered breeds as defined in point (24) of Article 2 of Regulation (EU) 2016/1012 of the European Parliament and of the Council (45) under the commitments referred to in Article 70; or the conservation of plant varieties threatened with genetic erosion in the framework of the commitments referred to in Article 70;

(e) interest on loans, except in the case of grants in the form of interest rate subsidies or guarantee fee subsidies;

(F) investment in large-scale infrastructures, as defined by Member States in their CAP Strategic Plans, that are not part of the community-led local development strategies set out in Article 32 of Regulation (EU) 2021/1060, with the exception of broadband systems and preventive measures for flood and coastal protection aimed at mitigating the consequences of likely natural disasters, adverse climatic events or catastrophic events;

(g) investments in afforestation that do not meet environmental and climate objectives in line with the principles for sustainable forest management set out in the Pan-European Guidelines for Afforestation and Reforestation.

Does the investment contain irrigation?

☐ Yes ☒ No

Investments in the improvement of existing irrigation installations, what is the potential water saving(s) required (expressed in %)

N/A

Details on different potential water savings according to the type of installation or infrastructure (where applicable)

Investments in the improvement of existing irrigation installations (affecting water bodies whose status is less than good) what is/are the requirement(s) for an effective reduction in water use - expressed in %)

Regional breakdown

10 WTO compliance

Green Box

Paragraph 11 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 11 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(2)(d) - Other regions	43.00%	20.00%	43.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD01e_O20_A01_ON - Support for investments in animal holdings for disease control, specific cost of reducing tail docking in the pig sector	Grant	91(2)(d)-HU-43.00%	Average		R.43; R.9	No

Explanation and justification related to the value of the unit amount

RD01e_O20_A01_ON - Support for investments in animal holdings for disease control, specific cost of reducing tail docking in the pig sector

It is based on historical data, based on the experience of the 2014-2020 programming period. When determining the average unit amounts, the applications for funding received and approved in response to calls for proposals under measure M04 (Bruehouses) of the Rural Development Programme 2014-2020 were taken into account, taking into account the funds allocated to the calls for proposals. The unit amount is the ratio between committed funds and subsidised applications, corrected by an inflation coefficient.

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO2 Enhance market orientation and increase farm competitiveness, both in the short and long term, including greater focus on research, technology and digitalisation

XCO Cross-cutting objective of modernising the sector by fostering and sharing of knowledge, innovation and digitalisation in agriculture and rural areas, and encouraging their uptake

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
2.1.7	Technological transition taking into account stricter phytosanitary requirements	1	Yes
2.3.1	Uptake of innovative technologies and sustainable approaches in agriculture	2	Yes
2.3.5	Increasing companies' innovativeness, responsiveness to changing market needs	2	Yes
CCO.1.2	Raising farmers' knowledge	1	Yes
CCO.4.3	Electronic administration, transparency	1	Partially
CCO.4.4	Development of digital infrastructure for agri-food and forest businesses	1	Yes
CCO.4.5	Development of digital solutions for quality assurance, certification, traceability, marking	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.3 Share of farms benefitting from support for digital farming technology through CAP

R.9 Share of farmers receiving investment support to restructure and modernise, including to improve resource efficiency

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Objectives set and expected impacts:

In order to realise the clear benefits of the digitalisation of agroium, it is necessary that digital technologies, including location-specific forms of farming, precision tools and decision support software and services, are used as widely as possible by farmers. Data generated by the implementation of production processes in place-specific farming are also important for the whole food chain, for example when running production and product traceability systems. The intervention provides farmers with the opportunity to use modern technologies and data-based decision-making to:

- Improve their operational results
- Comply with ever-increasing traceability and sustainability reporting obligations (public administration, lending, trade and purchasers)
- Rationalise and, where appropriate, reduce inputs (pesticides, fertilisers, gas oil, etc.)
- Reduce ammonia and GHG emissions and pressures on surface and underground waters
- Improve nutrient management and thus soil condition
- Contribute to the mitigation of climate change-induced changes in the production area and improve their capacity to adapt

The above activities can be small-scale or large-scale investments.

This intervention can be implemented alone or in conjunction with other interventions as a digital pillar.

Content:

Support for improvements needed to implement a farm-level digitalisation plan, in particular:

Purchase of equipment for digital and precision farming

- adapting existing and newly purchased machinery for site-specific cultivation (e.g. procurement of line guide, automatic steering; purchase of other sensors and sensors; design of precision staging of sprayers; acquisition of hardware and software assets for harvesters' yield measurement; automatic operation/efficiency control)
- construction of agro-meteorological sensors and stations
- digitalisation development of a sorting machine that classifies a post-harvest
- acquisition of sensor technologies in the food industry
- purchase of machinery and equipment for the construction of precision animal husbandry systems (e.g. sensors on scaffolds or in animals: oestrus monitoring for animal health forecasting; detection and automatic control of enclosure conditions (light, sound, air, etc.): cooling, ventilation, energy consumption, etc.)
- purchase of machinery and tools for the development of precision feeding (e.g. automated feeding systems, feed distribution robots, precision feeders, etc.); additionally
- purchase of autonomous robots (capping robots, head-bots, feed distribution robots, etc.), drones and other efficiency-enhancing devices, machinery, which can be used in specific sectors

The establishment of systematic and systematic data collection at operational level, the creation of databases and data links

1.

- integration of island systems
- acquisition of farm management software and management systems for farm-level data management and decision support
- sensor technologies for data collection and analysis according to sector specifications

Implementation and development of digital farm management, plant management, quality management

and monitoring systems

1.

- deployment of ‘smart farm’ systems, including the use of complex plant control systems (e.g. camera systems); automatic control of abiotic environmental factors (e.g. humidity, (LED) lighting, ventilation)
- precision water and nutrient supply in closed growing facilities
- development of precision/energy efficient drying
- storage crop monitoring
- development of food tracking methods, quality assurance

·Use of digital transition services

1.

- precision georeferenced soil sampling and related advisory services
- acquisition and analysis of satellite and near-ground remote sensing data
- delineation of management zones based on different procedures
- preparation of differentiated application plans and maps
- preparation of agro-meteorological and plant protection forecasts (pest, pathogen transmission and drawing monitoring) and related advisory services
- in the case of fruit orchards, identification of ripening group
- development of computer and other ICT software, customisation of an economy
- use of services related to land improvement activities for agricultural land (e.g. 3D map, digital design of the price system, installation of a drain tube, etc.)
- and all other future processes and services supporting digitalisation and precision farming that contribute to the achievement of the objectives set

Selection principles (which may be partially applicable):

- Quality of the digitalisation plan at farm level
- Quality of the business and financial plan
- Cooperation with or participation in State-recognised cooperation
- Participation in quality schemes
- Operation of monitoring systems
- Implementing environmental, climate and adaptation aspects
- Cooperation with EIP Operational Group
- Cooperation with European Digitalisation Innovation Hubs
- Cooperation with precision consultant
- Regional aspects
- Equal opportunities mainstreaming
- Employment
- Size of business with preference for small farms

Relevant legislation:

1470/2019. (VIII.) Government Decision on the promotion and coordination of the digitalisation of Hungarian agroium, Hungary's Digital Agricultural Strategy

38/2021. (II. Government Decree of 2 December 2006 on the flight of unmanned state aircraft

Government Decree No 44/2005 on aerial work in agriculture and forestry Government Decree No 4/2022 of 6 May 2022 amending Joint Decree No 4/2022 of the Minister for Agriculture and Rural Development, GKM-KvVM (II. Regulation of the Minister for Agriculture

Link with other interventions:

The intervention alone contributes to the achievement of digitalisation goals in line with the overarching

objective of the CAP and can be complementary to the relevant intervention of any CAP Strategic Plan.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiaries (eligible beneficiaries):

1.
 - Farmer or "CAP Strategic Plan 4.1.5. Young farmer", as defined under the heading 'Young farmer'
1. In the case of a consortium, all farmers participating in the group must comply with the eligibility conditions set out above.
2. A social cooperative must, on its own, meet the eligibility criteria set out above.
3. A cooperative which is a member of a farmer must:
 - in the closed financial year preceding the submission of the application, have a farm size resulting from an agricultural activity of at least EUR 10.000 in accordance with the GAEC methodology and at least 40 % of its turnover from agricultural activities in the previous year, or
 - the turnover of the members of the cooperative in the previous year shall be calculated, with at least 40 % of the total turnover coming from agricultural activity and proof of holding of at least EUR 10.000 for at least 40 % of the members participating in the cooperative.
4. Cooperation which has been recognised by the State shall be considered to be a farmer without proof of the conditions laid down.
5. An undertaking carrying out integrator or processing activities in connection with the production of medicinal crops is entitled to do so without proof of the specified conditions.

Specific eligibility criteria linked to an eligible beneficiary:

- Natural persons
- Enterprises with legal personality (companies and cooperatives (in particular social cooperatives))
- Non-profit legal entities (e.g. ecclesiastical entities, foundations, non-profit companies)
- Recognised producer group (PG), producer sales organisation (PO), producer integration organisation (PO)

and

- Have or will have to implement a plant-level digitalisation plan, including individual development targets (environmental, technological, quantitative) and milestones, taking into account a base state.
- Investments for technological transition linked to the taking into account of stricter plant health standards shall be eligible for support for a maximum of 24 months from the date on which the requirements became mandatory for the holding.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Eligible costs:

1. The purchase of new machinery and equipment, technologies directly related to digital technology, the modernisation of existing machinery and tools, including information and communication technologies, computer software and other ICT developments;
2. General costs linked to the above-mentioned expenditure (such as architect, engineer and consultation fees, public authority fees, consultancy and project management costs, fees related to advice on environmental and economic sustainability, including feasibility studies).
3. Intangible investment: purchase or development of computer software and acquisition of patents, licences, copyrights, trademarks, etc.
4. The purchase of the necessary real estate in relation to point 1 may be eligible for an amount not exceeding 5 % of the total eligible expenditure of the operation concerned and as a contribution in

kind, the value of existing land or real estate essential for the investment, provided that it does not exceed 5 % of the total eligible expenditure of the operation concerned. Up to 10 % of the investment is eligible for the purchase of new land.

5. Institution guarantee at preferential rates

Only costs incurred by the beneficiary on 01/01/2023 and 31/12/2029 at the latest are eligible.

Commitments and other requirements:

- Contribution to the implementation of a plant-level digitalisation plan with the achievement of milestones set by the end of the project
- Maintenance obligation of at least 5 years or 3 years in the case of the SME sector

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

☒ reimbursement of eligible costs actually incurred by a beneficiary

☐ unit costs

☐ lump sums

☐ flat-rate financing

Range of support at beneficiary level

The basic payment shall be limited to 50 % of eligible costs

Maximum amount of aid:

EUR 1000000/project

Maximum aid rate (intensity):

1. The maximum grant is 65 % of eligible costs.
2. The maximum aid rate may be further increased up to a maximum of 80 % of eligible costs, provided that the investment serves specific environmental and climate objectives and animal welfare improvements.
3. Young farmers may benefit from an increased aid intensity of 15 %.
4. In the case of economic transfers, an increased aid intensity of 15 % may be granted.
5. An increased aid intensity of 10 % may be granted in the case of an applicant for aid producing eco-certified products.
6. In the case of collective investment, an increased aid intensity of 10 % may be granted.
7. In the case of recourse to institutional guarantees at preferential rates, the aid intensity increased by 5 % compared to the basic subsidy may be granted.
8. In the case of an interest rate subsidy, the aid intensity may be increased by a maximum of 10 % compared to the basic payment.

Additional explanation

We calculated on the basis of historical data:

2905 aid applications for a total amount of HUF 212390759712 were submitted in response to call VP2-4.1.8-21 – Support for precision developments linked to the digital transition of agriculture – launched under the Rural Development Programme 2014-2020. Of which one average project size: HUF 73112138, i.e. EUR 200307. However, since the first official submission of the CAP Strategic Plan, inflation has increased the cost of investment components. Therefore, from 2025, we apply twice the rounded value of the previously determined unit amount. Thus, the unit amount is set at EUR 2 x 75000000 = HUF 150000000 (EUR 381679).

EUR 15928640 will be spent on the digital transition over the next period.

Expenditure is eligible in accordance with Article 86(4) of the CAP Strategy Regulation.

Expenditure shall be eligible for a contribution from the EAFRD if it has been incurred and paid by the beneficiary by 31 December 2029. The starting date for the eligibility of costs incurred by the beneficiary may be 1 January 2023.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☒ Yes ☐ No ☐ Mixed

Explanation of support activities falling outside the scope of Art. 42 TFEU

In view of the objective of the intervention set out in point 5, the competition rules are generally applicable.

Type of state aid instrument to be used for clearance:

☐ Notification ☒ GBER ☐ ABER ☐ de minimis

State Aid case number

SA.112040

Additional information:

☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.

☐ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.

☒ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

What is not eligible for support?

The following investments shall not be eligible:

(a) the purchase of agricultural production rights;

(b) purchase of payment entitlements;

(C) the purchase of land for an amount exceeding 10 % of the total eligible expenditure of the operation concerned, excluding the purchase of land for environmental purposes, the purchase of land for the conservation of carbon-rich soil and the purchase of land by young farmers through the use of financial instruments; in the case of financial instruments, that ceiling shall apply to the eligible public expenditure paid to the final recipient, or, in case of guarantees, to the amount of the underlying loan;

(D) the purchase of animals, the purchase of annual plants and the planting of such plants for purposes other than: agricultural or forestry potential following natural disasters, adverse climatic events or catastrophic events, or the protection of livestock against large carnivores or the use of animals in forestry instead of machinery, or the rearing of endangered breeds as defined in point (24) of Article 2 of Regulation (EU) 2016/1012 of the European Parliament and of the Council (45) under the commitments referred to in Article 70; or the conservation of plant varieties threatened with genetic erosion in the

framework of the commitments referred to in Article 70;

(e) interest on loans, except in the case of grants in the form of interest rate subsidies or guarantee fee subsidies;

(F) investment in large-scale infrastructures, as defined by Member States in their CAP Strategic Plans, that are not part of the community-led local development strategies set out in Article 32 of Regulation (EU) 2021/1060, with the exception of broadband systems and preventive measures for flood and coastal protection aimed at mitigating the consequences of likely natural disasters, adverse climatic events or catastrophic events;

(g) investments in afforestation that do not meet environmental and climate objectives in line with the principles for sustainable forest management set out in the Pan-European Guidelines for Afforestation and Reforestation.

Regional breakdown

10 WTO compliance

Green Box

Paragraph 11 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 11 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(2)(d) - Other regions	43.00%	20.00%	43.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD02_O20_A01_ON - Supporting the digital transition of agricultural holdings	Grant	91(2)(d)-HU-43.00%	Average		R.3; R.9	No

Explanation and justification related to the value of the unit amount

RD02_O20_A01_ON - Supporting the digital transition of agricultural holdings

It is based on historical data, based on experience from the previous programming period. When determining the average unit amounts, the aid applications received and approved in response to calls for proposals under measures M04 of the Rural Development Programme 2014-2020 were taken into account, taking into account the funds allocated to the calls for proposals. The unit amount is the ratio between committed funds and subsidised applications, corrected by an inflation coefficient.

Average unit amount of small-scale investments per project: EUR 136986,3

Average unit amount of large investments per project: EUR 684,931,5

In response to the call VP2-4.1.8-21 – Support for precision developments linked to the digital transition of agriculture under the Rural Development Programme 2014-2020, 2905 aid applications were submitted, an average project size: The average was EUR 200307. The small and large project sizes were established taking into account the upper and lower standard deviations. However, since the first official submission of the CAP Strategic Plan, inflation has led to increased costs for investment components. Therefore, from 2025, we apply twice the rounded value of the previously determined unit amount. Thus, the unit amount is set at $\text{EUR } 2 \times 75000000 = \text{HUF } 150000000$ (EUR 381679).

For the maximum planned unit amounts, we took into account the effectiveness and eligibility of digital solutions with inflation and some innovative elements by approximately 15 %.

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029

Code	Description
HU	Magyarország

Description of the Territorial Scope

Entire country

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO2 Enhance market orientation and increase farm competitiveness, both in the short and long term, including greater focus on research, technology and digitalisation

SO7 Attract and sustain young farmers and other new farmers and facilitate sustainable business development in rural areas

SO8 Promote employment, growth, gender equality, including the participation of women in farming, social inclusion and local development in rural areas, including the circular bio-economy and sustainable forestry

SO9 Improve the response of Union agriculture to societal demands on food and health, including high quality, safe, and nutritious food produced in a sustainable way, the reduction of food waste, as well as improving animal welfare and combatting antimicrobial resistances

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
2.1.3	Increasing the level of processing of agricultural raw materials	1	Yes
7.3.2	On-farm/off-farm diversification, with the aim of creating multi-start rural businesses	2	Yes
8.1.1	Increasing the employment rate of women in rural areas	1	Partially
8.1.2	Improving the profitability of rural micro-enterprises	1	Partially
8.1.5	Improving the profitability of small farms	2	Yes
8.4.2	Encouraging Roma inclusion programmes, reducing segregation	3	Partially
9.3.1	Product development and packaging development that meet consumers' expectations	3	Yes
9.3.2	Use of innovative technological solutions in food production – packaging	2	Partially
9.3.3	Promoting compliance with the	2	Yes

	Packaging and Waste Framework Directive		
9.4.1	Increase the share of organic products in the internal market and related processing capacities	2	Yes
9.8.1	Meeting dietary needs due to specific health or social reasons	2	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.39 Number of rural businesses including bio-economy businesses developed with CAP support

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

The objective of the intervention is to support investments in technological development to enhance the value added of agricultural products and market access in order to increase the efficiency of food processing in enterprises and to support improvements related to adding value to agricultural products. The intervention contributes to meeting the needs identified in SWOT by adding value to agricultural products and gaining market access, technological development, and increasing the corporate efficiency of food processing.

Support under the intervention will allow for more competitive business, production and product structures, optimisation and market access (including storage and cooling) for higher value-added products, as well as capacity-building based on market demand and/or product track cooperation.

Selection criteria which can be applied in part:

- Quality of the business plan
- Cooperation with public recognition or participation in it
- Participation in quality schemes
- Regional perspective
- Development takes place under the Roma inclusion programme
- Digitalisation development
- Development related to integration
- Employment
- Woman applying for support

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiaries:

Natural persons

Enterprises with legal personality (partners+cooperatives (including social cooperatives))

– Undertakings without legal personality

Non-profit organisations with legal personality (Church legal persons, foundations, non-profit companies, etc.)

Eligibility criteria:

—Natural and legal persons

As this measure falls outside the scope of Article 42 TFEU (see point 8), with the exception of de minimis aid, **no aid may be granted** to a beneficiary under Commission Regulation (EU) No 651/2014 or Commission Regulation (EU) No 702/2014

- it is considered to be a firm in difficulty (the concept of a firm in difficulty is defined in Decree 37/2011 on the procedure for State aid for the purposes of EU competition law and on the regional aid map. (III. As defined in Section 6(4a) and (4b) of Government Decree No 487/2015, or
- it failed to comply with the decision of the European Commission addressed to Hungary requiring the recovery of State aid within the meaning of EU competition law.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Eligible costs for the intervention:

construction, development and modernisation of buildings and structures directly related to technology or infrastructure for the operation of the plant.

(b) Purchase of new machinery and devices, technologies, modernisation of existing machinery and equipment, including information and communication technologies.

general costs related to the abovementioned expenditure, such as architects, engineers, consultation fees, administrative procedural fees, consultancy and project management costs, fees related to advice on environmental and economic sustainability, including feasibility studies.

(D) Intangible investments: acquisition or development of computer software and acquisition of patents, licences, copyrights, trademarks, etc.

the purchase of immovable property required in relation to point (a) up to a maximum of 5 % of the total eligible expenditure of the operation concerned and the value of existing land or real estate essential for the investment shall be eligible as contributions in kind, provided that it does not exceed 5 % of the total eligible expenditure of the operation concerned. Up to 10 % of the investment is eligible for the purchase of new land.

recourse to institutional guarantees with a reduced premium rate

Only costs that are eligible are those incurred by the beneficiary at the earliest on 01/01/2023 or 31.12.2029 at the latest.

Commitment:

Maintenance obligation for at least 5 years, or at least 3 years for the SME sector

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

☒ reimbursement of eligible costs actually incurred by a beneficiary

☐ unit costs

☐ lump sums

☐ flat-rate financing

Range of support at beneficiary level

The basic grant shall be up to 50 % of the eligible costs.

In the case of an aid application producing an ÖKO qualified product, an aid intensity increased by 10 % compared to the basic aid may be granted.

In the case of collective investment, an aid intensity increased by 10 % compared to the basic aid may be granted.

In the case of the use of an institutional guarantee at a reduced rate, the aid intensity may be increased by 5 % compared to the basic grant.

In the case of an interest rate subsidy, an aid intensity may be increased by up to 10 % compared to the basic aid.

The maximum amount of aid that can be applied for a project is: EUR 15 million

Additional explanation

Not relevant.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☐ No ☒ Mixed

Explanation of support activities falling outside the scope of Art. 42 TFEU

This measure supports, in whole or in part, investments and developments in the production of non-Annex I products and therefore the competition rules (State aid) are generally applicable to this.

ABER: SA.112038

Type of state aid instrument to be used for clearance:

☐ Notification ☒ GBER ☐ ABER ☒ de minimis

State Aid case number

SA.112038

SA.112040

SA.107119

Additional information:

☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.

☐ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.

☒ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

What is not eligible for support?

The following investments shall not be eligible:

(a) the purchase of agricultural production rights;

(b) purchase of payment entitlements;

(C) the purchase of land for an amount exceeding 10 % of the total eligible expenditure of the operation concerned, excluding the purchase of land for environmental purposes, the purchase of land for the conservation of carbon-rich soil and the purchase of land by young farmers through the use of financial instruments; in the case of financial instruments, that ceiling shall apply to the eligible public expenditure paid to the final recipient, or, in case of guarantees, to the amount of the underlying loan;

(D) the purchase of animals, the purchase of annual plants and the planting of such plants for purposes other than: agricultural or forestry potential following natural disasters, adverse climatic events or catastrophic events, or the protection of livestock against large carnivores or the use of animals in forestry instead of machinery, or the rearing of endangered breeds as defined in point (24) of Article 2 of Regulation (EU) 2016/1012 of the European Parliament and of the Council (45) under the commitments referred to in Article 70; or the conservation of plant varieties threatened with genetic erosion in the framework of the commitments referred to in Article 70;

(e) interest on loans, except in the case of grants in the form of interest rate subsidies or guarantee fee subsidies;

(F) investment in large-scale infrastructures, as defined by Member States in their CAP Strategic Plans, that are not part of the community-led local development strategies set out in Article 32 of Regulation (EU) 2021/1060, with the exception of broadband systems and preventive measures for flood and coastal protection aimed at mitigating the consequences of likely natural disasters, adverse climatic events or catastrophic events;

(g) investments in afforestation that do not meet environmental and climate objectives in line with the principles for sustainable forest management set out in the Pan-European Guidelines for Afforestation and Reforestation.

Does the investment contain irrigation?

☐ Yes ☒ No

Investments in the improvement of existing irrigation installations, what is the potential water saving(s) required (expressed in %)

N/A

Details on different potential water savings according to the type of installation or infrastructure (where applicable)

Investments in the improvement of existing irrigation installations (affecting water bodies whose status is less than good) what is/are the requirement(s) for an effective reduction in water use - expressed in %)

Regional breakdown

10 WTO compliance

Green Box

Paragraph 11 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 11 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(2)(d) - Other regions	43.00%	20.00%	43.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD04a_O24_A01_ON - Specific support for adding value to agricultural products	Grant	91(2)(d)-HU-43.00%	Average		R.39	No

Explanation and justification related to the value of the unit amount

RD04a_O24_A01_ON - Specific support for adding value to agricultural products

The calculation was based on historical data. When determining the average unit amounts, the aid applications received and approved in response to calls for proposals under measures M04 of the Rural Development Programme 2014-2020 were taken into account, taking into account the funds allocated to the calls for proposals. The unit amount is the ratio between committed funds and subsidised applications, corrected by an inflation coefficient.

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029
RD04a_O24_A01_ON - Specific support for adding value to agricultural products (Grant - Average)	Planned unit amount (Total Public Expenditure in EUR)	0.00	0.00	650,959.00	650,959.00	0.00	0.00	0.00

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
4.3.1	Increasing the use of renewable energy, taking into account potential environmental conflicts	3	Yes
4.3.3	Increasing efficiency of energy use at operational and technological level	1	Yes
8.1.6	Biomass feedstocks, intermediate products, waste processing, renewable energy use	1	Partially
8.1.7	Replacement of fossil industrial feedstocks with green substitutes	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.15 Supported investments in renewable energy production capacity, including bio-based (in MW)
R.16 Share of farms benefitting from CAP investment support contributing to climate change mitigation and adaptation, and to the production of renewable energy or biomaterials

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

The objective of the intervention is to support investments in technological development to enhance the value of agricultural products and market access, to increase the efficiency of food processing in

companies, in particular to support improvements in resource and energy efficiency linked to adding value to agricultural products.

One of the objectives of the intervention is to increase the self-sufficiency of energy in the sector and to reduce energy dependency by supporting reductions in CO₂ emissions and energy use in processing plants by improving energy efficiency and promoting renewable energy sources. Ecological considerations are taken into account through the use of environmentally friendly technologies and improvements in energy efficiency. Reducing energy costs, increasing energy efficiency, promoting renewable energy sources, biomass-based systems and increasing the use of biogas from agriculture will also contribute to strengthening the competitiveness of the processing sector. The intervention also encourages the implementation of projects that follow a circular biomass economy model, based on the use of in-situ biomass resources, and the exploitation of by-products is also an important aspect (e.g.: soil improvement).

The intervention shall include a reduction in the energy use of activities linked to adding value to agricultural products in order to reduce the environmental burden caused by the processing sector: it improves the efficiency of the energy use of processing plants, mainly through upgrades and renovations in building energy, technical building and energy supply.

Hungary aims to achieve a share of renewable energy of at least 21 % in gross final energy consumption by 2030. The intervention also contributes to achieving Hungary's objective.

The intervention also aims to support investments that encourage the use of agricultural by-products for other non-food uses (e.g.: fibre extraction, biorefining, substitution of fossil inputs).

●

Selection criteria which can be applied in part:

- Quality of the business plan
 - Cooperation with public recognition or participation in it
 - Mainstreaming environmental, climate and adaptation aspects (e.g. improvement of environmental impact relevant input efficiency, reduction of emissions per unit of pollutant; re-use or recycling, organic farming and/or processing of organic products and/or)
 - Developments leading to increased energy savings and increased use of renewable energy
 - Participation in quality schemes
 - Regional perspective
 - Development takes place under the Roma inclusion programme
 - Digitalisation development
 - Development related to integration
 - Employment
 - A woman seeking support,
- Provision of reference data

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiaries:

Natural persons

Enterprises with legal personality (partners+cooperatives (including social cooperatives))

– Undertakings without legal personality

Non-profit organisations with legal personality (Church legal persons, foundations, non-profit companies, etc.)

Eligibility criteria:

—Natural and legal persons

As this measure falls outside the scope of Article 42 TFEU (see point 8), with the exception of de minimis aid, **no aid may be granted** to a beneficiary under Commission Regulation (EU) No 651/2014 or Commission Regulation (EU) No 702/2014

- it is considered to be a firm in difficulty (the concept of a firm in difficulty is defined in Decree 37/2011 on the procedure for State aid for the purposes of EU competition law and on the regional aid map. (III. As defined in Section 6(4a) and (4b) of Government Decree No 487/2015, or
- it failed to comply with the decision of the European Commission addressed to Hungary requiring the recovery of State aid within the meaning of EU competition law.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Eligible costs for the intervention:

construction, development and modernisation of a building for the achievement of green objectives.

(b) Purchase of new machinery and devices, technologies, modernisation of existing machinery and equipment, including information and communication technologies.

general costs related to the abovementioned expenditure, such as architects, engineers, consultation fees, administrative procedural fees, consultancy and project management costs, fees related to advice on environmental and economic sustainability, including feasibility studies.

(D) Intangible investments: acquisition or development of computer software and acquisition of patents, licences, copyrights, trademarks, etc.

the purchase of immovable property required in relation to point (a) up to a maximum of 5 % of the total eligible expenditure of the operation concerned and the value of existing land or real estate essential for the investment shall be eligible as contributions in kind, provided that it does not exceed 5 % of the total eligible expenditure of the operation concerned. Up to 10 % of the investment is eligible for the purchase of new land.

(F) Institutional guarantee with a discounted premium.

Only costs that are eligible are those incurred by the beneficiary at the earliest on 01/01/2023 or 31.12.2029 at the latest.

Commitments:

if Anaerobic decomposition (biogas technology) is used, the proportion of cereals used and starch and sugar-containing crops (excluding waste, harvest residues, by-products) shall be less than 50 % of the input feed.

using Anaerobic digestion or, in case of biorefining, producing and using ferment of quality suitable for soil improvement.

in the case of the use of a biomass-based renewable energy solution of agricultural origin, the feedstock shall only be a by-product of the production and use of Annex I product and Annex I product.

where, in the case of biomass-based energy production of agricultural origin, the primary objective is to produce electricity, at least 25 % of the heat generated above process self-consumption shall be used on the own farm.

maintenance obligation for at least 5 years, or at least 3 years for the SME sector

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

Description of the Territorial Scope

Entire country

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO2 Enhance market orientation and increase farm competitiveness, both in the short and long term, including greater focus on research, technology and digitalisation

SO7 Attract and sustain young farmers and other new farmers and facilitate sustainable business development in rural areas

SO8 Promote employment, growth, gender equality, including the participation of women in farming, social inclusion and local development in rural areas, including the circular bio-economy and sustainable forestry

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
2.1.1	Increasing operational and business efficiency of production	1	Yes
7.3.1	Business start-up support for people outside the young farmer category	1	Yes
8.1.5	Improving the profitability of small farms	2	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.42 Number of persons covered by supported social inclusion projects

R.9 Share of farmers receiving investment support to restructure and modernise, including to improve resource efficiency

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

The objective of the intervention is to help small farmers, who are able to develop according to their characteristics and ambitions, to earn incomes and increase their economic growth. Boosting income and employment is essential in order to preserve stability and quality of life in rural areas. Support for small farms shall be aimed in particular at achieving the following objectives: stabilising and improving the market position of existing product structures, modernising and diversifying the product structure on the basis of market demand, producing traditional handicrafts by processing raw materials, modernising the production method, increasing environmental efficiency, producing higher value added products,

prioritising digitalisation.

Principles governing the establishment of selection criteria, which may be partially applied (selection criteria):

Quality of the business plan, including an advantage:

Professional qualifications

Construction of a product structure with higher labour demand

Mainstreaming environmental, climate and adaptation aspects

Regional perspective

Membership of a producer group or of a producer organisation or of a related interbranch organisation

Agricultural social cooperative or membership thereof

Employment.

● Women applying for support

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible Beneficiaries:

Meeting the eligibility criteria:

— Natural persons

— Legal person

Eligibility criteria:

— Operating holding.

— Plant size of 5000 or more but less than EUR 10,000 SO.

— Drawing up a business plan.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Only costs that are eligible are those incurred by the beneficiary at the earliest on 01/01/2023 or 31.12.2029 at the latest.

Commitments:

Increase in farm size by 50 % by the end of the commitment period.

Implementation of an investment committed in a business plan

Maintenance obligation for at least 5 years, or at least 3 years for the SME sector

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

☒ reimbursement of eligible costs actually incurred by a beneficiary

☒ unit costs

☐ lump sums

☐ flat-rate financing

Basis for the establishment

Str Article 83(1)(a), 1(b) and 2 (a)(i)

1(a) – cost-based accounting in all cases except for plantation

1(b) – unit cost for plantation

Range of support at beneficiary level

—The maximum grant rate is EUR 60,000, i.e. up to 85 % of the total eligible costs of the project.

Additional explanation

Not relevant

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

What is not eligible for support?

The following investments shall not be eligible:

(a) the purchase of agricultural production rights;

(b) purchase of payment entitlements;

(C) the purchase of land for an amount exceeding 10 % of the total eligible expenditure of the operation concerned, excluding the purchase of land for environmental purposes, the purchase of land for the conservation of carbon-rich soil and the purchase of land by young farmers through the use of financial instruments; in the case of financial instruments, that ceiling shall apply to the eligible public expenditure paid to the final recipient, or, in case of guarantees, to the amount of the underlying loan;

(D) the purchase of animals, the purchase of annual plants and the planting of such plants for purposes other than: agricultural or forestry potential following natural disasters, adverse climatic events or catastrophic events, or the protection of livestock against large carnivores or the use of animals in forestry instead of machinery, or the rearing of endangered breeds as defined in point (24) of Article 2 of Regulation (EU) 2016/1012 of the European Parliament and of the Council (45) under the commitments referred to in Article 70; or the conservation of plant varieties threatened with genetic erosion in the framework of the commitments referred to in Article 70;

(e) interest on loans, except in the case of grants in the form of interest rate subsidies or guarantee fee subsidies;

(F) investment in large-scale infrastructures, as defined by Member States in their CAP Strategic Plans, that are not part of the community-led local development strategies set out in Article 32 of Regulation (EU) 2021/1060, with the exception of broadband systems and preventive measures for flood and coastal protection aimed at mitigating the consequences of likely natural disasters, adverse climatic events or catastrophic events;

(g) investments in afforestation that do not meet environmental and climate objectives in line with the principles for sustainable forest management set out in the Pan-European Guidelines for Afforestation and Reforestation.

Does the investment contain irrigation?

☐ Yes ☒ No

Investments in the improvement of existing irrigation installations, what is the potential water saving(s) required (expressed in %)

N/A

Details on different potential water savings according to the type of installation or infrastructure (where applicable)

Investments in the improvement of existing irrigation installations (affecting water bodies whose status is less than good) what is/are the requirement(s) for an effective reduction in water use - expressed in %)

Regional breakdown

10 WTO compliance

Green Box

Paragraph 11 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 11 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(2)(d) - Other regions	43.00%	20.00%	43.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD09a_O20_A01_ON - Specific cost of developing the sustainability of small farms	Grant	91(2)(d)-HU-43.00%	Average		R.42; R.9	No

Explanation and justification related to the value of the unit amount

RD09a_O20_A01_ON - Specific cost of developing the sustainability of small farms

The average unit amounts were calculated on the basis of historical data. The average unit amounts were determined taking into account the aid applications received and approved in response to calls for proposals under measures M07 of the Rural Development Programme 2014-2020, taking into account the funds allocated to the calls for proposals. The unit amount is the ratio between committed funds and subsidised applications, corrected by an inflation coefficient.

8.1.5	Improving the profitability of small farms	2	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.39 Number of rural businesses including bio-economy businesses developed with CAP support

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

They form an integral part of the ornamental gardening sector and the expansion of agricultural production is facilitated by activities carried out by operators which do not qualify as agricultural production. The latter often exceed 50 % of the total turnover and could not benefit from farm development measures. This problem occurred mainly in the small-scale rural business segment, which tends to be the hardest to access to investment on a market-based basis.

The targeted beneficiaries will primarily provide the local population with liveable, healthy living plant material and related services, thus contributing to the population-retaining power of rural Hungary while significantly increasing local employment. The marketing of own-grown crops either directly or in the form of gardening services improves the effectiveness of small businesses and their resilience to crisis

situations, which has recently gained great importance.

In the selection process, preference should be given to enterprises employing workers with the right skills or substantial professional experience, as this will ensure long-term satisfaction and confidence of consumers.

Principles governing the establishment of selection criteria, which may be partially applied (selection criteria):

Quality of the business plan

– Professional qualifications

Proven professional experience

Proof that activities in the ornamental plant sector have been carried out during the two full calendar years preceding the date of submission

- Mainstreaming environmental, climate and adaptation aspects

— Regional aspect

Membership of one of the member organisations of the Interbranch Organisation of Hungarian Architects

04 04 01 01 – Employment

-The woman applying for support

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible Beneficiaries

Undertakings that meet eligibility criteria and are engaged in the trading of ornamental plants or the management of green areas

Eligibility criteria:

- Act XVII of 2007 on certain aspects of the procedure relating to agricultural, rural development and fisheries aid and other measures (hereinafter: Economic operator holding a client identifier (Single Agricultural Client Registration System) in accordance with Section 28 of Act XVII of 2007

- Agricultural turnover not exceeding 40 % or forestry turnover not exceeding 50 % at the time of application for aid

- For at least the two years preceding the submission of the application, the undertaking's activity shall consist of at least one of the following: management of green spaces, retail trade services of ornamental plants and wholesale trade services of ornamental plants

— Classified as a micro or small enterprise

Project in rural areas

As this measure falls outside the scope of Article 42 TFEU (see point 8), with the exception of de minimis aid, **no aid may be granted** to a beneficiary under Commission Regulation (EU) No 651/2014 or Commission Regulation (EU) No 702/2014

- it is considered to be a firm in difficulty (the concept of a firm in difficulty is defined in Decree 37/2011 on the procedure for State aid for the purposes of EU competition law and on the regional aid map. (III. As defined in Section 6(4a) and (4b) of Government Decree No 487/2015, or
- it failed to comply with the decision of the European Commission addressed to Hungary requiring the recovery of State aid within the meaning of EU competition law.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Eligible costs for the intervention:

construction, development and modernisation of buildings and buildings.

(b) Purchase of new machinery and devices, technologies, modernisation of existing machinery and equipment, including information and communication technologies.

general costs related to the abovementioned expenditure, such as architects, engineers, consultation fees, administrative procedural fees, consultancy and project management costs, fees related to advice on environmental and economic sustainability, including feasibility studies.

(D) Intangible investments: acquisition or development of computer software and acquisition of patents, licences, copyrights, trademarks, etc.

the purchase of immovable property required in relation to point (a) up to a maximum of 5 % of the total eligible expenditure of the operation concerned and the value of existing land or real estate essential for the investment shall be eligible as contributions in kind, provided that it does not exceed 5 % of the total eligible expenditure of the operation concerned. Up to 10 % of the investment is eligible for the purchase of new land.

(F) Institutional guarantee with a reduced premium rate

Only costs that are eligible are those incurred by the beneficiary at the earliest on 01/01/2023 or 31.12.2029 at the latest.

Commitments:

– The enterprise's turnover increases

Implementation of the investment undertaken in the business plan.

—Maintenance obligation for at least 5 years, or at least 3 years for the SME sector

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

The setting-up and further development of start-up or existing non-agricultural or forestry activities of farmers or forest managers in rural areas can create more economic jobs. Actions that are in some way linked to an agricultural or forest management activity are eligible for support under the intervention. The intervention shall support investments in the development of non-agricultural or forest-farming production and service activities.

Principles governing the establishment of selection criteria, which may be partially applied (selection

criteria):

- Quality of the business plan
- Professional qualifications
- Proven professional experience
- Mainstreaming environmental, climate and adaptation aspects
- Regional perspective
- Social enterprises benefit from scoring
- Participation in a quality or certification system
- Employment
- Young farmers or young forest start-up entrepreneurs are given priority in scoring
- Woman applying for support

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible Beneficiaries:

Farmers or forest managers meeting eligibility criteria

Eligibility criteria:

Operating agricultural holding or registered forest manager

– Agricultural and forestry turnover exceeding 40 % at the time of the aid application

Project in rural areas

As this measure falls outside the scope of Article 42 TFEU (see point 8), **no aid may be granted** to a beneficiary under Commission Regulation (EU) No 651/2014 or Commission Regulation (EU) No 702/2014, with the exception of the minimis aid

- it is considered to be a firm in difficulty (the concept of a firm in difficulty is defined in Decree 37/2011 on the procedure for State aid for the purposes of EU competition law and on the regional aid map. (III. As defined in Section 6(4a) and (4b) of Government Decree No 487/2015, or
- it failed to comply with the decision of the European Commission addressed to Hungary requiring the recovery of State aid within the meaning of EU competition law.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Eligible costs for the intervention:

construction, development and modernisation of buildings and buildings.

(b) Purchase of new machinery and devices, technologies, modernisation of existing machinery and equipment, including information and communication technologies.

general costs related to the abovementioned expenditure, such as architects, engineers, consultation fees, administrative procedural fees, consultancy and project management costs, fees related to advice on environmental and economic sustainability, including feasibility studies.

(D) Intangible investments: acquisition or development of computer software and acquisition of patents, licences, copyrights, trademarks, etc.

the purchase of immovable property required in relation to point (a) up to a maximum of 5 % of the total eligible expenditure of the operation concerned and the value of existing land or real estate essential for the investment shall be eligible as contributions in kind, provided that it does not exceed 5 % of the total eligible expenditure of the operation concerned. Up to 10 % of the investment is eligible for the purchase of new land.

(F) Institutional guarantee with a reduced premium rate

Only costs that are eligible are those incurred by the beneficiary at the earliest on 01/01/2023 or

31.12.2029 at the latest.

Commitments:

Turnover from non-agricultural or forestry activities increases

The turnover from non-agricultural or forestry activities related to the project subject to the application must reach at least 10 % of the total cost of the project by the end of the commitment period

-A maintenance obligation of at least 5 years, or at least 3 years for the SME sector

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

Additional information:

☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.

☐ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.

☒ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

What is not eligible for support?

Investment component or acquisition for agricultural or forestry activities with a turnover of at least 40 % of the holder.

Ineligible irrigation development in any form

The following investments are not eligible:

(a) the purchase of agricultural production rights;

(b) purchase of payment entitlements;

(C) the purchase of land for an amount exceeding 10 % of the total eligible expenditure of the operation concerned, excluding the purchase of land for environmental purposes, the purchase of land for the conservation of carbon-rich soil and the purchase of land by young farmers through the use of financial instruments; in the case of financial instruments, that ceiling shall apply to the eligible public expenditure paid to the final recipient, or, in case of guarantees, to the amount of the underlying loan;

(D) the purchase of animals, the purchase of annual plants and the planting of such plants for purposes other than: agricultural or forestry potential following natural disasters, adverse climatic events or catastrophic events, or the protection of livestock against large carnivores or the use of animals in forestry instead of machinery, or the rearing of endangered breeds as defined in point (24) of Article 2 of Regulation (EU) 2016/1012 of the European Parliament and of the Council (45) under the commitments referred to in Article 70; or the conservation of plant varieties threatened with genetic erosion in the framework of the commitments referred to in Article 70;

(e) interest on loans, except in the case of grants in the form of interest rate subsidies or guarantee fee subsidies;

(F) investment in large-scale infrastructures, as defined by Member States in their CAP Strategic Plans, that are not part of the community-led local development strategies set out in Article 32 of Regulation (EU) 2021/1060, with the exception of broadband systems and preventive measures for flood and coastal protection aimed at mitigating the consequences of likely natural disasters, adverse climatic events or catastrophic events;

(g) investments in afforestation that do not meet environmental and climate objectives in line with the principles for sustainable forest management set out in the Pan-European Guidelines for Afforestation and Reforestation.

Does the investment contain irrigation?

☐ Yes ☒ No

10 WTO compliance

Green Box

Paragraph 11 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 11 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(2)(d) - Other regions	43.00%	20.00%	43.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD11_O24_A01_ON - Specific cost of aid for diversification of off-farm activities	Grant	91(2)(d)-HU-43.00%	Average		R.39	No

Explanation and justification related to the value of the unit amount

RD11_O24_A01_ON - Specific cost of aid for diversification of off-farm activities

Calculated on the basis of historical data. When determining the average unit amounts, the aid applications received and approved in response to calls for proposals under measures M06 of the Rural Development Programme 2014-2020 were taken into account, taking into account the funds allocated to the calls for proposals. The unit amount is the ratio between committed funds and subsidised applications, corrected by an inflation coefficient.

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO2 Enhance market orientation and increase farm competitiveness, both in the short and long term, including greater focus on research, technology and digitalisation

SO5 Foster sustainable development and efficient management of natural resources such as water, soil and air, including by reducing chemical dependency

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
2.1.1	Increasing operational and business efficiency of production	1	Yes
2.1.4	Management of water scarcity in arable crops	1	Yes
5.1.2	Reducing nutrient losses, preventing nutrient leaching	1	Yes
5.2.1	Sustainable use of surface and groundwater	1.	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.26 Share of farms benefitting from CAP productive and non-productive investment support related to care for the natural resource

R.9 Share of farmers receiving investment support to restructure and modernise, including to improve resource efficiency

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Target area 1: Support investments to improve the efficiency of irrigation water use
In the last few years, the frequency and severity of droughts have increased in a significant part of Europe. The effects of climate change, changes in land use and water abstraction will have to increase in the future and will have significant social, economic and environmental consequences.
The objective to be achieved in the agricultural areas most vulnerable to climate change is to ensure the

supply of water, for which irrigation is an essential tool. The increase in irrigated areas does not necessarily imply an increase in irrigation water. The intervention also aims to support the introduction of water-efficient irrigation technologies, the optimisation of water use in irrigation systems, the development and reconstruction of water-efficient irrigation infrastructure and related structures, and the creation of new irrigation water supply works and systems. Under optimal water use and targeted efficiency, it is understandable to introduce a complex method of water saving, which takes into account the specific characteristics of the area to be irrigated (soil conditions, crops, topography and precipitation conditions) and predicts the need for irrigation and the amount of irrigation water, and the automation of the irrigation system. These can be achieved through the acquisition, development and expert advice of computer software, supported by the intervention. If irrigation is tailored to the area to be irrigated, it will in any event have a positive impact on the conservation of water resources in the long term. Support should also be given to the introduction of energy-saving irrigation technologies and the optimisation of the energy use of irrigation systems.

Through the intervention, a drought monitoring station can also be built. A complex examination of the underlying causes of drought damage aims to identify water scarcity or surpluses in soil in order to take the necessary measures to prevent damage.

The investments supported will help secure production, prevent water scarcity and droughts in dry years, and adapt to the expected adverse impacts of climate change.

Within the target area, it is possible to set up smaller reservoirs than medium reservoirs to meet technological needs and improve the quality of irrigation water. The quality of irrigation water has a significant impact on the development of the irrigated culture, the development of its intrinsic values and the maintenance of the plant's resilience. It also has an impact on preserving and improving optimal soil status. The high salinity of irrigation water contributes to the development of salinisation. For example, low salinity water with a high sodium ratio may lead to slowing of water infiltration and the formation of oxygen depletion, which can lead to root suffocation. Pre-treatment of surface water or groundwater may be necessary to avoid negative effects, such as: desalination, chemistry adjustment, sedimentation before they are applied.

A reservoir of less than medium size is suitable for up to 10 thousand m³ water.

Target area 2: Support for water retention facilities by ensuring the sustainable management of water resources

The target area aims to support the technical solutions necessary for collecting and storing rainwater, which causes more damage than tolerable damage from cultivated areas, and contributes to reducing the volatility of agricultural production through the draining and utilisation of surplus waters, and to ensuring water efficiency and sustainable management of water resources.

Storm water management requires, on the one hand, the reduction of nutrient loads of water streams that receive water collected in ditches, including through the establishment of natural filtration fields, before the discharge of the collected waters into the receiver. On the other hand, the collection and storage of surplus waters that are harmful to farming, allowing irrigation from water collected in reservoirs during drier periods, are collected and stored.

Reservoirs improve the region's resilience to climate change, reduce climate change risks, damage, losses, and balance water scarcity and water surpluses, and establish buffer zones to achieve water quality and quantity targets.

It is necessary to support the development of medium reservoirs, the size of which already allows irrigation water to be exempted. In addition, in order to ensure that excess and harmful surface water is drained and exploited on the basis of water-saving criteria, it is also possible, through the intervention, to implement lined water collection and storage facilities (vacuums) that can be cultivated and interoperable.

The medium-sized reservoir can contain^{between} 10 thousand m³ (1 ha in a plane) and 1 million m³.

Drainage is intended solely for the draining of excess rainwater that is suddenly crushing, which specifically damages the soil. The filling of rainwater reservoirs from surface water or groundwater is forbidden; this has not previously been done (in projects funded by the VP) and no such permitted activity is planned thereafter.

Target area 3: Support for improvement of land use and water efficiency

The target area typically supports land-related land on the farm and the development of improvement pathways. Rainwater, which falls in large quantities, has a physical, rarely chemical effect on agricultural land roads, which must be protected by appropriate drainage solutions and the stability of the road's track structure.

The agricultural road, as a technical installation, must be free from the negative impact of water, but account must also be taken of the fact that the area of construction of the road is an area of land which cannot be allowed to be dried. Water management should aim at retaining usable water and ensuring that only surplus, non-storable water is decoupled. Agricultural water management is responsible, inter alia, for intervention to prevent water damage.

The objective of support is to develop small on-farm infrastructure to ensure tillage, harvesting, other coupled transport and safe and rapid access to land (e.g.: design of unencumbered track with beetle or unidirectional gradient, sparking and/or drainage). The soil is the largest aquifer and, in order to fulfil this function, it is also necessary to rehabilitate the natural geological and soil conditions of the area. As a result of cultivation, the resulting watertight layer must be loosened in order to allow the soil to store the rainwater. The intervention can significantly reduce the damage caused by water scarcity and excess water.

All target areas take into account the recommendations of the River Basin Management Plan (VGT 2, VGT 3 from 2022) on agricultural measures. Accordingly, the basic objective of the intervention is to support the measures necessary to bring and/or maintain the good status of surface and subsurface water bodies, including water retention, the sustainable management of our water resources, the uptake of saving irrigation technologies, climate-resilient production methods and sustainable land use.

All three target areas serve ecological objectives while contributing to a more balanced agricultural production. The farmer, as a water user, is undoubtedly a key player in water management. Therefore, encouraging farmers to develop up-to-date water use can only be effective if there is also a quantifiable production benefit at farm level.

A nationwide cadastral database (National Melioration Cadastre) containing the spatial location and descriptive data of the melioration works is being developed in order to expand the information and data on the exact location and technical status of the melioration works.

The Hungarian authorities clearly aim to spread sustainable water management through the water licensing criteria. As a result, the increase in irrigated areas does not result in a necessary or straight increase in water use (volume of water irrigated). In the case of irrigation farming, priority should be given to technical solutions that take into account the scarcity of surface water and groundwater resources and thus lead to maximum water savings.

The legislation required for the permit-granting process ensures that the operation of irrigation systems takes into account climate impacts (impacts of climate change).

The promotion of energy efficient irrigation systems using renewable energy sources will therefore be an important aspect of support decisions.

Principles governing the establishment of selection criteria, which may be partially applied (selection criteria):

—Quality of business plan

- in order to reduce water use higher than mandatory, priority should be given to projects achieving the highest possible water savings in the case of renovation or modernisation of the existing irrigation system
- priority should be given to projects on water bodies under stress for quantitative reasons

—Participation in state-recognised cooperation

—Company size

-Mainstreaming environmental, climate protection, landscape management and adaptation aspects (e.g. improving input efficiency relevant to environmental pressures, reducing per unit of pollutant emissions;

use of reuse or recycling, continuation of organic farming)

—Participation in quality schemes

Investments in inland water sensitive areas/Investments in sensitive areas, vulnerable area according to flood risk map (climate change adaptation (drift risk mitigation))

—Developments leading to energy savings

—The development is directly or indirectly linked to the use of renewable energy

—Reduction of water use higher than mandatory

—Applied self-handling technology

—Regional aspect

—Compliance with the status of young farmer

—Development focusing on digitalisation and innovation

—Integration development

—Employment

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligibility criteria:

- IN CASE 269/2007. The irrigation of Natura 2000 grasslands is prohibited under Section 4(2) of Government Decree No 487/2015 of 18 October 2000 on land use rules for the maintenance of Natura 2000 grasslands, and therefore investment in irrigation in these areas is not eligible. In Natura 2000 land for the protection of hostages, the irrigation investment is also not an activity to be supported, as it has a significant negative impact on hostages as a flag species. In accordance with Section 8(1)(b) of Act LIII of 1996 on nature protection, in a protected natural area, the authorisation of the nature conservation authority is required, in particular, for irrigation, so the existence of a permit is a prerequisite for the start of the project.
- Farmer or young farmer:
 - have a minimum farm size from agricultural activities of at least EUR 10.000 in the closed financial year preceding the submission of the tender, in accordance with the Standard Output Value (SPO) methodology.
 - ofwhom at least 40 % of the turnover in the preceding year derives from agricultural production.
- In the case of a consortium, all farmers in the group must comply with the eligibility conditions.
- A social cooperative must in itself fulfil the eligibility criteria set out above.
- Farmers' cooperatives must:
 - have a farm size of at least EUR 10,000 resulting from agricultural activity in the closed financial year preceding the submission of the application, in accordance with the SO methodology, and at least 40 % of its turnover in the preceding year must come from agricultural activities, or
 - the turnover of the members of the cooperative in the preceding year shall be aggregated and at least 40 % of the total turnover shall come from agricultural activities, and at least 40 % of the members participating in the cooperative shall be certified as having a holding size of at least EUR 10,000.
- Co-operation with state recognition is considered to be a farmer without the need to justify the conditions laid down.
- A sustainable water management community recognised in the intervention by the minister responsible for agricultural policy is also entitled to carry out collective investment, and a sustainable water management community is considered to be a farmer without justifying the conditions laid down.
- An undertaking engaged in integrator or processing activities related to the cultivation of herbs is eligible without proof of the size of the holding or turnover, but it is required to certify the turnover from the production of herbal products and to substantiate its activity by means of a

cultivation and/or purchase contract.

- Investments in the development of irrigation are eligible only if they comply with the requirements of Article 74 of the Strategic Plan Regulation.
- Investments in the development of existing irrigation installations or parts of existing irrigation systems shall only be eligible if the ex-ante assessment concludes that they will result in at least 10 % potential water savings for micro-irrigation based on the technical parameters of the existing installation or system, and at least 15 % for liners and reeling drums.
- Where the investment concerns a body of groundwater or surface water that has been rated less than good in the relevant river basin management plan for reasons related to water quantity, the investment shall also comply with the following cumulative conditions:
 - the project must ensure that, for irrigation installations or irrigation systems concerned by the project, actual water consumption is reduced by at least 50 % of the potential water savings identified by the ex-ante assessment of the project; and
 - where the project concerns only part of the irrigated area of a holding, the total water consumption of the holding at farm level shall be reduced by at least 50 %. The total water consumption of the holding shall include the quantities of water sold by the holding or transferred by any other means for irrigation.
 - None of the specified conditions shall apply to investments in existing irrigation installations which only concern energy efficiency, to investments in the creation of reservoirs or to investments in the use of reclaimed water that do not affect a body of groundwater or surface water.
- Aid for investments resulting in a net increase in irrigated areas and affecting specific bodies of groundwater or surface water (including investments defined in target area 2 of the intervention) shall only be granted if the water body concerned has not been classified less than good in the relevant river basin management plan for reasons relating to water quantity; and an environmental impact analysis demonstrates that the investment does not have significant negative effects on the environment. Such an environmental impact analysis shall be either carried out by or approved by the competent authority and may also refer to groups of holdings. (Article 74(6) of the Strategic Plan Regulation)
- In the case of investments resulting in a net increase in the irrigated area (including investments defined in target area 2), irrespective of the size of the area affected by the project, Article 74(6) of the Strategic Plan Decree 314/2005 on the environmental impact assessment and the uniform environmental use permit procedure. (XII. 25) Decree of the Government (hereinafter: 314/2005. (XII. Government Decree No 25/2000) requires **at least one of the regulated environmental impact assessment procedures**. For the purpose of determining the procedure to be carried out, Decree 314/2005. (XII. The conditions and thresholds set out in Annexes 1 and 3 to Government Decree No 25/2000 shall apply. If the activity is subject to a water-right permit, the environmental authority's opinion issued in the course of the water-law authorisation procedure shall prevail.
- The eligibility condition for the establishment of reservoirs is 314/2005. (XII. The **carrying out of at least one of the environmental impact assessment procedures** laid down in Government Decree No 25/2000, even if the project does not result in an increase in the irrigated area and irrespective of the size of the area affected by the project. For the purpose of determining the procedure to be carried out, Decree 314/2005. (XII. The conditions and thresholds set out in Annexes 1 and 3 to Government Decree No 25/2000 shall apply. If the activity is subject to a water-right permit, the environmental authority's opinion issued in the course of the water-law authorisation procedure shall prevail.
- Under Article 74(5) of Regulation (EU) No 2115/2021, Member States may grant support for investments in the use of reclaimed water as an alternative water supply only if the supply and use of such water complies with Regulation (EU) 2020/741 of the European Parliament and of the Council.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Eligible costs for the intervention:

the reconstruction, construction or improvement of water facilities and related structures;

(b) Purchase of new machinery and equipment, modernisation of existing systems, including computer software, ICT developments;
 general costs linked to the expenditure referred to in points (a) to (b), such as architects', engineers' fees, administrative fees, consultancy and project management costs;
 the following intangible investments: the acquisition or development of computer software and the acquisition of patents, licences, copyrights and trademarks or procedures;
 the purchase of real estate required in relation to point (a) up to a maximum of 5 % of the total eligible expenditure of the project concerned and the value of existing land or real estate essential for the investment shall be eligible as contributions in kind, provided that it does not exceed 5 % of the total eligible expenditure of the operation concerned. Up to 10 % of the investment is eligible for the purchase of new land;
 the cost of purchasing and installing water meters.
 (g) Institutional guarantee with a reduced premium rate

Costs are eligible only if they are incurred by the beneficiary at the earliest on 01/01/2023 or 31.12.2029 at the latest.

Commitment:

Maintenance obligation for at least 5 years, or at least 3 years for the SME sector

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

☒ reimbursement of eligible costs actually incurred by a beneficiary

☐ unit costs

☐ lump sums

☐ flat-rate financing

Range of support at beneficiary level

The basic grant shall be up to 50 % of the eligible costs.

The maximum aid rate shall be up to 70 % of the eligible costs for the development of an existing irrigation installation or element of irrigation infrastructure.

Young farmers may be granted an aid intensity increased by 15 % compared to the basic payment.

In the case of farm transfer, an aid intensity increased by 15 % compared to the basic payment may be granted.

In the case of an aid application producing an ÖKO qualified product, an aid intensity increased by 10 % compared to the basic aid may be granted.

In the case of collective investment, an aid intensity increased by 15 % compared to the basic aid may be granted.

In the case of an interest rate subsidy, an aid intensity may be increased by up to 10 % compared to the basic aid.

In the case of the use of an institutional guarantee at a reduced rate, the aid intensity may be increased by 5 % compared to the basic grant.

The maximum amount of aid that can be applied for a project is: EUR 15 million.

Additional explanation

.Not relevant.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

What is not eligible for support?

The following investments shall not be eligible:

(a) the purchase of agricultural production rights;

(b) purchase of payment entitlements;

(C) the purchase of land for an amount exceeding 10 % of the total eligible expenditure of the operation concerned, excluding the purchase of land for environmental purposes, the purchase of land for the conservation of carbon-rich soil and the purchase of land by young farmers through the use of financial instruments; in the case of financial instruments, that ceiling shall apply to the eligible public expenditure paid to the final recipient, or, in case of guarantees, to the amount of the underlying loan;

(D) the purchase of animals, the purchase of annual plants and the planting of such plants for purposes other than: agricultural or forestry potential following natural disasters, adverse climatic events or catastrophic events, or the protection of livestock against large carnivores or the use of animals in forestry instead of machinery, or the rearing of endangered breeds as defined in point (24) of Article 2 of Regulation (EU) 2016/1012 of the European Parliament and of the Council (45) under the commitments referred to in Article 70; or the conservation of plant varieties threatened with genetic erosion in the framework of the commitments referred to in Article 70;

(e) interest on loans, except in the case of grants in the form of interest rate subsidies or guarantee fee subsidies;

(F) investment in large-scale infrastructures, as defined by Member States in their CAP Strategic Plans, that are not part of the community-led local development strategies set out in Article 32 of Regulation (EU) 2021/1060, with the exception of broadband systems and preventive measures for flood and coastal protection aimed at mitigating the consequences of likely natural disasters, adverse climatic events or catastrophic events;

(g) investments in afforestation that do not meet environmental and climate objectives in line with the principles for sustainable forest management set out in the Pan-European Guidelines for Afforestation and Reforestation.

For investments in the development of existing irrigation installations, the potential water savings needed are:

According to Commission observation 324, water savings of at least 10 % for 'micro-irrigation' and 15 % for rainfall irrigation should be achieved. Only one value can be included in the SFC field below, so the two data are recorded here.

Does the investment contain irrigation?

☒ Yes ☐ No

Regional breakdown

10 WTO compliance

Green Box

Paragraph 11 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 11 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(2)(d) - Other regions	43.00%	20.00%	43.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD12_O20_A01_ON - On-farm investment improving water efficiency: unit cost of modernisation of existing irrigation systems	Grant	91(2)(d)-HU-43.00%	Average		R.26	No
RD12_O20_A02_ON - On-farm investment improving water efficiency: unit cost of net growth of irrigated area	Grant	91(2)(d)-HU-43.00%	Average		R.9	No

Explanation and justification related to the value of the unit amount

RD12_O20_A01_ON - On-farm investment improving water efficiency: unit cost of modernisation of existing irrigation systems

Calculated on the basis of historical data. When determining the average unit amounts, the aid applications received and approved in response to calls for proposals under measures M16 of the Rural Development Programme 2014-2020 were taken into account, taking into account the funds allocated to the calls for proposals. The unit amount is the ratio between committed funds and subsidised applications, corrected by an inflation coefficient.

RD12_O20_A02_ON - On-farm investment improving water efficiency: unit cost of net growth of irrigated area

The calculation was based on historical data. When determining the average unit amounts, the aid applications received and approved in response to calls for proposals under measures M16 of the Rural Development Programme 2014-2020 were taken into account, taking into account the funds allocated to the calls for proposals. The unit amount is the ratio between committed funds and subsidised applications, corrected by an inflation coefficient.

RD18_I03_JGR_73 - Agricultural Risk Management System (Pillar III) Digitalisation of the National Agricultural Hail Mitigation System

Intervention Code (MS)	RD18_I03_JGR_73
Intervention Name	Agricultural Risk Management System (Pillar III) Digitalisation of the National Agricultural Hail Mitigation System
Type of Intervention	INVEST(73-74) - Investments, including investments in irrigation
Common Output Indicator	O.20. Number of supported on-farm productive investment operations or units
Contributing to ringfencing requirement for/on	Generational Renewal: No Environment: No ES rebate system: LEADER: No

1 Territorial scope and, if relevant, regional dimension

Territorial scope: **National**

Code	Description
HU	Magyarország

Description of the Territorial Scope

The agricultural hail mitigation system covers the entire territory of the country.

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO4 Contribute to climate change mitigation and adaptation, including by reducing greenhouse gas emission and enhancing carbon sequestration, as well as promote sustainable energy

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
4.4.1	Development of solutions and tools to protect against adverse weather effects	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.27 Number of operations contributing to environmental sustainability and the achievement of climate mitigation and adaptation goals in rural areas

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Hungary has a complex **four-pillar agricultural risk management system**. The **third pillar** of this scheme is the **national hail mitigation system**, which focuses specifically on one of the most harmful weather events in Hungary.

The National Chamber of Agricultural Economics (hereinafter: With **986 soil generators**, the **national hail mitigation system set up by the** European Parliament started operating in May 2018. The system, which fully covers the territory of Hungary, uses equipment installed along a grid of approximately 10 x 10 km to mitigate hail damage using the **active substance silver iodide acetone**. A larger proportion of equipment, **767 manually** operated equipment requiring human resources, while **219 automatic machines** operate remotely without human intervention. Operation of the ground generators during the **protection period: between 15 April and 30 September**.

Distribution of soil generators by region

Region	Manual ground generator	Automatic ground generator
North Transdanubia	180 items	39
Central Hungary	232 items	97
East Hungary	178 items	64
South Transdanubia	177 items	19

In the years 2018-2021, based on the damage statistics submitted to the Compensation Fund, it can be shown that hail damage **decreased by 43 %** compared to 2015-2017, despite the more extreme weather conditions due to climate change in all four protected years.

During the years of operation of the hail mitigation system, the National Meteorological Service issuing the alerts and the Chamber are continually improving the **use of the active substance in a more economical** way. Despite this reduction in active substance consumption, the price of raw materials on the world market means that much more needs to be spent every year on the purchase of active substances. In 2022, we estimate that we will use HUF 900 million of active substances, which is sixty percent of the annual budget. The purchase of this year's quantity would have been HUF 460 million in 2018. Therefore, compared to the annual operating cost calculated before the start of 2018, it has significantly increased due to the cost of running the current system, inflation, the minimum wage and the doubling of the active ingredient price.

Manual generator operators play an important role in the operation of the ground-generator icemitigation system, who are 15 April during the control period. from 30 September to 30 September (for 169 days per year). It is also a problem that manual generator operators are increasingly fluctuating and having to replace operators due to their age and low fees.

On the basis of the above, it can be seen that the current **operating environment cannot be maintained in the medium term without** changing the current operating environment.

Therefore, in order to ensure the continued and long-term functioning of the system, while maintaining the current system, the aim is to implement a new development within the CAP Strategic Plan by which a modern automated system will be built.

Automation can increase operational efficiency, while more precise operation can reduce the amount of active substance emitted and fuel used in maintenance. Furthermore, as detailed below, while reducing the system's ecological footprint, the costs of operation remain controllable in the long term.

As a result of the more precise switch-on and switch-offs due to the operating mechanism of automatic generators, savings in the use of materials can be expected to be in the order of 10 %. Based on the operational experience of recent years, we can identify a more advanced alternator, which could lead to additional savings of 10-20 %. The lower number of active substances used also represents a lower environmental impact, which is an important factor despite the fact that the active substance is not harmful to the environment. The cost of active substances accounts for the largest part of the costs, i.e. around 40 %, thus saving between 10 % and 20 % would result in significant cost-effectiveness.

In terms of logistics costs, 55 % savings can be achieved, as the number of exits to generators is expected to be reduced by 43 % by automatic alternators. This is because due to more efficient operation, less active substances are used and therefore need to go to the alternator for refilling. As a result, both fuel costs and vehicle service costs (less km) are reduced.

The **objective of the RD18_I03_JGR_73 intervention is therefore to** build a fully automated national hail mitigation system based on state-of-the-art technology.

Requirements for newly developed automatic ground generators:

– Exact switch-on and deactivation

Reduction of the consumption of the active substance by means of meteorological instruments installed on equipment

Moderate maintenance needs

Environmentally friendly operation with renewable energy sources

A high level of system security

Principles governing the establishment of selection criteria, which may also be partially applied (selection criteria):

Selection criteria are not applied.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligibility criteria:

The National Chamber of Agriculture, which operates the national hail mitigation system.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Eligible costs for the intervention:

the purchase of new automatic ground generators and motor vehicles in order to ensure the sustainable operation of the national hail mitigation system, and the expansion of regional sites;

general costs related to the aforementioned expenditure, such as architects, engineers, consultation fees, administrative procedural fees, consultancy and project management costs, fees related to advice on environmental and economic sustainability, including feasibility studies.

(C) Intangible investments: acquisition or development of computer software and acquisition of patents, licences, copyrights, trademarks, etc.

(D) Institutional Guarantee with Reduced Premium

Only costs that are eligible are those incurred by the beneficiary at the earliest on 01/01/2023 or 31.12.2029 at the latest.

Commitment:

Maintenance obligation for at least 5 years, or at least 3 years for the SME sector

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☒ **Financial instrument**

Type of payment

☒ reimbursement of eligible costs actually incurred by a beneficiary

☐ unit costs

☐ lump sums

☐ flat-rate financing

Range of support at beneficiary level

The maximum rate of aid is 100 % of eligible costs.

Additional explanation

.Not relevant.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

What is not eligible for support?

The following investments shall not be eligible:

(a) the purchase of agricultural production rights;

(b) purchase of payment entitlements;

(C) the purchase of land for an amount exceeding 10 % of the total eligible expenditure of the operation concerned, excluding the purchase of land for environmental purposes, the purchase of land for the conservation of carbon-rich soil and the purchase of land by young farmers through the use of financial instruments; in the case of financial instruments, that ceiling shall apply to the eligible public expenditure paid to the final recipient, or, in case of guarantees, to the amount of the underlying loan;

(D) the purchase of animals, the purchase of annual plants and the planting of such plants for purposes other than: agricultural or forestry potential following natural disasters, adverse climatic events or catastrophic events, or the protection of livestock against large carnivores or the use of animals in forestry instead of machinery, or the rearing of endangered breeds as defined in point (24) of Article 2 of Regulation (EU) 2016/1012 of the European Parliament and of the Council (45) under the commitments referred to in Article 70; or the conservation of plant varieties threatened with genetic erosion in the framework of the commitments referred to in Article 70;

(e) interest on loans, except in the case of grants in the form of interest rate subsidies or guarantee fee subsidies;

(F) investment in large-scale infrastructures, as defined by Member States in their CAP Strategic Plans, that are not part of the community-led local development strategies set out in Article 32 of Regulation (EU) 2021/1060, with the exception of broadband systems and preventive measures for flood and coastal protection aimed at mitigating the consequences of likely natural disasters, adverse climatic events or catastrophic events;

(g) investments in afforestation that do not meet environmental and climate objectives in line with the principles for sustainable forest management set out in the Pan-European Guidelines for Afforestation and Reforestation.

Does the investment contain irrigation?

☐ Yes ☒ No

Investments in the improvement of existing irrigation installations, what is the potential water saving(s) required (expressed in %)

N/A

Details on different potential water savings according to the type of installation or infrastructure (where applicable)

Investments in the improvement of existing irrigation installations (affecting water bodies whose status is less than good) what is/are the requirement(s) for an effective reduction in water use - expressed in %

Regional breakdown

10 WTO compliance

Green Box

Paragraph 2 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

It is an infrastructure service within the meaning of point 2(g) of Annex II to the WTO Agreement on Agriculture.

(g) infrastructural **services**, including: electricity reticulation, roads and other means of transport, market and port facilities, water supply facilities, Dams and drainage schemes, and infrastructural works associated with environmental programmes. In all cases the expenditure shall be directed to the provision or construction of capital works only, and shall exclude the subsidised provision of on-farm facilities other than the reticulation of **generally available public utilities**. It shall not include subsidies to inputs or operating costs, or preferential user charges.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(2)(d) - Other regions	43.00%	20.00%	43.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD18_O20_A01_ON - Agricultural Risk Management - unit cost of the digital transition of the National Agricultural Hail Mitigation System	Grant	91(2)(d)-HU-43.00%	Average		R.27	No

Explanation and justification related to the value of the unit amount

RD18_O20_A01_ON - Agricultural Risk Management - unit cost of the digital transition of the National Agricultural Hail Mitigation System

The aid will contribute to the conversion of 767 soil generators currently operating manually into vending machines and to the refurbishment of 219 automatic generators.

· Device park upgrades, newly developed automatic soil generators: approx. EUR 12.5 million

· Acquisition of cars: approx. EUR 400 thousand

· Development and upgrading of space: approx. EUR 540 thousand

These amounts are estimated on the basis of the information currently available and we can finalise the exact distribution when preparing implementation.

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029

RESULT INDICATORS Code + Description	Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold
R.17 Area supported for afforestation, agroforestry restoration, including breakdowns	
R.26 Share of farms benefitting from CAP productive and non-productive investment support related to care for the natural resource	
R.32 Share of farms benefitting from CAP investment support contributing to biodiversity	

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Non-productive investments can be implemented under the intervention and do not lead directly to an increase in production value.

Agricultural land and associated habitats and landscape features are a crucial part of ecosystem systems and have a significant capacity to provide ecosystem services. They influence, for example, climate conditions, rainfall, soil and landscape water balances due to their regulatory effect. But they support soil protection, nutrient cycling and habitat, and can serve as feeding grounds for many agricultural-related and beneficial plant and animal species, such as pollinators, birds of prey, etc.

However, in recent decades, these habitats, which are part of the green infrastructure network, have been largely eradicated and disappeared with the transformation of landscape use, due to the growth of greenfield investments and the intensification of agricultural production. The restoration and development of grass roots, hedgerows, forest strips, tree rows and other semi-natural elements, thus disappearing, has become essential in order to combat pollination or pests, improve the water balance of agricultural areas, protect the quality of surface and groundwater, protect soil, improve local climatic conditions and increase the reduction of GHG emissions by agricultural means.

In order to protect our natural resources as a result of the increase in drought periods and changes in the intensity and distribution of precipitation and the rise in erosion phenomena, the preservation of excess water in the areas concerned for as long as possible and the establishment of certain erosion control facilities and buffer zones for watercourses are crucial. These activities make a major contribution to balancing small-scale climatic conditions in agricultural areas and carbon sequestration (SO4), protecting soil stocks and reducing nutrient loads and pollution in their waters (SO5), but the resulting habitats also contribute to the protection of biodiversity and the protection and improvement of landscape features (SO6).

The re-diversification of habitats and the restoration of landscape features, as well as the creation of elements to protect water and control erosion, will therefore help to mitigate and adapt to adverse climatic changes caused by agriculture, to protect biodiversity but also to protect soil, water and air, and to preserve and restore landscape features. At the same time, these activities do not ‘only’ serve environmental and conservation interests, but also – perhaps primarily in the eyes of farmers – sustainable agricultural production. Stability of yields, greater crop security, conservation and restoration of the natural resources needed for production.

These objectives can be achieved through non-productive investments that do not directly affect the value of farms and their ability to generate income, but which greatly increase their natural and public welfare value, ecosystem service capacity, but are designed and maintained as a small income and cost increase and require additional activity from farmers.

The effectiveness of habitats, landscape or protection features created by non-productive investments and farmers’ willingness is enhanced by the fact that the habitats, landscape or protection elements thus created do not lose their eligibility for support and thus remain eligible for BISS support. Furthermore, under Article 70, we intend to establish multi-annual maintenance support independent of the agri-environmental management programme (AKG) for certain non-productive investments, while the maintenance of certain elements is eligible for the agro-ecological programme and AEM.

Areas of intervention:

Within the scope of the intervention, support may be granted for non-productive investments in the following targeted areas:

A. Non-productive investments facilitating land use change and habitat restoration

(a) Installation of perennial crops for biodiversity protection

- I. stand-alone arable land parcels
- II. permanent crops, between rows
- III. on field tables or ecological boundaries of permanent crops

The planting of perennial crops for biodiversity protection aims to develop habitats favourable to pollinators, small wild game species, farmland bird species and other animal species, to develop Natura 2000 and High Nature Value Areas (HNV) areas, to support the functioning of ecosystems, and to improve habitat networking.

(b) establishment of grassland strips for erosion control on arable land and permanent crops

- I. on field tables or ecological boundaries of permanent crops
- (II) run-off routes parallel to the stratum lines and showing erosion notes within the tables
- III. permanent crops between rows

Grassland strips for erosion in arable land and permanent crops primarily serve to protect against soil erosion, while also contributing to the development of habitats for pollinators, small wild game species, farmland-bound bird species and other animal species, as well as Natura 2000 and High Nature Value (HNV) areas, to support ecosystems and improve habitat networking.

(C) Creation of scrub strips on arable land

- I. on the ecological boundary of the parcels
- II.a on run-off routes parallel to the stratum lines and showing erosion notes within the tables

The creation of grassland and scrub strips on arable land will also contribute to the development of habitats favourable to pollinators, small wild game species, farmland-bound bird species and other animal species, Natura 2000 and High Nature Value Areas (HNV) areas, to the functioning of ecosystems and to improve habitat networking.

(D) grassland planting in arable land

I. grassland planting for soil protection purposes

II. Creation of close-to-nature grasslands

Grassland planting on arable land aims at soil protection and, in the case of conservation objectives, habitat development, thus contributing to the development of habitats favourable to pollinators, small wild game species, farmland-bound bird species and other animal species, as well as Natura 2000 and High Nature Value Areas (HNV) areas, contributing to the functioning of ecosystems and improving habitat networking. One of the priority areas for grassland planting is the area of *kunhalms* classified as protected landscape features.

B. Installation of agroforestry systems for environmental or climate purposes

(a) installation of cellular tree rows

The planting of tree rows for crop protection contributes to the protection of soils against wind erosion and has a significant impact on habitat development and protection of surface water against leaching. Emerging new habitats contribute to the development of habitats favourable to pollinators, small wild game species, farmland bird species and other animal species, Natura 2000 and High Nature Value Areas (HNV) areas, ecosystems and habitat networking.

(b) Deployment of a series of trees and shrubs of plant protection forest strips

The planting of plant protection forest strips consisting of several rows of trees and shrubs contributes to the protection of soils against wind erosion and has a significant impact on the development of habitats, the development of favourable microclimates and the protection of surface water against leaching. Emerging new habitats contribute to the development of habitats favourable to pollinators, small wild game species, farmland bird species and other animal species, Natura 2000 and High Nature Value Areas (HNV) areas, ecosystems and habitat networking.

(C) Designation of woody pasture or woody hay on grassland

The creation of woody pastures or woody mowners on grasslands is primarily beneficial for animal welfare and habitat by providing shade. Emerging new habitats contribute to the development of habitats favourable to pollinators, small wild game species, farmland bird species and other animal species, Natura 2000 and High Nature Value Areas (HNV) areas, ecosystems and habitat networking.

C. Non-productive investments for water protection

C/I Non-productive investments for water protection – area-related

(a) Developing and developing a Partial Water Protection Buffer Zone

grassland with a width of 40 m, or

(II) establishment of a grass scrub protection area with a width of 20 m

In river basins that typically use agricultural land, it is common for cultivated plots to extend to the shores of watercourses. If the watercourse is not protected by dressing or depots, rainwater discharged from the fields or livestock holdings after precipitation events shall contaminate the watercourse with suspended matter and dissolved plant nutrients which have been washed by erosion. The establishment and development of a coastal water protection buffer zone with suitable vegetation and not under arable cultivation contributes to reducing the nutrient and pesticide load of water, by filtering out and depositing the washed suspended matter, by collecting and processing plant nutrients. The buffer strip also protects the watercourse from the effects of deflation and reduces the contaminated basic yield of the underground run-off. The investment will also contribute to the development of habitats, improving the connectivity of habitats and supporting the functioning of ecosystems. The development of floodplain vegetation typical of watercourses improves its nutrient flow by shielding the water surface.

(b) Establish habitats by retaining excess water on the site or re-humidating the sites

Establishment of open water or intermittent areas on agricultural land less suitable for arable or grassland farming, delineated by paludiculture, marshland, coastal vegetation and buffer zones. The creation of wetlands by retaining excess water in less suitable areas and by re-humidification of the land serves both climate protection by abandoning carbon-rich soils from cultivation and the creation of a favourable microclimatic environment through water retention. Emerging new habitats contribute to the development of habitats favourable to pollinators, small wild game species, farmland bird species and other animal species, Natura 2000 and High Nature Value Areas (HNV) areas, ecosystems and habitat networking.

C/II. Non-productive investments for water protection – area-based

(a) Developing and developing water retention facilities in deep water retention areas by ensuring that waters are pooled and maintained for as long as possible, creating temporary or permanent open water surfaces

These activities only contribute to the surface assembly of surplus waters, e.g. by steering waters into a certain area, but not by introducing them into watercourses. In other words, the quantity of water remains in the area for a certain period of time, concentrated in only one part of the area, thus optimising the cultivation of land. At the same time, the waters thus collected are not suitable for irrigation, serve only infiltration and evaporation and may develop favourable habitats.

development of water steering works: construction of drainage ditches, sewers, removable apples towards an area suitable for water retention

(II) design of a structure for water retention

(III) establishment of an area suitable for water retention

(IV) Designation of small gauge revolvable localisation charge

Part of non-productive investments for water protection aims to improve microclimatic conditions and groundwater resources by retaining surplus water. The water resources collected in this way cannot be used for irrigation.

(b) establishment and improvement of erosion control facilities

Support for non-productive investments (in particular: terraces, dresses, benches, ridges, capturing dams, grassland collectors, water scrubbers, which reduce the leaching of applied materials and contribute to the reduction of nutrient loads from erosion from land use.

The mandatory maintenance period is 5 years.

The development and development of technical facilities to ensure erosion control is designed to protect against soil erosion.

Selection criteria, which may be partially applied:

In the selection process of grant applications, priority shall be given to:

For target areas A and B

- Environmental added value of the chosen activities
- Areas of development proposed by the green infrastructure development project
- Natura 2000 areas
- Nitrate vulnerable zones
- Surface and floodplain areas
- Erosion-sensitive areas
- Inland water sensitive areas
- Drought-sensitive areas
- Areas with a slope above 12 %
- Use of tree and shrub species suitable for uterus or bee pasture
- Scale of housing
- Multiplication effect
- Above 100 ha of slab size
- In addition, for target area A.d, the areas of kunhalms classified as farming-related landscape features will be prioritised.

Participation in the work of the Test Plant Information Network (Test Plant System)

For Target Areas C/I and C/II:

- Environmental added value of the chosen activities
- Nitrate vulnerable zones
- The activity takes place in the catchment area of a body of surface water with a lower ecological and/or chemical status than good;
- The activity takes place on a body of near-surface groundwater with less than good qualitative and/or quantitative status
- And drought-sensitive areas for target area C/II.a.
- More favoured for Target Area C/I
- o Development areas proposed by the green infrastructure development project
- o Terminal and ramp areas
- o Natura 2000 sites

· In the case of target area C/I.b., the area of reservoirs under the 'Development of the Vásárhelyi Plan' programme

Participation in the work of the Test Plant Information Network (Test Plant System)

Link to other legislation:

- Act CXXIX of 2007 on the protection of agricultural land
- Act LIII of 1996 on nature protection
- 1155/2016. (III. Government Decision of 31 December 2006 on the revised 2015 river basin management

plan of Hungary

·23/2018. (X.31) OGY Resolution on the Second National Climate Change Strategy 2018-2030 with a 2050 perspective

Link to other CAP ST measures:

·The non-productive element created under the target areas A.a), A.b), A.c), B.a), B.b) and C/I.a. and C/I.b) of this investment shall not be eligible for the implementation of the relevant requirement of the DP17_G01_ECOS_16 – Agro-ecological programme in the year of construction.

Aid for the maintenance of a non-productive element created under target areas A.a), A.c), A.d), B.a), B.c) and C/I.a. and C/I.b. of this investment may be claimed under RD22_G05_LCP_70 – Agro-ecological land use change incentive payment

Environment and Energy Efficiency Operational Programme (KEHOP) Plus

3. Creating ecological and infrastructural conditions for the conservation and management of Natura 2000 sites and green infrastructure

The measures aim to create the necessary conditions for the conservation, healthy functioning and maintenance of natural ecosystems in protected natural areas and Natura 2000 sites – wetlands, aquatic communities, grasslands and forest areas – which are key elements of the green infrastructure in the outskirts, and to improve the conservation status of species and habitats of Community interest in line with the National Natura 2000 Prioritised Action Plan and to improve the status and management of Natura 2000 sites and protected natural areas, and to preserve in-situ/ex-situ the components (species, habitats) of the biodiversity (species, habitats) attached to them and playing a role in their survival. Thus, the following are eligible in particular:

- Rehabilitation of habitats in bad natural areas.
- Reconstruction of habitats to develop ecological links between the periphery of green infrastructure.
- Targeted conservation interventions.
- Improve nature conservation site management and guarding conditions and infrastructure.

Planned output indicator for the intervention field:

- Size of Natura 2000 sites subject to conservation and restoration measures: 100 000 ha

Planned allocation of funds for the intervention field:

- EUR 80 961 965

KEHOP Plus typically provides support opportunities for medium- and larger-scale State-owned and operated infrastructure development, while support opportunities are provided under this measure of the CAP Strategic Plan on a smaller scale and for other target groups (farmers).

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligibility criteria:

- Farmer
- Availability of an eligible area
- In the case of target area A/b, it is situated in an area sensitive to erosion and is situated in an area with a slope of more than 12 %
- In the case of C/I b, the area is located in an inland water vulnerable area
- The area in Target Area C/IIb is located in an erosion-sensitive area
- In the case of nature-protected sites or Natura 2000 sites, a statement of support from the competent

National Park Directorate on the eligibility of the investment for nature conservation purposes and its alignment with the management plan or Natura 2000 maintenance plan in place (if the plan has been completed).

The objects created in the context of the investment go beyond the obligations of the economic operator laid down in law or as a result of conditionality.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Type of aid:

Non-repayable grant.

The unit cost per hectare for the target areas, including the costs of preparatory and planting works for the first export, as well as the costs of propagating material of the species to be planted. The investment elements related to pastoral farming (teaching design, turf well design and wing design) have been determined on a unit cost basis.

For target areas B.a. and B.c., unit cost (pieces) based on the costs of preparatory and planting works for the first export, as well as the costs of propagating material of the species to be planted.

For target area B.b, the unit cost per linear metre, including the costs of preparatory and planting works for the first export, as well as the costs of propagating material of the species to be planted.

For the C.I target areas, a unit cost per hectare, including the costs of preparatory and planting works for the first export, as well as the costs of propagating material of the species to be planted.

In the case of non-productive investments in target area C.II for water protection purposes, the construction measures require, in the first place, investments in infrastructure and therefore the eligible costs actually incurred by the beneficiary during the aid will be reimbursed.

Within the scope of the intervention, support may be granted for non-productive investments in the following targeted areas:

A. Non-productive investments facilitating land use change and habitat restoration

(a) Installation of perennial crops for biodiversity protection

I. stand-alone fields of arable land,

(II) between rows of permanent crops,

III. on field tables or ecological boundaries of permanent crops

Implementation requirements:

- Planting of a multi-annual crop consisting of at least 6 species, including at least 1 butterfly, partially re-sown and providing pollinator insects with adequate food for as long as possible
- The use of fertilisers and pesticides is prohibited during planting.

Optional additional activity: T installation of sitting trees

The mandatory maintenance period is 7 years.

(b) establishment of grassland strips for erosion control on arable land and permanent crops

I. on field tables or ecological boundaries of permanent crops

II.a on run-off routes parallel to the stratum lines and showing erosion notes within the tables

III. permanent crops between rows

Implementation requirements:

- Deploying a mixture of at least 3 native grass species typical of the production area, meeting both environmental and conservation needs.
- The grassland planted must be used by mowing or grazing.
- The use of fertilisers and organic fertilisers for grassland planting is allowed up to 90 kg nitrogen per hectare. Grazing is prohibited in the year of planting.

Optional additional activity: T installation of sitting trees

The mandatory maintenance period is 7 years.

(C) Creation of scrub strips on arable land

I. on the ecological boundary of the parcels

II.a on run-off routes parallel to the stratum lines and showing erosion notes within the tables

Optional additional activity: T installation of sitting trees and birds

The mandatory maintenance period is 7 years.

Implementation requirements:

- The planting of a mixture of at least 3 native grass species and hedges of at least 3 native scrub species that meet both environmental and conservation needs.
- The width of the hedge may be 1.5 m or more but not more than 3 m, with a grass liquor on its two edges 1 to 1 m wide.

(D) grassland planting in arable land

I. grassland planting for soil protection purposes

II.Creation of close-to-nature grasslands

Optional additional activity: T installation of sitting trees

The mandatory maintenance period is 7 years.

Implementation requirements:

- The planting of a mixture of at least 3 semi-natural grasslands typical of the production area, consisting of 8 native grass species or other grassing species, meeting both environmental and nature conservation needs.
- Use the planted grassland by mowing or grazing.
- The use of fertilisers and organic fertilisers for grassland planting is allowed up to 90 kg nitrogen per hectare.
- Grazing is prohibited in the year of planting.

B. Installation of agroforestry systems for environmental or climate purposes

(a) installation of cellular tree rows

Implementation requirements:

- at least 0.5 ha of agricultural land
- Row 1 tree installation
- up to 35 individuals/ha can be installed

- Prepare planting 10 metres in width
- Planting: at a distance of at least 3 metres from the adjacent property, with a size of at least 1 m, railway min. 3 – max. 5 m
- individual tree strain protection

The mandatory maintenance period is 7 years, during which the maintenance of the tree row and the replacement of the trees are mandatory. RD22_G05_LCP_70 – Agro-ecological land use change incentive payment under intervention

(b) Installation of several rows of crop protection forest strips on arable land, consisting of trees and shrubs

Implementation requirements:

- at least 0.5 ha of agricultural land
- Installation of 5 rows of trees and 2 rows of shrubs over a 20 m wide area
- Preparation of planting at least 20 metres in width
- Planting: at a distance of at least 3 metres from the adjacent property, with a size of at least 1 m, sorband max. 2.5 m, spacing max. 3 m for trees, max. 1 m for shrub
- maximum 100 linear metres/ha and 165 trees/ha can be installed

The mandatory maintenance period is 7 years, during which the maintenance of the wooded strip and the replacement of trees and shrubs are mandatory and eligible for support under RD22_G05_LCP_70 – Payment to encourage agro-ecological land use change

(C) Designation of woody pastures or woody mowers on grasslands

Implementation requirements:

- Planting of at least 0.3 ha of grassland, with a maximum of 100 trees/ha
 - Soil preparation, measured at a distance of at least 3 m from neighbouring property, with a size of at least 1 m
 - group protection or microfence
- Optional additional elements:
- establishment of covered wings
 - establishment of a guide
 - establishment of a galley

The mandatory maintenance period is 7 years, during which the maintenance and replacement of trees is mandatory and eligible under RD22_G05_LCP_70 – Payment for agro-ecological land use change

C. Non-productive investments for water protection

C/I Non-productive investments for water protection – area-related

(a) Developing and developing a Partial Water Protection Buffer Zone

grassland with a width of 40 m, or

(II) establishment of a grass scrub protection area with a width of 20 m

The mandatory maintenance period is 5 years.

Implementation requirements:

for point (i)

- the planting of a mixture of grasslands, consisting of at least 3 native grass species or other grass forming species specific to the production area, meeting both environmental and nature protection needs, on the basis of a grassland planting guide.
- Use the planted grassland by mowing or grazing.
- The use of fertilisers and organic fertilisers for grassland planting is allowed for up to 90 kg nitrogen per hectare with immediate incorporation.
- Grazing is prohibited in the year of planting.

for point (ii)

- Establishment of a mixture of at least 3 native grass species and at least 3 native floodplain shrubs and tree species, meeting both environmental and nature conservation needs, so that a 5 m wide grass-based maintenance path on the coast side must be maintained.
- The use of fertilisers and livestock manure for planting is allowed for up to 90 kg nitrogen per hectare with immediate incorporation.

(b) Establish habitats by retaining excess water on the site or re-humidating the sites

Establish areas with open water or intermittent presence on agricultural land less suitable for arable or grassland farming, delineated by paludiculture, marshland, coastal vegetation and buffer zones, by retaining the excess water that emerges and by re- humidating the areas.

The mandatory maintenance period is 5 years.

C/II. Non-productive investments for water protection – project-based

(a) Developing and developing water retention facilities in deep water retention areas by ensuring that waters are pooled and maintained for as long as possible, creating temporary or permanent open water surfaces

These activities only contribute to the surface assembly of surplus waters, e.g. by steering waters into a certain area, but not by introducing them into watercourses. In other words, the quantity of water remains in the area for a certain period of time, concentrated in only one part of the area, thus optimising the cultivation of land. At the same time, the waters thus collected are not suitable for irrigation, serve only infiltration and evaporation and may develop favourable habitats.

development of water steering works: the construction of drainage floods, sewers and transplantable apples towards an area suitable for water retention, which are designed solely for environmental purposes and are designed for a definitely non-productive purpose.

(II) design of a structure for water retention

(III) establishment of an area suitable for water retention

(IV) Designation of small gauge revolvable localisation charge

The mandatory maintenance period is 5 years.

(b) establishment and improvement of erosion control facilities

Support for non-productive investments (in particular: terraces, ditches, benches, ridges, capturing dams,

grassland collectors, water scrubbers, which reduce the leaching of applied materials and contribute to the reduction of nutrient loads from erosion from land use.

The mandatory maintenance period is 5 years.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

☒ reimbursement of eligible costs actually incurred by a beneficiary

☒ unit costs

☐ lump sums

☐ flat-rate financing

Basis for the establishment

The payment shall be made in accordance with Article 83(1)(a), 1(b) and 2(a)(i) of the STR.

1(a): For target area C/II

1(b): For target areas A,B and C/I

In the case of target areas A, B and C/I:

Unit cost on the basis of a calculation, including the costs of preparatory and planting works for the first export as well as the costs of propagating material of the species to be planted.

Objective 1	Investment	Unit cost
A. Non-productive investments facilitating land use change and habitat restoration	(a) Installation of perennial crops for biodiversity protection	
	on stand-alone fields or their ecological boundaries	EUR 1020/ha
	permanent crops between rows or their ecological boundaries	EUR 333/ha
	(b) establishment of grassland strips for erosion control on arable land and permanent crops	
	on the ecological boundary of arable land parcels	EUR 1026/ha
	permanent crops between rows or their ecological boundaries	EUR 340/ha
	run-off routes parallel to the stratum lines or showing erosion notes within the tables	EUR 1026/ha
	(C) Creation of scrub strips on arable land	
	in the ecological boundary zone of tables	EUR 514/100m

	run-off routes parallel to the stratum lines or showing erosion notes within the tables	EUR 514/100m
	(D) grassland planting in arable land	
	grassland planting for soil protection purposes	EUR 1033/ha
	creation of semi-natural grasslands	EUR 1075/ha
B. Installation of agroforestry systems for environmental or climate purposes	(a) installation of cellular tree rows	EUR 38/number
	(b) planting of protective forest strips	EUR 12 per linear metre
	(a) construction of woody pastures or mowners	EUR 38/number
	Additional elements	
	covered wings	EUR 180/number
	waterer	EUR 135/number
	goose well	EUR 297/number
C/I Non-productive investments for water protection	(a) Developing and developing a Partial Water Protection Buffer Zone	
	grassland with a width of 40 m, or	895
	(II) establishment of a grass scrub protection area with a width of 20 m	1 220
	(b) Establish habitats by retaining excess water on the site or re-humidating the sites	958

For Target Areas C/II:

In the case of non-productive investments in target area C.II for water protection purposes, the design measures require, in the first place, investments in infrastructure, so the eligible costs actually incurred by the beneficiary during the aid are reimbursed in a project-based accounting procedure on the basis of an invoice. The costs of planning, purchase of equipment, implementation of land-use requirements and development of water infrastructure are eligible during the implementation of the activities.

Range of support at beneficiary level

The aid intensity is 100 % based on Article 73(4)(c)(i) of Regulation (EU) 2021/2115 of the European Parliament and of the Council.

●

Additional explanation

Background calculation of unit costs in target areas A and C/I for agro-ecological non-productive investments:

The calculation methodology was based on the use of the Test Operating System of the Institute of Agricultural Economy (FADN) and the Central Statistical Office (HCSO) databases and expert estimates. From the test scheme, data on production value and the costs of certain crops at sectoral level have been taken into account in particular. The test scheme collects sectoral data on the most important crops each year for more than 90 % of farmland, which is an important basis for background calculations, in arable

land, grassland, vegetables and permanent crops.

Target area b/a-Bb-B/c: for the installation of agro-forestry systems for environmental or climate protection, the development of unit cost categories of support is a separate annexed "CAP Strategic Plan Hungary 2023-2027 cost options prepared by the Forest Science Institute of Sopron University as an expert organisation independent of AM: unit costs).

The calculation shall be based on the determination of the additional costs incurred by complying with the requirements and the amount of loss of income. In calculating the aid amount, the expected income development of compliant farmers is compared to previous farming practices without making any investment. For each standard, the expected loss of revenue and the expected additional costs are taken into account. The value of the compensation was determined by aggregating the expected revenue losses and the expected additional costs under each provision. The investment elements related to pastoral farming (draining design, pomace well design and wings) are defined on a unit cost basis.

For target area C.II, the average unit amounts were determined on the basis of historical data. M04 – VP4-4.4.2.1-16 Non-productive investments for water protection: the design and development of facilities were based on projects with approved aid amounts among the grant applications received in the 2014-2020 period. The average value of the small number of samples was taken as the average unit amount for which we calculated for inflation. The maximum value shall be the rate of the highest approved project amount calculated in the form of inflation. The exchange rate used for the conversion of forint euros was 365 HUF/EUR

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☐ No ☒ Mixed

Explanation of support activities falling outside the scope of Art. 42 TFEU

This measure falls outside the scope of Article 42 TFEU and is therefore subject to the competition rules.

Type of state aid instrument to be used for clearance:

☐ Notification ☐ GBER ☒ ABER ☐ de minimis

State Aid case number

SA.112038

Additional information:

☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.

☐ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.

☒ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

What is not eligible for support?

- cost of purchasing machinery
- costs of constructing or renovating buildings

Does the investment contain irrigation?

☐ Yes ☒ No

Investments in the improvement of existing irrigation installations, what is the potential water saving(s) required (expressed in %)

N/A

Details on different potential water savings according to the type of installation or infrastructure (where applicable)

Investments in the improvement of existing irrigation installations (affecting water bodies whose status is less than good) what is/are the requirement(s) for an effective reduction in water use - expressed in %)

N/A

Regional breakdown

10 WTO compliance

Green Box

Paragraph 11 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

Agro-ecological non-productive investments under the measure are not linked to production and the aid is intended only to compensate for incurred costs.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(3)(b) - 73 - Support for non-productive investments referred to in Article 73	50.00%	20.00%	80.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD21_O21_A01_ON - Agro-ecological non-productive investments — Non-productive investments in water protection	Grant	91(3)(b) - 73-HU-50.00%	Average		R.26; R.32	No
RD21_O21_U01_HA - Agro-ecological non-productive investments in biodiversity planting perennial crops on stand-alone arable land on ground fields or in their ecological boundary zone	Grant	91(3)(b) - 73-HU-50.00%	Uniform		R.26; R.32	No
RD21_O21_U02_HA - Agro-ecological non-productive investments in the planting of perennial crops for biodiversity protection in permanent crop spacing or in the ecological boundary band thereof in plantations	Grant	91(3)(b) - 73-HU-50.00%	Uniform		R.26; R.32	No
RD21_O21_U03_HA - Agro-ecological non-productive investments in grassland strips for erosion control purposes in the ecological boundary of arable fields	Grant	91(3)(b) - 73-HU-50.00%	Uniform		R.26; R.32	No
RD21_O21_U04_HA - Agro-ecological non-productive investments in grassland strips to protect erosion in permanent crop spacing or in their ecological boundary strips in plantations	Grant	91(3)(b) - 73-HU-50.00%	Uniform		R.26; R.32	No
RD21_O21_U05_HA - Agro-ecological non-productive investments in grassland, scrub strips on arable land in ecological boundaries of fields	Grant	91(3)(b) - 73-HU-50.00%	Uniform		R.26; R.32	No
RD21_O21_U06_HA - Agro-ecological non-productive investments in grassland for soil protection	Grant	91(3)(b) - 73-HU-50.00%	Uniform		R.26; R.32	No

RD21_O21_U14_HA - Agro-ecological non-productive investments in grassland strips for erosion control purposes within the fields on run-off paths parallel to the contour lines and erosion features	Grant	91(3)(b) - 73-HU-50.00%	Uniform		R.26; R.32	No

RD21_O21_U15_HA - Agro-ecological non-productive investments in grassy scrub strips on arable land along run-off paths parallel to the strata and erosion notes within the fields	Grant	91(3)(b) - 73-HU-50.00%	Uniform		R.26; R.32	No

Explanation and justification related to the value of the unit amount

RD21_O21_A01_ON - Agro-ecological non-productive investments — Non-productive investments in water protection

The average unit amount was determined on the basis of historical data.

M04 – VP4-4.4.2.1-16 Non-productive investments for water protection: the design and development of facilities was requested on the basis of the applications for funding received in the 2014-2020 period, based on projects with approved aid amounts.

We took a rebalancing of the average unit amount for the small number of samples, for which inflation was calculated.

The maximum approved project amount, calculated on the basis of inflation, can be considered as a maximum value.

We calculated the exchange rate of HUF 365/EUR when converting the forint euro.

RD21_O21_U01_HA - Agro-ecological non-productive investments in biodiversity planting perennial crops on stand-alone arable land on ground fields or in their ecological boundary zone

The unit amount was determined on the basis of the unit costs of each target area. See the methodology for the calculation of unit costs in point 7.

RD21_O21_U02_HA - Agro-ecological non-productive investments in the planting of perennial crops for biodiversity protection in permanent crop spacing or in the ecological boundary band thereof in plantations

The unit amount was determined on the basis of the unit costs of each target area. See the methodology for the calculation of unit costs in point 7.

RD21_O21_U03_HA - Agro-ecological non-productive investments in grassland strips for erosion control purposes in the ecological boundary of arable fields

The unit amount was determined on the basis of the unit costs of each target area. See the methodology for the calculation of unit costs in point 7.

RD21_O21_U04_HA - Agro-ecological non-productive investments in grassland strips to protect erosion in permanent crop spacing or in their ecological boundary strips in plantations

The unit amount was determined on the basis of the unit costs of each target area. See the methodology for the calculation of unit costs in point 7.

RD21_O21_U05_HA - Agro-ecological non-productive investments in grassland, scrub strips on arable land in ecological boundaries of fields

The unit amount was determined on the basis of the unit costs of each target area. See the methodology for the calculation of unit costs in point 7.

RD21_O21_U06_HA - Agro-ecological non-productive investments in grassland for soil protection

The unit amount was determined on the basis of the unit costs of each target area. See the methodology for the calculation of unit costs in point 7.

RD21_O21_U07_HA - Agro-ecological non-productive investments in the creation of semi-natural grasslands

The unit amount was determined on the basis of the unit costs of each target area. See the methodology for the calculation of unit costs in point 7.
RD21_O21_U08_HA - Agro-ecological non-productive investments planting a protective tree line
The unit amount was determined on the basis of the unit costs of each target area. See the methodology for the calculation of unit costs in point 7.
RD21_O21_U09_HA - Agro-ecological non-productive investments planting a protective forest strip
The unit amount was determined on the basis of the unit costs of each target area. See the methodology for the calculation of unit costs in point 7.
RD21_O21_U10_HA - Agro-ecological non-productive investments in the construction of wooded pasture or meadows
The unit amount was determined on the basis of the unit costs of each target area. See the methodology for the calculation of unit costs in point 7.
RD21_O21_U11_HA - Agro-ecological non-productive investments establishing grassland protection areas in coastal water buffer zones
The unit amount was determined on the basis of the unit costs of each target area. See the methodology for the calculation of unit costs in point 7.
RD21_O21_U12_HA - Agro-ecological non-productive investments establishing a grassland-shrub protective area in coastal water protection buffer zone
The unit amount was determined on the basis of the unit costs of each target area. See the methodology for the calculation of unit costs in point 7.
RD21_O21_U13_HA - Agro-ecological non-productive investments - creation of water habitats
The unit amount was determined on the basis of the unit costs of each target area. See the methodology for the calculation of unit costs in point 7.
RD21_O21_U14_HA - Agro-ecological non-productive investments in grassland strips for erosion control purposes within the fields on run-off paths parallel to the contour lines and erosion features
The unit amount was determined on the basis of the unit costs of each target area. See the methodology for the calculation of unit costs in point 7.
RD21_O21_U15_HA - Agro-ecological non-productive investments in grassy scrub strips on arable land along run-off paths parallel to the strata and erosion notes within the fields
The unit amount was determined on the basis of the unit costs of each target area. See the methodology for the calculation of unit costs in point 7.

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029
RD21_O21_A01_ON - Agro-ecological non-productive investments — Non-productive investments in water protection (Grant - Average)	Planned unit amount (Total Public Expenditure in EUR)	0.00	212,997.71	233,267.50	0.00	0.00	0.00	0.00

Territorial scope: **National**

Code	Description
HU	Magyarország

Description of the Territorial Scope

The whole territory of Hungary.

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO4 Contribute to climate change mitigation and adaptation, including by reducing greenhouse gas emission and enhancing carbon sequestration, as well as promote sustainable energy

SO5 Foster sustainable development and efficient management of natural resources such as water, soil and air, including by reducing chemical dependency

SO6 Contribute to halting and reversing biodiversity loss, enhance ecosystem services and preserve habitats and landscapes

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
4.2.2	Reduction of GHG and atmospheric load gases emissions using forestry tools	2	Yes
4.4.2	Review of the use of arable land at the boundary of economics	2	Yes
4.4.3	Improving the water retention capacity of soils and ecosystems by encouraging land-use change	1	Yes
5.1.4	Protection of arable land by agroforestry systems	2	Yes
6.3.2	Increasing the share of forest land under forest management with continuous cover	1	Yes
6.4.1	Developing up-to-date data collection and monitoring systems for measuring biodiversity	1	Partially

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.16 Share of farms benefitting from CAP investment support contributing to climate change mitigation and adaptation, and to the production of renewable energy or biomaterials

R.17 Area supported for afforestation, agroforestry restoration, including breakdowns
R.18 Total investment to improve the performance of the forestry sector
R.26 Share of farms benefitting from CAP productive and non-productive investment support related to care for the natural resource
R.27 Number of operations contributing to environmental sustainability and the achievement of climate mitigation and adaptation goals in rural areas
R.32 Share of farms benefitting from CAP investment support contributing to biodiversity

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Objectives:

- facilitating land-use change;
- carbon sequestration,
- providing a sustainable feedstock for the bio-based economy

The purpose of the intervention is to:

The increase of forest cover and the creation of woodland contribute to land-use change. In the first place, in the case of marginal agricultural land, e.g. steep slope, poor fertility, erosion degradation or risk of erosion. Afforestation or creation of woodland decreases and then completely ceases to disturb the soil, use chemicals and provide habitats for a more diverse life.

Afforestation and creation of woodland significantly increases organic carbon sequestration both in the growth of trees and in the way they are bound in the stands.

One of the stated aims of the European Forest Strategy is to reduce the carbon footprint in industrial and construction material use, to improve the share of carbon stored in materials for long periods of time, and to increase the use of wood. Afforestation and creation of wood for industrial purposes can also ensure that the increased demand for timber is served in a sustainable way, while preserving ecological values

Target Area 1: forestation

The forest created in the course of conventional afforestation will later be forested land for which, after the first use of trees, pursuant to Act XXXVII of 2009 on forests, forest protection and forestry, the forest manager must renovate the forest and continue to manage it on a permanent basis in accordance with the rules on sustainable forest management.

Target Area 2: planting of woody plantations for the supply of raw materials for industrial purposes

In the case of woody plantations for industrial purposes, the requirement that planting may only take place in a manner that meets the conditions of the place of production and does not harm the natural environment will be validated in the licensing forestry authority procedure. Woody plantations for industrial purposes offer the land user an alternative source of income in a shorter and more predictable period than the transition to a forest with very long-term and high uncertainty. In addition, plantations with typical rotations of 20 years or more preserve the soil, have a water retention and microclimate effect and, in any event, give rise to higher biodiversity than intensive tillage.

No aid shall be granted for the planting of short rotation coppice, Christmas trees and trees for energy purposes of fast-growing species.

Ineligible:

with intensively spreading tree species

afforestation, creation of woodland or planting of ligneous plants established in accordance with separate

legislation

natural forest or natural forest within 100 metres of forest in natural status and within the area of any protected or Natura 2000 site and 100 m around it

Headline target: the intervention offers farmers the opportunity to make a long-term commitment to forestry or diversify their market-based incomes in the medium term. It also gives all eligible land users the possibility to install even dedicated ecosystem service forces (green belt function, water retention, soil protection, public welfare, etc.)

Selection Criteria.

- protective or public amenity purpose
- high naturalness category
- low-forested area
- regional aspect: climate adaptation adequacy
- low value food and feed land conversion;
- establishment of forest edges

Relevant legislation:

Act XXXVII of 2009 on forests, forest protection and forestry

61/2017. (XII. Decree No 21 of 21 October 2009 of the Minister for Agriculture on the implementation of Act XXXVII of 2009 on forests, forest protection and forestry

Decree No 383/2016 (XII.) On the designation of bodies carrying out the functions of the agricultural authority and administration

135/2017 (VI. Reg. 9.) on woody plantations

Synergies with other interventions: continuous availability of knowledge transfer and advice is necessary for the social promotion of the intervention and for the delivery of sub-measures of sufficient quality

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiary:

eligible land user

1. for target area 1, the applicant shall have approved afforestation plan documentation and permit
2. in the case of target area 2, it must be provided for in Section 135/2017. (VI. With a certificate in accordance with Government Decree No 487/2015

Minimum eligible land of 0.5 ha.

As this measure falls outside the scope of Article 42 TFEU (see point 8), **no aid may be granted** to a beneficiary under Commission Regulation (EU) No 702/2014, with the exception of de minimis aid

- it is considered to be a firm in difficulty (the concept of a firm in difficulty is defined in Decree 37/2011 on the procedure for State aid for the purposes of EU competition law and on the regional aid map. (III. As defined in Section 6(4a) and (4b) of Government Decree No 487/2015, or
- it failed to comply with the decision of the European Commission addressed to Hungary requiring the recovery of State aid within the meaning of EU competition law.
- **The planting of non-eligible natural forest or natural forest, forest in natural condition, forest with non-forest cultivation, protected or Natura 2000 nature area and forest, creation of trees**

or plantations of ligneous plants planted with woody species within the area of a protected or Natura 2000 site and within 100 metres of it shall be planted in accordance with separate legislation.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

In the case of target area 1, the cultivation of the land must be changed to 'forest' cultivation.

In the case of target area 2, it is obliged to carry out the stock shooting until 5 years after completion of the planting.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

☐ reimbursement of eligible costs actually incurred by a beneficiary

☒ unit costs

☐ lump sums

☐ flat-rate financing

Basis for the establishment

The use of standard scales of unit costs is based on the CAP support scheme developed and applied since 2005 for the same intervention, which is constantly reviewed and valorised.

The unit cost calculation is carried out by the Forest Science Institute on the basis of the figures of previous years and its own data collection and analytical methodology. The Forestry Science Institute is organisationally and financially independent from the Ministry of Agriculture.

Unit cost calculation based on Art. 83(1)(b) and 2(a)(i) STR

Range of support at beneficiary level

Basic payment (first export) by stock type/ha

Unit cost of support – first export	euro/ha
Oak, beech and other hard foliage	3 920
Other soft foliage and pine	2 885
Acacia	2 628
Noble mink	2 299
Acacia plantation for industrial use	2 233
Industrial noble summer plantation (year 1 without care)	2 329

Unit cost of supplementary elements:

Additional activity	quantity unit	Equivalent forint amount/quantity unit in euro
fence	FM	8 but not more than EUR 1600/ha

electric fence energisers	FM	5 but not more than EUR 518/ha
adhesives	FM	But not more than EUR 749/ha
chalky chalks	DB	8
wood and shrub forest edge*	FM	2
Creation of a pool of 10 %	if	500
Creation of a pool of 30 %	if	1000
Planting rare blends (min. 100/ha) in afforestation only	if	1800
Afforestation on 10 % or more gradient	if	+ 10 %

The additional activity “planting of rare blends” can only be supported in combination with the elements “creation of a 10 % mixed stock” or “creation of a 30 % mixed stock”.

Additional explanation

Not relevant.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☒ Yes ☐ No ☐ Mixed

Explanation of support activities falling outside the scope of Art. 42 TFEU

The competition rules (State aid rules) apply to aid to the forestry sector.

Type of state aid instrument to be used for clearance:

☐ Notification ☐ GBER ☒ ABER ☐ de minimis

State Aid case number

SA.112038

Additional information:

☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.

☐ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.

☒ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

What is not eligible for support?

No aid shall be granted for the planting of short rotation coppice, Christmas trees and trees for energy purposes of fast-growing species.

Does the investment contain irrigation?

☐ Yes ☒ No

Investments in the improvement of existing irrigation installations, what is the potential water saving(s) required (expressed in %)

N/A

Details on different potential water savings according to the type of installation or infrastructure (where applicable)

Investments in the improvement of existing irrigation installations (affecting water bodies whose status is less than good) what is/are the requirement(s) for an effective reduction in water use - expressed in %

N/A

Regional breakdown

10 WTO compliance

Green Box

Paragraph 8 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The supported interventions are aimed at achieving land-use change in combination with the increase of forest and wooded stands, as set out in the National Forest Strategy. The aid is aimed at the alternative use of areas less suitable for agriculture, the creation of public forests (green indoor, social function) and the implementation of international CO2 emission reduction commitments at national level. The amount of the aid is determined solely on the basis of the costs actually incurred and is paid only for the time necessary to carry out the investment.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(2)(d) - Other regions	43.00%	20.00%	43.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD38_O24_A01_HA - Area of projects involving afforestation or creation of woodland for industrial purposes	Grant	91(2)(d)-HU-43.00%	Average		R.16; R.17; R.18; R.26; R.27; R.32	No

Explanation and justification related to the value of the unit amount

RD38_O24_A01_HA - Area of projects involving afforestation or creation of woodland for industrial purposes

The unit amount calculation is based on data for 2014-2021.

On average per year, we plan to pay for the planting of 5.000 hectares of new forest, with a total of 20 000 hectares, of which a total of approximately 2000-3000 industrial trees are planned to be planted. An application received on average 9.7 ha in the last 7 years, but the dispersion of the area to be afforested in a project is very wide: Between 0.5 ha and 25 ha.

Around 94 % of the applications were afforestation and less than 6 % were wooded.

Approximately 61 % of afforestation stands are native stands, of which 58 % are oak-beech stands, coupled with higher unit planting costs due to the costs of additional elements. The payment is an ex-post and a lump sum (100 % after completion), therefore it is possible to plan for approximately continuous and steady use of resources per year from 2024 onwards (excluding weather dependency).

When calculating the average unit amount, we calculate a cost of EUR 4.146/ha using a weighted average method based on the actual and internal ratios of the VP and the new unit cost values and expected rates to be used in the CAP Strategy.

Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs).

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029

SO4 Contribute to climate change mitigation and adaptation, including by reducing greenhouse gas emission and enhancing carbon sequestration, as well as promote sustainable energy

SO8 Promote employment, growth, gender equality, including the participation of women in farming, social inclusion and local development in rural areas, including the circular bio-economy and sustainable forestry

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
4.2.1	Maintaining the carbon balance of forest stands and promoting climate adaptive renewal	2	Yes
8.6.1	Increase the scope and added value of forest benefits, improve profitability	3	Yes
8.6.2	Production of forest reproductive material to increase forest stands and to adapt them to climate change	2	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.18 Total investment to improve the performance of the forestry sector

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Objectives: In addition to the adaptation challenges arising from climate change, Hungary's forestry sector, as a specific rural agricultural sector, also faces very serious challenges in terms of competitiveness and sustainability, which can only be achieved by encouraging the necessary business development at every point in the sector's product conversion. The objective of the intervention is therefore to improve the competitiveness of the entire forestry business, in line with sustainability considerations: continuous supply of quality propagating material, efficiency of primary choice production, higher added value product production

Content: the intervention consists of 5 target areas, thus giving all farmers the opportunity to improve competitiveness in their activities: from propagating material production to silviculture and primary processing.

Target area 1: Development of forest reproductive material production: site and technology development

The production of forest reproductive material is the basis for afforestation, creation of woodland, establishment of agroforestry systems and reforestation and restructuring. Propagating material appropriate to the production area, which is reliable and predictable in terms of quality and quantity, is essential for forest management. The production of propagating material is a very high risk, labour and resource demanding activity. Reducing risks, improving production security and efficiency requires that forest chimney producers should be able to co-exist with the latest advances of the time, both in technology and in the development of the production site as a site of production.

Target area 2: Development of the basic forest management activity: site and technology development

Forest management has to meet an increasing number of conditions and expectations in an ever-changing business environment. Adapting to market expectations also requires that they can operate in a predictable and efficient manner. The direction of development is therefore on the one hand the continuous improvement of field technologies, but it may also be necessary and justified to improve the forest manager's site in order to reduce costs (maintenance on site, energy efficiency or renewable energy development) or to increase revenue (storage, drying capacity, site servicing, extension of choice, etc.).

Target area 3: Development of the added value of products from forestry (except food products): site and technology development

It is important not only for undertakings active in the forestry sector that the main and by-products of forest management are sold in as much processing as possible and that processing takes place as close as possible to the production area. This benefits the farmer, the local economy and the lack of unnecessary transport of raw materials saves the environment. We therefore offer incentives for both forest managers and first processors to develop product processing, either technologically or in the form of site development where processing activities are carried out.

Target area 4: Digitalisation improvements needed to improve the efficiency of modern forest management: specialised tools, software, services

Digital instruments and tools to improve the efficiency of forest management are already available in a wide variety and are still poorly used in domestic forest management. We therefore support the purchase of more accurate measurement, design, record keeping and digital tools to support entrepreneurship.

Target area 5: Mobilisation of forest production potential: completed nursing, cleaning, tribe type intervention

The incentive to carry out the functions of increasing the yield and value of forests has been proven and we plan to continue as usual.

Selection criteria, which may be applied in part:

1. quality of the business plan

Environmental, climate and adaptation aspects, e.g. higher processing levels, production of sustainable substitute products

3. regional aspect e.g. area with lower labour market activity

4. utilisation of digital tool (e.g. undertaking services to other forest managers)

Relevant legislation:

Act XXXVII of 2009 on forests, forest protection and forest management

61/2017. Decree No XXXVII of 21 December 2009 of the Minister for Agriculture on the implementation of Act XXXVII of 2009 on forests, forest protection and forest management

Government Decree No 383/2016 of 2 December 2016 designating bodies performing official and administrative tasks in the field of agriculture

Link with other measures: the continuous availability of modern knowledge transfer and advice is needed first to learn about market trends, bio-economic RDI innovations and opportunities, to share information, best available technologies and best practices, business development and business best practices, and the

CAP network.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

The forest manager is engaged in sustainable forest management, i.e. it is managed in accordance with Act XXXVII of 2009 on forests, forest protection and forest management and in the district forest plan, and is not subject to forest protection or conservation sanctions.

As this measure falls outside the scope of Article 42 TFEU (see point 8), with the exception of de minimis aid, **no aid may be granted** to a beneficiary under Commission Regulation (EU) No 651/2014 or Commission Regulation (EU) No 702/2014

- it qualifies as a firm in difficulty (the concept of firm in difficulty is referred to in Decree 37/2011 on the procedure for State aid for the purposes of EU competition law and on the regional aid map. (III. Specified in Section 6(4a) and (4b) of Government Decree No 22/2015) and
- it has not complied with a decision of the European Commission addressed to Hungary requiring the repayment of State aid within the meaning of EU competition law.

Target Area 1:

- a primary producer or undertaking holding a licence in accordance with Section 17 of Decree No 110/2003 of 21 October 2003 of the Minister for Agriculture on forest reproductive material and listed in the professional register as a distributor of propagating material pursuant to Section 21 of the same Decree
- more than 50 % of its turnover in the year preceding the submission of the aid application or on average over the preceding three years derives from the production of forest reproductive material and forestry, or
- on average over the previous three years, the turnover from the production of forest reproductive material was at least HUF 3.000.000
- submission of a simplified business plan or a business plan

Target Area 2:

- forest manager registered by the forestry authority, whose average turnover over the three years preceding the submission of the aid application was more than 50 % of its turnover from forest management (TEÁOR 2) and, on average, over the previous three years, the turnover from forest management (TEÁOR 2) was at least HUF 3.000.000

or

- an undertaking with an average of at least 50 ha over the last three years and an average turnover of at least HUF 3.000.000 from forest management (TEÁOR 2) over the last three years
- submission of a simplified business plan or a business plan

Target Area 3:

- a forest manager registered by the forestry authority or an undertaking with an average turnover of at least HUF 3.000.000 from forest management (TEÁOR 2) and/or sawn timber production (TEÁOR 16.1) over the previous three years
- submission of a business plan or a simplified business plan

Target Area 4

Forest manager registered by the forestry authority or an undertaking whose turnover in the three years preceding the submission of the aid application was more than 50 % derived from forest management (TEÁOR 2) and/or logging (TEÁOR 16.1) and its turnover. The resulting amount in the previous three years was at least HUF 3000000 on average

- submission of a business plan or a simplified business plan

Target Area 5: forest manager registered by a forestry authority

Commission Regulation (EU) No 702/2014 provides that no aid may be granted under an intervention to undertakings which are subject to an outstanding recovery order following a Commission decision declaring the aid illegal and incompatible with the internal market or to undertakings in difficulty.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments

Target Area 1:

- Implementation of the development undertaken in the business plan for the development of forest reproductive material production,
- 5 years of maintenance obligation

Target Area 2:

- Implementation of the development undertaken in the business plan for the development of the basic forest management activity,
- 5 years of maintenance obligation

Target Area 3:

- Implementation of the development undertaken in the business plan to develop the value added value of forestry products (excluding food products) 5 years maintenance obligation

Target Area 4:

- Implement the development undertaken in the business plan for the digitalisation development needed to improve the efficiency of modern forest management;
- 3 years maintenance obligation

Target Area 5:

- Carrying out activities undertaken with a view to mobilising forest production potential,
- 5 years maintenance obligation (stock cannot be produced)

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

☒ reimbursement of eligible costs actually incurred by a beneficiary

☒ unit costs

☐ lump sums

☒ flat-rate financing

Basis for the establishment

Payment based on Article 83(1)(a), 1(b), 1(d) and 2(a)(i) STR

1(a): 1 to 4 investments

1(b): 5 target areas

1(d): Overheads up to 10 % for 1-4 target areas

For target area 5, the unit aid rates have been established on the basis of data collection and calculations by the Forest Science Institute, similar to the methodology used in the last 15 years. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an

expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs).

Use of flat-rate financing: overhead costs related to investments in target areas 1 to 4, which in total are eligible up to a maximum of 10 %. Physical support: costs declared on an item-by-item basis in similar investment schemes under the Rural Development Programme.

Target area 5 (previous operation VP-8.6.2) will continue to be supported on a unit cost basis.

Range of support at beneficiary level

Target areas 1 to 5: A maximum of 65 % of eligible expenditure is eligible.

Maximum grant: EUR 1.000.000

Unit costs for Objective 5

Operation	Unit cost of grant (EUR/ha)
Completed care – manual	193
Completed nursing – mechanical	120
Cleaning in natural, transitional and derivative forests	193
cleaning of wood plantations and cultivated forests in natural state forests	99
high torso hollow (5 m)	147

The amounts indicated in the table include a 65 % subsidy for eligible costs.

Additional explanation

Not relevant.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☒ Yes ☐ No ☐ Mixed

Explanation of support activities falling outside the scope of Art. 42 TFEU

Since the forestry sector is a sector outside the scope of Article 42 TFEU, the aid granted to it is subject to the competition rules (State aid rules).

Type of state aid instrument to be used for clearance:

☐ Notification ☐ GBER ☒ ABER ☒ de minimis

State Aid case number

SA.112040

Additional information:

☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.

☐ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.

☒ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

What is not eligible for support?

Purchase of land

Does the investment contain irrigation?

☐ Yes ☒ No

Investments in the improvement of existing irrigation installations, what is the potential water saving(s) required (expressed in %)

N/A

Details on different potential water savings according to the type of installation or infrastructure (where applicable)

Investments in the improvement of existing irrigation installations (affecting water bodies whose status is less than good) what is/are the requirement(s) for an effective reduction in water use - expressed in %

N/A

Regional breakdown

10 WTO compliance

Green Box

Paragraph 11 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The aid was designed on the basis of criteria clearly defined by the State in order to achieve the objectives set out in the National Forest Strategy. It aims to reduce the exposure of forest managers, first processors and service providers to the timber market through improvements, reducing their technological and digitalisation disadvantages. The aid does not exceed the time necessary for the investment concerned to take place.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(2)(d) - Other regions	43.00%	20.00%	43.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD40_O24_A01_ON - Unit amount of income-generating investments improving the competitiveness of forestry	Grant	91(2)(d)-HU-43.00%	Average		R.18	No
RD40_O24_U01_HA - Income-generating investment to improve the competitiveness of forestry: unit amount of manually completed care	Grant	91(2)(d)-HU-43.00%	Uniform		R.18	No

RD40_O24_U03_HA - Unit amount of income-generating investment to improve the competitiveness of forestry selection in natural, transitional forests	Grant	91(2)(d)-HU-43.00%	Uniform		R.18	No
RD40_O24_U04_HA - Unit cost of selection in forests of natural status to improve income generation capacity and competitiveness of forestry	Grant	91(2)(d)-HU-43.00%	Uniform		R.18	No
RD40_O24_U05_HA - Income-generating investment to improve the competitiveness of forestry: unit cost of coppicing	Grant	91(2)(d)-HU-43.00%	Uniform		R.18	No

Explanation and justification related to the value of the unit amount

RD40_O24_A01_ON - Unit amount of income-generating investments improving the competitiveness of forestry

There can be a wide range of realistic project sizes and support in each target area, so the average project size has been planned partly based on the 2014-2020 experience numbers and on the basis of consultations with potential beneficiaries of new opportunities to be introduced from 2023.

Part of the calculation is based on the average project size supported by the RDP, which was around EUR 50000. This has been modified by three major new features:

- (a) in the period from 2023 onwards, the single “investment” intervention tool does not limit investment in machinery/technology only, therefore higher resource needs for site infrastructure developments are taken into account;
- (b) public undertakings will not be excluded in the new period;
- (C) an increase in the total resources available for this purpose and an average annual inflation of 5 %.

RD40_O24_U01_HA - Income-generating investment to improve the competitiveness of forestry: unit amount of manually completed care

For Target Area 5, uniform unit amounts are shown, which are the same as the calculated unit costs for support. The UA is defined in a ‘single’ manner, which is the value of the unit cost of support. . The establishment of the calculation of the unit cost of the grant is set out in a separate attached document prepared by the University of Sopron’s Forest Science Institute as an expert body independent of the AM.

RD40_O24_U02_HA - Unit amount of investment to improve the competitiveness of forestry - machine-completed care

For Target Area 5, uniform unit amounts are shown, which are the same as the calculated unit costs for support. The UA is defined in a ‘single’ manner, which is the value of the unit cost of support. . The development of the calculation of the unit cost of the grant is set out in a separate attached document prepared by the University of Sopron’s Forest Science Institute as an expert body independent of the AM.

RD40_O24_U03_HA - Unit amount of income-generating investment to improve the competitiveness of forestry selection in natural, transitional forests

For Target Area 5, uniform unit amounts are shown, which are the same as the calculated unit costs for support. The UA is defined in a ‘single’ manner, which is the value of the unit cost of support. . The development of the calculation of the unit cost of the grant is set out in a separate attached document prepared by the University of Sopron’s Forest Science Institute as an expert body independent of the AM.

RD40_O24_U04_HA - Unit cost of selection in forests of natural status to improve income generation capacity and competitiveness of forestry

There can be a wide range of realistic project sizes and support in each target area, so the average project size has been planned partly based on the 2014-2020 experience numbers and on the basis of consultations with potential beneficiaries of new opportunities to be introduced from 2023.

Part of the calculation is based on the average project size supported by the RDP, which was around EUR 50.000. This has been modified by three major new features:

(a) in the period from 2023 onwards, the single “investment” intervention tool does not limit investment in machinery/technology only, therefore higher resource needs for site infrastructure developments are taken into account;

(b) public undertakings will not be excluded in the new period;

(C) an increase in the total resources available for this purpose and an average annual inflation of 5 %.

For Target Area 5, uniform unit amounts are shown, which are the same as the calculated unit costs for support. The UA is defined in a ‘single’ manner, which is the value of the unit cost of support. . The development of the calculation of the unit cost of the grant is set out in a separate attached document prepared by the University of Sopron’s Forest Science Institute as an expert body independent of the AM.

RD40_O24_U05_HA - Income-generating investment to improve the competitiveness of forestry: unit cost of coppicing

There can be a wide range of realistic project sizes and support in each target area, so the average project size has been planned partly based on the 2014-2020 experience numbers and on the basis of consultations with potential beneficiaries of new opportunities to be introduced from 2023.

Part of the calculation is based on the average project size supported by the RDP, which was around EUR 50.000. This has been modified by three major new features:

(a) in the period from 2023 onwards, the single “investment” intervention tool does not limit investment in machinery/technology only, therefore higher resource needs for site infrastructure developments are taken into account;

(b) public undertakings will not be excluded in the new period;

(C) an increase in the total resources available for this purpose and an average annual inflation of 5 %.

For Target Area 5, uniform unit amounts are shown, which are the same as the calculated unit costs for support. The UA is defined in a ‘single’ manner, which is the value of the unit cost of support. . The development of the calculation of the unit cost of the grant is set out in a separate attached document prepared by the University of Sopron’s Forest Science Institute as an expert body independent of the AM.

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029

HU	Magyarország

Description of the Territorial Scope

The whole territory of Hungary.

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO4 Contribute to climate change mitigation and adaptation, including by reducing greenhouse gas emission and enhancing carbon sequestration, as well as promote sustainable energy

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
4.2.1	Maintaining the carbon balance of forest stands and promoting climate adaptive renewal	2	Yes
4.2.2	Reduction of GHG and atmospheric load gases emissions using forestry tools	2	Yes
4.4.1	Development of solutions and tools to protect against adverse weather effects	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.18 Total investment to improve the performance of the forestry sector

R.27 Number of operations contributing to environmental sustainability and the achievement of climate mitigation and adaptation goals in rural areas

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Objectives:

Due to rapidly changing climatic conditions and associated environmental impacts, forest stands face major challenges. The speed of climate change exceeds what tree species can adapt through natural processes and therefore requires active interventions. The factors that most affect the health status of forest stands and the ecosystem's ability to provide services and the development policy responses to them

are: counteracting the spread of new biotic pathogens and pests, including forest and vegetation fires due to water scarcity and drought, frost damage and storm damage, both by preventing damage to the forest potential and by restoring them in a more resilient way, while avoiding damage to forests and restoring damage to forests, the same priority is given to the long-term qualitative renewal of forests.

Forest restructuring can improve the age structure, unification and biodiversity of power stocks, thus improving the resilience and environmental value of forest ecosystems.

Eligible interventions must go beyond Act XXXVII of 2009 on forest protection and forest management in terms of resilience and environmental value. The mandatory requirements laid down in Sections 51-55 and its implementing rules.

Content:

Target area (a): prevention of biotic and abiotic damage to forest potential

A/1: establishment and development of firefighting, fire water storage and water retention facilities (stores);

A/2: control of biotic pests and pathogens, for example: biological or chemical control, bark beetle control in reforestation;

A/3 Absorption of waste cleaning material;

A/4: shredding or shredding in soil in high fire risk stands

(B) target area: restoring forest potential after abiotic or biotic damage;

(C) target area: Enhancing the resilience, adaptation or environmental value of forest ecosystems to climate change:

C/1: Forest restructuring;

C/2: Improved renovation by increasing blends;

C/3: Refurbishment with climate-resistant material.

Principles for selection:

- stock classified in the higher flammability category
- Natura 2000 population
- protective or public amenity purpose
- degree of naturalness of the forest concerned
- territorial aspect (e.g. proximity to a municipality or a national tour route or a special holiday area)
- quality of propagating material used
- creation of a mixed pool
- intensively spreading alien species are also contained without specific support
- indigenity of the population concerned

Relevant legislation:

Act XXX VII of 2009 on Forests, Forest Protection and Forest Management

61/2017. (XII. Decree No 21 of 2009 of the Minister for Agriculture on the implementation of Act XXXVII of 2009 on forests, forest protection and forest management

Decree No 383/2016 (XII. On the designation of bodies to carry out administrative and administrative tasks in the field of agriculture

1537/2016. National regulations contributing to the National Forest Strategy 2016-2030.

The most relevant pests for forest damage prevention are:

- Woollepke (*Lymantria dispar*)
- Cracking butterfly (*Operophtera*, *Erannis*, *Colotois*, *Agriopis*)
- Sodrómours (*Tortricidae*)
- Oak butterfly (*Thaumetopoeas processionea*)
- Gold-tailed Pille (*Euproctis chrysorrhoea*)
- Bark beetles on conifers, in particular the spruce bark beetle (*Ips typographus*)
- Exchange beetle species (*Melolontha* sp.)
- Native ornamental beetles on foliage trees (*Agrilus biguttatus*, *Agrilus viridis*, etc.)
- Flourdew species (*Erysiphe* sp.)
- High ash mortality (*Chalara fraxinea*)
- Acacia bark (*Phomopsis oncostoma*)

Potentially hazardous species:

- Alpine ash (*Agrilus planipennis*)
- Smooth-backed star beetle (*Anophlophorag labripennis*)
- Pine wood nematode (*Bursaphelenchus xylophilus*)
- Sudden oak mortality (*Phytophthora ramorum*)
- Other *Phytophthora* species on deciduous trees (*Fagus*, *Alnus*, etc.)
- ‘charcoal disease’ (*Biscogniauxia mediterranea*)

Complementarity with other interventions: continuous access to knowledge transfer and advice is necessary for the social promotion of the intervention and for the implementation of the sub-measures of sufficient quality

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiaries:

- eligible forest managers who have an approved forest plan for the forest section concerned

The forest manager is engaged in sustainable forest management, i.e. its management complies with the provisions of Act XXXVII of 2009 on forests, forest protection and forest management and the district forest plan, and is not subject to forest protection or conservation sanctions.

Minimum eligible area: 0.5 ha

Aid shall not be granted to an applicant for aid:

- on the basis of Commission Regulation (EU) No 651/2014 and Commission Regulation (EU) No 702/2014, 37/2011 on the procedure concerning State aid for the purposes of European Union competition law and the regional aid map. (III. Government Decree No 22/2000 of 22 October 2004 (hereinafter: 37/2011. (III. It qualified as an undertaking in difficulty pursuant to Section 6(4a) and (4b)(7) of Government Decree No 22,
- failed to comply with the decision of the European Commission, addressed to Hungary, requiring the recovery of State aid in the sense of EU competition law.

Specific eligibility criteria:

Target area (a): submission of a forest price prevention plan on the basis of which the competent authority confirms that the planned intervention will result in an improvement in the climate and/or environmental quality and/or biological diversity of the forest stands concerned.

(B) the competent authority has officially confirmed the occurrence of the natural disaster and that the disaster or measures adopted in accordance with Directive 2000/29/EC to eradicate or contain a plant

disease, pathogen or pest has caused the destruction of at least 50 % of the relevant forest potential.

(C) target area: on the basis of a reforestation or conversion plan, the competent authority confirms that the planned intervention will result in an improvement in the environmental quality, climate resistance or adaptation capacity or nature of the forest population concerned

According to Commission Regulation (EU) No 702/2014, aid under the intervention may not be granted to undertakings which are subject to an outstanding recovery order by a Commission decision declaring the aid illegal and incompatible with the internal market, or to undertakings in difficulty.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Standard scale of unit costs (unit cost/ha)

Commitments:

Target area: investment undertaken to prevent biotic and abiotic damage endangering forest potential

5 years maintenance

Target area: investment undertaken to restore forest potential after abiotic or biotic damage

5 years maintenance

Target area: Investment undertaken to increase the resilience, adaptation or environmental value of forest ecosystems to climate change

5 years maintenance

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

☐ reimbursement of eligible costs actually incurred by a beneficiary

☒ unit costs

☐ lump sums

☐ flat-rate financing

Basis for the establishment

Payment based on Article 83(1)(b) and 2(a)(i) STR

The intervention was created by merging and extending sub-measures 8.3, 8.4 and 8.5 of the VP 2014-2020. The calculation of unit costs for grants is essentially done by reviewing and valorising the subsidies already applied and accounted for. The unit cost calculation includes all costs necessary to carry out the operation (e.g. planning, authorisation, materials and fees). The unit cost does not include a compensation element of revenue foregone.

The calculation of the average type of unit amount was based partly on the facts of the VP and, for the new elements, on the calculation of the unit cost of the Scientific Forest Institute. Damage events cannot be calculated in advance, empirical numbers (2016-2020): Between 648 and 2.200 hectares, the compensation payment ranged between HUF 352 mt/year and HUF 1 270 m/year. On an annual average basis, the loss event concerned 1 200 hectares. However, in the next period, higher activity is expected on the side of the public forest managers (they applied for the VP only from 2020 on the basis of a management decision), and the average annual waiting rate is therefore increased to 1 700 hectares.

The unit aid rates have been established on the basis of data collection and calculations by the Forestry

Science Institute, similar to the methodology used in the last 15 years. Development of the categories of unit costs of support, prepared by the University of Sopron's Forest Science Institute as an expert organisation independent of AM, attached, "KAP Strategic Plan: unit costs).

Range of support at beneficiary level

A./Prevention of biotic and abiotic damage to forest potential

A/1 prevention of fire damage

Activities supported	Grant rate
	EUR/fm/year
Design and maintenance of a narrow type A fire scan	0,1
Maintenance of the development of a narrow firebreak type A to type B or C	0,4
Design and maintenance of type B accessible firepass	0,5
Establishment and maintenance of a type C wide fire strip	0,5
	EUR/unit
Type 1 for the construction of a type A drainage: if watertight soil is used	40.030
Type 2 for the construction of a type A source: for other insulation	46.750
Type 1 for the construction of a type B drainage: if watertight soil is used	47.140
Type 2 for the construction of a type B drainage: for other insulation	54.930
For type C drainage type 1: if watertight soil is used	60.230
For type C drainage type 2: for other insulation	69.000
Design of type A monkeys	40.030
Construction of type B monkeys	47.140
Construction of type C monkeys	60.230
	EUR/m ³
For the removal of pine pine pine cleaning material from the purification of stands of the main species pine (m ³ : gross fat volume to be extracted from a forest plan)	25
Grooves or shredders in the soil	25
	up to EUR 915/ha

A./2 Prevention of damage to biotic pests and pathogens

Activities supported	Grant rate
	EUR/ha
Chemical control of powdery powder (years)	110
Control of the bark beetle	
Installation of chemical application tubes; Additional installation costs (4000 tubes/ha) and	938
Annual irrigation (chemical application) during the first reforestation export and the following 3 years, 3 times per year (water, product, application) (per year) or	654

Single application of soil disinfectant	150

B. Restoration following abiotic or biotic damage to the forest potential

When determining the unit costs for the intervention for the restoration of damaged forest land, the unit costs of support for afforestation were used. Accordingly, the following amounts of aid have been determined.

(a) Restoration by planting: In completed or older stands, where the damaged area can be delimited as a sub-forest section and the damage to the tree stands of at least 50 % or the damage to the tree stands of the entire forest section is at least 70 %:

Target stock type group in completed flock	Total Recovery
Oak, beech and other hard foliage	EUR 4692/ha
Other soft foliage and pine	EUR 2999/ha
Acacia	EUR 2628/ha
Noble mink	EUR 2888/ha

Additional element: Clean-up of damaged wood in a stand closed after 70 % fracture damage (wind, snow, ice), wind-casting or fire damage: **EUR 1300/ha**

(b) Recovery by root shooting

In stands of completed age or over, where the damaged area can be delimited as a sub-forest section and the loss of the tree stands is at least 50 %, or the damage to the tree stands of the entire forest section is at least 70 %:

Root shooting in completed herd: **EUR 788/ha**.

Additional element: Clean up damaged wood after breakage (wind, snow, ice), wind-casting or fire damage in stands exceeding 70 %: **EUR 1300/ha**

(C) Recovery in herds completed or older by restocking

Where the damaged area can be delimited as a part forest section and the damage to the tree stands of more than 70 % or the damage to the tree stands of the entire forest section exceeds 50 %:

	Target stock type group			
	Oak, beech and other hard foliage	Other soft foliage and pine	Acacia	Noble mink
Aid (EUR/ha)	2089	1643	1438	1433

(D) Repair with replacement: In continuous stands, if the area delimited as a sub-forest section or the damage to the tree stands of the entire forest section reaches 50 %:

	Target stock type group			
	Oak, beech and other hard foliage	Other soft foliage and pine	Acacia	Noble mink
Aid (EUR/ha)	954	954	954	954

Additional elements for cases B/a to B/d:

Establishment of a bench in a gradient of more than 10 degrees: EUR 0,17 per linear metre with a maximum of EUR 749/ha;

- The construction of a russet or a dam on a slope of more than 15 degrees: EUR 1.2 per linear metre with a maximum of EUR 200/ha.

C/Increasing the resilience, adaptation or environmental value of forest ecosystems to climate change

C/1 forest restructuring

Target stock type group	Conversion of forest structures		Total EUR/ha
	Cost of first export	1st year nursing cost	
	euro/ha	euro/ha	
Oak, beech and other hard foliage	3 427	356	3.783
Other soft foliage	2 392	356	2.720

Additional elements:

In the case of conversion of forest structure from a variety of acacia trees, aid amounts increased by 10 % shall be applied!

C/2 Improved renovation by increasing blending:

The objective of the improved renovation area is to increase the diversity of forest renovations following clear-cutting, as set out in Article 61/2017. (XII. (21) The use of tree species, as defined in Annex 2 to Decree No 21/2001 of the Minister for Agriculture, which are native to certain forest landscapes, as mixed tree species.

Aid may be granted for artificial reforestation where a minimum of two mixed species are present at the time of the first export in a specified proportion of a mixture.

The unit cost resulting from the cost analysis of the extra technological elements and material (chips) is as follows:

Supported activity	Grant rate (euro/ha)
Improved renovation by increasing blending	954

C/3 Conversion with climate-resistant material

Activities supported	Grant rate EUR/ha
with chalky	1.326
oak monks	1.145

Cser makate	1.083
beech	1.733

C/1 – Additional elements as a one-off payment for target area C/3:

Establishment of a bench in a gradient of more than 10 degrees: EUR 0,17 per linear metre with a maximum of EUR 749/ha;

The construction of a russet or a dam on a slope of more than 15 degrees: EUR 1.2 per linear metre with a maximum of EUR 200/ha.

Metal fencing: EUR 8 per metre with a maximum of EUR 1600/ha.

Electric shepherds: EUR 5 per metre with a maximum of EUR 518/ha

Additional explanation

The unit subsidy rates, similar to the methodology applied in the last 15 years, have been established on the basis of the data collection and calculations of the Forest Science Institute. The development of the grant unit cost categories is a separate annexed "CAP Strategic Plan Hungary 2023-2027 Symplified cost options prepared by the Forest Science Institute of Sopron University as an expert organisation independent of AM: unit costs).

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☒ Yes ☐ No ☐ Mixed

Explanation of support activities falling outside the scope of Art. 42 TFEU

The beneficiary of this scheme is not a farmer and the aid does not contribute to agricultural production and therefore the competition rules (State aid rules) apply.

Type of state aid instrument to be used for clearance:

☐ Notification ☐ GBER ☒ ABER ☐ de minimis

State Aid case number

SA.112038

Additional information:

☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.

☐ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.

☒ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

What is not eligible for support?

No aid may be granted to an applicant for aid:

- pursuantto Commission Regulation (EU) No 651/2014 and Commission Regulation (EU) No 702/2014 of 37/2011 on the procedure for State aid for the purposes of European Union competition law and on the regional aid map. (III. Government Decree No 22/2015 of 22 December 2006 (hereinafter: 37/2011. (III. Section 6(4a) and (4b)(7) of the Government Decree,
- it failedto comply with the European Commission's decision to repay State aid within the meaning of EU competition law addressed to Hungary.

Does the investment contain irrigation?

☐ Yes ☒ No

Investments in the improvement of existing irrigation installations, what is the potential water saving(s) required (expressed in %)

N/A

Details on different potential water savings according to the type of installation or infrastructure (where applicable)

Investments in the improvement of existing irrigation installations (affecting water bodies whose status is less than good) what is/are the requirement(s) for an effective reduction in water use - expressed in %)

N/A

Regional breakdown

10 WTO compliance

Green Box

Paragraph 8 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The objective of this intervention is to support the prevention of forest degradation or the restoration of degraded stocks in the face of natural disasters (biotic or abiotic), and to ensure better future resilience and higher biodiversity through stock conversion. The presence of the pest or harmful event shall be confirmed by an authority. The aid covers only compensation, up to a maximum of 100 %, and is not linked to any other risk management tool.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(2)(d) - Other regions	43.00%	20.00%	43.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD41_O23_A01_ON - Unit cost for non-productive investment for climate and environmental sustainability of forestry	Grant	91(2)(d)-HU-43.00%	Average		R.18; R.27	No

Explanation and justification related to the value of the unit amount

RD41_O23_A01_ON - Unit cost for non-productive investment for climate and environmental sustainability of forestry

The UA is determined on an 'average' basis, based on the facts of the Rural Development Programme. Operations 8.3, 8.4 and 8.5.1 of the Rural Development Programme had a total envelope of EUR 72,229 million. 1254 applications were covered by a grant commitment, resulting in an average grant value per application of EUR 33392. Both public and private forest managers are eligible for the schemes, so there is no change in the target group. Funding framework for this intervention: EUR 65 495 600 million, so we expect successful grant applications of a similar size and average value.

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029
RD41_O23_A01_ON - Unit cost for non-productive investment for climate and environmental sustainability of forestry (Grant - Average)	Planned unit amount (Total Public Expenditure in EUR)	0.00	33,000.00	33,000.00	33,000.00	33,000.00	33,000.00	0.00

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO4 Contribute to climate change mitigation and adaptation, including by reducing greenhouse gas emission and enhancing carbon sequestration, as well as promote sustainable energy

SO8 Promote employment, growth, gender equality, including the participation of women in farming, social inclusion and local development in rural areas, including the circular bio-economy and sustainable forestry

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
4.3.1	Increasing the use of renewable energy, taking into account potential environmental conflicts	3	Yes
8.1.6	Biomass feedstocks, intermediate products, waste processing, renewable energy use	1	Partially
8.2.2	Developments that can be adapted to local/regional needs and have a measurable impact on them	1	Partially
8.3.1	Reducing regional disparities in rural transport infrastructure	3	Partially
8.3.2	Development of infrastructural background for local public services raising quality of life	3	Partially

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.15 Supported investments in renewable energy production capacity, including bio-based (in MW)

R.41 Share of rural population benefitting from improved access to services and infrastructure through CAP support

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

The purpose of the intervention is to:

Improving the quality of life in rural settlements, increasing sustainability by supporting the development of small-scale infrastructure that contributes to increasing energy efficiency, the development of the local economy and the supply of basic infrastructure.

The main purpose of the intervention is to improve the standard of living of those who live on the farm.
The intervention includes the following sub-measure:

Applications may be submitted for household-scale activities and investments aimed at achieving the following objectives:

- electricity,
- renewable energy use
- water supply;
- wastewater treatment improvements;
- creating and building an internet or internet network.

Principles governing the establishment of selection criteria, which may be partially applied (selection criteria):

- Maintenance and operations plan quality: justification, cost-effectiveness, innovation, sustainability
- Regional aspect
- Developments related to the use of renewable energy
- Improvements leading to improved energy efficiency
- Development preparation/planned with community involvement
- Development objectives/functions targeted at the most deprived populations
- Developments in a small municipality (less than 1000 inhabitants) or in a town of cherry
- Female applying for support

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiaries:

- Individuals
- Municipalities

Eligibility criteria:

- preparation of a maintenance and operation plan
- municipalities located in rural areas

The delineation of the intervention with the operational programmes has been described in detail under CAP ST 4.5 “Review of the coordination and demarcation of competences between the EAFRD and other Union funds operating in rural areas and their complementarity”. As a general principle of demarcation, the CAP MA requests the TOP MA to provide information on overlapping interventions (detailed below) before opening a tender, giving priority to the identification of the municipality and the place of implementation. Furthermore, the CAP MA states in the call for proposals that it does not allow the same development in the same municipality. Thanks to these two measures, the CAP and TOP+ are delineated at programme level.

The purpose of the RD42a closed garden, rural infrastructure RD43 and RD57 LEADER interventions is that the CAP MA states in the call for proposals that a beneficiary may receive support for the same development only on the basis of one call.

Whereas this measure falls outside the scope of Article 42 TFEU (see point 8), with the exception of de minimis aid, **no aid may be granted** to a beneficiary on the basis of Commission Regulation (EU) No 651/2014 or Commission Regulation (EU) No 702/2014

· is a firm in difficulty (the concept of a firm in difficulty is defined in Article 37/2011 on the procedure for State aid under EU competition law and on the regional aid map. (III. Section 6(4a) and (4b) of Government Decree No 273/2007) or

- which failed to comply with the European Commission's decision to repay State aid within the meaning of EU competition law addressed to Hungary

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Eligible costs for the intervention:

Tanya sub-measure:

(a) Construction, development and modernisation of buildings and structures.

(b) Acquisition of new machinery and equipment, technology, modernisation of existing machinery and equipment, including information and communication technologies.

(C) General costs linked to the aforementioned expenditure, such as architect, engineer and consultation fees, public authority procedural fees, consultancy and project management costs, fees related to advice on environmental and economic sustainability, including feasibility studies.

(D) Intangible investments: purchase or development of computer software and acquisition of patents, licences, copyrights, trademarks, etc.

(e) Acquisition of real estate necessary in relation to point (a) up to a maximum of 5 % of the total eligible expenditure of the operation concerned, and as contributions in kind, may be accounted for by the value of existing land or real estate essential for the investment, provided that it does not exceed 5 % of the total eligible expenditure of the operation concerned. Up to 10 % of the investment is eligible for the purchase of new land.

(F) Institutional guarantee at preferential rates

Only costs incurred by the beneficiary on 01/01/2023 and 31/12/2029 at the latest are eligible.

Commitment:

At least 5 years

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

☐ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.

☒ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

What is not eligible for support?

The following investments shall not be eligible:

(a) the purchase of agricultural production rights;

(b) purchase of payment entitlements;

(C) the purchase of land for an amount exceeding 10 % of the total eligible expenditure of the operation concerned, excluding the purchase of land for environmental purposes, the purchase of land for the conservation of carbon-rich soil and the purchase of land by young farmers through the use of financial instruments; in the case of financial instruments, that ceiling shall apply to the eligible public expenditure paid to the final recipient, or, in case of guarantees, to the amount of the underlying loan;

(D) the purchase of animals, the purchase of annual plants and the planting of such plants for purposes other than: agricultural or forestry potential following natural disasters, adverse climatic events or catastrophic events, or the protection of livestock against large carnivores or the use of animals in forestry instead of machinery, or the rearing of endangered breeds as defined in point (24) of Article 2 of Regulation (EU) 2016/1012 of the European Parliament and of the Council (45) under the commitments referred to in Article 70; or the conservation of plant varieties threatened with genetic erosion in the framework of the commitments referred to in Article 70;

(e) interest on loans, except in the case of grants in the form of interest rate subsidies or guarantee fee

subsidies;

(F) investment in large-scale infrastructures, as defined by Member States in their CAP Strategic Plans, that are not part of the community-led local development strategies set out in Article 32 of Regulation (EU) 2021/1060, with the exception of broadband systems and preventive measures for flood and coastal protection aimed at mitigating the consequences of likely natural disasters, adverse climatic events or catastrophic events;

(g) investments in afforestation that do not meet environmental and climate objectives in line with the principles for sustainable forest management set out in the Pan-European Guidelines for Afforestation and Reforestation.

Does the investment contain irrigation?

☐ Yes ☒ No

Investments in the improvement of existing irrigation installations, what is the potential water saving(s) required (expressed in %)

N/A

Details on different potential water savings according to the type of installation or infrastructure (where applicable)

Investments in the improvement of existing irrigation installations (affecting water bodies whose status is less than good) what is/are the requirement(s) for an effective reduction in water use - expressed in %)

N/A

Regional breakdown

10 WTO compliance

Green Box

Paragraph 11 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

It is a development within the meaning of paragraph 11 of Annex II to the WTO Agreement on Agriculture. We chose this because, in our view, the farm is considered to be an on-farm.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(2)(d) - Other regions	43.00%	20.00%	43.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD42_O22_A01_ON - Unit cost of rural infrastructure development on homesteads	Grant	91(2)(d)-HU-43.00%	Average		R.15; R.41	No

Explanation and justification related to the value of the unit amount

RD42_O22_A01_ON - Unit cost of rural infrastructure development on homesteads

Historical data were used. When determining the average unit amounts, the aid applications received and approved in response to calls for proposals under measures M07 of the Rural Development Programme 2014-2020 were taken into account, taking into account the funds allocated to the calls for proposals. The unit amount is the ratio between committed funds and subsidised applications, corrected by an inflation coefficient.

13 Planned Unit Amounts - Financial table with outputs

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

The purpose of the intervention is to:

The intervention facilitates the return of neglected areas to care and access to areas. Improvements to facilitate the agricultural use of properties entered in the land register as closed gardens, as well as the maintenance of the form of life associated with closed garden properties, require the regularisation and comprehensive infrastructure development of closed garden areas. The cultivation of gardens/vines makes it possible to preserve existing genetic diversity. Traditional closed garden farming is of particular importance to catch up in disadvantaged areas and to improve the conditions for self-sufficiency, self-care and food production for the local population. It is also important to enhance the capacity to generate value and income.

The purpose of the intervention is to develop the infrastructure of municipalities with closed garden areas. Closed garden properties are those listed as such in the public land register. Closed gardens are small-scale horticultural areas situated in the outskirts of the municipalities, usually agricultural land, which are located in blocks markedly separate from the areas used for large-scale production. Block-like parts are known as closed garden areas.

Applications may be submitted for activities and investments aimed at achieving the following objectives:

- construction and renovation of a road for access to closed gardens, landways and improvements to the sewerage network for the drainage of rainwater associated with the road section;
- the construction of a water source point through the construction of a well and the construction of small-scale water storage capacity related to water retention;
- developments related to electricity supply;
- development of waste water treatment, establishment of a wild fence, construction of game management/protecting elements;
- renovation of small monuments of local importance (rock cross, sculpture, etc.) where a community management function is associated with the renovation

Principles governing the establishment of selection criteria, which may be partially applied (selection criteria):

- Quality of the maintenance and operation plan: justification, cost-effectiveness, innovation, sustainability
- Regional perspective
- The closed garden area, or most of it, is certified as being in agricultural production
- Improvements leading to energy efficiency improvements
- Development preparation/planning with community involvement
- Development goals/functions targeted at the most deprived populations

Developments in small municipalities (less than 1000 inhabitants) or in a town of less than 10.000 inhabitants

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiaries:

- Municipalities

Eligibility criteria:

- development takes place in rural areas
- owners of properties in the closed garden area to be developed certify that they carry out agricultural production
- preparation of a maintenance and operation plan

The delineation of the intervention with the operational programmes has been described in detail under CAP ST 4.5 “Review of the coordination and demarcation of competences between the EAFRD and other Union funds operating in rural areas and their complementarity”. As a general principle of demarcation, the CAP MA requests the TOP MA to provide information on overlapping interventions (detailed below) before opening up the possibility of applying to municipalities, giving priority to the identification of the municipality and the place of implementation. Furthermore, the CAP MA states in the call for proposals that it does not allow the same development in the same municipality. Thanks to these two measures, the

CAP and TOP+ are delineated at programme level.

The delineation of the RD42 farm development, RD43 rural infrastructure and RD57 LEADER interventions is served by the fact that the CAP MA states in the call for proposals that one beneficiary may receive support for the same development only on the basis of one call.

Whereas this measure falls outside the scope of Article 42 TFEU (see point 8), with the exception of de minimis aid, **no aid may be granted** to a beneficiary on the basis of Commission Regulation (EU) No 651/2014 or Commission Regulation (EU) No 702/2014

- it is a firm in difficulty (the concept of a firm in difficulty is defined in Article 37/2011 on the procedure for State aid within the meaning of EU competition law and on the regional aid map. (III. Section 6(4a) and (4b) of Government Decree No 273/2007) or

it failed to comply with the European Commission's decision to repay State aid within the meaning of EU competition law addressed to Hungary.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Eligible costs for the intervention:

1. Investments
2. General costs linked to expenditure, such as architect, engineer and consultation fees, public procedure fees, consultancy and project management costs, fees related to advice on environmental and economic sustainability, including feasibility studies.
3. Institution guarantee at preferential rates

Only costs incurred by the beneficiary on 01/01/2023 and 31/12/2029 at the latest are eligible.

Commitment:

Maintenance obligation of at least 5 years

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☒ Yes ☐ No ☐ Mixed

Explanation of support activities falling outside the scope of Art. 42 TFEU

The intervention falls outside the scope of Article 42 TFEU, since it is intended to support the development of small-scale infrastructure which contributes to increasing energy efficiency, the development of the local economy, waste water treatment and the supply of basic infrastructure, so that competition rules are generally applicable to it.

Type of state aid instrument to be used for clearance:

☐ Notification ☒ GBER ☒ ABER ☒ de minimis

State Aid case number

SA.112038

Additional information:

- ☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.
- ☐ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.
- ☒ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

What is not eligible for support?

The following investments shall not be eligible:

1. purchase of agricultural production rights;
2. purchase of payment entitlements;
3. purchase of land for an amount exceeding 10 % of the total eligible expenditure for the operation concerned, with the exception of land purchase for environmental conservation and carbon-rich soil preservation or land purchased by young farmers through the use of financial instruments; in the case of financial instruments, that ceiling shall apply to the eligible public expenditure paid to the final recipient, or, in case of guarantees, to the amount of the underlying loan;
4. purchase of animals, and purchase of annual plants and their planting. for a purpose other than: agricultural or forestry potential following natural disasters, adverse climatic events or catastrophic events, or the protection of livestock against large carnivores or the use of animals in forestry instead of machinery, or the rearing of endangered breeds as defined in point (24) of Article 2 of Regulation (EU) 2016/1012 of the European Parliament and of the Council (45) under the commitments referred to in Article 70; or the conservation of plant varieties threatened with genetic erosion in the framework of the commitments referred to in Article 70;
5. interest on debt, except in relation to grants given in the form of an interest rate subsidy or guarantee fee subsidy;
6. investments in large-scale infrastructure, as determined by Member States in their CAP Strategic Plans, not being part of the community-led local development strategies set out in Article 32 of Regulation (EU) 2021/1060, except for broadband and flood or coastal protection preventive actions aimed at reducing the consequences of probable natural disasters, adverse climatic events or catastrophic events;
7. investments in afforestation which are not consistent with environmental and climate-related objectives in line with sustainable forest management principles, as developed in the Pan-European Guidelines for Afforestation and Reforestation.

investments in Irrigation

Does the investment contain irrigation?

☐ Yes ☒ No

Investments in the improvement of existing irrigation installations, what is the potential water saving(s) required (expressed in %)

N/A

Details on different potential water savings according to the type of installation or infrastructure (where applicable)

Investments in the improvement of existing irrigation installations (affecting water bodies whose status is less than good) what is/are the requirement(s) for an effective reduction in water use - expressed in %)

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of

this intervention are displayed in bold

R.41 Share of rural population benefitting from improved access to services and infrastructure through CAP support

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

The purpose of the intervention is to:

Improving the quality of life of people living in rural settlements, increasing sustainability by supporting the development of small-scale infrastructure that contributes to increasing energy efficiency, the development of the local economy, wastewater treatment and the provision of basic infrastructure. The measure contributes to strengthening rural population retention capacity. The most effective way to reintegrate long-term inactive people into society is to involve them in municipal development/maintenance activities, preferably in normal employment. Local development is therefore of an extraordinarily important nature.

Elements of the built environment and/or infrastructure of municipalities that have a real community or economic use/function, adapted to the extent of local needs, can be developed. Among these, we also highlighted multifunctional community spaces, in particular for child protection, health and education, think tanks, sports facilities and tourism development.

The quality of public spaces and services in rural areas is generally lower than in more urbanised areas. The role of local authorities is, inter alia, to develop and expand the spaces for social organisation and to ensure equal access to them for the general public.

As in previous programme periods, we will continue to support the development of local markets, but we want to put more emphasis on the sale of locally produced products, including the use of the widest range of digital opportunities (shopping communities, online marketing, etc.).

Geographical mobility, ease of access to employment, redevelopment of urban roads to help them manage and access services are, in most cases, the main determinants of quality of life on the part of the local population. Therefore, under the CAP Strategic Plan, we are supporting a larger-scale road renovation than before.

The development of local mass caterers contributes not only to the provision of healthy, high-quality food to the population, but also to the development of the local economy through the use of local raw materials.

The creation and maintenance of property security is a crucial element of the liveability of individual municipalities. The provision of motor vehicle and equipment investments by the various watches will thus certainly contribute to meeting the needs.

The establishment of village curatorship is well established as a means of ensuring everyday mobility (shopping, physician, hot meals, administration, etc.) in areas where access is difficult. Securing the investments of these services therefore brings particular social benefits.

As the smart village strategies in Hungary have been completed in a very small number of municipalities, we would like to focus on their preparation and the subsequent implementation of the investments contained therein. Broadband infrastructure is already available in most Hungarian municipalities, for which there would be a high demand, the deployment of a WIFI signal service throughout the municipality.

Target area:

- the transition of renewable energy based primarily on local biomass in local public services: the modernisation of installations performing community functions, the use of forestry (firewood) and other in-situ biomass and the possibility of biogas production;

— energy upgrades and related external reconstruction of buildings that define urban landscapes;

- development and acquisition of equipment for multifunctional community spaces/service centres: the delivery and operation of at least 3 different community services as a result of the development, in particular child protection, health and education services;

construction and renovation of cemeteries with a public function;

— creation of sport and recreational spaces, development of existing ones and/or acquisition of

equipment;

— tourism valorisation and development of cultural, built and natural heritage of local, regional importance and attractiveness for tourism/eco-tourism (information services, sale of local products, introduction of programmes for tourists)

— energy upgrade of facilities performing community functions that do not involve state or municipal functions.

Target B:

establishment and development of infrastructure for local sales of goods and fairs;

— supporting the creation of points of sale for local products and creating opportunities for local distribution;

— regional cooperation supporting local sales of goods (e.g. trademark network, local consumer basket, shopping community, parks, etc.), infrastructure investments;

purchase of equipment and/or on- and off-line marketing tools for cooperation supporting the sale of local, rural quality-enhancing products and services

Target Area C:

development and maintenance of outlying local roads (only roads with a topographical number, owned or managed by the aid applicant);

— purchase of power and work equipment for the management, repair and maintenance of municipal and asset-managed roads;

Target D:

— in municipalities of less than 2000 p.e. (p.e.) not included in the list of agglomerations defined in Annex 1 to Government Decree No 25/2002 of 27 February 2002, or in isolated parts or outlying areas of municipalities listed in Annex 1 to Government Decree No 25/2002 of 27 February 2002 alone, with an appropriate level of wastewater disposal and treatment and the implementation of sewage sludge treatment through the implementation of near-autonomous waste water treatment solutions or individual small waste water treatment facilities

This target area:

- the establishment and improvement of the kitchen of mass caterers and associated storage and/or preparatory premises (including: purchase and installation of machinery, equipment and equipment) and local sourcing of raw materials for supply

Target area F:

- developments for public and property security: free vehicles and equipment purchases by citizens, field guards, voluntary fire-fighting services, other public bodies;

— development of village and farm care services by purchasing vehicles and equipment free of charge

Target area g:

— support the development of infrastructure for smart village projects, where necessary, roll-out/development of broadband internet;

— roll-out of rural WIFI networks

Principles governing the establishment of selection criteria, which may be partially applied (selection criteria):

- Maintenance and operation plan, quality of feasibility study: justification, cost-effectiveness, innovation, sustainability
- Regional aspect.

- Development of renewable energy
- Improvements leading to energy efficiency improvements
- Priority will be given to projects with components aimed at digitalisation and awareness-raising of applicants.
- Cooperative or collective development
- Development and renovation of a protected building
- Increasing the employment impact
- Building for community functions not located in the municipality
- Development preparation/planning with community involvement
- Development goals/functions targeted at the most deprived populations
- Development in a small municipality (less than 1000 inhabitants) or in a town of cherry

— Development in or with the participation of municipalities with a population of 1000 inhabitants or more in the case of outlying road development

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible Beneficiaries:

Undertakings with legal personality

– Undertakings without legal personality

— Budgetary and administrative bodies (local government budget management and budgetary bodies)

Associations

— Non-profit legal entities (e.g. ecclesiastical entities, foundations, non-profit companies)

Eligibility criteria:

Preparation of a maintenance and operation plan

— The ownership, use (management) or maintenance relationship relating to the subject-matter of the development continues at least until the end of the maintenance period;

— Municipalities located in rural areas

Territorial scope: Continuing the practice of the 2014-2020 programming period, the territorial scope of the intervention covers all rural municipalities in the country (a municipality where, regardless of administrative status (city/municipality) is defined as a rural area:

a residential population of less than 10 thousand; with a population of over 10 thousand inhabitants

the outskirts of the observatory municipalities; in spite of the above characteristics, you are not entitled to: Budapest and the municipalities belonging to the Budapest agglomeration.

The delineation of projects with other operational programmes has been described in detail in the chapter 4.5 Review of the coordination and demarcation of competences between the EAFRD and other Union funds operating in rural areas and the complementarity of those funds.

Whereas this measure falls outside the scope of Article 42 TFEU (see point 8), with the exception of de minimis aid, **no aid may be granted** to a beneficiary on the basis of Commission Regulation (EU) No 651/2014 or Commission Regulation (EU) No 702/2014

- it is a firm in difficulty (the concept of a firm in difficulty is defined in Article 37/2011 on the procedure for State aid within the meaning of EU competition law and on the regional aid map. (III. Section 6(4a) and (4b) of Government Decree No 273/2007) or
- it failed to comply with the European Commission's decision to repay State aid within the meaning of EU competition law addressed to Hungary.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Eligible costs for the intervention:

- (a) Construction, development and modernisation of buildings and structures.
- (b) Acquisition of new machinery and equipment, technology, modernisation of existing machinery and equipment, including information and communication technologies.
- (C) General costs linked to the aforementioned expenditure, such as architect, engineer and consultation fees, public authority procedural fees, consultancy and project management costs, fees related to advice on environmental and economic sustainability, including feasibility studies.
- (D) Intangible investments: purchase or development of computer software and acquisition of patents, licences, copyrights, trademarks, etc.
- (e) The purchase of the necessary real estate in relation to point (a) up to a maximum of 5 % of the total eligible expenditure of the operation concerned and the value of existing land or real estate essential for the investment may be eligible as contributions in kind, provided that it does not exceed 5 % of the total eligible expenditure of the operation concerned. Up to 10 % of the investment is eligible for the purchase of new land.
- (F) Institutional guarantee at preferential rates

Only costs incurred by the beneficiary on 01/01/2023 and 31/12/2029 at the latest are eligible.

Commitment:

Maintenance obligation of at least 5 years or 3 years in the case of the SME sector

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

In the case of the use of an institutional guarantee at a reduced rate, an aid intensity increased by 5 % compared to the basic grant may be granted

Additional explanation

Not relevant.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☒ Yes ☐ No ☐ Mixed

Explanation of support activities falling outside the scope of Art. 42 TFEU

The intervention aims to improve the quality of life of people living in rural settlements, increase sustainability by supporting small-scale infrastructure development that contributes to increasing energy efficiency, developing the local economy, wastewater treatment and its supply with basic infrastructure. In the light of the foregoing, that measure falls outside the scope of Article 42 TFEU and is therefore subject

to the competition rules (State aid rules).

SA.112038

SA.112040

SA.107119

Additional information:

☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.

☐ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.

☒ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

What is not eligible for support?

The following investments shall not be eligible:

(a) the purchase of agricultural production rights;

(b) purchase of payment entitlements;

(C) the purchase of land for an amount exceeding 10 % of the total eligible expenditure of the operation concerned, excluding the purchase of land for environmental purposes, the purchase of land for the conservation of carbon-rich soil and the purchase of land by young farmers through the use of financial instruments; in the case of financial instruments, that ceiling shall apply to the eligible public expenditure paid to the final recipient, or, in case of guarantees, to the amount of the underlying loan;

(D) the purchase of animals, the purchase of annual plants and the planting of such plants for purposes other than: agricultural or forestry potential following natural disasters, adverse climatic events or catastrophic events, or the protection of livestock against large carnivores or the use of animals in forestry instead of machinery, or the rearing of endangered breeds as defined in point (24) of Article 2 of Regulation (EU) 2016/1012 of the European Parliament and of the Council (45) under the commitments referred to in Article 70; or the conservation of plant varieties threatened with genetic erosion in the framework of the commitments referred to in Article 70;

(e) interest on loans, except in the case of grants in the form of interest rate subsidies or guarantee fee subsidies;

(F) investment in large-scale infrastructures, as defined by Member States in their CAP Strategic Plans, that are not part of the community-led local development strategies set out in Article 32 of Regulation (EU) 2021/1060, with the exception of broadband systems and preventive measures for flood and coastal protection aimed at mitigating the consequences of likely natural disasters, adverse climatic events or catastrophic events;

(g) investments in afforestation that do not meet environmental and climate objectives in line with the principles for sustainable forest management set out in the Pan-European Guidelines for Afforestation and Reforestation.

Does the investment contain irrigation?

☐ Yes ☒ No

Investments in the improvement of existing irrigation installations, what is the potential water saving(s) required (expressed in %)

N/A

Details on different potential water savings according to the type of installation or infrastructure (where applicable)

Investments in the improvement of existing irrigation installations (affecting water bodies whose status is less than good) what is/are the requirement(s) for an effective reduction in water use - expressed in %)

Regional breakdown

10 WTO compliance

Green Box

Paragraph 2 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

This is the creation of a dedicated rural infrastructure service within the meaning of point 2(g) of Annex II to the WTO Agreement on Agriculture.

(g) infrastructural **services**, including: electricity reticulation, roads and other means of transport, market and port facilities, water supply facilities, Dams and drainage schemes, and infrastructural works associated with environmental programmes. In all cases the expenditure shall be directed to the provision or construction of capital works only, and shall exclude the subsidised provision of on-farm facilities other than the reticulation of generally available public utilities. It shall not include subsidies to inputs or operating costs, or preferential user charges.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(2)(d) - Other regions	43.00%	20.00%	43.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD43_O22_A01_ON - Specific cost of rural infrastructure development in small settlements	Grant	91(2)(d)-HU-43.00%	Average		R.41	No

Explanation and justification related to the value of the unit amount

RD43_O22_A01_ON - Specific cost of rural infrastructure development in small settlements

Historical data were used. When determining the average unit amounts, the aid applications received and approved in response to calls for proposals under measures M07 of the Rural Development Programme 2014-2020 were taken into account, taking into account the funds allocated to the calls for proposals. The unit amount is the ratio between committed funds and subsidised applications, corrected by an inflation coefficient.

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029

SO7 Attract and sustain young farmers and other new farmers and facilitate sustainable business development in rural areas
SO8 Promote employment, growth, gender equality, including the participation of women in farming, social inclusion and local development in rural areas, including the circular bio-economy and sustainable forestry

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
7.1.1	Encouraging business start-ups in agriculture and forestry among young people	1	Yes
7.1.3	Easing access to land for young farmers	2	Partially
7.2.1	Providing complex entrepreneurial skills for setting up a farm	1	Yes
7.2.2	Attracting young generations to farming	1	Yes
8.1.2	Improving the profitability of rural micro-enterprises	1	Partially

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold
R.36 Number of young farmers benefitting from setting up with support from the CAP, including a gender breakdown
R.37 New jobs supported in CAP projects

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Purpose of the intervention: In order to halt the ageing of agriculture, encourage agro-generational change and reduce the rural exodus of young people, it is also necessary to provide support through the instruments of the Common

Agricultural Policy to facilitate the start-up of farmers who wish to manage agricultural production on a lifelong basis. The setting-up of an agricultural activity presupposes the existence of basic know-how and production potential (land area, livestock, etc.) on which the start-up can rely on in order to achieve the objectives set out in its business plan.

A fundamental feature of the younger generation is that they typically have no or lower accumulated capital due to their age characteristics, which also justifies their support.

Principles governing the establishment of selection criteria, which may also be partially applied (selection criteria):

quality of the business plan,
level of professional qualifications,
previous professional experience,
higher value-added farming activity or farming mode,
—continuation of organic farming,
employment impact,
a woman applying for support,

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible Beneficiaries:

Natural persons

– Undertakings having legal personality

Eligibility criteria:

“CAP Strategic Plan 4.1.5 Young farmer as defined in the chapter:

(a) a natural person aged 18 years or more and up to 40 years of age who:

- State-recognised agricultural know-how;
- keep a holding established for up to 5 years
- have a farm size of 10.000 or more but less than or equal to 50.000 SO.

in the case of a legal person carrying out an agricultural activity not more than 5 years from the date of submission of the application as its main activity:

- the senior official and owner of the legal person is between 18 and 40 years old,
- the chief executive and owner of the legal person have recognised agricultural expertise;
- the juridical person has a plant size of at least 10.000 STE and the manager and owner of the juridical person together have an operating size equal to or less than 50.000 STE.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments (commitments):

- start implementing the business plan within a maximum of 9 months from the grant decision,
 - compliance with the commitments made in the business plan by the end of the 4th management year at the latest,
 - the manager and owner of the beneficiary or legal entity at the end of the period agreed in the business plan, at the latest in the 4th closed farming year of the aid, earned at least the minimum wage in the previous year, and must manage his holding with personal assistance,
 - submit annual accounts,
 - cooperation with a special adviser
- Reserve a minimum SO of EUR 10000 until the end of the 5th year.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

RD05_O25_U01_BN - Specific number of generational renewal with start-up support for young farmers	Grant	91(2)(a)-HU-85.00%	Uniform		R.36; R.37	No

Explanation and justification related to the value of the unit amount

RD05_O25_U01_BN - Specific number of generational renewal with start-up support for young farmers

Calculated on the basis of historical data. When determining the average unit amounts, the aid applications received and approved in response to calls for proposals under measures M06 of the Rural Development Programme 2014-2020 were taken into account, taking into account the funds allocated to the calls for proposals. The unit amount is the ratio between committed funds and subsidised applications, corrected by an inflation coefficient.

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Purpose of the intervention:

The objective of the intervention is to take over one or more holdings from the transferor of a holding in operation and the corresponding payment entitlements and all the obligations. The intervention supports the recipient of the holding with the aim of acquiring the holding, in the form of an initial grant.

The continued operation and development of existing and competitive farms contributes to maintaining

and improving the competitiveness of agriculture. Younger farmers who are close to retirement age will benefit generational renewal.

Support for generational renewal is aimed at improving the age structure of farmers, but in addition to generational renewal, it is also an important objective not to close operational farms.

Principles governing the establishment of selection criteria, which may be partially applied:

For the recipient(s):

content and quality of the project plan (In particular: environmental and climate adaptation, environmental and climate adaptation, undertaking to participate in a quality scheme or quality assurance or quality management system, organic farming, employment impact (including: employment of people with disabilities).

the level of professional qualifications,

previous professional experience,

co-operation with the Adviser managing the takeover,

higher value-added farming activity or farming mode

Relevant legislation:

Act CXLIII of 2021 on the transfer of agricultural holdings

Link to other interventions:

“ RD07_B03_YFO_77 – Generational renewal, cooperation on economic transfers” – intervention.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible Beneficiaries:

- The person who takes over the holding and its obligations.
- Commercialisation can only be created between natural persons.

Eligibility criteria:

- The farm transfer contract in force at the time of submission of the aid application.
- Project Plan
- The transferee shall be a primary farmer or self-employed person engaged in agricultural or agricultural or forestry activities at least ten years younger than the farm transferor, who is at least 18 years old and less than 50 years old, and who fulfils the conditions laid down by law for the operation of the holding to be taken over
- The holding to be transferred has a minimum farm size of EUR 10000 or an agricultural turnover of EUR 10000.
- In the case of the transferee of the holding, a professional qualification.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments:

- Participation in compulsory training

- The takeover of the holding shall operate the holding taken over for at least 5 years, during which the holding size or agricultural turnover shall not fall below the size of the holding or the agricultural turnover at the time of transfer.

— The transfer of the holding must end no later than 5 years after the decision to grant support.

— The transferee of the holding shall not transfer the ownership or use of the land received to another person within five years of acquiring the ownership or use of the land received, shall not use it for any other purpose and shall comply with the obligation to use the land laid down in the Act on the Protection

of Land.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Target Area 1: The objective of the intervention is to promote the start-up of commercial or service businesses in rural areas that serve local needs, with a particular focus on business development in farmya settlements and small wallworm areas with a lack of business. The intervention is support for business start-ups in rural areas, which contributes to making rural settlements more liveable and attractive.

Targetarea2: In line with the unfavourable age structure of agricultural businesses, forest managers are ageing, and it is therefore necessary to provide targeted incentives for young professionals to start up their

own businesses. Members of the younger generation of foresters tend to have no or lower accumulated capital due to their age characteristics, which also justifies their specific support. An incidental objective is the professionalisation of unmanaged forests as far as possible. It is also extremely difficult for young professionals with qualified experience and meeting the requirements of 'eligible professionals' to set up a self-employed forest management company. The very long payback time for forest management and the capital and debt to reach rational plant sizes are extremely difficult.

Content: facilitating the start-up of young forest professionals with special lump sum support.

Principles governing the establishment of selection criteria, which may be partially applied:

- Business plan quality
- Regional perspective
- Social enterprises benefit from scoring
- Employment
- Professional qualifications
- Management of non-farmed forests
- Connection to a Quality Certification Scheme (PEFC, FSC)
- Participation in a mentoring programme

Link to legislation:

Act XXXVII of 2009 on Forest, Forest Protection and Forest Management

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Target area 1

Natural persons

Enterprises with legal personality (economic associations + cooperatives (particularly social cooperatives)

Undertakings without legal personality

– Non-profit organisations with legal personality (ecclesiastical legal persons, foundations, non-profit business associations)

2 target areas

In the case of an individual: eligible forestry specialists aged 18 years or over and under 40 years of age

In case of a legal person:

not more than 5 years from the date of submission of the application, carry out forest management activities as its main activity

the senior official and majority owner of the legal person with the right to sign independently is 40 years old or less,

the chief executive officer and majority owner of the legal person who has the right to sign independently is entitled to forestry

Eligibility criteria:

Target area 1

proof of normal residence in a rural area during the 12 months preceding the submission of the application, or, in the case of a legal person, the registered office of the legal person is located in a rural area during the 12 months preceding the submission of the application and its owners and managers have their place of residence in rural areas during the 12 months preceding the submission of the application.

development of non-agricultural activities in rural areas.

a natural person or a sole trader who, during the 12 months prior to the submission of the application, has/have been owned by a sole trader in an enterprise/who has been a member of a partnership which has carried out the activity covered by the application may not apply.

(D) No legal entity may apply if it has carried out the activity covered by the application in the 12 months preceding the submission of the application.

an applicant who has been awarded an application for the same action in the same municipality in the last five years under the LEADER or other Fund-funded Operational Programme shall not be eligible.

applicants must have at least secondary vocational education

submission of business plan

2 target areas

Submission of a business plan

As this measure falls outside the scope of Article 42 TFEU (see point 8), with the exception of de minimis aid, **no aid may be granted** to a beneficiary under Commission Regulation (EU) No 651/2014 or Commission Regulation (EU) No 702/2014

- it qualifies as a firm in difficulty (the concept of firm in difficulty is referred to in Decree 37/2011 on the procedure for State aid for the purposes of EU competition law and on the regional aid map. (III. Specified in Section 6(4a) and (4b) of Government Decree No 22/2015) and
- it has not complied with a decision of the European Commission addressed to Hungary requiring the repayment of State aid within the meaning of EU competition law.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments:

Target area 1

- implementation of a business plan by the end of the commitment period.

Target area 2

- start implementing the business plan no later than 9 months after the grant decision;
- become a forest manager entitled to at least 20 hectares of forest by the end of the 4th management year from the start at the latest
- compliance with the commitments made in the business plan by the end of the 4th management year at the latest,
- at the latest in the 4th closed management year of the aid, the beneficiary's income from forestry activities is at least equal to the previous year's statutory minimum wage and must manage the undertaking with personal involvement;
- submission of an annual technical report,
- cooperation with a special adviser, compulsory participation in a total of five training sessions per year
- mandatory investment within 4 years, with a minimum value of EUR 30,000,

- the sponsored person or, in the case of a legal person, its executive officer and the majority owner with independent signature rights may not change (except in the case of inheritance)

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD08_O27_A01_BN - Unit cost of generational renewal by supporting rural start-ups	Grant	91(2)(d)-HU-43.00%	Average		R.39	No
RD08_O27_A02_BN - Unit amount of start-up aid for young forest managers	Grant	91(2)(d)-HU-43.00%	Average		R.37; R.39	No

Explanation and justification related to the value of the unit amount

RD08_O27_A01_BN - Unit cost of generational renewal by supporting rural start-ups

Based on historical data, the Rural Development Programme was calculated on the basis of the relevant operations of measure M6.

RD08_O27_A02_BN - Unit amount of start-up aid for young forest managers

Justification for Target Area 2 (FIEG) 'average' UA (EUR 100.000): experience with start-up aid for young mg (VP6.1): with few exceptions, all applicants applied for the maximum amount that can be claimed.

In the case of a young start-up forest manager, we estimate the order of EUR 100.000 because:

(a) the maximum amount may be obtained by undertaking 5 + another 5 years of farming;

(b) in the case of forest management, it has no rationality to calculate a business period of less than 10 years.

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

The Agricultural Damage Mitigation Risk Management Fund (hereinafter: The rules governing the operation of the Compensation Fund) were notified by the Ministry of Agriculture in 2011 (SA. 61783), approved by the EU Commission. The Compensation Fund in its current form was launched in 2012. The Damage Fund covers part of the compensation for losses in yields caused by drought, frost (winter, spring, autumn), agricultural flooding, inland water, cloud rupture, storm and hail. Since the start of the measure, the number of participants in the risk pool ranged from 72 to 75 thousand, and the area covered by the measure was 3.7 million hectares (around 86 % of the total arable land, vine and plantation area).

The purpose of the intervention is to: Hungary operates the Damage Fund to mitigate economic damage to farmers as a result of weather and other natural risks and to encourage willingness to take out insurance.

The measure aims to address the protection and weather risks of certain crop sectors (arable crop

production, arable vegetable production and cropyards).

The Hungarian State Treasury, as the agricultural damage control body, the National Food Chain Safety Office, as the agricultural administration body and the county government office, is involved in the operation of the Damage Fund. The financial resources of the Compensation Fund are as follows:

(a) the amount of compensation contributions paid annually by farmers who are members of the compensation fund (approximately 30 % of the total annual new resources of the Fund)

(b) cash from the national budget (at least 30 % of the total resources of the Fund) supplementing each HUF 1 producer's contribution by at least HUF 1

(C) CAP ST funds (intervention RD14)(up to 40 % of the total resources of the Fund, but

Combined with the resources referred to in points (b) and (c), up to 70 % of the total new annual resources of the Fund)

(D) Residual of the Fund's resources not used for compensation to producers in previous years.

The level of compensation contributions depends on the crop sector, the amount of the contribution is HUF 4500 per hectare for vegetable and plantation production on arable land (HUF 5400 per hectare as of 2024) and HUF 1500 per hectare for other arable production (1 800 HUF/ha as of 2024). Members of the Compensation Fund may, subject to payment of the compensation contribution, receive a compensation allowance in the event of a reduction of more than 30 % or a reduction (product of yield and price) of more than 30 % of the reference yield at crop level over the past 5 years, excluding the lowest and the highest value. The mitigation allowance shall be limited to 80 % of the reduction in the value of the return if the producer has appropriate plant insurance (or crisis insurance from 2024). In the absence of insurance, only 40 % of the reduction in yield value can be compensated by the producer

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Beneficiaries: The beneficiary of the compensation is the Compensation Fund and the final beneficiary is the producers that are members of the Fund. It is mandatory to join the Compensation Fund for active farmers who are eligible for the basic income support (BISS) and have submitted a single application (EC) and:

they have at least 1 hectare of plantation in the EC submitted,

the area of arable vegetables in the EC submitted is 5 hectares,

they have an area of 10 hectares of other arable crops in the EC submitted,

the combined area of arable vegetables and the area of plantation used for cultivation in the EC submitted reaches 5 hectares,

the area of arable vegetables and other arable crops and their area of plantation in the EC submitted is 10 hectares.

A farmer with land smaller than the above-mentioned size may join the Compensation Fund voluntarily, with a separate declaration made in the EC for the current year, on the basis of 3 years' continuous membership. May be entitled to a compensatory allowance, who:

— has suffered at least 30 % of the reference return and has declared the incident on the electronic interface set up for this purpose in due time,

at farm level, it has suffered a reduction in yield of at least 15 % compared to its reference yield for the crop affected by the elemental damage,

— at least 30 % of the reference yield was confirmed by decision of the agricultural damage assessment body,

The application for compensation was submitted by the deadline laid down by law,

- the compensation contribution was paid on time and in full. The conditions of eligibility of the final beneficiaries are thus the same as SA. Under the conditions laid down in the State aid scheme 61783.

As a beneficiary, the Compensation Fund must comply with the following conditions:

the Compensation Fund shall be accredited by the competent authority in accordance with national law no later than 2024,

the Compensation Fund shall pursue a transparent policy for payments to and payments from the Fund,

and

— the Compensation Fund establishes the liability for any debt incurred on the basis of clear rules.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Pursuant to Article 76(3)(b) of the CAP Strategic Plan Regulation 2021/2115, the maximum amount of the financial contribution from Pillar II to the allocation of the compensation fund, taking into account support from the national budget, shall be limited to a maximum of 70 % of the eligible costs.

Eligible cost:

farmers' annual compensation contribution to the compensation fund

The final beneficiaries of measure RD 14 are farmers and therefore this measure falls within the scope of Article 42 TFEU, which has the effect of exempting the measure from further State aid review. Under measure RD 14, compensation benefits will be paid for the first time in March 2025 (until 31 March 2025). Producers will be able to join this Risk Management Fund as of April 2024 and the annual producer contribution will be paid by 15 September 2024.

For the calendar year 2024, it is still fully nationally funded for claims for compensation in 2023 (SA. 61783) we operate an agricultural damage mitigation scheme through which compensation payments will be made (until 31 March 2024). However, as of calendar year 2025, which served to mitigate the damage in 2024, the Damage Fund will draw on the funds of measure RD 14

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

☒ reimbursement of eligible costs actually incurred by a beneficiary

☐ unit costs

☐ lump sums

☐ flat-rate financing

Range of support at beneficiary level

Maximum amount of the financial contribution from Pillar II to the resources of the Compensation Fund, taking into account support from the State budget. The aid intensity is limited to a maximum of 70 % of the eligible costs.

73000 final beneficiaries are expected to participate in the measure.

Additional explanation

If the amount available in the Compensation Fund (unused resources of previous years + producer payment for the year in question + national top-up for producer payments + CAP ST aid linked to producer payments) does not cover the amount of the compensation payments established for the damage of the year in question, the amount of the allowances should be reduced uniformly and proportionately.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

Compensation of losses. What is the threshold triggering compensation?

The intervention shall receive a financial contribution to the Compensation Fund in order to provide a

mitigation allowance from the Fund where an active farmer who has acceded to the Fund has suffered a reduction in yield exceeding 30 % and a reduction in yield value of more than 15 % from the five-year period preceding the reference year as a result of a decision of an active farmer who has acceded to the Fund, compared to the three years calculated by leaving the two years with the highest and the lowest yield.

What is the methodology for the calculation of losses and triggering factors for compensation?

The reduction in the value of the yield is determined as the product of the reduction in the yield in the current year multiplied by the reference price for the crop in the current year, as published in the Ministerial Notice, compared to the average yield value of the reference period in the reference period. A farmer may only be entitled to the maximum amount of the compensation, i.e. 80 % of the reduction in the value of the yield, if he has an agricultural insurance contract covering an agricultural event specific to a crop. In the absence of insurance, a producer may be entitled to half of the mitigation benefit, i.e. 40 % of the reduction in the value of the return.

What is the type of risk management tool?

- ☐ Insurance
☒ Mutual fund
☐ Other

What are the production losses coverage?

crop

horticulture

What are the income losses coverage?

non sector specific

What are the provisions in order to avoid overcompensation of that contribution?

In accordance with point 357 of sub-chapter 1.2.1.2 of the current agro-forestry guidelines, the amount of the compensation allowance is to be taken into account in determining the amount of the compensation granted under national or Union measures or under a subsidised insurance scheme for the same plant, area or damage. In order to avoid overcompensation, costs recovered in other ways (e.g. costs not incurred as a result of a reduction in yield) are also taken into account as a reducing factor.

10 WTO compliance

Green Box

Paragraph 7 of Annex 2 WTO

Explanation of whether and, if so, how the intervention respects relevant provisions of Annex 2 to the WTO Agreement on Agriculture (Green Box)

Under the intervention, a financial contribution shall be granted to the Compensation Fund on the basis that an active farmer affiliated to the Fund suffers a reduction in yield of more than 30 % from the five-year period preceding the reference year as a result of a primary damage event compared to three years after the two years with the highest and the lowest yield.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(2)(d) - Other regions	43.00%	20.00%	43.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD14_O09_A01_FN - Rural development eligible costs	Grant	91(2)(d)-HU-43.00%	Average		R.5	No

Explanation and justification related to the value of the unit amount

RD14_O09_A01_FN - Rural development eligible costs

Support for viable farm income and resilience in the European Union in relation to specific objective No 1 to maintain food security is the main need No 2 to reduce income fluctuations due to natural (weather) and market risks, justifying the continuation of the intervention over the period 2023-2027. In particular, the intervention contributes to and addresses the following sub-necessities:

Addressing adverse climatic events and damage to farmers caused by climate change in agriculture (crops, arable horticulture, plantations),

2.4 Promotion of agricultural insurance (self-insurance).

The value of the unit amount depends on the number and amount of claims for compensation. In 2024, the Compensation Fund will order the payment of a contribution from the joining producers of around HUF 7.5 billion, supplemented by funds of HUF 7.5 billion from the national budget. During the planning period, the number of members of the Damage Fund is stagnating, given the compulsory membership of the farm size.

An average unit amount is used, as a different amount of compensation is paid per final beneficiary. We also set a maximum planned average unit amount, making use of the possibility provided for in Article 102(3) of the CAP STR. The average unit amount represents the amount of the specific mitigation benefit per final beneficiary using the risk management tool. The number and amount of claims for the mitigation allowance and the number of producers wishing to use the risk management tool are factors of uncertainty for the planning of the unit amount.

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

An insurance premium scheme covering arable crops (including arable vegetables) and permanent crops was introduced as Pillar II of the complex agricultural risk management system from 2012 to 2014, financed from EAGF in 2012-2014, from national resources in 2015 and from 2016 onwards from EAFRD. The popularity of subsidised insurances has been increasing year on year and the European Court of Auditors has also expressed a positive view on this measure in its report.

In order to address farmers' losses caused by adverse climatic events and climate change, and to promote and maintain farmers' self-care, encourage the conclusion of plant insurance contracts covering agricultural damage resulting from weather risks exceeding a 20 % yield reduction by means of support for insurance premiums.

Types of subsidised insurance: Type A insurance is a type of package insurance **which** covers all risks of hail, drought, agricultural flooding, winter frost, spring frost, autumn frost, cloud breakage, storm weather (so-called total risk insurance).

Type A insurance may **only be taken out jointly** for the listed types of damage. Because of its overall risk nature, this method of insurance provides the best protection against natural risks. Under this type of insurance, only arable crops and crops grown most frequently in the largest production area and in the most common field can be covered (see. Table 1). The premiums for package A insurance are of course higher than those for type B or C insurance due to their overall risk nature.

1. *table 1 Type A insurance for the following crops*

<i>Crops eligible for type A insurance cover</i>	<i>calenders: wheat, barley, rye, triticale, maize.</i> <i>oil crops: swede rape, sunflower</i> <i>fruit plantations: apples, peaches, apricots, nectarines, plums, nuts, hazelnuts, almonds, pears, sour cherries, cherries</i> <i>vineyard</i>

In the case of type B and type C insurance, the insured person may choose which of the eight weather risk factors listed in the introduction he/she wishes to cover in combination (the so-called **named risk**).

Type B and C insurances differ only in terms of which crops can be covered (Table 2).

2. *table 1 Crops which may be covered by type B or C insurance*

<i>Crops eligible for type B insurance cover</i>	<i>fruit and vegetable plantations: all fruit and vegetables</i>
<i>Crops eligible for type C insurance cover</i>	<i>crawlers grown on arable land, industrial, protein, forage and medicinal plants</i>

Type A plant insurance: multi-Peril (**multi-Peril**) covering all eight weather risks (spring frost damage, winter frost damage, winter frost damage, agricultural flood damage, cloud damage, burners, storm damage, drought damage). The types of damage listed are eligible for insurance cover only in combination.

Type B and C plant insurance: of the eight weather risks (spring frost, winter frost damage, winter frost damage, agricultural flood damage, cloud damage, storm damage, drought damage), the insured person may determine which damage, or even several types of damage, should be covered by insurance (the so-called **single Peril**)

Subsidised agricultural insurance may be claimed only for insurance contracts covering damage resulting from adverse climatic events (hail, drought, agricultural flood damage, spring/winter frost, cloud breakage, storm damage) causing a **reduction in the farmer's crop at farm level by more than 20 %**. The draft insurance contract containing the premium-subsidised insurance subsidy shall be approved by the Minister for Agriculture at the request of the insurance company.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

The beneficiaries of the premium shall be producers who submit a single application and are therefore active farmers.

Therefore, a producer with a client identifier at the Hungarian State Treasury may apply for a fee subsidy if he indicates in the single application that he applies for a fee subsidy.

- The insurance contract covers the following losses resulting from adverse climatic events: hail, drought, agricultural flooding, winter frost, spring frost, autumn frost, cloud break, storm.
 - The insurance contract covers losses that result in a drop in yield by more than 20 %.
 - The maximum aid rate is the total eligible costs (net annual insurance premium paid)
- 70 %

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Aid for premiums for agricultural insurance contracts which meet the conditions set out above.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

Range of support at beneficiary level

The maximum aid rate is **70 %** of the annual net insurance premium paid.

Additional explanation

The extent of the decrease in the planned unit amount from 2027 to 2028 is proportional to the increase in the number of beneficiaries from 2027 to 2028 (4 per cent). The maximum planned unit amount (EUR 220) has been established taking into account a historical reference period: From 2017, we examined, first, how many producers (beneficiaries) benefited from fee subsidies in the previous programming period, followed by **(17 per cent) has been defined as the maximum unit amount. We also sought the opinion of the Hungarian Insurance Association (MABISZ) on their forecast of the number of clients (beneficiaries) benefiting from the premium support up to 2028. 2017: 10 997 2018: 14 172 2019: 15 132 2020: 17 197 2021: 20 790** As seen, historical data show a dynamic increase in the number of beneficiaries from year to year (an average increase of 24 % over an eight-year period). However, on the basis of MABISZ's projections and technical opinions, we expect much more subdued growth in the coming years: We reported an increase of 5 % until 2024 and 4 % from 2025 to 2028. However, according to our information from our senior managers, only the 2027s and 2028s are relevant for the Strategy Plan. In establishing the maximum amounts, for measure RD16, we calculated 35 % of the unit amounts (drastically increased crop prices, war situation, uncalculable economic environment, exchange rate fluctuations, inflation, etc.)

Relation of premium support to the other agricultural risk management pillars:

I. agricultural damage mitigation vs. premium support Approved by the Commission on the basis of sub-chapter 1.2.1.2 (362) of the current agro-forestry guidelines, the compensation amount paid by the insurance company for the same eligible cost (same crop, area, damage event) is taken into account in the calculation of the aid under the agricultural damage mitigation pillar (Pillar I) financed from purely national funds.

II. Insurance premium support vs. Crisis insurance Overcompensation is also excluded with regard to the crisis insurance pillar of the agricultural risk management system (Pillar IV), as other agricultural income must be shown and fully accounted for the compensation received from the insurer in relation to the incident.

III. Premium support vs. Sectoral measure With regard to the objective referred to in Article 46(j) of the Regulation of the European Parliament and of the Council concerning climate risks in the fruit and vegetables sector, the following harvest and production insurance referred to in Article 47(2)(i) is described in the description of the type of intervention with code SC26_I08_FVH_47. Harvest and production insurance interventions shall not cover insurance payments which compensate producers for more than 100 % of the income loss suffered, taking into account any compensation the producers obtain

from other support or insurance schemes related to the insured risk.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

Compensation of losses. What is the threshold triggering compensation?

In the insurance contract, the damage threshold for the area covered by the insurance contract for all three types of insurance ('A', 'B' and 'C') exceeds 20 % of the sum insured in the damaged area.

What is the methodology for the calculation of losses and triggering factors for compensation?

Insurance companies determine the extent of the reduction in yield by carrying out an on-the-spot injury assessment.

The premium is available on premiums for insurance contracts which clearly provide that compensation is paid only for agricultural damage of more than 20 %.

Insurance companies shall lay down the rules governing the determination of claims and the extent of the service in the insurance contract. In all cases, the loss of yield is determined by a damage expert on which a report is drawn up (including a photo).

The simplified steps in the injury assessment and settlement process are as follows:

·on-the-spot damage assessment: within a maximum of 5 days following the reporting of claims, the insurer's claims experts shall determine the extent of the yield loss by means of an on-the-spot damage assessment. In the course of the on-the-spot damage assessment, a report of the damage is drawn up and signed by the insured person on the spot. The report shall set out the method used to determine the amount of crop loss during the damage assessment and whether the insured person accepts the loss of yield established by the damage expert. The injury assessment also produces geotagged pictorial evidence.

·compensation: the injury review report and the visual evidence shall be forwarded by the injury expert to the claims management department of the insurance company. The first step in the settlement of claims is the examination of the legal basis of the claim and then of the coverage. If that investigation is successful, then, as a second step, the injury organiser determines the actual loss of yield and the amount of compensation.

For each type of insurance, insurance companies establish a specific tariff (the so-called tariff) from which they calculate insurance premiums. The pricing of agricultural plant insurances does not use the insurance policy tracking method (indexation) used in property insurance, but a unit price based on the current market price of individual plant species. These unit prices are updated by the insurer's professionals before each insurance season in order to prevent under- or over-insurance and the resulting inconvenience.

What is the type of risk management tool?

sector specific

What are the provisions in order to avoid overcompensation of that contribution?

There are no other public or private measures supporting the same eligible costs (insurance premiums) as this measure.

10 WTO compliance

Amber Box

Explanation of whether and, if so, how the intervention respects relevant provisions of Annex 2 to the WTO Agreement on Agriculture (Green Box)

On the basis of **Article 76 of Regulation (EU) No 2021/2115**:

“Member States shall ensure that support is granted only if the drop in the income of the farmer exceeds a threshold of at least 20 % of the average annual production or income calculated on the basis of the preceding three-year period or a three-year average based on the preceding five-year period excluding the highest and lowest entry. The sectoral production risk management tools shall calculate losses at farm level or at the level of the holding’s activity in the sector concerned.”

Point 8 of **Annex 2 to the WTO Agreement on Agriculture** provides that agricultural tariff subsidies are exempted from the so-called reduction commitments if the crop losses exceed 30 % of the average annual harvest calculated on the basis of the preceding three-year period or a three-year average based on the preceding five-year period excluding the highest and lowest entry.

The **second sentence of the second paragraph of Article 10 of Regulation (EU) No 2021/2115** indicates that, for measures not listed in Annex 2 to that regulation, the WTO paragraphs listed in that annex are indicative and may correspond to other paragraphs of Annex 2 to the WTO Agreement on Agriculture.

The agricultural guarantee premium measure, using the possibility provided for in the relevant EU regulations, is designed in such a way that the premium can be used for insurance premiums covering losses exceeding 20 % of the 5-year average (except the highest and lowest two years). Due to the 20 % average annual crop loss, this measure is among the amber box measures of the WTO.

Furthermore, this measure complies with paragraph 8 of the WTO Agreement on Agriculture, i.e.:

- the natural (or similar) disaster is depleted by the authorities;
- the payment covers income losses incurred as a result of, and not exceeding, the natural disaster
- the aid is less than 100 % of the loss of income suffered as a result of that damage by the amount paid to the producer for the same damage.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(2)(d) - Other regions	43.00%	20.00%	43.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD16_O09_A01_BN - Amount of insurance premium supported	Grant	91(2)(d)-HU-43.00%	Average		R.5	No

Explanation and justification related to the value of the unit amount

RD16_O09_A01_BN - Amount of insurance premium supported

The average unit amount represents the amount of the specific premium subsidy per beneficiary using the risk management tool. The unit amount is unique per beneficiary, as the premium, and hence the aid amount, depends on the culture covered, the rates of the insurance company in question, the type of insurance and the risk. The number of enterprises wishing to use the risk management tool, the impact of the inflation rate and the increase in insurance prices on premiums are an element of uncertainty for the design of the unit amount.

1.2.3	Offsetting and mitigating the impact of market risks	2	Yes
1.2.4	Promotion of agricultural insurance (self-care)	2	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.5 Share of farms with supported CAP risk management tools

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Hungary has been operating an agricultural crisis insurance scheme in accordance with Regulation (EU) No 1305/2013 since 2021 to stabilise agricultural incomes. In the next CAP period, we would like to continue this system (see: CAP ST – intervention RD17_I02_IST_76).

The agricultural crisis insurance scheme is financed by a financial fund, the Crisis Insurance Fund, and is operated by the crisis insurance body (Hungarian State Treasury). 2 main sources of funding for the Fund the amount of crisis insurance contributions paid by farmers who are members of the crisis insurance scheme, and the amount of support from the European Agricultural Fund for Rural Development.

The crisis insurance fund, which consists of farmers' payments and rural development support, addresses a wide range of risks (including weather events, animal diseases, changes in market conditions, exchange rate fluctuations, increases in feed prices) that cause a drop in farm income.

The farmer may **voluntarily** join the agricultural crisis insurance scheme for a **period of 3 years**. The farmer participates in the crisis insurance scheme with all his agricultural products (crop and livestock production).

Each year after accession, the producer **must pay a financial contribution (crisis insurance contribution) to the crisis insurance fund**. The amount of the contribution is determined by multiplying the natural data (size of arable land, number of animals) by the unit rates. Unit rates are laid down in national legislation.

During the period of membership, the farmer is subject to the obligation to provide information, covering, on the one hand, income data (data necessary to establish the reference income and income for the reference year) and, on the other hand, farm size data. On the basis of the data provided by the farmer and the data available in the public databases, the agricultural income can be determined on the basis of the following formula:

$$\text{Agricultural income} = \text{income from agricultural activities} - \text{Costs incurred by agricultural activities}$$

The individual items required for the recognition of agricultural income and profit or loss must be specified by the farmer at the level of detail in accordance with the Hungarian accounting rules. In determining annual income, it is necessary to book events that comply with International Accounting Standards (IAS 20) on the basis of the principle of completeness.

Agricultural income is income calculated in accordance with Article 39(1) of Regulation (EU) No 1305/2013 of the European Parliament and of the Council, calculated by subtracting from the receipts related to the agricultural activity the amount of the costs incurred in the course of the agricultural activity.

The reduction in income is the difference between the reference income and the agricultural income of the reference year, where the reference income is the average of the farmer's agricultural income in the three years preceding the reference year.

Overcompensation is excluded as it has to be recorded and recorded as other agricultural revenue

- the nationally funded compensation allowance (SA.33418),
- the amount received from an insurer in connection with the incident,
- any other aid reducing production costs.

A farmer shall be entitled to crisis insurance compensation (aid) if:

- agricultural income decreases by more than 30 %,
- has paid its contribution to the crisis insurance in full and in due time,
- has submitted a claim for compensation for crisis insurance,
- the average agricultural income in the three years preceding the year of accession is not negative,
- keep income and costs from agricultural and non-agricultural activities separately.

The following shall not be compensated:

- from a change in the size of the plant,
- negligent (negligence, serious agrotechnical deficiency),

- loss of income due to artificial creation of conditions.

The **amount of the crisis insurance compensation is 69.9 % of the fall in income**. The compensation comes from 30 % of the amount of contributions for crisis insurance by producers and 70 % from rural development support.

The risk management system introduced in 2012 was initially launched with 2 pillars (Agricultural Mitigation System, Insurance Premium Support), which was expanded to four pillars for 2021. The features of the Hungarian risk management system are as follows:

· Pillar I: an agricultural mitigation scheme approved by the European Commission (notified) financed by national funds;

· Pillar II: EU co-financed agricultural premium subsidies (for plant insurance); (RD16_I01_INS_76)

· Pillar III: the National Hail Mitigation System (JÉGER) established from EU funds and operated from national sources; (RD18_I03_JGR_73)

· Pillar IV: agricultural crisis insurance scheme (RD17_I02_IST_76)

While the first two pillars are limited to the crop production sector, the benefits of the third pillar are also enjoyed by the entire national economy and by a wide range of people (preventing damage to property). The fourth pillar, introduced in 2021, is a pioneering aid scheme covering not only crop production but also the livestock sector and the range of risks it manages beyond the damage caused by weather and climatic events. On the basis of the above, it can be concluded that the Hungarian risk management system is complete with the crisis insurance.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Range of support applicants: The beneficiary of rural development support is the crisis insurance fund (which is operated by the crisis insurance body, i.e. the Hungarian State Treasury), and the crisis insurance body is entitled to draw on the aid.

The Fund shall comply with the following conditions:

the Fund has been accredited by the competent authority in accordance with national law,

the Fund shall have a transparent policy on payments to and from the Fund, and

the Fund shall establish liability for any debt incurred on the basis of clear rules.

The **designation of the crisis insurance body is laid down in national legislation**. Within the Hungarian State Treasury, the tasks of the crisis insurance body are carried out by a **separate organisational unit which is accredited in accordance with EU law in accordance with** national law. The accreditation requirements have been defined by the Ministry of Agriculture, taking into account the criteria laid down in Community legislation.

The relevant rules are set out in Act CLXVIII of 2011 and the decree implementing it (Decree 6820221. (XII.)) The internal rules of procedure, rules and other documents examined and approved in detail in the course of accreditation are provided for.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

The maximum financial contribution for rural development to the resources of the mutual fund shall be limited to 70 % of the eligible costs.

Eligible cost

the amount of compensation paid to farmers, or

supplement to annual payments and supplements to the Fund

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

☒ reimbursement of eligible costs actually incurred by a beneficiary

☐ unit costs

☐ lump sums

☐ flat-rate financing

Range of support at beneficiary level

The maximum financial contribution for rural development to the resources of the mutual fund shall be limited to 70 % of the eligible costs.

The measure involves 1 beneficiary.

Around 150 producers joined the scheme in the start-up year (2021) and we expect to grow at a moderate pace in the future.

Additional explanation

As this measure started in 2021 and no payments have been made from the Fund so far, no historical affairs are available. The calculation of the amount of HUF 150 million is based on the payments made by the producers currently affiliated to the scheme. In determining the maximum unit amount, we considered it appropriate to set a rate of 10 % as it is a replacement of farm income (in the case of an economy, the result of a sector in crisis may be offset by the 'surplus income of the other sector').

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

Compensation of losses. What is the threshold triggering compensation?

The intervention shall receive a financial contribution to the mutual fund in order to allow compensation from the Fund in the event of a fall of more than 30 % of the average agricultural income of an active farmer affiliated to the Fund in the current year compared to the average income from agricultural activity in the previous three years.

What is the methodology for the calculation of losses and triggering factors for compensation?

Income=Revenue-Cost

Revenue:

turnover from sales of own-produced primary agricultural products,
changes in stocks of primary agricultural stocks,
other income received in respect of agricultural production activities

Cost:

material expenditure incurred as a result of agricultural production,
staff costs,
depreciation

3 methods may be used to determine income:

Method A: on the basis of individual data recorded in accordance with the double-entry rules
→ every producer can choose, but it is mandatory for those required to keep double accounts

Method B: on the basis of individual revenue and cost data recorded in full in accordance with single accounting rules, adjusted for inventory values
→ you can only choose one-off accounts if you also have a full cost register

Method C: on the basis of individual revenue data recorded in accordance with single accounting rules, adjusted for inventory values, and cost data offered by the AKI
→ every single account keeper can choose

What is the type of risk management tool?

- ☐ Insurance
- ☒ Mutual fund
- ☐ Other

What are the production losses coverage?

crop

horticulture

livestock

What are the income losses coverage?

non sector specific

What are the provisions in order to avoid overcompensation of that contribution?

Only the proportion of lost income as defined in EU legislation (STR) is compensated. There are no measures supporting the same eligible costs at EU or national level.

10 WTO compliance

Green Box

Paragraph 7 of Annex 2 WTO

Explanation of whether and, if so, how the intervention respects relevant provisions of Annex 2 to the WTO Agreement on Agriculture (Green Box)

The intervention shall provide a financial contribution to the mutual fund in order to provide compensation from the Fund in case the income of an active farmer who has joined the mutual fund from the agricultural activity in the current year falls by more than 30 % compared to the average income from agricultural activity in the previous three years.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(2)(d) - Other regions	43.00%	20.00%	43.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD17_O09_A01_FN - Eligible costs chargeable to rural development	Grant	91(2)(d)-HU-43.00%	Average		R.5	No

Explanation and justification related to the value of the unit amount

RD17_O09_A01_FN - Eligible costs chargeable to rural development

Support for viable farm income and resilience in the European Union in relation to specific objective No 1 to maintain food security is the main need No 2 to reduce income fluctuations due to natural (weather) and market risks, justifying the continuation of the intervention over the period 2023-2027. In particular, the intervention contributes to and addresses the following sub-necessities:

Addressing adverse climatic events and producer damage caused by climate change in agriculture (crop, livestock, horticulture),

Compensation and mitigation of market risks,

2.4 Promotion of agricultural insurance (self-insurance).

The value of the unit amount is subject to producer payments to the Fund and compensation payments from the Fund. In 2021, the Fund ordered the payment of a total of HUF 150 million from the joining producers. During the planning period, we expect a moderate increase in the desire to join, given that it is a measure starting in 2021. Based on an objective assessment, we estimate the number of connected producers at 350 people for 2026-2027 (years covered by the financing from ST). If an animal health epidemic (e.g. avian influenza, swine fever) were to occur or if sectoral regulations were to be put in place under which membership of a crisis insurance scheme would be eligible, the number of people joining the Fund could be as high as twice the number of people connected to the Fund compared to the plans drawn up on the basis of objective calculations. However, we note that, based on the more pessimistic scenario, due to the COVID-19 pandemic, the years 2020-2021 could result in lower farm incomes, which could negatively affect the willingness to join in the following years, as the income of the reference period will be low.

7.1.5	Reducing the administrative burden of intergenerational transfer of agricultural enterprises	2	Partially
8.1.5	Improving the profitability of small farms	2	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.39 Number of rural businesses including bio-economy businesses developed with CAP support

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Given the structural situation of Hungarian agriculture and the challenges arising in the near and distant future, farmers' cooperation plays a crucial role in achieving sustainable agriculture. However, a series of experiences shows that the level of willingness of farmers to cooperate is extremely low in Hungary today. It is therefore necessary to help increase the willingness to cooperate by all means.

Only new cooperation and existing cooperation shall be eligible for new activities.

Managing and promoting generational renewal, beyond the sectoral framework, and smoother

generational renewal in agriculture are essential for the future of Hungarian agriculture.

Objective:

Encouraging farm transfers, promoting the social and economic sustainability of family farms based on successful succession phases.

The intervention addresses farmers who are close to the retirement age and who are already planning to transfer their holdings but who do not have the necessary preparedness to close down farming and the security of livelihood for a transitional period. In the context of cooperation on farm transfer, the transferor of the farm can benefit from the costs of closing the farm value survey and farming, and the form of annuity fee support to encourage a secure transition, and mentoring is intended to help carry out the farm transfer.

Content:

Farm transfer cooperation for a farmer close to retirement age:
expenditure on activities aimed at the transfer of the holding and the orderly closure of its farming operations,
furthermore, annuity-like support value to support the transition (e.g. farm survey fee, annuity fee, mentoring, coaching, etc.)

Selection principles (which may be partially applicable):

Content and quality of the cooperation project plan. The cooperation plan is an integrated business planning model, explaining the readiness of those involved in economic transfers to transfer the economy, taking into account economic, environmental and personal competences.

Level of professional qualifications,

Previous professional experience,

Higher value-added farming activity or farming mode,

Mainstreaming environmental, climate and adaptation aspects

Mainstreaming social aspects

Mainstreaming of equal opportunities

Relevant legislation:

Act CXLIII of 2021 on the transfer of agricultural holdings

Link to other interventions:

Intervention “RD06_B02_YFY_75 – Generational renewal supported by the economic user”.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiaries:

Farmers participating in the farm transfer under the law who have reached or reach the retirement age determined in accordance with national legislation at the time of completion of the operation.

Specific eligibility criteria related to the eligible beneficiary:

- Economic activity based on at least two main collaborations, in which the following are met:
- Cooperating parties are in possession of a letter of economic transfer or a project plan for

cooperation at the time of submission of the aid application

- The cooperating transferring farmer transfers a holding on which a farmer has been active for 10 years prior to the transfer of the holding (i.e. the transferor's own activity or that of its predecessor)
- The holding to be transferred has an agricultural turnover of at least EUR 10000 SO or EUR 10,000.
- The cooperating economy is a recipient partner with a vocational qualification

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments and other requirements:

- Cooperation on farm transfers shall be established with a maximum commitment of 5 years
- Use of a farm transfer consultant or cooperation with the Rural and Regional Development Support Unit of the CAP Network (process assistance, communication, conflict management, etc.)
- Implementation of the cooperation project plan
- In addition to self-sufficiency land and livestock, the transferor of the holding transfers the entire holding to the transferee
- The transferring farmer does not engage in agricultural production after the transfer, in excess of the self-sufficiency rate
- No later than 2 years after the decision of sponsorship, the cooperating parties shall have an economic transfer contract in force.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

Between EUR 10000 and EUR 1999: EUR 10000
Between EUR 20000-289 and EUR 999: EUR 15000
Between EUR 30000-39999: EUR 20000
Between EUR 40000-49 999: EUR 25000
Between EUR 50000 and EUR 59 999: EUR 30000
Between EUR 60000 and EUR 69 999: EUR 35000
Between EUR 70000 and EUR 79999: EUR 40000
Between EUR 80000 and EUR 89999: EUR 45000
Above EUR 90000: EUR 50000

Additional explanation

Support for generational renewal is a new element in the Strategic Plan, no previous experience is available.

The amount of aid shall be used to encourage and cover the associated costs and shall be used as a transitional annuity.

Basis for calculation:

https://www.ksh.hu/docs/hun/xstadat/xstadat_eves/i_zhc034b.html: Amount of income deemed necessary for different levels of living in households with children, without children and single-person households

According to the above statistics, the income required in a single-person household is HUF 117.800 per person per month (approximately EUR 3.200 per year), but this ensures very limited livelihoods. The average pension is EUR 4.600 per year
<https://www.ksh.hu/docs/hun/xftp/idoszaki/regio/orsz/nyugdij/nyugdij19.pdf>, but the average pension for people retiring from agriculture is below this level, so in many cases there is no transfer of the farm because the potential transferor is unable to forgo farm income. It is therefore also necessary to provide temporary support for livelihoods in order to encourage economic transfers. The aid rate was set for 5 years in proportion to the productive capacity of the holding to be transferred.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☒ Yes ☐ No ☐ Mixed

Explanation of support activities falling outside the scope of Art. 42 TFEU

In view of the objective of the intervention set out in point 5, the competition rules are generally applicable.

Type of state aid instrument to be used for clearance:

☐ Notification ☒ GBER ☒ ABER ☒ de minimis

State Aid case number

SA.112038

SA.112040

Additional information:

- ☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.
- ☐ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.
- ☒ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

R.39 Number of rural businesses including bio-economy businesses developed with CAP support

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Cooperation-based interventions aim at encouraging members of agricultural and local communities to act together. Given the structural situation of Hungarian agriculture and the challenges that will develop in the near future and beyond, farmers' cooperation is of paramount importance in achieving sustainable agriculture. However, experience shows that the level of willingness to cooperate among farmers is very low today in Hungary. This is why the willingness to cooperate should be supported by all means.

The low level of cooperation and innovation skills between operators in the Hungarian agricultural sector hinders the development of more competitive, resource-efficient or coordinated farming structures adapted to environmental conditions in a number of ways. For this reason, we consider it particularly important to provide cooperative support in order to encourage those involved in agriculture.

The objective of this intervention is to support voluntary cooperation and the functioning of sustainable water management communities. Cooperation will increase the efficiency and safety of agricultural production and contribute to the spread of sustainable irrigation farming. A more efficient use of available

water resources will result in collective and cooperative use by farmers wishing to irrigate, together with the construction and co-existence of irrigation infrastructure, as well as first steps to make investments possible. The recognised sustainable water management community strives for the introduction and application of best possible agricultural practices for sustainable water management in the irrigation district

An investment in irrigation development covering a larger area requires long-term planning and commitment on a large scale well beyond the size of small producers and can therefore typically be effectively implemented through Community investment. The promotion and coordination of producer cooperation and more efficient and sustainable use of water and energy in the areas of a sustainable water management community is of paramount importance if members irrigate the larger area through a water distribution system in coordination and cooperation with water-saving irrigation equipment.

Irrigated farming entails high investment needs and significant operating costs, but it is more worthwhile to continue the activity in a larger area, reduce unit costs, reduce losses and make work organisation more efficient. All these factors help to optimise the use of available water resources in the areas of sustainable water management communities. The use of targeted precision irrigation methods, in which water can be measured accurately, leaching and leaching can be reduced and water stress (over-irrigation) within the field can be avoided, also contributes to increased water use efficiency. Such resource-intensive investments by communities, prepared with support under this intervention, make an essential contribution to the efficient use of water resources. Support for sustainable water management communities also promotes the introduction of water-saving irrigation technologies, the optimisation of water use of irrigation systems, the development and optimal operation and maintenance of water efficient irrigation infrastructure and related structures, the introduction of energy-saving irrigation technologies and the optimisation of the energy use of irrigation systems. Against this background, the intervention contributes to increased water efficiency, sustainability of in-situ water use and use.

Only new collaborations and existing ones can be supported for new activities.

The intervention is intended to support project preparation and operational activities of a sustainable water management community recognised under the conditions laid down in separate legislation. Investments in irrigation prepared through the intervention and supported by the programme must comply with all the requirements laid down in Article 74 of the Regulation.

Principles governing the establishment of selection criteria, which may be partially applied:

The content and quality of the project plan, evaluating:

- Professional experience of participants in cooperation
- Mainstreaming environmental, climate, landscape management and adaptation aspects (e.g. improving input efficiency relevant to the environment, reducing emissions per unit of pollutant; use of reuse or recycling, continuation of organic farming)
- The composition of a sustainable water management community (e.g.: number of farmers or young farmers)
- Increasing water efficiency
- Priority will be given to communities using alternative and sustainable technologies, e.g.: use of drought-tolerant crops or advanced irrigation technology

Pursuant to Article 77(4) of the Strategic Plan Regulation, operations supported by this intervention in the form of an 'overall amount' must comply with the rules of Articles 70 to 76 and 78 of the Strategic Plan Regulation.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligibility criteria:

- Preparation of a project plan.
- Sustainable water management community recognised by the Minister responsible for agricultural policy.
- Members of sustainable water management communities must take account of Article 74 of the SPR Decree
- Under Article 77(2) of the Strategic Plan Regulation, only new forms of cooperation may be supported, including existing cooperation where a new activity is launched. — 2021/2115 (EU)

Eligible beneficiaries:

sustainable water management community

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Eligible costs for the intervention:

- costs related to the setting-up and maintenance of the cooperation team, including running costs,
- costs of cooperation, planning, project preparation and project management activities
- the cost of services related to professional implementation,
- other administrative costs

Commitments (commitments):

- Implementation of the project plan

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

10 WTO compliance

Green Box

Paragraph 2 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 2 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(2)(d) - Other regions	43.00%	20.00%	43.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD15_O32_A01_ON - specific amount of support for sustainable water management communities improving water efficiency	Grant	91(2)(d)-HU-43.00%	Average		R.39	No

Explanation and justification related to the value of the unit amount

RD15_O32_A01_ON - specific amount of support for sustainable water management communities improving water efficiency

When determining the average unit amounts, the aid applications received and approved in response to the relevant calls for proposals under measure M16 of the Rural Development Programme 2014-2020 were taken into account, taking into account the funds allocated to the calls for proposals. The unit amount is the ratio between committed funds and subsidised applications, corrected by an inflation coefficient.

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.27 Number of operations contributing to environmental sustainability and the achievement of climate mitigation and adaptation goals in rural areas

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Cooperation-based interventions aim at encouraging members of agricultural and local communities to act together. Given the structural situation of Hungarian agriculture and the challenges that will develop in the near future and beyond, farmers' cooperation is of paramount importance in achieving sustainable agriculture. However, experience shows that the level of willingness to cooperate among farmers is very low today in Hungary. This is why the willingness to cooperate should be supported by all means.

The low level of cooperation and innovation skills between actors in the agricultural sector, including forestry, hinders in many ways the development of more coordinated farming structures adapted to environmental conditions. The aim of the intervention is to create a solution that deviates from the

previous practice as a result of collaborative developments.

There are many opportunities based on agricultural, including forestry, and other features of rural areas, whose collaborative and coordinated development can significantly contribute to the success of forest ecosystem services and rural areas.

The objective of this intervention is to support the establishment of voluntary cooperation between forest managers and specialised public bodies for the purpose of modern, multi-farming complex planning and implementation of forest fire prevention and mitigation on a territorial scale. Cooperation shall be based on forest management activities.

The intervention was inspired by projects in previous years FIRELIFE, MICACC and LOGOS 4 Waters, which are LIFE-funded pilot projects. The focus of the intervention is on nature-based solutions NBS, which operate with blue and green infrastructure elements (reduction of run-off, retention of water in the landscape, erosion control, fire prevention, etc.)

Examples of intervention elements covered by co-design and coordinated implementation generating synergies include: advanced development of firebreaks, water retention facilities, multifunctional exploration networks promoting more environmentally friendly forest management. Cooperation will increase the security of prevention of forest and vegetation fires and improve the climate security and sustainability of forest management.

The structural situation of Hungary's agriculture and forestry is vulnerable due to increasing and evolving challenges. In this context of uncertainty, farm cooperation is of paramount importance in order to achieve sustainable agriculture and forestry. As a result of bringing together producers in each sector, the resulting collaborations will be able to ensure higher profitability and contribute to competitiveness while achieving joint results through joint activities. In Hungary, the willingness to cooperate among farmers is low, which negatively affects the objectives mentioned above. It is therefore necessary to support targeted cooperation in the Hungarian CAP Strategic Plan, with which the entire vertices of Hungarian agriculture and forestry can develop and withstand emerging challenges together. An economy is much more at risk if it wants to carry out a development on its own, but it is more likely to succeed as a member of a cooperation. Hungary intends to implement cooperation in the CAP Strategic Plan, part of which is already a well-known and tried-and-tested scheme for farmers, as experience from the 2014-2020 period has shown that these aids are successful in the form of cooperation.

Only new collaborations and existing ones can be supported for new activities.

Principles governing the establishment of selection criteria, which may be partially applied:

- content and quality of the project plan
- content and quality of the maintenance plan
- residential area (neighborhood of a municipality or part of a municipality)
- environmental, climate and adaptation aspects, e.g. fire hazard classification, drought damage occurrence, conservation, Natura 2000 habitats, in particular habitats 9110, 9130, 9150, 9180, 91E0, 91F0, 91G0, 91H0, 91K0, 91L0, 91L0, 91M1, 91N0

Relevant legislation:

Act XXXVII of 2009 on Forest, Forest Protection and Forest Management,

Act LIII of 1996 on nature protection

61/2017. (XII. FM Decree on the implementation of Act XXXVII of 2009 on forests, forest protection and forest management

Decree No 383/2016 of 18 December 2016 On the designation of bodies performing official and administrative tasks in the field of agriculture

Government Decree No 4/2008 on the protection of forests against fire Decree No 1 of 1 August 2008 of the Minister for the Interior

Link to other interventions: in the context of knowledge transfer, it is necessary to share and pass on good practices in these projects (demonstration plant, training of consultants, publications, AKIS) In the context of this intervention, the aim of this intervention is to support the establishment of voluntary cooperation for the development of modern, sustainable, multi-farmers' complex planning and implementation of forest fire prevention and mitigation. Cooperation is based on forest management activities

— RD58_A01_TRA_78 – Training and demonstration facility support

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiaries:

a co-operative forest fire prevention community (consortium) with prior State recognition, made up of at least 5 independent forest managers and other directly affected land users.

The forest manager carries out sustainable forest management, i.e. its management complies with Act XXXVII of 2009 on forests, forest protection and forest management and the district forest plan, and is not subject to forest protection or conservation sanctions.

Eligibility criteria:

- preparation of a project plan and a maintenance plan.
- forest land included in projects of 1 000 ha or more

Aid shall not be granted to aid applicants:

- pursuant to Commission Regulation (EU) No 651/2014 and Commission Regulation (EU) No 702/2014 on State aid proceedings within the meaning of European Union competition law and on the regional aid map (III. Government Decree No 22/2015 (hereinafter: 37/2011. (III. In accordance with Section 6(4a) and (4b)(7) of the Government Decree,
- it failed to comply with the decision of the European Commission addressed to Hungary requiring the recovery of State aid within the meaning of EU competition law.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments

- **The fulfilment** of the commitments made in the project plan and the publication of the results
- participation in compulsory training per year (5 in total)
- maximum duration of cooperation 5 years

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

☒ reimbursement of eligible costs actually incurred by a beneficiary

☐ unit costs

☐ lump sums

☒ flat-rate financing

Basis for the establishment

Payment based on Article 83(1)(a), 1(d) and 2(a)(i) STR

1(a): For investments

(1)(d): General activity (max. 15 % of project cost)

Range of support at beneficiary level

Average unit amount: EUR 1140000/cooperation.

The total project cost is total to cover the costs of cooperation and operations carried out.

The implemented operation (projects) will comply with the relevant rules and requirements laid down in Articles 70 to 76 and 78 of Regulation (EU) 2021/2115 (STR).

A maximum of 25 % of the total project cost and a minimum of 15 % flat rate may be allocated to general activities of cooperation, planning and project management, etc. (cooperation costs).

Up to 85 % of the project cost, or 75 % of the project cost.

Additional explanation

Not relevant.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☒ Yes ☐ No ☐ Mixed

Explanation of support activities falling outside the scope of Art. 42 TFEU

The forestry sector is a sector outside the scope of Article 42 TFEU and therefore the competition rules (State aid rules) apply to the aid granted to it.

Type of state aid instrument to be used for clearance:

☐ Notification ☐ GBER ☒ ABER ☒ de minimis

State Aid case number

SA.112038

Additional information:

☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.

☐ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.

☒ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

N/A

10 WTO compliance

Green Box

Paragraph 2 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The intervention is targeted at general services (point 2) combining research on environmental programmes (2a) and investments in infrastructure linked to environmental programmes (2 g points).

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(2)(d) - Other regions	43.00%	20.00%	43.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD37_O32_A01_ON - Unit cost for forest fire prevention cooperation	Grant	91(2)(d)-HU-43.00%	Average		R.27	No

Explanation and justification related to the value of the unit amount

RD37_O32_A01_ON - Unit cost for forest fire prevention cooperation

No history, no experience number. Justification: the minimum area of intervention is 1 000 hectares. At the same time, this is a new and complex intervention, so we expect on average smaller projects between around 10 projects. The objective of the intervention is to implement at least 10 complex sample fire prevention projects in different locations in the country, which should also perform a ‘demonstration plant’ function as good practices for climate change preparation/adaptation in areas with different production, climatic, water and forest management conditions. Accordingly, the minimum project size planned by the policy (because at least 1 000 ha needs to be addressed together): EUR 1000000, maximum project size (as around 10 projects are expected from different points in the country): EUR 2000000.

13 Planned Unit Amounts - Financial table with outputs

3.1.4	Development of local cooperation in product production, distribution and marketing	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.10 Share of farms participating in producer groups, producer organisations, local markets, short supply chain circuits and quality schemes supported by the CAP

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

The aim of the intervention is to encourage the formation and functioning of producer groups, producer organisations and producer integration organisations, thereby stabilising and strengthening the income position of producers and indirectly improving rural living conditions. Cooperation is also necessary because, in the absence of producer cooperation, producers' bargaining power in the supply chain remains weak. By addressing current problems in the sector in a uniform way, recommending production and production methods to support the production of a high-quality and market-oriented commodity fund, the

development of the sectors can be enhanced, the level of processing of the products produced can be increased and their market access improved.

However, by adapting the production and results of membership to market requirements, it is possible to influence markets and generate higher incomes than producers. Cooperation can also play a significant role in strengthening smaller economies, including through the facilitation of innovation in the coordination of production and the production of raw materials. The intervention also promotes the development of a uniform quality and higher processed product base. Producer associations also help to achieve climate protection objectives, as they generate significant efficiency gains at the level of individual producers' activity, in preparation, processing and access to the market.

The intervention may grant setting-up aid to newly formed producer groups and producer organisations, which may be granted on a degressive basis for a maximum period of 5 years. The establishment aid or aid granted to producer groups or producer organisations implementing a new activity as referred to in Article 152(1)(b) of Regulation (EU) No 1308/2013 after at least 5 years shall be granted for a maximum period of five years.

The intervention shall encourage the establishment and efficient operation of cooperation between producers by partially covering the costs of implementing the new activities referred to in Article 152(1)(b) of Regulation (EU) No 1308/2013 in connection with the establishment and operation of their organisations and the achievement of specific objectives.

Only new and existing co-operations are eligible for new activities.

Principles governing the establishment of selection criteria, which may be partially applied (selection criteria):

- level of producer and product concentration achieved
- co-operational tasks at different levels of the food chain
- the role of regional cooperation in rural employment
- economically sustainable cooperation

Pursuant to Article 77(4) of the Strategic Plan Regulation, operations supported by this intervention must comply with the rules of Articles 70 to 76 and 78 of the Strategic Plan Regulation.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible Beneficiaries:

- Recognised producer groups and producer organisations recognised under Article 154 of Regulation (EU) No 1308/2013

Eligibility criteria:

Recognised producer group or producer organisation

As this measure falls outside the scope of Article 42 TFEU (see point 8), with the exception of de minimis aid, **no aid may be granted** to a beneficiary under Commission Regulation (EU) No 651/2014 or Commission Regulation (EU) No 702/2014

- it is considered to be a firm in difficulty (the concept of a firm in difficulty is defined in Decree 37/2011 on the procedure for State aid for the purposes of EU competition law and on the regional aid map. (III. As defined in Section 6(4a) and (4b) of Government Decree No 487/2015, or
- it failed to comply with the decision of the European Commission addressed to Hungary requiring

the recovery of State aid within the meaning of EU competition law.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments (commitments):

- During the grant period, the beneficiary must comply with the conditions for recognition.
- In the case of creation, payment of the last aid unit shall be conditional upon completion of the previous years of the business plan accepted as part of the recognition.
- In case of implementation of a new action, during the grant period, the beneficiary must implement a cooperation plan containing new activities for that period.
- Carrying out a new activity in accordance with Article 152(1)(b) of Regulation (EU) No 1308/2013.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

☐ reimbursement of eligible costs actually incurred by a beneficiary

☐ unit costs

☒ lump sums

☐ flat-rate financing

Basis for the establishment

The payment is based on Article 83(1)(c) and 2(a)(i) of the STR.

The grant is a lump sum which includes all costs.

Range of support at beneficiary level

For the year of recognition and for the following 4 years of operation, the level of support shall be subject to the conditions laid down by the organisation or its members:

10 % of annual marketed production in year 1, up to a maximum of EUR 100,000

9 % of the annual marketed production in year 2, up to a maximum of EUR 100,000

8 % of annual marketed production in year 3 but not more than EUR 100,000

7 % of annual marketed production in year 4, up to a maximum of EUR 100,000

6 % of the annual marketed production in year 5, up to a maximum of EUR 100,000.

In the case of the implementation of a new activity, the aid shall be 6 % of the annual value of marketed production sold by the organisation or its producer members under contractual conditions corresponding to the negotiations conducted by the organisation, up to a maximum of EUR 100,000 per organisation per year.

Additional explanation

Not relevant.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☐ No ☒ Mixed

Explanation of support activities falling outside the scope of Art. 42 TFEU

The aim of the intervention is to encourage the formation of producer groups, producer organisations,

producer integration organisations and the implementation of new activities, thereby stabilising and strengthening the income position of producers and indirectly improving rural living conditions. To the extent that the eligible activities do not relate only to the primary production, processing and marketing of agricultural products within the meaning of Annex I to the TFEU, the rules constituting State aid apply on the basis of Article 107(1) TFEU.

Type of state aid instrument to be used for clearance:

☐ Notification ☐ GBER ☒ ABER ☐ de minimis

State Aid case number

SA.112038

Additional information:

☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.

☐ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.

☒ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

N/A

10 WTO compliance

Green Box

Paragraph 2 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 2 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(2)(d) - Other regions	43.00%	20.00%	43.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD44_O28_U01_BN - Unit cost of intervention for producer groups and producer organisations	Grant	91(2)(d)-HU-43.00%	Uniform		R.10	No

Explanation and justification related to the value of the unit amount

RD44_O28_U01_BN - Unit cost of intervention for producer groups and producer organisations

In the CAP Strategic Plan, cooperation between producer groups and organisations is supported on a flat-rate basis, continuing with the previous programming period. The amount of aid is the maximum amount of aid that may be granted in accordance with Regulation (EU) 2021/2115 of the European Parliament and of the Council: EUR 100.000 per year, equal to the maximum unit amount.

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO3 Improve the farmer' position in the value chain

SO9 Improve the response of Union agriculture to societal demands on food and health, including high quality, safe, and nutritious food produced in a sustainable way, the reduction of food waste, as well as improving animal welfare and combatting antimicrobial resistances

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
3.1.4	Development of local cooperation in product production, distribution and marketing	1	Yes
9.3.4	Quality schemes, quality assurance and certification schemes, consumer information	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.10 Share of farms participating in producer groups, producer organisations, local markets, short supply chain circuits and quality schemes supported by the CAP

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Initiating, within EU quality schemes, the recognition of designations of origin and geographical indications as PDOs/PGIs/GIs or the recognition of traditional specialities guaranteed in the context of newly established cooperation between actors in the value chain, i.e. by setting up a new grouping or by an existing group in the context of a new activity.

The intervention will encourage cooperation in the development of **new PDO/PGI/GJ/TSG product specifications and registration of new names within the EU** quality schemes, as well as the start of new activities concerning the product with the status “registered” in the EU eAmbrosia. The intervention aims to increase the competitiveness of farms participating in quality schemes recognised by the Union under Regulation (EU) 2024/1143, to improve the position of farmers in the value chain and to strengthen cooperation between the parties to the quality scheme.

Products produced under quality schemes have specific characteristics linked to the geographical area or are produced using traditional production methods, so encouraging participation in quality schemes facilitates the production of higher value-added products.

Only new co-operations and new activities of existing co-operations shall be eligible.

The maximum duration of the grant shall be five years.

Principles of selection which may be applied in part:

- a project will be considered more favourably if:
 - the existing grouping involves at least 10 actors
 - at least one participant in the cooperation is a young farmer;
- adds value to the project plan
 - a vocational level of education;
 - quality of the project design.

Pursuant to Article 77(4) of the Strategic Plan Regulation, operations supported by this intervention in the form of an ‘overall amount’ must comply with the rules of Articles 70 to 76 and 78 of the Strategic Plan Regulation.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiaries:

Producer groups under Regulation (EU) 2024/1143 (hereinafter: groupings) which:

(1) initiate Union recognition of a new designation of origin, geographical indication or traditional speciality guaranteed;

(2) a new activity concerning the product with the status ‘registered’ in the eAmbrosia register, which serves to improve the quality system.

Specific eligibility criteria:

· **an existing grouping with legal personality**, involving at least two actors (members), initiating the recognition of designations of origin and geographical indications as PDO/PGI/GI or the recognition of traditional specialities guaranteed, or entering into a new activity involving a geographical indication or a traditional product already registered and produced by it, or

· **a new grouping with legal personality**, involving at least ten actors (members), initiating the recognition of designations of origin and geographical indications as PDO/PGI/GI, or entering into a new activity involving a geographical indication or traditional products already registered and where:
in the case of an agricultural product, at least 2/3 of the members are farmers who produce or undertake to produce the designation of origin, geographical indication or traditional speciality guaranteed in accordance with the relevant product specification;

— in the case of a food product, at least half of the members are farmers who produce or undertake to produce the raw material required for the production of the relevant designation of origin, geographical indication or traditional speciality guaranteed in accordance with the relevant product specification (e.g.

growing paprika paprika in the case of a final product).

Farmers and food producers produce a specific designation of origin, geographical indication or traditional product or the raw material necessary for it within the framework of cooperation.

Members undertake to participate in the quality scheme for at least three years.

Whereas this measure falls outside the scope of Article 42 TFEU (see point 8), with the exception of de minimis aid, **no aid may be granted** to a beneficiary under Commission Regulation (EU) No 651/2014 or Commission Regulation (EU) No 702/2014

·undertaking in difficulty (the concept of a firm in difficulty is 37/2011 on the procedure for State aid for the purposes of EU competition law and on the regional aid map. (III. Section 6(4a) and (4b) of Government Decree No 487/2015) and

it has failed to comply with the decision of the European Commission addressed to Hungary to repay State aid within the meaning of EU competition law.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

The aid may finance the costs incurred by the group in drawing up a product specification for a designation of origin, a geographical indication or a traditional speciality guaranteed, establishing and operating cooperation and carrying out a new activity linked to the operation of the quality scheme.

Eligible costs:

— costs associated with the establishment and maintenance of new cooperation (e.g. costs of establishing a legal entity, legal fees), including operating costs,

- fees for services used in drawing up the product specification and other related documents (e.g. single document) (e.g., but not exhaustive: consultancy services, consultancy services, expert activities, costs of analytical tests, etc.),

— other costs incurred in preparing the application for registration,

costs incurred in connection with related administrative procedures,

— the costs of EU recognition,

project preparation costs,

— costs of services related to new activities (e.g. lawyers' fees, costs of market research, costs of internal control, cost of economic analyses, consultancy services),

— miscellaneous administrative costs.

Ineligible activities:

Information and promotion activities related to quality schemes are not eligible under this intervention.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

☒ reimbursement of eligible costs actually incurred by a beneficiary

☐ unit costs

- ☐ lump sums
☒ flat-rate financing

Basis for the establishment

The payment is based on Article 83(1)(a), 1(d) and 2(a)(i) STR.

1(a): For direct costs

(1)(d): General activity

Range of support at beneficiary level

The project cost is a full amount covering the costs of cooperation and of the operations carried out.

The implemented operation(s) will comply with the relevant rules and requirements laid down in Articles 70 to 76 and 78 of Regulation (EU) 2021/2115 (STR).

The maximum amount of aid that may be granted per project is: EUR 500,000

A maximum of 25 % of the total project cost can be used as a flat rate flat-rate for cooperation, planning, project management, etc. for general activities (cooperation costs).

Minimum 75 % of the project cost, investment and other project-related costs (e.g. surveys and studies, knowledge-sharing costs, expert costs, lawyers' fees, translation interpreting, etc.), which can be accounted for by individual supporting documents.

Additional explanation

Not relevant.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☒ Yes ☐ No ☐ Mixed

Explanation of support activities falling outside the scope of Art. 42 TFEU

Having regard to the purpose of the intervention (see: Point 5) it supports an activity outside the scope of Article 42 TFEU, which is why the competition rules are generally applicable to it.

Type of state aid instrument to be used for clearance:

☐ Notification ☐ GBER ☒ ABER ☐ de minimis

State Aid case number

SA.112038

Additional information:

- ☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.
☐ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.
☒ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.10 Share of farms participating in producer groups, producer organisations, local markets, short supply chain circuits and quality schemes supported by the CAP

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Only new co-operations and new activities of existing co-operations shall be eligible.

1. Sub-measure EU quality schemes: A protected designation of origin, a protected geographical

indication, a geographical indication or a traditional speciality guaranteed registered in the Union under Regulation (EU) 2024/1143 (hereinafter: PDO/PGI/GJ/TSG) and the production of organic products under Regulation (EU) 2018/848 in the context of new cooperation.

The aim of the intervention is to encourage the entry of new players into quality schemes and to promote as effective cooperation as possible between those involved in quality schemes in the value chain.

The aim of the intervention is to improve the participation of producers and producers participating in quality schemes in cooperation that facilitates market access for products placed on the market under a name recognised at Union level under the status 'registered' in the official Union registers of geographical indications or traditional specialties guaranteed (eAmbrosia), strengthens their role in the value chain and enhances the value of products produced in accordance with the requirements of Union quality schemes.

The intervention is based on Article 77 of Regulation (EU) 2021/2115, which provides that aid may be granted to promote new forms of cooperation and existing cooperation in the event of the start of a new activity. The producer members included in a given quality scheme are considered to be cooperating parties in this intervention. In the case of organic farming, producers, food processors and accredited control and certification bodies are considered to be cooperating parties, with the latter not eligible for support.

We see it as a new form of cooperation:

- (1) farmers who are natural or legal persons are a **producer group within the meaning of Regulation (EU) 2024/1143 (hereinafter: they shall become members of the eAmbrosia register in order to produce a product under the status 'registered' or to join a group already producing such a product;**
- (2) the organic product is produced by the operator under a newly established control and certification contract with the certification body in accordance with Regulation (EU) 2018/848.

Selection criteria:

·quality of the project plan

The project will be considered more favourably if:

- the pool involves at least ten participants;
- at least one participant in the group is a young farmer;
- as many members as possible have specialised education.

2. Recognised national quality schemes sub-measure

In accordance with Article 16(1)(b) and (c) of Regulation (EU) No 1305/2013, A national quality scheme or a voluntary agricultural product certification scheme recognised and registered under the Decree of the Minister for Agriculture (X. 1.) (together: products produced under the framework of the Quality Scheme (quality scheme) are of higher quality than other similar products meeting the minimum requirements of the legislation, and therefore the promotion of awareness and recognition of quality schemes also encourages the production and consumption of products with higher added value.

The intervention seeks to encourage the production of certified products of higher quality.

Selection criteria:

Projects will be treated more favourably if the members or some of them are:

- participation in a producer group (PO) or a producer organisation or an interprofessional organisation;
 - specialised education
 - participate with a variety of products in the quality scheme to be created;
- organic farmers under EU legislation (Regulation (EU) 848/2018)

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiaries:

1. Sub-measure EU quality schemes:

(1) Natural and legal persons who produce the designation of origin, geographical indication or traditional product, or the raw material required for it, within the framework of cooperation, by joining already registered PDO/PGI/GJ/TSG groups or becoming members of a new grouping for PDO/PGI/GJ/TSG names already registered.

In the case of organic farming, natural and legal persons carrying out farming or food processing in accordance with Regulation (EU) 2018/848 under a newly established control and certification contract with the organic certification body.

2. Recognised national quality schemes sub-measure:

Natural or legal persons who adhere to a national quality scheme recognised by the Union.

Specific eligibility criteria

Union quality schemes for sub-measures:

(a) natural and legal persons producing a product bearing the name PDO/PGI/GJ/TSG, who:

— the product covered by the name entered in the eAmbrosia register as ‘registered’ and the raw material required for that purpose are produced within the group in question in accordance with the relevant product specification and certified by the authorised representative of the group,

— undertake to participate in the quality scheme for at least three years, and

— their activities are notified to the competent government office responsible for controls or to the NFCSO and their origin is recorded in the register kept by the NFCSO;

(b) natural and legal persons producing organic products who:

— they produce their products under a new contract with the organic control and certification body in accordance with Regulation (EU) 2018/848 on organic production;

— undertake to participate in the quality scheme for at least five years

2. In the case of a sub-measure of recognised national quality schemes:

Only cooperation involving at least two actors, at least one of which produces a product under a recognised national quality scheme, shall be eligible.

Whereas this measure falls outside the scope of Article 42 TFEU (see point 8), with the exception of de minimis aid, **no aid may be granted** to a beneficiary under Commission Regulation (EU) No 651/2014 or Commission Regulation (EU) No 702/2014

·undertaking in difficulty (the concept of a firm in difficulty is 37/2011 on the procedure for State aid for the purposes of EU competition law and on the regional aid map. (III. Section 6(4a) and (4b) of Government Decree No 487/2015) and

it has failed to comply with the decision of the European Commission addressed to Hungary to repay State aid within the meaning of EU competition law.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Eligible type of support:

1. Sub-measure EU quality schemes:

The aid shall be:

- the organic producer may finance the costs incurred by the organic farmer/producer in relation to the organic conversion in addition to the costs of obtaining the designation of organic product under

Regulation (EU) 2018/848 (e.g. drawing up an in-conversion plan, costs of data provision)
— it may finance the costs incurred in complying with the requirements of the product specification of the product covered by the registered name PDO/PGI/GI/TSG and during formal accession.

Eligible costs:

PDO/PGI/GI/TSG for a product with a registered name:

- costs of participation in the quality scheme,
- the costs of complying with the requirements of the product specification,
- costs incurred in connection with related administrative procedures,
- investment costs.

For organic farming:

- costs incurred in drawing up a changeover plan in case of a new audit contract
- investment costs

2. Recognised national quality schemes sub-action:

The aid may be granted to the producer.

Eligible costs:

- costs of participation in the quality scheme, costs of compliance with requirements,
- costs incurred in connection with related administrative procedures,
- the costs of establishing and maintaining new cooperation, including operating costs,
- miscellaneous administrative expenditure

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

- ☐ reimbursement of eligible costs actually incurred by a beneficiary
- ☐ unit costs
- ☒ lump sums
- ☐ flat-rate financing

Basis for the establishment

The payment is based on Article 83(1)(c) and 2(a)(i) of the STR.

A background calculation to substantiate the amount of lump sum funding is provided in Annex “Quality systems_background calculation_RD46”.

Average unit amount: EUR 13000 per co-operating party.

Range of support at beneficiary level

The project cost is a full amount covering the cost of the operations carried out.

The implemented operation(s) will comply with the relevant rules and requirements laid down in Articles 70 to 76 and 78 of Regulation (EU) 2021/2115 (STR).

Additional explanation

Not relevant.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☒ Yes ☐ No ☐ Mixed

Explanation of support activities falling outside the scope of Art. 42 TFEU

The objective of the intervention is to achieve the most effective cooperation between actors involved in quality schemes in the value chain, thus supporting activities falling outside the scope of Article 42 TFEU. Against this background, the competition rules are generally applicable to this intervention.

Type of state aid instrument to be used for clearance:

☐ Notification ☐ GBER ☒ ABER ☒ de minimis

State Aid case number

SA.112038

Additional information:

☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.

☐ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.

☒ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

N/A

10 WTO compliance

Green Box

Paragraph 2 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 2 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(2)(d) - Other regions	43.00%	20.00%	43.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD46_O29_A01_BN - Specific amount for the existing national quality schemes or in the case of PDO/PGI/GI/TSG registered under an EU quality scheme	Grant	91(2)(d)-HU-43.00%	Average		R.10	No

Explanation and justification related to the value of the unit amount

RD46_O29_A01_BN - Specific amount for the existing national quality schemes or in the case of PDO/PGI/GI/TSG registered under an EU quality scheme

When determining the average unit amounts, the aid applications received and approved in response to the relevant calls for proposals under measure M03 of the Rural Development Programme 2014-2020 were taken into account, taking into account the funds allocated to the calls for proposals. Unit amount is the ratio between committed funds and applications supported, corrected by an inflation coefficient

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Collaborative interventions aim to encourage members of agriculture and local communities to act together. Given the structural situation of Hungarian agriculture and the challenges that will develop in the near future and beyond, farmers' cooperation is of paramount importance in achieving sustainable agriculture. However, a series of experiences shows that the level of willingness of farmers to cooperate is extremely low in Hungary today. It is therefore necessary to help increase the willingness to cooperate by all means.

The low level of cooperation and innovation skills between actors in the Hungarian agricultural sector hinders the development of more competitive, resource-efficient or more environmentally friendly, coordinated farming structures in a number of ways. We therefore consider it particularly important to provide support based on cooperation in order to encourage agricultural operators.

Joining quality assurance and management systems adopted and increasingly demanded by international

markets can significantly improve the role of farmers in the value chain and seize new market opportunities, but can also contribute to improving the quality of food produced and the environmental and social conditions of production.

A number of quality assurance and management systems also offer group certification options, which, in particular, could be a realistic opportunity for smaller economic operators to qualify. At the same time, a common approach in Hungary needs to be encouraged, first and foremost among small-scale farmers.

Supporting access to quality assurance/management systems is also important because it makes it easier for producers and processors to meet the needs of market purchasers, thereby also facilitating market access for smaller farms.

Only new cooperation and existing cooperation shall be eligible for new activities.

Specific objective of the intervention:

Support the promotion of adherence to internationally recognised quality assurance and management systems in agriculture, food processing and forestry (e.g. EMAS, ISO, BRC, IFS, GMP, Global G.A.P. or FSC, PEFC) through horizontal or vertical cooperation. The aim of the cooperation is to significantly facilitate access to certification schemes for economic operators: it also serves to acquire and share the necessary knowledge and skills, as well as to share costs.

Participants in the cooperation may be:

agro-farmers for the purpose of obtaining the relevant certification,

furthermore, a professional organisation which is familiar with the requirements of the selected certification scheme, assists in the preparation and is already certified, or a professional body which is not a certification body

The cooperation shall involve at least two farmers, food processors or forest managers to achieve the objective set.

The objective of the intervention is to support farmers, food processors or forest managers who participate for the first time in a quality assurance or management system.

This form of cooperation should contribute to the achievement of one or more of the specific objectives (Specific Objective) set out in Article 6(1) and (2) of Regulation (EU) 2021/2115.

Principles governing the establishment of selection criteria, which may be applied in part:

- Content and quality of project or maintenance plan
- Strengthening existing business and social links, creating new ones, exploiting synergies
- Number of participants in collaborations
- Regional perspective
- Employment, including volunteering
- Participation of young farmers
- Mainstreaming environmental, climate and adaptation aspects

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Agricultural and forest managers associated with quality management systems (e.g. Good Manufacturing Practices, ISO, BRC, IFS, EMAS, Global G.A.P. FSC, PEFC, etc.).

Eligibility criteria:

- The farmer is involved for the first time in a quality assurance or management system

- Partner to help farmers prepare: the economic operator already in possession of the relevant certification or a professional organisation familiar with the criteria for targeted certification, which is not itself a certification body
- Preparation of a project plan or maintenance plan
- Participation of at least 2 farmers, food processors or foresters not yet certified in the cooperation.

As this measure falls outside the scope of Article 42 TFEU (see point 8), with the exception of de minimis aid, no aid may be granted to a beneficiary under Commission Regulation (EU) No 651/2014 or Commission Regulation (EU) No 702/2014

- it is considered to be a firm in difficulty (the concept of a firm in difficulty is defined in Decree 37/2011 on the procedure for State aid for the purposes of EU competition law and on the regional aid map. (III. As defined in Section 6(4a) and (4b) of Government Decree No 487/2015, or
- it failed to comply with the decision of the European Commission addressed to Hungary requiring the recovery of State aid within the meaning of EU competition law.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments (commitments):

- duration of cooperation: maximum 2 years (to obtain certification) + 4 years (maintenance, confirmation of certification), total maximum 5 years.
- to obtain and maintain a quality assurance and quality management certification for a period of at least 5 years.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

☒ reimbursement of eligible costs actually incurred by a beneficiary

☐ unit costs

☐ lump sums

☒ flat-rate financing

Basis for the establishment

The payment is based on Article 83(1)(a), 1(d) and 2(a)(i) STR.

1(a): For direct costs

(1)(d): For indirect costs

Range of support at beneficiary level

Eligible costs for the first 5 years of accession:

Indirect costs: Costs related to the establishment and maintenance of the cooperation team, including operational costs.

Direct costs: Direct costs incurred in complying with the criteria of the quality assurance/management system, e.g. surveys and studies, knowledge sharing costs, expert costs prior to the certification procedure and assisting the farmer in the process, costs of setting up the necessary special records, procedures, control points, etc., costs of setting up an audit-trail, translation interpretation, etc., annual contributions for participation in the quality assurance/management system, certification of compliance with the specific conditions of the quality assurance/management system and/or certification for a further period of up to 4 years.

The cost of certification may be part of the eligible costs, but is not eligible on its own.

Direct costs are eligible by itemisation of costs actually incurred, at a minimum rate of 75 %

The percentage of indirect costs may be up to 25 %.

Rate of assistance: In accordance with Articles 70 to 76 and 78 of the Str.

Additional explanation

Ineligible costs:

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☒ Yes ☐ No ☐ Mixed

Explanation of support activities falling outside the scope of Art. 42 TFEU

The aim of the intervention is to bring about a different solution (product, service, process, farming practice, etc.) as a result of collaborative developments, so that the supported activity falls outside the scope of Article 42 TFEU. Therefore, in the light of the objective pursued by the intervention, the competition rules are generally applicable.

Type of state aid instrument to be used for clearance:

☐ Notification ☐ GBER ☒ ABER ☐ de minimis

State Aid case number

SA.112038

Additional information:

☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.

☐ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.

☒ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Only new cooperation and existing cooperation shall be eligible for new activities.

Target Area 1: Promoting EU quality schemes: Information and promotion activities aimed at promoting quality schemes recognised by the Union (geographical indications, traditional specialities

guaranteed, organic production) and products marketed under a name recognised at Union level with the status of “registered” in the official Union (eAmbrosia) registers of geographical indications or traditional specialities guaranteed.

The objective is to ensure that the quality schemes laid down in Regulations (EU) 2018/848 and (EU) 2024/1143 and products placed on the market with the status of ‘registered’ in the official EU eAmbrosia registers of geographical indications and traditional specialities guaranteed are known and recognised on the market and by customers.

The products produced under the quality schemes have specific characteristics linked to the geographical area and are produced using traditional production methods. Therefore, the promotion and recognition of quality schemes also encourages the production and consumption of products with higher added value.

Specific targeting:

- (a) the activity must concern only the quality scheme, including organic production, or the product placed on the market under the registered name,
- (b) promotion activities may only be carried out in conjunction with information.

Target Area 2: Promotion of recognised national quality schemes

Article 16(1), points (b) and (c), of Regulation (EU) No 1305/2013, in accordance with Article 16(1)(b) and (c) of Regulation (EU) No 1305/2013, in accordance with Article 26/2018. National quality schemes and voluntary agricultural product certification schemes recognised and registered on the basis of Decree No 1 of the Minister for Agriculture (hereinafter collectively: information and promotion activities promoting products certified by quality schemes).

The intervention greatly contributes to ensuring that the quality schemes recognised by Hungary and the products produced thereunder are known and recognised by markets and customers.

Specific objective: promote public recognition and recognition of national quality schemes, which also encourage the production and consumption of products with higher added value.

Indicative selection principles for both target areas:

quality of the promotion project plan;

— the size of the target group that can be reached by the promotion activity;

the number of promotional tools used;

climate and environmental mainstreaming (access modes, material use, waste, etc.)

— cost-effectiveness, share of unit costs in relation to the target group to be achieved

sales of surplus products after promotion;

— in the case of a quality scheme with organic farming members, co-promotion of the quality scheme and the EU organic conditionality

mainstreaming of equal opportunities and solutions

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiaries:

Target Area 1:

Groupings within the meaning of Regulation (EU) 2024/1143 and their cooperation, interbranch organisations and producer groups, associations, non-profit organisations with a public interest within the meaning of Regulation (EU) 2018/848.

Only cooperation which is set up and implemented as a new cooperation, or an existing group(s) starts to carry out information and promotion activities as a new activity, shall be eligible.

Target Area 2:

Groupings of natural and legal persons operating a quality scheme and participating in the quality scheme.

Specific eligibility criteria:

- Information and promotion activities
 - Target Area 1: for quality schemes recognised by the Union, including organic production, or for products marketed under the name ‘registered’ in the official Union (eAmbrosia) registers of geographical indications or traditional specialities guaranteed recognised at Union level
 - TargetArea 2 in Annex I to Regulation (EU) No 26/2018. It must relate to a quality scheme recognised and registered on the basis of Decree No 1 of the Minister for Agriculture and Rural Development and to the product(s) certified by that quality scheme.

it should be targeted.

- the activity must concern only the quality scheme or the product placed on the market under the registered name
- promotion activities can only be carried out in conjunction with information

Whereas this measure falls outside the scope of Article 42 TFEU (see point 8), with the exception of de minimis aid, **no aid may be granted** to a beneficiary under Commission Regulation (EU) No 651/2014 or Commission Regulation (EU) No 702/2014

- it is a firm in difficulty (the concept of a firm in difficulty is defined as 37/2011 on the State aid procedure for the purposes of EU competition law and on the regional aid map. (III. Section 6(4a) and (4b) of Government Decree No 22/2000) and
- failed to comply with the decision of the European Commission, addressed to Hungary, requiring the recovery of State aid in the sense of EU competition law.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Indirect costs: Costs related to the establishment and maintenance of the cooperation team, including running costs.

Direct costs: Direct costs related to information and promotion, such as project preparation, technical implementation services, investments, project management, etc.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

☒ reimbursement of eligible costs actually incurred by a beneficiary

☐ unit costs

☐ lump sums

☒ flat-rate financing

Basis for the establishment

Pursuant to Article 77(8)(a) of Regulation (EU) 2021/2115, support shall not exceed 70 % of the eligible costs.

The payment is based on Article 83(1)(a)(d) and 2(a)(i) STR.

1(a): For direct costs
(1)(d): For indirect costs

Range of support at beneficiary level

The total project cost shall cover the cost of the cooperation and the operations carried out.

The implemented operation (projects) will comply with the relevant rules and requirements laid down in Articles 70 to 76 and 78 of Regulation (EU) 2021/2115 (STR).

Maximum grant amount per project: EUR 500,000

Direct costs are eligible by itemisation of the costs actually incurred, at a minimum rate of 75 %.

The percentage of indirect costs may be up to 25 %.

Additional explanation

Not relevant.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☒ Yes ☐ No ☐ Mixed

Explanation of support activities falling outside the scope of Art. 42 TFEU

in view of the objectives set out in point 5 of the intervention, the competition rules are generally applicable

Type of state aid instrument to be used for clearance:

☐ Notification ☐ GBER ☒ ABER ☐ de minimis

State Aid case number

SA.112038

Additional information:

☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.

☐ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.

☒ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

R.10 Share of farms participating in producer groups, producer organisations, local markets, short supply chain circuits and quality schemes supported by the CAP

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Collaborative interventions aim to encourage members of agriculture and local communities to act together. Given the structural situation of Hungarian agriculture and the challenges that will develop in the near future and beyond, farmers' cooperation is of paramount importance in achieving sustainable agriculture. However, a series of experiences shows that the level of willingness of farmers to cooperate is extremely low in Hungary today. It is therefore necessary to help increase the willingness to cooperate by all means.

The low level of cooperation and innovation skills between actors in the Hungarian agricultural sector hinders the development of more competitive, resource-efficient or more environmentally friendly, coordinated farming structures in a number of ways. We therefore consider it particularly important to provide support based on cooperation in order to encourage agricultural operators.

Cooperation may include the investments of the participants in the cooperation, which are not separate investments, but jointly created investments which are not eligible elsewhere.

The purpose of this intervention is to ensure that producers have access to the common and direct market, bearing in mind that, in line with EU processes, there is also an increasing consumer demand in Hungary for food purchased directly from producers or at most from an intermediary. Producer and consumer participation in the short supply chain (REL) can provide producers with better bargaining power, bring social and environmental benefits, and increase trust between consumers and producers.

The cooperation may involve a market organiser, as the closer the producer comes to the consumer, the more work that a third party can perform with a higher level of quality, such as equipment, time and competence, would have to be expected to go beyond the productive activity. In most cases, farmers willing to cooperate do not have adequate transport, commercial or storage conditions, and support for their development is absolutely justified. The development may include the development of databases, tools, infrastructure and competence, as well as the development of alliances in product production, distribution and marketing. Well-functioning co-operations are also eligible. Cooperation may concern only farmers, in order to gain common access to the market, or cooperation between farmers and consumers (e.g. a basket community).

Only new cooperation and existing cooperation shall be eligible for new activities.

Principles governing the establishment of selection criteria, which may be applied in part:

- Content and quality of the project or maintenance plan, in which the following will be assessed:
- Strengthening existing business and social links, creating new ones, exploiting synergies
- Professional experience of participants in the collaborations
- Mainstreaming environmental, climate and adaptation aspects
- Regional perspective
- Employment, including volunteering
- Composition of the cooperation (e.g.: participation of young farmers)

Pursuant to Article 77(4) of the Strategic Plan Regulation, operations supported by this intervention in the form of an 'overall amount' must comply with the provisions of Articles 70 to 76 and 78 of the Strategic Plan Decree.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiaries:

Short Supply Lance (hereinafter: (Rel) members of the Cooperation Group

Conditions of employment:

Preparation of a project plan or a maintenance plan.

Cooperation between producers and consumers involving at least 2 actors (e.g. farmer, municipality, church, foundation, hospitality (HORECA), catering, etc.).

There shall be no more than one intermediary between farmers and consumers.

As this measure falls outside the scope of Article 42 TFEU (see point 8), with the exception of de minimis aid, **no aid may be granted** to a beneficiary under Commission Regulation (EU) No 651/2014 or

Commission Regulation (EU) No 702/2014

- it is considered to be a firm in difficulty (the concept of a firm in difficulty is defined in Decree 37/2011 on the procedure for State aid for the purposes of EU competition law and on the regional aid map. (III. As defined in Section 6(4a) and (4b) of Government Decree No 487/2015, or
- it failed to comply with the decision of the European Commission addressed to Hungary requiring the recovery of State aid within the meaning of EU competition law.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Eligible costs for the intervention:

Indirect costs, such as:

- costs related to the setting-up and maintenance of the cooperation team, including running costs

Direct costs, such as:

- project preparation, costs of studies on the submitted project,
- costs of promotion activities,
- direct costs of individual projects (investments) linked to the implementation of the objectives approved in the project plan, services used for technical implementation.

Direct costs shall be eligible by means of an itemised declaration of the costs actually incurred, with a minimum rate of 75 %.

Indirect costs are eligible as a fixed percentage of the total project (flat rate), with a maximum rate of 25 %.

Aid rate: Str 70-76 and 78

Commitments:

Carrying out the tasks undertaken in the project plan.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Collaborative interventions aim to encourage members of the agricultural community and local communities to act together. Given the structural situation of Hungarian agriculture and the challenges in the near future and beyond, farmers' cooperation is of paramount importance in achieving sustainable agriculture. However, a series of experience shows that the level of willingness of farmers to cooperate is extremely low in Hungary today. Every effort must therefore be made to increase the willingness to cooperate.

The low level of cooperation and innovation skills between actors in the Hungarian agricultural sector hinders the development of more competitive, resource-efficient or coordinated farming structures adapted to environmental conditions in many ways. For this reason, we consider it particularly important to grant

collaborative support in order to encourage agricultural operators.

Cooperation may include investments by the co-operating participants, which are not separate investments, but jointly created investments that are not eligible elsewhere.

Only new cooperation and existing cooperation shall be eligible for new activities.

The purpose of the intervention is to:

The aim of the intervention is to improve the quality of life of local communities or certain vulnerable groups and that collaborative developments result in a different solution (product, service, process, farming practice, etc.).

There are many opportunities based on agronomy and other features of rural areas, the coordinated development of which, based on cooperation, can make a significant contribution to the success of the agricultural economy (including processing and forestry in addition to agriculture) and rural areas.

We want to focus on supporting social innovation cooperation, social entrepreneurship such as social farms and social cooperatives.

We draw on the experience of established forms of cooperation between producers and consumers (e.g. Communities, Open Ports, Camrature, etc.).

Target area – Support for social farm-type collaborations

A social farm is a cooperative farming form, operating in accordance with the principles of social solidarity, for the purpose of social and environmental awareness-raising, which carries out agricultural, processing and service activities involving disadvantaged persons; and agriculture-related awareness-raising activities for a wider society.

Based on Hungarian experience, three sub-types of social farms are distinguished:

- rehabilitative farm or social/rehabilitative farm: its main feature is the involvement of disadvantaged persons in the context of employment within a social institution
- caring farm or caring farm: its main characteristic is the involvement of disadvantaged persons by agricultural operators at the place where the agricultural activity takes place
- social farm or collaborative economy: the main characteristic is awareness-raising for a specific group of persons and/or involvement in employment by persons carrying out an agricultural activity at the place where the agricultural activity is carried out

One possible form of setting up social farms is that support organisations look for farmers in the neighbourhood to whom they 'extend' the disadvantaged target group to work on a regular (even daily) basis. Thus, support organisations do not need to create an agricultural environment and do not need to employ an agricultural professional to maintain it. Support organisations may themselves set up agricultural units, where the involvement of the members of their own disadvantaged target groups is much more intense. However, in order to manage the resulting social farms in a sustainable and professionally sound manner, the recruitment of a farmer (with the qualifications required by law) by assisting organisations may be essential.

The personal scope of social farm service providers can be defined according to two basic categories:

Social farm economy: a farming organisation engaged in an agricultural activity which accepts disadvantaged people to carry out an active activity and/or hosts children and pupils for educational/educational purposes

2nd Social Farm Community: social service providers who themselves engage in farming/service and marketing activities involving their (own) disadvantaged target groups.

Target area B – Support for social cooperatives

The basic characteristics of social cooperatives are: Members – Act X of 2006 on cooperatives Pursuant to Section 15(1): 'A social cooperative, in addition to the **members of a natural person, at least one local**

or minority self-government or an association of these with legal personality (hereinafter referred to collectively as: local authority) or be a member of a non-profit organisation engaged in charitable activities as defined by law.’ – they specify **with which capital is to form an open- member cooperative.** In the application for membership, the person applying for membership **must declare the acceptance of the provisions of the cooperative’s statutes** and the contribution made. If personal assistance is undertaken, the application for membership shall also specify its content. The social cooperative operates according to the variable capital principle, which means that the size of the capital varies with the entry and exit of its members. The aim of a social cooperative is to meet the economic, cultural, educational, social and health needs of its members and to create working conditions for unemployed or socially disadvantaged members. Members are required to be personally involved in the activities of social cooperatives (Act X of 2006 on cooperatives Pursuant to Section 15(2): ‘Society cooperatives shall not be members of a social cooperative, with the exception of a local authority or a non-profit organisation engaged in charitable activities.’ Activities may be carried out in a social cooperative as a member, an employee or a business/assignment contract. A cooperative may form a community fund from which it provides cultural, educational, social and health support to its members and members of their families. Act X of 2006 on cooperatives Pursuant to Article 14(1). ‘The aim of a social cooperative is to **create working conditions for its disadvantaged members and to otherwise help improve their social situation.**’ It thus achieves its role in society not necessarily in the **case of persons with a reduced capacity to work but from disadvantaged backgrounds.** This is **explicitly considered as social engagement.** Nothing prevents a social cooperative from also being a social farm.

Principles governing the establishment of selection criteria, which may be partially applicable:

- Content and quality of the project or maintenance plan
- Strengthening existing business and social relations, creating new ones, exploiting synergies
- Professional experience of participants in collaborations
- Mainstreaming environmental, climate and adaptation aspects
- Regional aspect
- Employment, including voluntary work
- improved income-generating and self-sustainability due to cooperation
- Participation by young farmers

Under Article 77(4) of the Strategic Plan Regulation, operations supported by this intervention in the form of an ‘overall amount’ must comply with the rules of Articles 70 to 76 and 78 of the Strategic Plan Regulation.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible Beneficiaries:

- The non-profit organisation participating in the cooperation and the farmer involved (among others: Social Farm Farmers and Collaborative Institution, Social Businesses).

A natural or legal person who is a farmer, processor or service provider, with the involvement of disadvantaged persons, or a social cooperative.

Eligibility criteria:

- Prepare a project plan or a maintenance plan.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Eligible costs for the intervention:

- Costs directly linked to the realisation of the project objective, such as: costs of studies on the submitted project, costs of individual projects (investments) linked to the implementation of the objectives approved in the project plan, costs of planning, project preparation and project management activities, costs of services related to professional implementation.
- Indirect costs, such as: costs related to the establishment and maintenance of the cooperation team,

including running costs.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

8.1.2	Improving the profitability of rural micro-enterprises	1	Partially
8.1.5	Improving the profitability of small farms	2	Yes
8.2.2	Developments that can be adapted to local/regional needs and have a measurable impact on them	1	Partially

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.18 Total investment to improve the performance of the forestry sector

R.39 Number of rural businesses including bio-economy businesses developed with CAP support

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Only new cooperation and existing cooperation shall be eligible for new activities.

Cooperation aims at farmers, foresters, farmers, farm farmers and other local actors (e.g.: encourage agri-, active and eco-tourism cooperation between local tourism providers, the implementation of programmes aimed at presenting local values, traditions and attractors for tourism purposes, the organisation of local, individual attractions and services and local products into competitive tourism products; development of farm networks, thematic themes for the complex presentation of natural and other local values, sustainable, regularly implemented, specific festivals and legacy programmes.

Principles governing the establishment of selection criteria, which may be applied in part:

- Content and quality of the project plan or maintenance plan
- Professional experience of participants in collaborations
- Mainstreaming environmental, climate and adaptation aspects
- Regional perspective
- Employment, including volunteering
- Young farmer or forest start-up manager
- Equal opportunities aspects, commitments

Pursuant to Article 77(4) of the Strategic Plan Regulation, operations supported by this intervention must comply with Articles 70-76 and 78 of the Strategic Plan Regulation.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiaries:

Cooperation between farmers, forest managers, natural persons, companies with legal personality, undertakings without legal personality, non-profit organisations with legal personality (churches, foundations, non-profit companies)

Eligibility criteria:

- Prepare a business plan.
- Cooperation between at least one farmer or forest manager and at least one local non-profit-making tourism organisation or local tourism service undertaking
- Cooperation is only eligible if it is created and implemented as a new cooperation or existing EGTC(s) start a new activity.

As this measure falls outside the scope of Article 42 TFEU (see point 8), with the exception of de minimis aid, no aid may be granted to a beneficiary under Commission Regulation (EU) No 651/2014 or Commission Regulation (EU) No 702/2014

- it is considered to be a firm in difficulty (the concept of a firm in difficulty is defined in Decree 37/2011 on the procedure for State aid for the purposes of EU competition law and on the regional aid map. (III. As defined in Section 6(4a) and (4b) of Government Decree No 487/2015, or
- it failed to comply with the decision of the European Commission addressed to Hungary requiring the recovery of State aid within the meaning of EU competition law.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments (commitments):

- Compliance with commitments made in a business plan.

Eligible costs for the intervention:

- Costs directly linked to the realisation of the project objective, such as: costs of studies on the submitted project, direct costs of individual projects (investments) linked to the implementation of the objectives approved in the project plan, costs of planning, project preparation and project management activities, costs of services related to professional implementation
- Indirect costs, such as: costs related to the establishment and maintenance of the cooperation team, including running costs,

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

☒ reimbursement of eligible costs actually incurred by a beneficiary

☐ unit costs

☐ lump sums

☒ flat-rate financing

Basis for the establishment

The payment is based on Article 83(1)(a), 1(d) and 2(a)(i) STR.

1(a): Direct costs

(1)(d): Indirect costs

Average unit amount: EUR 218.472/cooperation.

Range of support at beneficiary level

The total project cost shall cover the cost of the cooperation and the operations carried out.

The implemented operation (projects) will comply with the relevant rules and requirements laid down in Articles 70 to 76 and 78 of Regulation (EU) 2021/2115 (STR).

Maximum grant amount per project: EUR 500,000

Up to 25 % of the total project cost can be used as a flat rate for general activities for cooperation, planning and project management, etc. (cooperation costs), while the costs of activities and investments directly serving the purpose of the project amount to a minimum of 75 %.

Rate of aid in direct costs: In accordance with Articles 70 to 76 and 78 of the Str.

Additional explanation

Not relevant.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☒ Yes ☐ No ☐ Mixed

Explanation of support activities falling outside the scope of Art. 42 TFEU

In view of the objective of the intervention set out in point 5, the competition rules are generally applicable.

Type of state aid instrument to be used for clearance:

☐ Notification ☐ GBER ☒ ABER ☒ de minimis

State Aid case number

SA.112038

Additional information:

- ☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.
- ☐ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.
- ☒ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.15 Supported investments in renewable energy production capacity, including bio-based (in MW)

R.18 Total investment to improve the performance of the forestry sector

R.39 Number of rural businesses including bio-economy businesses developed with CAP support

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

In order to achieve the objectives of sustainable agricultural management, responsible management of resources and the transition to circular farming, farmers' cooperation is of paramount importance. However, domestic experience shows that the level of willingness to cooperate among farmers remains low. The new type of cooperation to be supported includes cooperation that has so far not been included in rural development support but has been demanded by the industry, and it can be assumed that they will be successful in the form of cooperation.

In-situ resource flows import materials and services on a large scale, including those that can be replaced by in-situ biomass-based solutions. However, the latter are not accustomed, often unknown to decision-makers, and their implementation is more complex than solutions imported into the region even over long distances.

The focus of the intervention is placed on the local use of biomass funds, which is why, in addition to farmers, territorial public service actors, such as municipalities, local public service providers, are key players in cooperation. Cooperation may aim at co-creating new product or service solutions, such as biomass-based local renewable energy supply, energy community model, professional re-use or recycling of by-products or waste, etc.

Only new or existing cooperation shall be eligible for a new action.

The purpose of the intervention is to:

The aim of the intervention is to be a different solution from previous practice as a result of collaborative developments: create a product or service using locally generated, unused or under-used biomass. The action also aims to promote a circular bio-based and collaborative approach and good practices (e.g. by-products, waste, residues) in local public services.

Necessity and added value of cooperation: On the side of both farmers and local public service providers, they rely decisively on their usual main product markets or their sources of supply and do not actively seek new ways of using locally existing resources. The reasons for this include a lack of knowledge and information, as well as the underdevelopment and initial additional cost of a culture of predictable cooperation developed jointly over the long term.

In view of the above, biomass-based in-situ collaborations should be encouraged and facilitated, not only through financial means, but also in the form of knowledge-building, moderation, etc., which will in any case entail additional costs in the first years compared to normal marketing or sourcing solutions.

Elements of intervention under co-design and coordinated implementation creating synergistic effects: raw materials and needs assessment; capacity and supply planning; establishing a long-term cooperation and settlement contractual arrangement;

In the intervention, beneficiaries should take into account the Best Available Technologies (Bats) as defined in Directive 2010/75/EU of the European Parliament and of the Council on industrial emissions.

Selection criteria:

- Quality of the project design

- Composition of the collaborative community
- Mainstreaming environmental, climate and adaptation aspects (e.g. air quality, substitution of fossil or synthetic feedstock, reduction of supply distance, soil protection, broad awareness-raising)
- Regional aspect (fiscal capacity, catching up municipalities)
- Employment aspect
- Nature of biomass use (e.g. cascading principle)

Pursuant to Article 77(4) of the Strategic Plan Regulation, operations supported by this intervention in the form of an 'overall amount' must comply with the rules of Articles 70 to 76 and 78 of the Strategic Plan Regulation as follows:

- Where the operation contains an investment element, the rules laid down in Article 73 of the Strategic Plan Regulation shall apply.
- In case the operation involves rural business start-ups, the rules laid down in Article 75 of the Strategic Plan Regulation apply.
- Where the operation contains an element of knowledge transfer and dissemination of information, the rules laid down in Article 78 of the Strategic Plan Regulation shall apply.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiaries:

- cooperation between biomass feedstock producers and biomass feedstock users

Eligibility criteria:

- At least 2 cooperative communities (consortium) formed by independent farmers, food processors, forest managers, forest owners or timber processors (the criterion of independence is the same as for affiliated companies) or a local public service provider.
- Submit a project plan containing:

Create a biomass-based product or service (not for food or feed) to meet the specific demand with at least 2 cooperating partners

- Maintenance plan or business plan

Whereas this measure falls outside the scope of Article 42 TFEU (see point 8), with the exception of de minimis aid, no aid may be granted to a beneficiary under Commission Regulation (EU) No 651/2014 or Commission Regulation (EU) No 702/2014

- it is a firm in difficulty (the concept of a firm in difficulty is defined as 37/2011 on the State aid procedure for the purposes of EU competition law and on the regional aid map. (III. Section 6(4a) and (4b) of Government Decree No 22/2000) and
- failed to comply with the decision of the European Commission, addressed to Hungary, requiring the recovery of State aid in the sense of EU competition law.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments:

- implementation of a project plan or maintenance plan
- create a new product or service to meet local specific needs with at least 2 suppliers
- undertake to cooperate at least for the maintenance period with up to 30 km of biomass raw material supplier or suppliers
- only investments that meet the requirements of low-emission technologies (Best Available Technologies, BATs) are eligible.
- renewable energy production must comply with Directive (EU) 2018/2001 on the promotion of the

use of energy from renewable sources (REDII) and the domestic legislation implementing it (in particular Act CXVII of 2010, 821/2021). (XII. Government Decree No 34/2021 and Government Decree No 34/2021 (Decree 6) of the Minister for Agriculture)

- commitment for a minimum duration of 3 years up to 5 years

Ineligible costs for the intervention

- collaborations involving research institutions only
- for investments, the cost elements in Article 73(3) (Investments) of the Strategic Plan Regulation
- purchase of real estate
- investment in irrigation

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

Description of the Territorial Scope

Continuing the practice of the 2014-2020 programming period, the territorial scope of the LEADER intervention covers all rural municipalities in the country. The selected Local Action Groups (hereafter: LAGs) are expected to fully cover the country's rural municipalities.

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO3 Improve the farmer' position in the value chain

SO4 Contribute to climate change mitigation and adaptation, including by reducing greenhouse gas emission and enhancing carbon sequestration, as well as promote sustainable energy

SO5 Foster sustainable development and efficient management of natural resources such as water, soil and air, including by reducing chemical dependency

SO8 Promote employment, growth, gender equality, including the participation of women in farming, social inclusion and local development in rural areas, including the circular bio-economy and sustainable forestry

XCO Cross-cutting objective of modernising the sector by fostering and sharing of knowledge, innovation and digitalisation in agriculture and rural areas, and encouraging their uptake

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
8.1.1	Increasing the employment rate of women in rural areas	1	Partially
8.1.2	Improving the profitability of rural micro-enterprises	1	Partially
8.1.6	Biomass feedstocks, intermediate products, waste processing, renewable energy use	1	Partially
8.2.1	Human resources for the implementation of development policy programmes	2	Partially
8.2.2	Developments that can be adapted to local/regional needs and have a measurable impact on them	1	Partially
8.2.3	Coherence of local development programmes, regional cooperation	1	Partially
8.3.1	Reducing regional disparities in rural transport infrastructure	3	Partially

8.3.2	Development of infrastructural background for local public services raising quality of life	3	Partially
8.4.2	Encouraging Roma inclusion programmes, reducing segregation	3	Partially
8.6.1	Increase the scope and added value of forest benefits, improve profitability	3	Yes
CCO.4.1	Providing personal access to broadband internet services	2	Partially
CCO.4.3	Electronic administration, transparency	1	Partially

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.10 Share of farms participating in producer groups, producer organisations, local markets, short supply chain circuits and quality schemes supported by the CAP

R.15 Supported investments in renewable energy production capacity, including bio-based (in MW)

R.27 Number of operations contributing to environmental sustainability and the achievement of climate mitigation and adaptation goals in rural areas

R.37 New jobs supported in CAP projects

R.38 Share of rural population covered by local development strategies

R.39 Number of rural businesses including bio-economy businesses developed with CAP support

R.40 Number of supported smart-village strategies

R.41 Share of rural population benefitting from improved access to services and infrastructure through CAP support

R.42 Number of persons covered by supported social inclusion projects

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

The Local Action Groups already in operation or set up in the territories of the country, which play a significant role in the territorially balanced development of rural areas and communities (hereinafter: LAGs). Under the measure, LAGs meet local development needs in line with the objectives of the Strategic Plan (hereinafter: HFS). In the LAG approved by the Managing Authority, the LAGs define development objectives that are pursued by regional actors.

The HFS includes the amount of the development envelope available to the LAG.

The measure also supports the operation and animation of LAGs, the implementation of their LFS and the implementation of interregional and international cooperation.

The intervention aims to develop capacity at local level, involve and activate rural actors by organising community actions, awareness-raising and training, including awareness-raising and capacity building on equal opportunities, social inclusion and the fight against poverty. In the context of the intervention, the preparation of LFSs will also be financed. Training and briefings provided by the MA, as well as mentoring, will assist in the preparation of the HFS. The technical basis for strategy preparation, including the collection of data for the region, the use of studies/analyses, and the involvement of Community actors. The MA approves the HFS on the basis of its content and quality and the suitability of the capacity required for its implementation. The LAGs have the sole responsibility and responsibility for establishing the content of the LAGs, for which the operation provides the necessary financial framework.

In addition to the LAG-related activities, the main task of the LAG is to motivate, activate and assist the

local community so that new opportunities, ideas are brought to the fore and delivered in line with the objectives of the LAG, as well as the development and implementation of local development strategies by the community and networking with other LAGs domestically and across borders.

In this context, LAGs may also support the development of project ideas into proposals, provided that the implementation of the project is in line with the objectives of the LFS.

Tasks to be carried out exclusively by LAGs (Regulation (EU) 2021/1060 33. (3)) the following are:

‘Local action groups shall carry out, on an exclusive basis, all of the following tasks:

- (a) building the capacity of local actors to develop and implement operations;
- (b) establishing a non-discriminatory and transparent selection procedure and criteria that exclude conflicts of interest and ensure that no interest group can direct selection decisions;
- (C) preparation and publication of calls for proposals;
- (D) selection of operations and fixing of the amount of support and submission of proposals to the responsible body before approval for final eligibility verification (application management);
- (e) monitoring progress towards achieving the objectives of the strategy;
- (F) an assessment of the implementation of the strategy.’

The MA assists the LAGs with continuous mentoring and training through the CAP network.

The priorities are:

- setting up, maintaining and strengthening micro, small and medium-sized enterprises in rural areas;
- start-up and development of social enterprises;
- development of local products and services;
- development of low asset-intensive food processing investments;
- development of a local craft and artisanal layer (e.g.: painter, bricklayer, car mechanic, etc.);
- promoting, raising awareness and supporting the marketing of local cooperation for economic development;
- promoting access to human public services for the population in rural areas;
- establishment of a joint marketing point/box/safer system;
- use of renewable energy, climate-friendly, water retention and environmental solutions at local level;
- facilitating the preparation of smart village strategies;
- strengthening rural areas as a business space and residence;
- the development and implementation of complex, sustainable tourism and hospitality programmes based on a local community and presenting natural and other values, conditions, traditions and specific products;
- strengthening the individual activity, ownership and cooperation skills of members of local communities;
- to work together more actively in society, create stronger local identity, encourage community thinking and work and provide the conditions for them;
- community life, community marketing, infrastructure development of community spaces, conservation of built and cultural heritage;
- support the retention of young people, help them settle and prevent emigration;
- encouraging inclusion, equal opportunities and social inclusion

Target area: Support the preparation of the LFS, corresponding to Article 34(a) of the CPR (capacity building and preparatory actions supporting the development and future implementation of the local development strategy);

Target B: Implementation of the LSD, corresponding to Article 34(b) of the CPR (implementation of operations selected on the basis of the local development strategy);

Target Area C: Implementation of interregional and international cooperation, corresponding to Article 34(b) of the CPR (cooperation activities and their preparation);

TargetD: Operation of the LSD and associated animation activity, corresponding to Article 34(c) of the CPR (management, monitoring and evaluation of the local development strategy and its implementation, including facilitating exchanges of views and experience between those involved in the implementation of the strategy)

This target area is: Developing and implementing smart village strategies

Smart villages are rural collaborations that seek practical solutions to local economic, social and/or environmental challenges and strive to make the best possible use of digital technologies for the local population.

Target:

- catching up with digital tools in disadvantaged and lagging regions
- municipalities develop their own smart village strategy
- use of digitalisation for community development, community development, communication, active local communities
- strengthening cooperation between rural communities and developing regional cooperation;
- the quality of life in rural areas and the rural ecosystem are improved;
- increase the population retention and attraction of rural areas,
- needs-driven rural development interventions are implemented along the smart village concept.

Content:

developing smart village strategies

implementation of Community solutions for digitalisation

development of local, community services, “proximity” to local residents (e.g. e-health, smart care, co-working, carpooling, development of community Wi-Fi points, digital public safety, etc.)

— local smart markets, market monitoring, e-commerce development

— support for the sharing economy through digital means

transition to circular farming

promotion of energy efficiency

improving water management, retaining and preserving water resources

protection and enhancement of biodiversity

establishment of digital registers for the benefit of the countryside (e.g. reducing administrative burdens, supporting activities, developing apps for rural communities, etc.)

— procurement of support systems for urban development based on the processing of relevant databases

Hungary does not use the multi-fund LEADER/CLLD option.

Principles governing the establishment of selection criteria, which may be partially applied (selection criteria):

- access to the aid is conditional on the fulfilment of the eligibility criteria;
- encouraging initiatives to reduce gender inequality and disadvantage
- consistency with the objectives of the HFS,
- innovative solutions that are innovative for the region;
- the reality of milestones and targets, where possible, their measurability;
- value for money, i.e. balance between planned costs and results, cost-effectiveness,

- physical/financial/environmental feasibility and sustainability;
- quality of the project design,
- regional aspect,
- principle of territorial integrity for cross-border cooperation projects (TNC)
- the environmental, economic and social characteristics of the area of operation,
- a description of how the community is involved (project data sheets, etc.),
- planning timing (local calls, resources);
- existence of human resources.

If a LFS cannot be accepted by the MA on the basis of the selection criteria, that LFS will be returned for improvement to the LAG concerned.

Eligibility criteria for LAGs for target areas A,B,C,D:

1. the population of the area to be covered by the LFS may range from 10 to 150 thousand people;
The LAG's action area is a territorially contiguous unit, one municipality may belong to only one LAG;
3. The eligibility condition for the selection of LAGs is that the LAGs are managed by local action groups composed of representatives of public and private local socio-economic interests in which there is no single stakeholder controlling decision-making;
4. The eligibility criterion for the selection of LFSs shall be the content in accordance with Article 32 of Council Regulation 2021/1060;
5. Animation by LAGs supporting networking, easier access to resources, innovativeness in the local environment and cooperation with other territorial actors, where appropriate, is an important element in the implementation of LEADER intervention;
6. The approval of the LFS is the responsibility and responsibility of the EAFRD Managing Authority. Compliance with the eligibility criteria governing the LAG area, decision-making and content of the LAG gives the LAG the right to use the resources allocated to the operation and animation and the implementation of the LFS.
7. The EAFRD Managing Authority shall implement the approval of the LFS within 12 months of the adoption of the CAP Strategic Plan.

In local calls for the implementation of LSDs, the funding rates should not exceed the support rates for the same type of interventions of the programme;

The complementarity with other interventions and programmes is determined locally by LAGs when planning LFSs based on local needs and opportunities. The description of complementarity is part of the description of the interventions of the LFS.

The LAG's decision-making bodies shall include at least one woman and at least one young person.

Eligibility criteria for target area E:

- smart village projects in cooperation with at least 2 partners
- one of the cooperating partners can also be the LAG itself
- reach at least 1000 inhabitants with development in rural areas
- at least 1 local authority partner in the cooperation,
- the collaborative project is linked to the local development, urban development, environmental, social inclusion, etc. strategy of the area concerned;
- the cooperation shall contribute to one of the topics linked to the specific objectives or/or the overall objectives of the CAP Strategic Plan.
- only one smart village strategy per municipality can be supported
- target area E can only be used for LAGs that incorporate it into their LFS

Pursuant to **Article 31 of Regulation (EU) 2021/1060:**

— Cooperation across sub-regional areas can take place in the context of international projects or at national level. The international relations of the LAGs in Hungary are notable, with larger cross-border initiatives.

— In the LEADER programme, decision-making should take into account the proportion of the spheres, none of which should have a significant share of voting rights, which should be laid down in separate rules of procedure.

— All LEADER projects are linked to those set out in the LAG HFS concerned.

— The fulfilment of the LEADER principles is essential and the LSDs are also developed taking into account the principles.

Sub-regional area (definition): Uniform areas smaller than NUTS 3 regions covered by LAGs. The population covered by the sub-regional areas may be delimited by LAGs in the LFSs.

Link with other interventions:

RD58_A01_TRA_78 – Training and demonstration programmes

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiaries

Target areas A, D:

Recognised LAGs

Target B:

Recognised LAGs

Partner in the implementation of the HFS adopted by the MA:

Paragraph 2 Natural persons

Paragraph 1 Undertakings having legal personality

Section 3 Budgetary bodies and bodies operating in accordance with the budgetary regime

‘Paragraph 3 Associations

Non-profit legal entities (e.g. church legal entities, foundations, non-profit-making farmers’ associations)

Target Area C:

Recognised LAGs

Companies with legal personality

Budgetary bodies and bodies operating in accordance with the budgetary order

Associations

Non-profit legal entities (e.g. ecclesiastical entities, foundations, non-profit companies)

The LAG may itself be the owner of target areas A to D and implement measures in line with the strategy, provided that the LAG ensures the principle of separation of activities (Article 33(5) CPR).

This target area:

Private and legal persons

Non-profit organisations

Associations

Cooperatives

Municipalities

Recognised LAGs

Territorial scope: Continuing the practice of the 2014-2020 programming period, the territorial scope of the LEADER intervention covers all rural municipalities in the country (a municipality with less than 10 thousand inhabitants regardless of administrative status (city/municipality) is considered to be rural; or the outskirts of the municipalities with a population of more than 10 thousand inhabitants; you are not entitled to: Budapest. The selected LAGs are expected to fully cover the country's rural municipalities.

Offices operated by LEADER LAGs may be located in municipalities with more than 10 thousand inhabitants in justified cases, with the exception of Budapest (e.g. where an area covered by LAGs encloses a settlement of more than 10 thousand inhabitants).

The delineation of LEADER LAGs with other operational programmes has been described in detail in the chapter 4.5 Review of the coordination and demarcation of competences between the EAFRD and other EU funds in rural areas and their complementarity.

The LAG may itself be the owner of the target areas and implement measures in line with the strategy, provided that the LAG ensures the principle of separation of activities (Article 33(5) CPR).

Territorial scope: Continuing the practice of the 2014-2020 programming period, the territorial scope of the LEADER intervention covers all rural municipalities in the country (a municipality with less than 10 thousand inhabitants regardless of administrative status (city/municipality) is considered to be rural; or the outskirts of the municipalities with a population of more than 10 thousand inhabitants; you are not entitled to: Budapest. The selected LAGs are expected to fully cover the country's rural municipalities.

Offices operated by LEADER LAGs may be located in municipalities with more than 10 thousand inhabitants in justified cases, with the exception of Budapest (e.g. where an area covered by LAGs encloses a settlement of more than 10 thousand inhabitants).

The delineation of LEADER LAGs with other operational programmes has been described in detail in the chapter 4.5 Review of the coordination and demarcation of competences between the EAFRD and other EU funds in rural areas and their complementarity.

Whereas this measure falls outside the scope of Article 42 TFEU (see point 8), with the exception of de minimis aid, **no aid may be granted** to a beneficiary on the basis of Commission Regulation (EU) No 651/2014 or Commission Regulation (EU) No 702/2014

is a firm in difficulty (the concept of a firm in difficulty is defined in Article 37/2011 on the procedure for State aid under EU competition law and on the regional aid map. (III. Section 6(4a) and (4b) of Government Decree No 273/2007) or

- it failed to comply with the European Commission's decision to repay State aid within the meaning of EU competition law addressed to Hungary.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Institutional guarantee at preferential rates.

The cost of the preparatory activities for the LFS may be awarded as a lump sum.

In the implementation of the measure, priority shall be given to the use of a lump sum grant.

In the case of LEADER, defined as community-led local development in Article 31 of the CPR, the following costs are eligible:

- on the basis of Article 34(1)(a) of the CPR, costs for all preparatory activities and support for the implementation of the LFS selected pursuant to Article 32 of that Regulation may be awarded as a single amount, or
- Member States should ensure that the Strategic Plan Regulation (Investments), 71 (Cooperation), 72 (Knowledge Transfer and Information) EU rules and requirements for similar operations.

(LAGs have the possibility to claim an advance of 50 % on their operating costs, without the obligation to provide a security.)

Costs for strategy planning for the 2021-2027 period are eligible even if the strategy is not finally selected and financed (CPR 34 (2)).

Commitments for Target Area E (preparation and implementation of smart village strategies):

- the planned cooperation under target area E must be included in the local development strategy of the LAG concerned
- preparation of a smart village strategy and full or partial implementation of the strategy, whereby, depending on the nature of the project, at least one of the following conditions must be met:
 - - improving local living conditions (e.g.: e-health, smart care, public safety, community Wi-Fi points, etc.) or
 - improvement of economic conditions and improvements to maintain or expand employment in rural areas (e.g.: collaborative economy, teleworking, co-working, carpooling, helping marginalised groups to work, etc.) or
 - improvement of the environmental status (e.g.: eco-footprint reduction, climate adaptation solutions, etc.), or
 - improving the visibility of communities online (e.g.: municipal marketing, agro-tourism, etc.).
- liaise with the rural and regional development support unit of the CAP-h network related to the theme.

The duration of the commitment shall be at least 3 years up to 5 years.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

☒ reimbursement of eligible costs actually incurred by a beneficiary

☒ unit costs

☐ lump sums

☒ flat-rate financing

Basis for the establishment

- Str Article 83(1a), 1(d) and 2(a)(i)

- 1(a): For investments
 1(b): For the organisation of events
 (1)(d): For general activities, for LAGs operating costs

Non-repayable grant.

The unit cost to be used for the organisation of events is HUF 2000 per person.

Background to the calculation of the unit cost: The amount determined on the basis of the background calculation made during the RDP period has been updated to reflect the inflation rate.

The maximum aid rate is 100 % of eligible costs.

Range of support at beneficiary level

The Local Action Groups shall determine the aid intensity applicable in local calls on the basis of Regulation (EU) 2021/2115 of the European Parliament and of the Council as follows:

- For investment-type aid, the aid intensity must be determined on the basis of Article 73(4) of Regulation (EU) 2021/2115.
- For aid of an investment nature relating to irrigation, the aid intensity shall be determined on the basis of Article 74(8) of Regulation (EU) 2021/2115.
- For start-up aid in rural areas, the aid intensity must be determined on the basis of Article 75(4) of Regulation (EU) 2021/2115.
- In the case of cooperation-type aid, the aid intensity shall be determined on the basis of Article 77(8) of Regulation (EU) 2021/2115.
- For knowledge transfer type aid (Exchange of knowledge and dissemination of information), the aid intensity must be determined on the basis of Article 78(4) of Regulation (EU) 2021/2115.

For this target area:

- The project cost is a full amount covering the costs of cooperation and operations carried out.
- The implemented operation (projects) will comply with the relevant rules and requirements laid down in Articles 70 to 76 and 78 of Regulation (EU) 2021/2115 (STR).
- Up to 25 % of the total project costs can be used as flat-rate flat-rates for cooperation, planning and project management, etc. for general activities (cooperation costs), while a minimum of 75 % must be allocated to costs directly serving the purpose of the project, which are subject to the method of accounting for the costs actually incurred.
- Rate of assistance: In accordance with Articles 70 to 76 and 78 Str.

Additional explanation

Ineligible actions for the intervention:

Investments on agricultural holdings, except for projects with proven LEADER added value.

- Purchase of live animals
- Acquisition of second-hand goods
- Purchase of payment entitlements

Other ineligible activities as defined in the HFSs

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☒ Yes ☐ No ☐ Mixed

Explanation of support activities falling outside the scope of Art. 42 TFEU

In view of the objective of the intervention set out in point 5, the competition rules are generally applicable.

Type of state aid instrument to be used for clearance:

☐ Notification ☐ GBER ☒ ABER ☒ de minimis

State Aid case number

Additional information:

- ☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.
- ☐ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.
- ☒ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

What is the added value of the LEADER approach for Rural Development aimed?

On the one hand, the added value of the LEADER approach to rural development is ensured by actively involving the community in the development of local development strategies and by implementing bottom-up initiatives that respond to local needs and problems. On the other hand, Local Action Groups (LAGs) work to support, inter alia, potential beneficiaries who would not be able to realise their development vision without this assistance.

Certain projects eligible under LEADER would not be eligible or could be implemented under other interventions or from other funds. The added value of LEADER lies in the local approach. LAGs identify local problems, prepare LFSs and publish local calls based on the subsidiarity principle. This is not possible without the LEADER approach.

LAGs need to test the LEADER added value on a project-by-project basis and demonstrate that investment projects would not have been possible without applying the LEADER method.

The added value of LEADER encompasses the benefits achieved through the proper application of the LEADER method, as compared to the benefits that would have been achieved without the application of the method. The added value resulting from the application of the LEADER method can be achieved by meeting the following criteria (indicative and non-exhaustive list):

- The project could not have been implemented outside LEADER (e.g. support from another fund or other intervention of the CAP Strategic Plan)
- The project contributes to improving local social capital, e.g. through the creation of local networks or cooperation between different local actors
- The project is in synergy with other projects (e.g. combination of skills and investments, synergies between sectors)
- The project responds directly to local needs and objectives
- Collective investments or other community benefits as a result of an investment project
- Sustainable rural job creation
- Social farming and other social benefits deriving from the project
- Multiple actors in the local value chain benefit from the project
- The project involves the assessment and application of local individual territorial assets
- The project contributes to the positive development of local society and environment
- Mainly benefits resulting in better implementation of the LEADER method for LAG's own projects:
- Improve LAG's transparency and inclusiveness
- Development of LAG communication tools
- Better project management and monitoring
- Development of the LAG organisation (innovation, education, network development)

Describe how the basic requirements and principles related to the LEADER approach will be ensured through the delivery model

The seven pillars of the LEADER programme will be implemented in the following ways:

- 1) Area-based approach: an area covered by LEADER LAG is a homogeneous, coherent rural unit, which does not always correspond to administrative boundaries. Municipalities and residents of the area of operation are linked by their common identity, traditions, customs, history or even their geographical position. This approach is workable, the real needs are better defined and more precise actions can be taken.
- 2) A bottom-up approach: the implementation of certain developments and programmes is more effective and efficient if local residents and organisations familiar with local conditions and resources formulate the objectives and development needs to be achieved. In formulating local development strategies, LEADER LAGs encourage local people to engage in joint work and think together in developing the future of their region. For bottom-up concepts, local community development, cooperation, the development and implementation of a proactive strategy for all are of particular importance.
- (3) Innovability: identifying specific bottom-up needs is key to innovation. The innovative nature of the LEADER programme relies on local resources, with unique, new ideas emerging at local level in all areas.
- 4) Integrated approach: one of the main foundations of the LEADER programme is not a development programme for a sector, but a link between activities and sectors for the development of rural areas. In jointly formulated strategies, a multi-sectoral approach to measures at all levels, linking them together, generates positive effects and contributes to the success of the programme.
- 5) Specific management and funding methods: in the LEADER programme, decentralisedness is reflected, inter alia, in decision-making and the use of available resources. This specificity reflects local needs. The principle is based on the fact that local actors are the most familiar with the problems of the region and are thus the most competent in developing and implementing developments.
- 6) Networking, cooperation: the existence of networks between LEADER LAGs and other organisations is based on the dissemination, exchange, knowledge and working methods of local experiences, good practices and results. Networking contributes to the integration and development of more isolated rural areas. Through the networks, LAGs can also co-create and achieve development objectives.
- 7) Local Partnership(s), LAGs engagement at local level: tripartite partnerships play a central role in the LEADER programme. The strategies coordinated by LAGs are designed and implemented in cooperation between representatives of different organisations and sectors, highlighting the development and deepening of partnerships based on mutual interests.

Is support from more than one EU fund planned?

☐ Yes ☒ No

Would the lead fund option be applied?

☐ Yes ☒ No

10 WTO compliance

Green Box

Paragraph 2 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 2 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(3)(b) - 77(1)(b) - LEADER under Article 77(1), point(b)	50.00%	20.00%	80.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD57_O31_A01_ST - Preparation of LEADER strategies, unit amount	Grant	91(3)(b) - 77(1)(b)-HU-50.00%	Average		R.38	No
RD57_O31_A02_ST - Leader LAGs and implementation of LFS including smart village strategies, specific amount	Grant	91(3)(b) - 77(1)(b)-HU-50.00%	Average		R.10; R.15; R.27; R.37; R.38; R.39; R.40; R.41; R.42	No

Explanation and justification related to the value of the unit amount

RD57_O31_A01_ST - Preparation of LEADER strategies, unit amount

When determining the average unit amounts, the aid applications received and approved in response to the relevant calls for proposals under measure M19 of the Rural Development Programme 2014-2020 were taken into account, taking into account the funds allocated to the calls for proposals. Unit amount is the ratio between committed funds and applications supported, corrected by an inflation coefficient

RD57_O31_A02_ST - Leader LAGs and implementation of LFS including smart village strategies, specific amount

When determining the average unit amounts, the aid applications received and approved in response to the relevant calls for proposals under measure M19 of the Rural Development Programme 2014-2020 were taken into account, taking into account the funds allocated to the calls for proposals. Unit amount is the ratio between committed funds and applications supported, corrected by an inflation coefficient

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029
RD57_O31_A01_ST - Preparation of LEADER strategies, unit amount (Grant - Average)	Planned unit amount (Total Public Expenditure in EUR)	106,397.00	106,397.00	106,397.00	106,397.00	106,397.00	106,397.00	106,397.00	
	Maximum planned average unit amount (where applicable) (EUR)	0.00	0.00	0.00	0.00	0.00	0.00	0.00	
	O.31 (unit: Strategies)	0.00	105.00	0.00	0.00	0.00	0.00	0.00	Sum: 105.00 Max: 105.00

RD61_A05_EIP_77 - European Innovation Partnership (EIP) cooperation

Intervention Code (MS)	RD61_A05_EIP_77
Intervention Name	European Innovation Partnership (EIP) cooperation
Type of Intervention	COOP(77) - Cooperation
Common Output Indicator	O.1. Number of European Innovation Partnership (EIP) operational group projects
Contributing to ringfencing requirement for/on	Generational Renewal: No Environment: No ES rebate system: LEADER: No

1 Territorial scope and, if relevant, regional dimension

Territorial scope: **National**

Code	Description
HU	Magyarország

Description of the Territorial Scope

The whole territory of Hungary.

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

XCO Cross-cutting objective of modernising the sector by fostering and sharing of knowledge, innovation and digitalisation in agriculture and rural areas, and encouraging their uptake

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
CCO.1.1	Support for practice-oriented knowledge transfer in support of sectoral objectives	1	Yes
CCO.1.10	Consumer education and awareness raising	1	Partially
CCO.1.2	Raising farmers' knowledge	1	Yes
CCO.1.3	Strengthening cooperation between producers and processors of researchers	1	Yes
CCO.1.6	Knowledge transfer to accelerate generational renewal in agriculture and forestry	2	Yes
CCO.2.2	Design of demonstration plants	1	Yes
CCO.3.1	Increasing the level of skills of the workforce to make use of innovative technologies	1	Yes
CCO.3.2	Hosting qualified researchers, support to the RDI sector	2	Yes
CCO.3.3	Increasing the innovativeness of agricultural and food business operators	2	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.1 Number of persons benefitting from advice, training, knowledge exchange, or participating in European Innovation Partnership (EIP) operational groups supported by the CAP in order to enhance sustainable economic, social, environmental, climate and resource efficiency performance

R.2 Number of advisors receiving support to be integrated within Agricultural Knowledge and Innovation Systems (AKIS)

R.28 Number of persons benefitting from advice, training, knowledge exchange, or participating in European Innovation

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

In general, cooperation-based interventions are aimed at encouraging farmers to participate in a community in the Hungarian CAP Strategic Plan. All other elements of these interventions (investments, promotion) are marginal. Given the structural situation of Hungarian agriculture and the challenges in the near and remote future, farmers' cooperation is of paramount importance in achieving sustainable agriculture. However, a series of experiences show that the level of willingness of farmers to cooperate is extremely low today in Hungary. This is why every means should be used to strengthen the willingness to cooperate, as Western practices show that farmers' conspiracy and joint action help to strengthen their competitive positions and resilience. An economy is much more at risk if it wants to develop, but it is more likely to implement successful programmes as part of a cooperation. In the CAP Strategic Plan, Hungary intends to engage in cooperation, one of which is a well-known and proven scheme for farmers, such as supporting sustainable water management communities or supporting short supply chains. These grants should continue to be co-operative because the experience of the 2014-2020 period shows that they are successful in a cooperative form. Another type of cooperation includes co-operations that have not yet been included in rural development support, but have been demanded by the sector in the design of the CAP Strategic Plan and are shown to be successful in a collaborative way. In all cases, the grants shall support cooperation and the associated costs. Complementary activities such as an investment are not possible without the establishment and operation of the cooperation.

Only new and existing co-operations are eligible for new activities.

Innovation collaborations allow actors from different professional backgrounds to connect and find solutions to a current problem and challenge in a complementary way. The purpose of the Partnerships is to translate their existing knowledge into innovative solutions that can be applied in practice by the various actors involved in innovation, agriculture, forestry, food, rural development, research and advice.

The European Innovation Partnership for the Productivity and Sustainability of the Agricultural Economy (EIP) aims to stimulate innovation and improve knowledge transfer. The EIP should support the AKIS by linking policies and instruments to speed up innovation. The interaction between individual AKIS actors and synergies between knowledge transfer, innovation and digitalisation interventions should be facilitated by the CAP Network through support units responsible for networking in specific thematic areas and assisting in the implementation of interventions. The themes covered by the CAP Network, within and between which networking and synergy of relevant measures will be supported.

Objective:

- support collaborations for the development, transfer and implementation of innovative practices and encourage the uptake of innovation solutions;
- making the agricultural, forestry, food and food sectors more productive and sustainable, improving competitiveness and helping communities benefit from social innovations in the rural development sector;
- individual sectors are better adapted to current challenges such as increased competition, volatile market prices, climate change and compliance with stricter environmental rules.

Article 1 Green innovative solutions (innovations supporting policy goals)

Pre-defined themes will be developed for EIP Goal 1 Operational Groups. The pre-defined themes are among the most important policy challenges for domestic farmers. Operational Groups are tasked with

developing innovative solutions for compliance with policy conditions, assessing them and formulating policy recommendations where necessary. The list below is non-exclusive, additional topics may be included in this target area if new challenges arise in the future.

1.1. Soil

- implementation of soil protection measures and action plan
- erosion prevention cooperation
- interventions to reduce ammonia emissions from agriculture (manure storage, treatment, application, correct nutrient management)
- sustainable soil management and improvement (TCST)

Plant protection, organic farming

- implementation of plant protection measures and action plan
- developing good agricultural practices (draining and banning water-intensive crop production) in drought-affected areas to address the needs and measures directly related to reducing the use of pesticides and reducing the use of plant protection products

Air protection, GHG

- prevention and reduction of agricultural ammonia and GHG emissions
- carbon sequestration and greenhouse gas emissions reduction practices (land-use change, direct sowing, soil cover, reduction of fertiliser use, increase of soil organic matter, etc.)
- development of livestock farms to reduce emissions (feeding, manure storage and treatment, flooring, insulation, air scrubber and other abatement technologies, BAT requirements, etc.)

1.4. Water protection

- water protection measures and compliance with the Water Framework Directive
- interventions to reduce nutrient pollution to reduce high levels of eutrophication of surface waters

1.5. Animal welfare, AMR

- animal welfare and AMR measures
- measures to reduce the use of antimicrobials (AMR)

1.6. Coordination of forestry and hunting

- Establishment and operation of a national forest wild impact monitoring system

1.7 Forest management and matching of societal needs

- Establishment and operation of a national forest visitor monitoring system

The above are the societal challenges and themes currently visible. If new policy needs arise later (e.g. the Green Deal targets are transposed into legislation), the themes could be further expanded.

Article 2 (bottom-up innovation initiatives)

Support European Innovation Partnership (EIP) innovation collaborations where the innovation content of projects can be product, service, process or technological development, social or adaptive innovation

— agricultural,

— forestry and hunting,

— food and feed production,

in the rural development sector, or

- in a biomass-based economy (also moving towards industrial production), and

— in the area of consumer and rural social issues.

For the above target area, the project ideas are expected as a bottom-up initiative and by collaborators, which can be supported by the work of the CAP Network's Innovation and Digital Support Unit and by innovation consultants. In line with mandatory innovation support under 15(4)(e), in particular for the

preparation and implementation of EIP Operational Group projects referred to in Article 127(3).

Project themes may include, for example, taking into account the above objectives:

1. Animal husbandry
2. Animal welfare
3. Feed and feed
4. Arable crops
5. Outdoor horticulture and woody plants (including viticulture, olives, fruit, ornamental plants).
6. Greenhouse crops
7. Forestry
8. Wildlife management
9. Aquaculture
10. Genetic resources
11. Pest/disease control
12. Pest/disease control in animals
13. Plant nutrients
14. Soil
15. Water
16. Energy
17. Climate change (including greenhouse gas reduction, adaptation and mitigation, and other air-related issues, alternative farming methods in drought areas)
18. Organic farming
19. Agro-ecology
20. Crop conversion/cultivation diversification/dual or mixed production
21. Biodiversity and nature
22. Sustainable landscape/land management (e.g., erosion prevention measures)
23. Circular economy, including waste, by-products and residues
24. Equipment and machinery
25. Competitiveness/new business models
26. Diversification of the economy
27. Supply chain, marketing and consumption
28. Food safety, safety, quality, processing and nutrition
29. Digitalisation, including data and data technologies
30. AKIS, including advice, training, farm demonstrations, interactive innovation projects.

The Operational Group project can contribute to achieving one of the following relevant Green Deal, Farm to Fork, Biodiversity Strategy and European Forest Strategy objectives:

1. Achieving climate neutrality
2. Reducing the overall use and risk of chemical plant protection products and/or the use of more hazardous plant protection products
3. Organic farming and/or organic aquaculture, with a view to increasing uptake
4. Reducing the use of antimicrobials in farmed animals and aquaculture
5. Reducing nutrient losses and the use of fertilisers while maintaining soil fertility
6. Improving the management of natural resources such as water, soil and air used by agriculture
7. Protection and/or restoration of biodiversity and ecosystem services within agricultural and forestry systems

8. Re-entry of agricultural land under high diversity landscape features
9. Facilitating access to fast broadband in rural areas
10. Improve animal welfare
11. Biodiversity-friendly afforestation and afforestation, climate, economic and social challenges for the forest management of the future

The Operational Group project can contribute to improving knowledge on the following CAP-specific objectives:

Ensuring viable income

2. enhancing competitiveness
3. rebalancing power in the food chain
4. climate change resilience and adaptation
5. environmental care
6. preserve landscapes and biodiversity
7. support generational renewal
8. vibrant rural areas
9. improving the response to societal demands on food and health

It shall in particular:

- (a) create added value by enhancing the link between research and farming practices and by promoting the wider use of available innovation measures;
- (b) connect innovation actors and projects;
- (C) encourages faster and wider practical implementation of innovative solutions, including the exchange of information between farmers; and
- (D) inform the scientific community of research needs related to farming practices.

Selection principles (which may be partially applicable according to the purpose of the call):

1. Selection principles to be applied in all cases:

- Quality and content of the innovation project plan, financial plan
- Participation of an editor or innovation facilitator in the project
- Existence of multi-actor partnerships in the AKIS system, operating in accordance with the interactive innovation model described in Article 127(3)
- Complementarities of EIP Operational Group working partners (synergies)
- Previous professional experience in collaborations or in the field of the project

2. Selection principles that can be partially applied according to the purpose of the call:

- The innovation potential of the project and the history of innovation on the topic (domestic and international)
- Number of small farms involved in cooperation
- Number of EIP Operational Group cooperating partners
- Qualifications of the professionals involved in the cooperation, relevant references obtained in a given topic
- Cooperation in national and foreign education, consultancy, research institutions, participation in international networks, where relevant
- Inclusion of Natura 2000 habitats, in particular 9110, 9130, 9150, 9180, 91E0, 91F0, 91G0, 91H0, 91K0, 91L0, 91M1, 91N0.
- Mainstreaming environmental, climate and adaptation aspects
- Social mainstreaming

- Mainstreaming of equal opportunities

Relevant legislation:

Act LXXVI of 2014 on scientific research, development and innovation

Act XXXVII of 2009 on forests, forest protection and forest management

Act LV of 1996 on the protection of wild game, wildlife management and hunting

Relationship with other interventions and measures:

Under the CAP network, the Innovation and Digital Support Unit supports the EIP Operational Groups from the development of innovation project ideas to their implementation.

RD58_A01_TRA_78 – Training and demonstration programmes, and

RD60_A04_ADP_78 – Advisory services can be linked to interventions as basic knowledge-sharing pillars of the AKIS system in the function of EIP projects, knowledge generation or knowledge translation.

RD02_D01-FRM_73 – Supporting the digital transition of agricultural plants as a pillar of digitalisation of the AKIS system can be linked to EIP projects in the digital competence development function.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiaries:

1. Farmer, farm worker or farmer's organisation
2. Forest manager, forestry worker or professional forestry organisation
3. Persons entitled to hunt
4. Advisory organisation or chamber of agriculture
5. Research or research organisation
6. Educational or vocational training organisation (including trainers)
7. Climate/environment/conservation organisation or agency
8. Service providers other than advisors: this may include e.g. input providers, contract workers, facilitators, veterinarians, social workers, machinery suppliers/service providers, IT experts/IT company, technology developers, lawyers, financial experts, communications experts, specialised consultants, etc].
9. Processor or retailer
10. Consumer/consumer organisation
11. Authority
12. Lead group
13. Other (examples: farmers' associations/consortia, producer organisations, technology centres, municipalities, local development companies, regional agencies, schools and education/training centres, multimedia/communication companies, processing firms, marketing companies, trade unions, national parks, other nature conservation organisations)

Specific eligibility criteria related to the eligible beneficiary and area:

- the innovation cooperation project is a bridge between the practical problem and research; and other areas of expertise
- the innovation cooperation project has already participated in the pre-screening of innovation project ideas and is eligible to apply under the call under the intervention.
- there are at least 2 cooperating partners in an EIP Operational Group, of which at least 1 partner has expertise relevant to the purpose of the project (e.g. farmer or food processor or forest manager, or producer of timber products, other forest products, or hunting, and at least 1 research or research

organisation or consultant)

- the EIP Operational Group has a cooperation agreement (minimum requirement: description of the project plan, topicality, relevance, practical problem and options to be exploited, allocation of tasks and responsibilities within the cooperating group, timetable)
- Each EIP Operational Group shall draw up a detailed plan for the design and implementation of an innovative project.
- The innovative project shall be based on the interactive innovation model which has as key principles: the development of innovative solutions focusing on the needs of farmers and forest managers and hunt holders, while addressing interactions throughout the supply chain when this proves useful; (b) bringing together partners with complementary knowledge, such as farmers, forest managers, advisors, researchers, businesses, governmental or non-governmental organisations, in a targeted composition adapted to the objectives of the project, and (c) joint decision-making and co-creation throughout the project.
- The EIP Operational Groups shall disseminate a summary of their plans and the results of their projects, in particular through the national and European CAP networks: dissemination, communication and dissemination of the results of innovation projects; liaising with the AKIS coordination organisation of the Ministry of Agriculture; cooperation with the Innovation and Digitalisation Support Unit;

Commitment duration of 2 years or more but not more than 7 years

Up to 1 international partner may be involved in EIP collaborations.

As this measure falls outside the scope of Article 42 TFEU (see point 8), no aid may be granted to a beneficiary under Commission Regulation (EU) No 651/2014 or Commission Regulation (EU) No 702/2014, with the exception of de minimis aid.

- it is considered to be a firm in difficulty (the concept of a firm in difficulty is defined in Decree 37/2011 on the procedure for State aid for the purposes of EU competition law and on the regional aid map. (III. As defined in Section 6(4a) and (4b) of Government Decree No 487/2015, or
- it failed to comply with the decision of the European Commission addressed to Hungary requiring the recovery of State aid within the meaning of EU competition law.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Eligible costs for the intervention:

The costs of setting up, operating, promoting and researching the operational team, including own performance.

We plan to make the investment-related costs of the operational groups and its members eligible by means of itemised cost accounting.

For both target areas:

Itemised cost accounting on the basis of the actual costs incurred for the implementation of the project.

Flat-rate: Indirect costs necessary for research are eligible up to a maximum of 20 %.

Lump sum: Lump sums are possible for small-scale projects

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

☒ reimbursement of eligible costs actually incurred by a beneficiary

☐ unit costs

☒ lump sums

☒ flat-rate financing

Basis for the establishment

The payment shall be made in accordance with Article 83(1)(a), 1(c), 1(d), 2(a)(i) and 2(b) of the STR.

1(a): Itemised cost statement based on actual costs incurred in implementing the project.

1(c) and 1(d): Flat rate and flat rate: indirect costs for research shall be eligible up to a maximum of 20 %.

Range of support at beneficiary level

For both target areas:

A maximum aid intensity of 100 %.

Additional explanation

Investment-type costs of an operational group and its members are planned to be eligible with an itemised cost statement.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☒ Yes ☐ No ☐ Mixed

Explanation of support activities falling outside the scope of Art. 42 TFEU

In view of the objective of the intervention set out in point 5, the competition rules are generally applicable.

Type of state aid instrument to be used for clearance:

☐ Notification ☐ GBER ☒ ABER ☐ de minimis

State Aid case number

SA.112038

Additional information:

☐ The Member State has not yet chosen the instrument(s) and has indicated the alternatives. No support will be paid to beneficiaries before the date when the clearance of the instrument chosen comes into effect.

☐ The Member State has chosen the instrument, as indicated, but the clearance has not yet been obtained. No support will be paid to beneficiaries before the date when the clearance comes into effect.

☒ The Member State has chosen the instrument, as indicated, the clearance has been obtained and the SA number has been indicated for notification, GBER or ABER

9 Additional questions/information specific to the Type of Intervention

N/A

10 WTO compliance

Green Box

Paragraph 2 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria

referred to in point 2 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(2)(d) - Other regions	43.00%	20.00%	43.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD61_O01_A01_PR - Of innovative collaborations to achieve green goals	Grant	91(2)(d)-HU-43.00%	Average		R.1; R.2; R.28	No
RD61_O01_A02_PR - Innovative collaborations from bottom-up initiatives	Grant	91(2)(d)-HU-43.00%	Average		R.1; R.2; R.28	No

Explanation and justification related to the value of the unit amount

RD61_O01_A01_PR - Of innovative collaborations to achieve green goals

The unit amounts have been established taking into account the budget of the current supported operational groups of the Rural Development Programme, as well as inflation and the increased tasks resulting from the CAP reform.

The call for Innovation Operational Groups and support for the investment needed to implement the innovative project was launched in 2017, and a total of 169 applications were submitted, out of which 82 projects were supported.

Of these, the 7 largest-budget VP EIP projects, representing between 8 % and 10 % of all projects, have an average budget of EUR 1852574,44.

This amount is also taken into account for target area 1 of the EIP intervention, where 7 innovative collaborations linked to SO4-06 are planned with a larger budget. These collaborations are innovation partnerships to address the challenges identified by EU legislation on environment, biodiversity and climate change, with a commitment close to the programming cycle.

Inflation is also taken into account in determining the unit amount, so we have constructed the unit amount per project 2.190. EUR 000.

The maximum unit amount was taken at 20 % in view of the innovative nature of the projects, where it is difficult to determine in advance the inputs needed to achieve the intended results.

RD61_O01_A02_PR - Innovative collaborations from bottom-up initiatives

The unit amounts have been established taking into account the budget of the current supported operational groups of the Rural Development Programme, as well as inflation and the increased tasks resulting from the CAP reform.

The call for Innovation Operational Groups and support for the investment needed to implement the innovative project was launched in 2017, under which 82 projects were funded.

38 of these are representative of bottom-up initiatives. They have an average budget of EUR 324956,68.

This need is also taken into account in target area 2 of the EIP intervention, where we plan to support 63 bottom-up innovative cooperation projects with smaller budgets. The development of new innovation ideas is encouraged by the creation of an innovation and digitalisation support unit to support the creation and operation of the European Innovation Partnerships in Hungary. If during this preparation process we get a closer picture of the current innovation project needs, at the initiative of the support unit, the Managing Authority will reduce the planned unit amount of the intervention by means of a

programme amendment, thereby increasing the number of projects.

Inflation is also taken into account in determining the unit amount, so we have established a unit amount of EUR 330.000 per project.

The maximum unit amount was taken at 20 % in view of the innovative nature of the projects, where it is difficult to determine in advance the inputs needed to achieve the intended results.

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029
RD61_O01_A01_PR - Of innovative collaborations to achieve green goals (Grant - Average)	Planned unit amount (Total Public Expenditure in EUR)	0.00	2,190,000.00	2,190,000.00	2,190,000.00	2,190,000.00	2,190,000.00	2,190,000.00	
	Maximum planned average unit amount (where applicable) (EUR)	0.00	2,740,000.00	2,740,000.00	2,740,000.00	2,740,000.00	2,740,000.00	2,740,000.00	
	O.1 (unit: Projects)	0.00	3.00	4.00	0.00	0.00	0.00	0.00	Sum: 7.00

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.1 Number of persons benefitting from advice, training, knowledge exchange, or participating in European Innovation Partnership (EIP) operational groups supported by the CAP in order to enhance sustainable economic, social, environmental, climate and resource efficiency performance

R.2 Number of advisors receiving support to be integrated within Agricultural Knowledge and Innovation Systems (AKIS)

R.28 Number of persons benefitting from advice, training, knowledge exchange, or participating in European Innovation Partnership (EIP) operational groups supported by the CAP related to environmental or climate-related performance

R.3 Share of farms benefitting from support for digital farming technology through CAP

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

The level of knowledge, quality of knowledge, modernity or practicality of farmers determines their competitiveness, which plays an important role in fostering economic growth and social development in rural areas. The training activity should be linked to one or more objectives covered by the CAP Strategic Plan.

The interaction between AKIS actors and synergies between knowledge transfer, innovation and digitalisation interventions will be facilitated by the CAP Network's continuous cooperation in each theme, responsible for networking and assisting in the implementation of interventions, thus achieving synergies between networking and relevant measures in the themes covered by the CAP Network, thereby improving the efficiency of knowledge transfer.

Target:

- encourage participation in lifelong learning by supporting an applied professional knowledge transfer service responding to the specific needs of the economy, enterprise or farmer,
- a wide range of training and knowledge transfer opportunities respond to current challenges and be accessible both in person and online for actors in agriculture, forestry, food and rural development.

Content:

Target A – Mandatory training

The provision of mandatory training for beneficiaries as required by the CAP ST interventions.

—Compulsory training required for certain CAP Strategic Plan interventions

- RD19_G01_AEC_70 – Agricultural Environmental Management Payments (AKG) -(a mandatory component of the mandatory training is digital competence development e.g. webGN)
- RD20_G02_ORT_70 – Support for organic farming (ÖKO) -(a mandatory element of digital competence development as part of mandatory training e.g. webGN)
- RD35_F02_FEC_70 – Forest multiannual commitments for the environment (ERA)
- RD36_F03_GEN_70 – Multiannual forest genetic commitments
- RD37_F04_FRC_77 – Collaborative support for forest fire prevention and risk reduction
- RD23_G06_NAG_72 – compensation payments for Natura 2000 agricultural areas
- RD06_B02_YFY_75 – Generational renewal supported by a receiver
- RD08_B04_BIS_75 – Generational renewal supported by rural and young forest start-ups

- Show-breaking programmes, other training, further training, trainings combining knowledge and practice in the field, competence and skills training, training for trainers, training of special advisers, etc., such as:

Training of special advisers in support of generational renewal

-Target B – Other training courses

Non-compulsory training in agriculture, further training, trainings combining knowledge and practice, competence and skills training, including vocational training and official training, which are not required by calls for proposals.

Target Area C – Demonstration Plant Programmes

Support for the implementation of demonstration, information and consultation programmes organised on the farm site, enabling farmers and forest managers to familiarise themselves with innovative technologies, new varieties and environmental, animal welfare, farm management, organisation and marketing solutions, among others.

Practice-driven knowledge transfer activities can take place in classroom (target areas A and B) and practical/demonstration sites (target area C), both domestically and abroad

Selection principles (which may be partially applicable):

Quality of professional, financial and training plans

Quality of personal competences, infrastructure and material conditions

The qualifications of the professionals involved in the service by the training service provider and the relevant references in the subject area.

Existence of multi-stakeholder partnerships in the AKIS system (multiactor approach)

Participation in FarmDemo Hub

Live cooperation with knowledge-sharing platforms at home and abroad

Practice-orientation of knowledge transfer

Use of digital solutions

Use and diffusion of innovative solutions

Extent of territorial coverage

Regional aspects

Environmental, climate and adaptation aspects

Social mainstreaming

Mainstreaming of equal opportunities

Relevant legislation:

Act LXXVII of 2013 on adult education

Act LXXX of 2019 on vocational training

12/2020. (II. Government Decree of 7 July 2006 on the implementation of the Act on vocational training

Link with other interventions:

Knowledge sharing under the training intervention contributes to all CAP Strategic Plan interventions.

Under the CAP Strategic Plan, calls for proposals launched by the Managing Authority may require mandatory training for each intervention.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiaries:

Target area A Compulsory training

agricultural vocational training centres – Decree No 12/2020 on the implementation of the Law on vocational education and training following a call for expressions of interest published in a priority selection procedure (II. Institutions defined on the basis of Section 91 of Government Decree No 487/2015

Target area B Other training and target area C

Demonstration programmes:organisation authorised to carry out knowledge transfer activities

Specific eligibility criteria related to the eligible beneficiary and area for each target area:

- has a training and knowledge transfer plan (with minimum mandatory content: description of the technical content of the planned programmes, number of programmes, duration, planned visitor number, dissemination (distribution of project results))
- accreditation under the conditions set by a specialised department (may be designated by ministerial or legislation), taking into account the diversity of organisations authorised to carry out knowledge transfer activities
- participation of trainers in compulsory training
- impartiality and independence

Whereas this measure falls outside the scope of Article 42 TFEU (see point 8), with the exception of de minimis aid, **no aid may be granted** to a beneficiary under Commission Regulation (EU) No 651/2014 or Commission Regulation (EU) No 702/2014

- it is a firm in difficulty (the concept of a firm in difficulty is defined as 37/2011 on the State aid procedure for the purposes of EU competition law and on the regional aid map. (III. Section 6(4a) and (4b) of Government Decree No 22/2000) and
- failed to comply with the decision of the European Commission, addressed to Hungary, requiring the recovery of State aid in the sense of EU competition law.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments and other requirements for all three target areas:

— liaise with the AKIS coordination organisation of the Ministry of Agriculture, liaising with the support units of the CAP Network related to the theme;

— implementation of the training and knowledge transfer plan

1 person providing training shall not be eligible for more than 8 hours of supported knowledge transfer activities per working day.

Possible themes related to agriculture and CAP objectives for target areas B and C:

1. Animal husbandry
2. Animal welfare
3. Feed and Feed
4. Arable crops
5. Outdoor horticulture and woody plants (including viticulture, olives, fruit, ornamental plants).
6. Greenhouse crops
7. Forestry, agro-forestry systems, production of forest reproductive material, wood processing, forest genetic resources, forest tourism
8. Wildlife management
9. Aquaculture
10. Genetic resources
11. Control of plant pests/diseases
12. Pest/disease control in animals
13. Plant nutrients
14. Soil
15. Water /training on irrigation management
16. Energy
17. Climate change (including greenhouse gas reduction, adaptation and mitigation and other air-related issues)
18. Organic farming

19. Agroecology
20. Crop conversion/cultivation diversification/dual or mixed production
21. Biodiversity and nature
22. Sustainable landscape/land management
23. Circular economy, including waste, by-products and residues
24. Equipment and machinery
25. Competitiveness/new business models
26. Diversification of the economy
27. Supply chain, marketing and consumption
28. Development and operation of producer cooperation
29. Food safety, safety, quality, processing and nutrition
30. Generational renewal
31. Digitalisation, including data and data technologies
32. AKIS, including advice, training, farm demonstrations, interactive innovation projects (EIP priority themes)(trainers)

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

☒ reimbursement of eligible costs actually incurred by a beneficiary

☒ unit costs

☐ lump sums

☐ flat-rate financing

Basis for the establishment

The payment is based on Article 83(1)(a), (b) and 2(a)(i) of the STR.

The hourly unit cost of the training activity is based on the current (in 2020) supported training data, complemented by inflation, consultation of the organisation in charge of coordinating training and increased tasks as a result of the CAP reform. The unit cost has been calculated separately for several types of training (8, 24, 80, 280 hours). The reimbursement of eligible costs actually incurred by the beneficiary is possible only for the management of operations.

Range of support at beneficiary level

Aid intensity: maximum 100 %

Additional explanation

Method

The hourly unit cost of training activities during the intervention of *the CAP Strategic Plan* RD58 – Training and Demonstration Plant Programmes can be determined on the basis of data from the 2020 RDP supported training cost. Based on the training experience of the Rural Development Programme 2014-2020, the unit cost of the training intervention was established separately for the four different types of training (8 hours ‘compulsory’, 24 hours ‘other’ and 80 hours ‘official’, with an average of 280 hours of professional qualification). The cost items taken into account in the calculation of the unit cost include the

direct costs of training, the costs of organisation and the cost of testing.

Results

For each type of training, hourly unit costs can be determined on the basis of the number of participants planned on the basis of previous years' experience, the total number of hours and the total cost of training per person. It is thus calculated that the unit cost per hour of training for vocational and vocational training of an average of 280 hours is EUR 5.7 perhour/person trained, the unit cost of compulsory training required for each intervention of the8hour CAP Strategic Plan is EUR 16.6 perhour/trained person, the unit cost of24hours' 'other' training is EUR 11.6 per hour/person trained and theunit cost for the80-hour official training is EUR 6.5 per hour/person trained. The combined average unit cost of the supported trainings on this basis amounts to EUR 8.2 per hour/trained person.

Vocational training	2 505	3 987 411	701 400	5,7
Other training courses	6 350	1 771 041	152 400	11,6
Official training	7 100	3 715 342	568 000	6,5
Compulsory training	31 730	4 224 871	253 840	16,6
<i>Total</i>	<i>47 685</i>	<i>13 698 666</i>	<i>1 675 640</i>	8,2

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

N/A

10 WTO compliance

Green Box

Paragraph 2 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 2 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(2)(d) - Other regions	43.00%	20.00%	43.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD58_O33_A01_HO - Training	Grant	91(2)(d)-HU-43.00%	Average		R.1; R.2; R.28; R.3	No

Explanation and justification related to the value of the unit amount

RD58_O33_A01_HO - Training

Four different types of training were defined on the basis of the current supported training experience, which have different cost structures, so it was not possible to establish a uniform hourly rate per unit cost. Therefore, the average value was calculated taking into account the planned hours of the four types of training.

During the implementation period of the CAP Strategic Plan, it is conceivable that there will be a year in which only compulsory training is supported, so the maximum planned unit amount is also set on the basis of this.

In detail, the explanatory memorandum is entitled ‘AKI: Determination of the unit cost of SUPPORTED TRAINING can be found in Background information’.

13 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	2028	2029	Total 2023 - 2029

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.1 Number of persons benefitting from advice, training, knowledge exchange, or participating in European Innovation Partnership (EIP) operational groups supported by the CAP in order to enhance sustainable economic, social, environmental, climate and resource efficiency performance

R.2 Number of advisors receiving support to be integrated within Agricultural Knowledge and Innovation Systems (AKIS)

R.28 Number of persons benefitting from advice, training, knowledge exchange, or participating in European Innovation Partnership (EIP) operational groups supported by the CAP related to environmental or climate-related performance

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Objectives of advisory services for farmers and the establishment of advisory services related to the implementation of the CAP

Social, economic and environmental challenges require a high degree of flexibility for farmers. Modernisation processes have accelerated and technological developments in the agro-food industry need to be followed by up-to-date knowledge and specific knowledge in order to be able to cope with fierce competition on the market. At the same time, it is also expected that sustainable farming models will be used consciously in response to the challenges posed by climate change. This requires the development of a complex knowledge base and the development of farmers' skills. To achieve this, we need to give every help to jointly achieve the objectives of the Common Agricultural Policy. The purpose of the intervention is to have sufficient independent consultants to cover all areas.

All advisory activities are key to promoting economic growth and social development in rural areas, supporting generational renewal and improving the sustainability, competitiveness, resource efficiency and environmental performance of agricultural and forestry holdings. Synergies between advisory, training and innovation activities should be created in the AKIS system. This knowledge transfer activity should be linked to one or more of the objectives covered by the CAP Strategic Plan. The intervention will cover the mandatory themes set out in Article 15 of the CAP Strategic Plan Regulation.

Interaction between individual AKIS actors and synergies between knowledge transfer, innovation and digitalisation interventions will be facilitated by the CAP Network through its continuous cooperation in each thematic area, responsible for networking and for the implementation of interventions. The themes covered by the CAP Network, within and between which networking and synergy of relevant measures will be supported.

Advisory services are an intervention to help farmers who want to find a technical problem in their economic situation, so that their knowledge can be deepened. For this intervention, it is expected that in the previous period, in addition to the economic operator who has used the advice and is open to professional development, we expect to attract interest from among the 110.000 farmers using general advisory services, thereby strengthening the role of professionally responsive, initiating farmers in the AKIS. For this reason, the accounting basis for target areas B and C of the intervention was chosen to be hourly accounting.

Content of the intervention:

A. Launch of a new advisory service

(creation of a new service)

- The creation of new independent advisory services in professional, inter-branch and non-profit associations. The services cover, in whole or in part, the mandatory elements of Article 15 of the STR.

B. Operation of the General Advisory Network

Individual forms of advice in the regional office network of the organisation referred to in Act CXXVI of 2012 on the Hungarian Chamber of Agriculture, Food Economy and Rural Development – farmers turn to consultants – in which knowledge is transferred:

- coaching on specific CAP measures focusing on IACS type measures;
- personalised advice on changes in farming practices due to the specific objectives of the CAP, the Green Deal objectives and related regulatory and support measures;
- coaching on the organisation and development of farm management and administrative data and reporting related to the CAP
- advice on participation in other AKIS measures to help improve professional knowledge (agriculture, forestry, hunting, food, rural development) and innovation (innovation support services)
- active participation in the activities of the CAP network

C. Special advisory services

Individual forms of advice provided by specialised advisory organisations and individual special advisers,

involving in-depth knowledge transfer targeting the specific problems of agriculture, forestry, food and rural actors, responding to their specific economic, environmental and social needs, promoting effective practical application and innovation, with key topics such as (non-exhaustive list):

- sustainable management of water, soil and nutrients;
- risk prevention and management;
- environmentally friendly plant protection;
- tackling infectious animal diseases and treatment practices to prevent the development of antimicrobial resistance (AMR) to combat antimicrobial resistance;
- animal welfare practices;
- reducing national atmospheric emissions, improving air quality;
- the conservation of natural habitats, wild fauna and flora and the protection of pollinators;
- employment conditions, employer obligations, health and safety at work, social support in agricultural communities;
- digital technologies in agriculture and rural areas;
 - organic farming
- innovation grants for the preparation and implementation of EIP Operational Group projects, etc.

Selection principles (which may be partially applicable):

- Quality of the technical and financial plan.
- Personal competences, infrastructure and material conditions, quality of assets.
- The number of professionals involved in the service by the service provider, their qualifications and the relevant references obtained in the subject matter.
- Use of the Fast system
- Use of digital solutions.
- use of organic agriculture
- Practice orientation of knowledge transfer.
- Extent of territorial coverage.
- Existence of multi-stakeholder partnerships in the AKIS system (multiactor approach)
- Uptake and dissemination of innovative solutions
- Regional aspects
- Mainstreaming of environmental, climate and adaptation aspects
- Social mainstreaming
- Mainstreaming equal opportunities

Relevant legislation:

Act CXXVI of 2012 on the Hungarian Chamber of Agriculture, Food Economy and Rural Development

Act XCVII of 2015 on certain aspects of the organisation of the markets in agricultural products, producer organisations and interbranch organisations

525/2013. (XII. Government Decree No 30/2001 laying down the administrative and other tasks of the network of village farmers operated by the Hungarian Chamber of Agriculture, Food Economy and Rural Development

1/2022. Decree (I. 14.) of the Minister for Agriculture on the activities of special advisers in agriculture and rural development and on the agricultural farm advisory system

Act XXXVII of 2009 on forests, forest protection and forest management

43/2010. (IV. Decree of the Minister for Agriculture and Rural Development on plant protection activities

24/2020. (VI. 22) Decree of the Minister for Agriculture on producer integration organisations

42/2015. (VII. Decree No 22/2001 of the Minister for Agriculture on the recognition of producer groups

50/2017. Decree (X.10.) of the Minister for Agriculture on fruit and vegetable producer organisations

Relationship with other interventions:

All forms of advice contribute to the interventions of the CAP Strategic Plan.

- RD27_G10_GPX_70 – Ex situ conservation of plant genetic resources and micro-organisms
- RD28_G11_GPI_70 – In situ conservation of plant genetic resources
- RD29_G12_AWC_70 – Animal welfare subsidies in the small ruminant sector
- RD30_G13_AWC_70 – Animal welfare support in the cattle sector
- RD32_G15_AWC_70 – Animal welfare premiums in the poultry sector
- RD33_G16_ANB_70 – Animal welfare aid in the apiculture sector
- RD_33b_G17_AMR_70 – Compensatory payment for the fight against antimicrobial resistance

The RD58_A01_TRA_78 – Training and demonstration programmes, and

RD61_A05_EIP_77 – European Innovation Partnership interventions as key pillars of the AKIS system for knowledge sharing and innovation can be linked to the advisors' function of translating knowledge into practice.

RD02_D01-FRM_73 – Supporting the digital transformation of agricultural plants as a basic pillar of the AKIS system could be linked to the digital competence development function of consultants.

RD07_B03_YFO_77 – Generational renewal, farm transfer cooperation in mentoring farm transfer processes under the intervention.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible beneficiaries:

A. Launch of a new advisory service

professional, inter-branch and non-profit associations carrying out consultancy activities

B. Operation of a general advisory network

Organisation within the meaning of Act CXXVI of 2012 on the Hungarian Chamber of Agriculture, Food Economy and Rural Development

C. Special advisory services

individual consultants, advisory organisations

Specific eligibility criteria related to the eligible beneficiary and area:

authorised to provide advice on the subject and area of expertise

Whereas this measure falls outside the scope of Article 42 TFEU (see point 8), with the exception of de minimis aid, **no aid may be granted** to a beneficiary on the basis of Commission Regulation (EU) No 702/2014

- it is a firm in difficulty (the concept of a firm in difficulty is defined in Article 37/2011 on the procedure for State aid within the meaning of EU competition law and on the regional aid map. (III. Section 6(4a) and (4b) of Government Decree No 273/2007) or
- it failed to comply with the European Commission's decision to repay State aid within the meaning of EU competition law addressed to Hungary.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments and other requirements:

- the advice supported must be free from any conflict of interest and the advice provided must be impartial and adapted to the different types of production and the nature of the farms
- the Special Adviser regularly participates in further training in his/her field of expertise and enhances his/her knowledge

has an advisory plan in place and implements the advisory plan

liaising with the AKIS Coordination Organisation of the Ministry of Agriculture

liaising with the support units of the CAP Network related to the theme

the duration of the commitment is limited to 5 years

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Form and rate of support/amounts/calculation methods

Form of support

☒ **Grant**

☐ **Financial instrument**

Type of payment

☐ reimbursement of eligible costs actually incurred by a beneficiary

☒ unit costs

☒ lump sums

☐ flat-rate financing

Basis for the establishment

The payment shall be made in accordance with Article 83(1)(b), 1(c) and 2(a)(i) of the STR.

1(b): Unit costs – advice: the unit cost of advisory activity is based on hourly basis and based on 2020 data from the current advisory system, taking into account the increased tasks due to inflation and the CAP reform.

1(c): Lump sums – creation of a new advisory service: for new advisory activities, a maximum of EUR 200.000 per new advisory activity in the form of a lump sum, which may focus on developing the necessary tools and qualifications

Range of support at beneficiary level

Aid intensity: maximum 100 %

Additional explanation

A. Launch of a new advisory service

operation: creation of a new advisory service.

Lump sum payment of EUR 200000 for a maximum of 5 years (CAP ST Regulation)

B. Operation of a general advisory network and C. operation of special advisory services

operation: advice between a client and the beneficiary of the measure (unit: (hours)

Unit cost: (hour-based accounting)

Method

The intervention of the CAP Strategic Plan “Advisory Services” concerns support for the provision of solutions to problems encountered by farmers, their farm/holding, independent professional advisory

activities. For the purpose of determining the unit cost for the advisory service, the special advisers are referred to in Article 16/2019. (IV). The hourly rates provided in the 2020 report drawn up on the basis of the Decree of the Minister for Agriculture and Rural Development and the results of an anonymous questionnaire survey carried out by the National Chamber of Agricultural Economics on 2-3 November 2021. To validate the calculated result, we used the hourly consultancy fees planned and implemented by the supported advisory organisations during the Rural Development Programme call for ‘Agriculture, forestry and food processing individual and group consultancy’.

Results

For the supported consultancy, it is proposed to use hourly unit costs. The basis for calculating the unit cost for individual consultancy is the result of the most recent questionnaire survey carried out in November 2021, which results in an hourly rate of EUR 35 for special advisers. This amount corresponds to the size of the funds involved in the validation – the 2020 accounts of the specialised advisory bodies, the planning and factual data of the VP 2014-2020 advisory measure – and can therefore be used for the planning of the consultancy intervention of the CAP Strategic Plan.

8 Information regarding State aid assessment

The intervention falls outside the scope of Article 42 TFEU and is subject to state aid assessment:

☐ Yes ☒ No ☐ Mixed

9 Additional questions/information specific to the Type of Intervention

N/A

10 WTO compliance

Green Box

Paragraph 2 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 2 of Annex II.

11 Contribution rate(s) applicable to this intervention

Region	Article	Applicable rate	Min Rate	Max Rate
HU - Magyarország	91(2)(d) - Other regions	43.00%	20.00%	43.00%

12 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Support	Contribution rate(s)	Type of Planned Unit Amount	Region(s)	Result Indicator(s)	Is the unit amount based on carried over expenditure?
RD60_O33_U01_ON - Launch of a new advisory service	Grant	91(2)(d)-HU-43.00%	Uniform		R.2	No
RD60_O33_U02_HO - Operation of specialised advisory services	Grant	91(2)(d)-HU-43.00%	Uniform		R.1; R.2; R.28	No
RD60_O33_U03_HO - Operation of a network of general advisory services	Grant	91(2)(d)-HU-43.00%	Uniform		R.1; R.2; R.28	No

Explanation and justification related to the value of the unit amount

RD60_O33_U01_ON - Launch of a new advisory service

On the basis of consultation with professional organisations, the development of the tools and qualifications needed to develop new advisory activities is necessary and sufficient to meet the increased expectations resulting from the CAP reform and the amount provided by the CAP Strategic Plan Regulation is sufficient.

Regulation (EU) 2021/2115 OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 2 December 2021 establishing rules on support for strategic plans to be drawn up by Member States under the common agricultural policy (CAP Strategic Plans) and financed by the European Agricultural Guarantee Fund (EAGF) and by the European Agricultural Fund for Rural Development (EAFRD) and repealing Regulations (EU) No 1305/2013 and (EU) No 1307/2013 Article 78 Exchange of information and dissemination of information pursuant to Article 78(4) Member States may grant support for the establishment of advisory services up to a fixed amount of EUR 200000

RD60_O33_U02_HO - Operation of specialised advisory services

The unit cost of consultancy activity was calculated on the basis of the hourly basis and the current advisory system based on the 2020 accounts of the special advisers and the replies to the anonymous questionnaire survey provided by the special advisers, carried out on 2-3 November 2021, taking into account the increased tasks due to inflation and the CAP reform.

The special advisers report on the activities of special advisers in agriculture and rural development and the agricultural advisory system. (IV. (29) are prepared each year with the data content required by the AM Decree. In addition, the online questionnaire was sent to them specifically for the purpose of calculating the unit cost for the purpose of collecting data. The questionnaire was anonymously filled in, mixedly by natural persons and legal advisers.

The results of the above two tests are given in the table below:

Basis for calculation	Number of respondents	Client number ¹		Personal sessions/customer/year ²	Hour/Option ³	Hourly rate ⁴
2020 accounts	948	31 ⁵	112 ⁶	—	—	11.300, —
Questionnaire 2021	63	76		17	3	12.845, —

¹ original question: How many clients do you or your organisation have a contractual relationship with? (DB) ² original questions: On an annual basis, how many face-to-face sessions do the advice have on average with a client who has a contract with you? (DB) ³ original questions: How long does one face-to-face advisory action take on average? (hours) ⁴ original questions: What is the gross amount of the hourly fee for personal counselling? (HUF) ⁵ Individual consultant ⁶ Special advisory organisation On the basis of the above, the use of a unit cost per hour for the subsidised consultancy services is in any case envisaged. The hourly rates shown in the table consist predominantly of personnel costs, but also include the overheads of the underlying activities. For the determination of the unit cost, it is planned to use the recent figure, i.e. HUF 12.845 from the 2021 questionnaire survey, i.e. EUR 35 (at the exchange rate of HUF 365/EUR and rounded). This amount of EUR is also proposed in the grant decisions/contracts to ensure that the aid is valued, inter alia to compensate for inflation and possible additional costs due to additional consultancy tasks as a result of the CAP reform. The other results of the tests indicated above are intended to be used to make further calculations for the planning of the consultancy intervention, taking into account that these data refer only to directory consultancy. In detail, the explanatory memorandum is entitled ‘AKI: Determination of unit cost of AID ADOPTION Background information’						

RD60_O33_U03_HO - Operation of a network of general advisory services

Brief description of the set up and organisation of the Competent Authority

Brief description of the structure and organisation of the Competent Authority:

The **designated ministerial authority (Competent Authority)** in Hungary pursuant to **Article 1(1) of Commission Implementing Regulation (EU) No 908/2014 [Article 1(1) of Regulation (EU) 2022/128] – Section 9(1) (10) of Act XVII of 2007 on certain aspects of the procedure relating to agricultural, rural development and fisheries support and other measures, Section 12(2) of Act LXV of 2022 on the rules of procedure for agricultural support from the Common Agricultural Policy and the national budget, and Decree No 601/2022 on the organisation and institutions for the implementation of the Common Agricultural Policy and agricultural subsidies from the national budget (XII. On the basis of Section 2(1) of the Government Decree – the minister responsible for agricultural policy, i.e. **the Minister for Agriculture**. Government Decree No 10/2019 on the Organisational and Operational Rules of the Ministry of Agriculture (XII. 30.) On the basis of the delegation of tasks referred to in Section 11(i) of Annex 1 to the Order of the Minister of Agriculture, the **State Secretary for Public Administration** shall be **responsible** for issuing decisions relating to the competent authority's tasks relating to the supervision of the implementation of the EAFRD and the EAGF, in **the** name and on behalf of the Minister.**

The **functional functions of the competent authority are performed by the Department of Competent Authority, managed by the State Secretary for Public Administration.**

Under the direct administration of the State Secretary for Public Administration, it is possible to ensure that the performance of the tasks of the competent authority, including from the technical management of the EAGF/EAFRD and from the organisational system linked to the paying agency's activities, is and will be carried out separately, in a coordinated and efficient manner. The functional independence of the Competent Authority is also essential for the definition and acceptance of the audit topic related to the performance of tasks.

The Hungarian State Treasury, as the only Hungarian EAGF/EAFRD Paying Agency, has been granted the existing full accreditation status from the Competent Authority with effect from 16 October 2017, in line with the expectation under Regulation (EU) No 1306/2013 [Regulation (EU) 2021/2116 as of 2023] that only expenditure incurred by accredited paying agencies can be reimbursed from the EU budget.

Accreditation procedure and ongoing supervision of the Paying Agency:

Designated Competent Authority

— Grants, reviews and revokes the **accreditation of the Paying Agency pursuant to Articles 1-2 of Regulation (EU) No 908/2014 [Articles 1-2 of Regulation (EU) 2022/128 from 2023];** continuously monitor **compliance with the accreditation criteria and monitor changes in implementation through the certification body's reports and accreditation supervisory inspections;** in the event of any material changes to the system, verify whether the Paying Agency still complies with the accreditation criteria set out in Annex I to Regulation (EU) No 907/2014 [Annex I of Regulation (EU) 2022/127 from

2023]; a plan of action is requested from the bodies and departments concerned in relation to the deficiencies identified during the accreditation supervisory inspections and checks on compliance and compliance with the measures taken to remedy the deficiencies are carried out in the framework of monitoring audits; a detailed report is prepared every three years on its monitoring and monitoring activities, using an external agent independent from the Paying Agency (the next report is due by 30/0/2022).

— **Article 5 of Regulation (EU) No 908/2014***[Article 5 of Regulation (EU) 2022/128 from 2023]*, (XI. Section 28/B of Government Decree No 601/2022 (XII. Pursuant to Section 7 of Government Decree No 1306/2013, select the Certification Body referred to in Article 9 of Regulation (EU) No 1306/2013 *[from 2023 onwards, Article 12 of Regulation (EU) 2021/2116]*, which became the KPMG Consortium for both EAGF and EAFRD by 31 May 2025 as a result of a public procurement procedure;

Designated Certification Body

— The Paying Agency shall issue an opinion on an annual basis, drawn up in accordance with internationally accepted audit standards, in accordance with the criteria laid down by law, based on the results of the audit work carried out in three stages (half-year, intermediate, annual);

— its methodology, including the timing of inspections and reporting, is one of the good practices recognised by the European Commission, which can ensure that sanctions for deficiencies detected during the financial year are avoided and reduced, with the possibility to correct them as soon as possible, and effectively support the supervisory activities of the Competent Authority in accordance with Article 2 of Regulation (EU) No 908/2014 *[Article 2 of Regulation (EU) 2022/128 from 2023]*.

The Monitoring Committee is the decision-making body operated by the Managing Authority, whose main task is to monitor the progress of the CAP Strategic Plan and the achievement of its objectives. The Monitoring Committee is independent in its functioning from the Managing Authority (it may issue opinions on working documents sent to it, vote on them, initiate the convening of a meeting, etc.).

In determining the composition of the Monitoring Committee, Hungary takes into account the requirements laid down in Article 106(3) of the SPR Regulation, i.e. the implementation of the principles of partnership and equal opportunities by involving the following actors:

— Authorities at regional and local level,

— competent authorities for the environment and climate action,

Economic and social partners,

Civil society and non-governmental organisations (in particular in the fields of environment, climate, energy, sustainable development, gender equality, equal opportunities, equal treatment and non-discrimination)

Pursuant to Article 124(1) of Regulation (EU) 2021/2115, the Member State has three months to set up a monitoring committee following the notification of the Commission's implementing decision approving the CAP Strategic Plan, so we can only provide the specific composition of the Commission at a later stage.

7.2 Description of the monitoring and reporting structure

The purpose of the monitoring and reporting system of the Hungarian CAP Strategic Plan ('the **monitoring system**') is to provide the decision-makers of the European Union and the Member State and the partnership with the information necessary for the effective and effective implementation of the CAP Strategic Plan. The functions of the monitoring system shall be designed to take into account the reporting obligations imposed by Community legislation and the data needs of decision-makers in agricultural and rural development in previous programming periods, as well as the typical needs of thematic evaluations.

The monitoring system includes a cooperative network of government organisations (**organisational structure**), the rules of **procedure** governing the monitoring tasks of the institutional system and an **IT system** supporting data collection and processing. The availability of **administrative databases** which are not directly part of the monitoring system and the availability of **independent external evaluation capacities** are also necessary for the functioning of the system and are therefore part of the planning and development of the system.

The monitoring system of the CAP Strategic Plan is based on the operational mechanisms established in previous development periods, i.e. the organisational structure, IT system and evaluation solutions used in the implementation of the support measures to date will be built up by further developing the system of the new period on the basis of the legal provisions governing the new programming period.

The structure of the monitoring system identified the main responsibilities at Member State level. Their delineation is key in the design of the system of responsibility in order to reliably monitor progress in the implementation of the CAP Strategic Plan and in achieving the objectives of the CAP Strategic Plan.

On the one hand, the **organisational structure** includes dedicated departments carrying out monitoring tasks, but it also includes other affiliated entities with only reporting obligations. The two key elements of the organisational structure are the monitoring and evaluation division of the Managing Authority and the monitoring department of the Paying Agency.

The **Managing Authority** shall perform the following responsibilities in relation to the monitoring system:

- developing the concept of the monitoring system, regularly reviewing it and overseeing its operation;
- regulate the monitoring tasks and responsibilities of the institutional system;
- enshrine monitoring requirements for beneficiaries in calls for proposals and regulations;
- contribute to the call for proposals in terms of compliance with the performance framework and the milestones committed by the Member State;
- ensure the information needs of the European Commission, national decision-makers and social partners, in particular the Monitoring Committee;
- collection and documentation of monitoring needs for IT systems;
- providing the necessary data for thematic evaluations through agreements with administrative and other data owners;
- ensure independent expert capacities for thematic evaluations and publish evaluations;
- collection of specific data on the LEADER approach through the Local Action Groups reporting system;
- providing the necessary competences for the functioning of the monitoring system through training and international cooperation;
- cooperation with the Paying Agency during the preparation of the Annual Performance Report
- facilitate in the fulfilment of reporting obligations under Community legislation.

The **Paying Agency** shall perform the following tasks in relation to the monitoring system:

- providing the data generated during the application and payment processes for the operation of the monitoring system;

- collection from beneficiaries of additional information necessary for the functioning of the monitoring system and designated by the Managing Authority;
- opinion of calls for proposals and proposals for the collection of monitoring data
- development and operation of IT solutions necessary for the functioning of the monitoring system;
- facilitating the information needs of the European Commission, national decision-makers, social partners and thematic evaluations;
- facilitate in the fulfilment of reporting obligations under Community legislation.

The reporting obligations imposed by Community legislation, including the preparation of the Annual Performance Report, require close cooperation between the Managing Authority and the Paying Agency.

The Paying Agency is responsible for the management and control of expenditure, while the Managing Authority is responsible for managing and implementing the CAP Strategic Plan. Accordingly, in the context of the **annual performance clearance (output indicators)**, the **Paying Agency** is accountable to the Commission, while the **Managing Authority** is accountable to the Commission for the **annual performance review (result indicators)**.

In addition to the organisational structure, it is of paramount importance to define the **rules of procedure for the monitoring system**, with a separation of tasks – and powers within the support institutional system. In addition, it is important to ensure transparency and control roles at system level. When establishing the organisational structure and the rules of procedure, the relevant EU rules form the basis of the system, complemented by detailed domestic rules at national level.

The **rules** of procedure of the monitoring system consist of, on the one hand, a regulation setting out the division of tasks between the institutional system actors and, on the other hand, a complementary methodology containing definitions, data needs and production of outputs, results and impact indicators.

The **IT system** for recording, storing, supplying and collecting data on aid is based on the Integrated Administration and Control System (IACS), which is operated by the Paying Agency. The data and reporting requirements of the monitoring system will be integrated into the IT system during the planning process.

The **data** underlying the monitoring system is typically derived from the application, data generated during the processing of applications and beneficiary data. In parallel, additional data is collected from public or professional sources, such as, inter alia, the Central Statistical Office, the National Food Chain Safety Office and the Hungarian Madarian Association (MME) in order to effectively monitor the achievement of the policy objectives using result and impact indicators. With the reporting partners, the Managing Authority shall lay down in agreements the details of the cooperation and the data to be provided.

The **IT system** (IACS) fully ensures that all interventions (both IACS and non-IACS) generate all the data required for performance reporting (APR) during the implementation of the CAP Strategic Plan. The system shall provide, in an integrated manner, the appropriate data recording, data processing, control and search functions for the implementation of the measures, continuous monitoring, reporting obligations and evaluations.

The IACS, as a closed IT system, ensures that all CAP Strategic Plan interventions are subject to a uniform data structure hierarchy from the submission of aid applications until the end of the maintenance (operational) period and that reports with the same logic are available for the CAP Strategic Plan as a whole.

By connecting to the IACS core application data, the reliability of the statutory reports created by the monitoring and reporting functions is ensured by the administrative and on-the-spot checks carried out during the application management process and by the use of public records.

The system includes the recording of a wide range of characteristics of indicators and other data for monitoring and evaluation purposes for the 2023-2027 programming period, as well as the possibility to

search and display them in real time according to different criteria. The planned base and target values for indicators, aggregates, indicator breakdowns, unit amounts, other monitoring and evaluation data (where relevant) are also managed and maintained within the system, and in all cases the actual values are followed within the system.

The IT system also aims to develop a report system that fully supports the preparation of the reports, reports required at different times, the standard and ad-hoc reports required by the European Commission, ministries and other institutions, as well as the various levels of management, as well as analytical lists supporting the reports.

Continuous monitoring and regular analysis of output and result indicators ensure that results and progress are assessed as a basis for the successful implementation of the Strategic Plan.

Databases, development components:

The Monitoring Application Data Database developed in the IACS will ensure that the basic data required for the reports and the establishment of indicator factual values are made available in one location to the component layer serving the reports. This is an analytic with monitoring data, which should include different levels of data structures and support the creation of different aggregated data and the filtering of duplications.

The modules supporting the implementation of each measure shall provide to this database, on a compulsory basis, data at specific points of the application processing in a data structure corresponding to the parameterisation, in a time series.

Related steps for improvement:

1. Structure preparation and parameterisation

A monitoring parameter interface must be filled in before each support intervention/legal title is launched. This will help to place the item in the hierarchy of the CAP Strategic Plan, to define the related indicators, indicator breakdowns (e.g. unit amount) and to provide guidance to the intervention/item on related data reporting (calculation methodologies, types of basic data, time of delivery). The parameterisation determines which data will be included in the Monitoring Application Data Database. Monitoring parameterisation supports the production of reliable, timely and consistent data. The monitoring parameter interface shall be based on the data and structure recorded in the CAP Strategic Plan and the methodological descriptions issued by the Commission, on the basis of which a set of rules can be established to guarantee the appropriate source, production method and consistency of the data with the payment data. The structure of the budget codes for identifying payments in the budget structure (ABB code) is subject to some changes in the 2023-2027 programming period and becomes a key reference for the monitoring system (e.g. including a reference not only to the intervention but also to the output indicator and unit amount). On this basis, it can ensure the interconnectivity of applications/application instalments and payment flows at the appropriate level in order to meet monitoring needs.

2. Submission of a request

The submitting interfaces of the support interventions/items launched under the CAP Strategic Plan shall be designed according to the data needs for monitoring. The data shall be requested in such depth as the reports and data provision may be required and the data structure of the measures shall be designed in such a way that they are able to provide the data in the structure necessary for the implementation of the delivery model.

The submission of applications requires the integration of data into the Monitoring Application Data Database, which will partly serve the reports and analyses used for forecasting on the basis of the planned data. The framework should ensure that all titles are obliged to use this service.

3. Request processing

The processing of the application shall include a service to the Monitoring Application Data Database. This service will enter the monitoring data of the intervention/legal title concerned in the database with a

unified structure according to the rules provided during the parameterisation, based on the CAP Strategic Plan and methodological guidelines issued by the Commission. Such data may be data requested by an application, data generated during the evaluation of an application, and data calculated specifically for monitoring data. The service should be used at certain stages of the evaluation of the application and should ensure that data changes are monitored and searchable for a given period of time. The framework should ensure that all titles are obliged to use this service.

4. Monitoring database/component

The modules supporting the implementation of each intervention (resource framework register, commitment register, finance) provide data to this database on a mandatory basis in the data structure corresponding to the parameterisation at specific points of the application processing, in a time series.

Reporting Component Layer

A new system component, capable of serving the reports of the common agricultural policy for the period 2023-2027, will be built in the repository.

The main but not the only source for this component is the new Monitoring Application Data Database to be created in the IACS. The architecture should be designed to be able to work from other data sources, including running individual SQLs and displaying the result as an itemised list, thus supporting rapid ad-hoc work.

During the transformation, the data and its changes shall be stored with timestamp in the historical layer of the Data Repository. The data thus believed should be retained so that subsequent checks and external investigations can be served at any time and the reports submitted can be reproduced after they have been

submitted. The layer of actual reports shall be optimised for queries. The data of this schema shall be archived and refillable.

The retrieval of indicators from the repository ensures that the reports are timely and of sufficient quality, and that the indicators are monitored. An important element is that the system sends regular newsletters to the Paying Agency's colleagues in order to be able to take the necessary corrective action in the event of a failure to meet the required level.

Inspections

It is necessary to ensure the reliability of the basic data of the monitoring and reporting system by using the checks carried out during the application management process and public records.

In the operation of the system, it is essential to ensure consistency testing of data from primary data sources.

The production of consistent and reliable data and the production of reports based on them shall be ensured by means of audit tests built into the following system:

- Formal verification (data in the appropriate format is present in the field)
- Charge verification (if relevant data is provided in all fields)
- Logical verification (checks the adequacy of the data against certain contexts).

7.3 Information on the control system and penalties

7.3.1 IACS - Integrated Administration and Control System

Is IACS used to manage and control interventions in the wine sector as laid down in Title III of Regulation (EU) ... [CAP Strategic Plan Regulation]? : **No**

Is IACS used to manage and control conditionality? : **Yes**

Article 65(4)(d) of the HZR gives the possibility to MS to define the "agricultural parcel". Please provide the definition of "agricultural parcel" in your Member State.

‘Agricultural parcel’: continuous land declared by a farmer that does not cover more than one crop/land cover. The declaration of agricultural parcels may also take into account the specificities of the aid intervention concerned

7.3.1.1 All elements of the IACS as set out in the Regulation [HZR] are established and operating as from 1 January 2023

All elements of the IACS as set out in the Regulation [HZR] are established and operating as from 1 January 2023 : **Yes**

7.3.1.1.1 Identification system for agricultural parcels (LPIS)

The Hungarian LPIS is a geographical information system based on physical blocks. This is the only reference system used to control area-based direct payments and rural development interventions. It indicates agricultural areas, non-agricultural areas and the different areas considered eligible under the area-based interventions in the national CAP Strategic Plan. In addition, the LPIS contains a large number of thematic layers and is regularly updated on the basis of ortho-photos

7.3.1.1.2 Geo-spatial (GSA) and an animal-based application system (GSA)

In Hungary, the single payment application covers all area-based CAP aid schemes and a number of animal-based and other interventions. The application is fully electronic, with electronic channels of communication to and from the notifiers. The tender shall contain pre-completed information on the basis of the previous year's tender data, in particular for agricultural parcels. The geographical area displays available graphic material (mainly ortho-photos), LPIS data and data from previous applications. This

allows for the accurate and unambiguous identification of agricultural parcels. The application contains a large number of control warnings and controls that guide farmers to submit complete, consistent applications that are free of possible non-compliance and errors.

7.3.1.1.3 Are you applying an automatic claim system (in the meaning of Article 65(4)(f) of the HZR?

For area-based interventions? : **No**

For animal-based interventions? : **No**

7.3.1.1.4 Area monitoring system (AMS)

The AMS will be used to monitor and assess certain agricultural events and practices on eligible hectares. The monitoring activity is based on Sentinel satellite data, complemented by other data sources of equivalent value. All eligibility conditions are covered by AMS, which can be monitored by automatic processing and analysis of remote sensing data. If a possible breach of the eligibility criteria is detected, a communication will be sent to farmers so that they can modify their application or send additional information, in particular in the form of photos with a geographical label.

7.3.1.1.5 Control and penalties system

Are requirements set out in Article 72 of the HZR fulfilled? : **Yes**

7.3.1.1.5.1 Description of the control and penalty system(s) for IACS interventions

See attached document(s)

7.3.1.1.6 System for the identification and registration of payment entitlements, where applicable

Are requirements set out in Article 71 of the HZR fulfilled? : **N/A**

7.3.1.1.7 System for the identification and registration of animals in the meaning of article 65(4)(c) [Article 66(1)(g) HZR]

Do you have a system for the identification and registration of animals referred to in Article 66(1)(g) of HZR? : **Yes**

system for the identification and registration of bovine animals laid down by Regulation (EC) No 1760/2000 of the European Parliament and of the Council : **Yes**

system for the identification and registration of ovine and caprine animals laid down by Council Regulation (EC) No 21/2004 : **Yes**

system for the identification and registration of pigs laid down by Council Directive 2008/71/EC : **Yes**

7.3.2 Non-IACS

7.3.2.1 Brief description on the penalty system for non-IACS interventions in line with the principles of effectiveness, proportionality and dissuasiveness

Non-IACS EAGF

If in the course of a subsequent administrative or on-the-spot check, or for any other reason, it is established that aid has been paid unduly to a beneficiary, the competent authority will order the repayment of the amount unduly paid, plus applicable interest. It shall repay to the beneficiary the amount of the undue aid as provided for in the Decision. If the beneficiary fails to pay the amount within the prescribed period, the competent authority shall, by exercising his right of retention, withhold it from the amount of other eligible aid, so that the debt is deemed to have been paid. Any unduly used aid qualifies as public dues collectible as taxes, therefore, if there is no duly paid aid that could cover the debt, the tax authority will recover the amount of the undue aid. Undue participation in a measure can be established within five years from communication of the decision establishing eligibility. The Office ordering the

recovery of undue aid keeps a record of the beneficiaries who have unduly participated in the measure(s)

Non-IACS EAFRD

For rural development support, under EU rules, non-compliance, i.e. totally or partially ineligible expenditure, is sanctioned by **reducing payments or excluding them from the total amount of payments**.

As a matter of principle, the aid unduly claimed cannot be paid and the aid unduly paid must be recovered. The penalties to be applied in addition shall be determined by Community and national legislation and by specific rules applicable to measures.

Under EU rules, if the amount claimed by the beneficiary in the payment claim (application) on the basis of the grant decision (support document, hereinafter referred to as TO) exceeds by more than 10 % the amount to be paid to the beneficiary following the examination of the eligibility of the expenditure included in the payment claim, an **administrative penalty** corresponding to the difference between the above two amounts, but not exceeding the amount due, is to be applied to the amount approved for the payment claim.

The legal consequences in the event of non-compliance with the obligations or commitments are laid down in the specific rules applicable to the measures.

The legal consequences established in connection with EU legislation and applied by the Member State are laid down in Government Decree No 272/2014 on the rules governing the use of assistance from certain European Union funds in the 2014-2020 programming period. (XI. Government Decree No 5/1999 of 5 May 2004 (hereinafter: 272/2014. (XI. 5.) and published in the call itself and in the document 'General contractual conditions for grant agreements with beneficiaries receiving support under the Rural Development Programme' (GSZF), the 'GENERAL GENERAL FOR MEASURES for measures to be financed by the EAFRD' (ÁÚF) and/or the separate document on legal consequences. The penalty for non-compliance with the commitments undertaken in relation to the substantive evaluation criteria is/ is determined as a percentage of the approved aid (according to the TO) and, in the event of non-compliance with the obligations laid down in the call, depending on the extent or gravity of the irregularity, the Managing Authority is entitled to withdraw from the grant agreement or to withdraw from the Contract (full withdrawal of the grant) or to withdraw the aid in part.

In accordance with the provisions of the General Law, the beneficiary must provide proof of the extension or replacement of the security in the case of a security with a shorter maturity than the guarantee period (until the payment on account is accepted) – which is lodged at the same time as the advance application – 45 calendar days before the due date. Failure to do so shall entail the management of irregularities and, as a legal consequence of the irregularity, the recovery of the unaccounted advance of the aid or, in the event of non-recovery by the beneficiary, the call on the security of the amount of the unaccounted advance of the aid, and the grantor may withdraw from the Contract.

272/2014. (XI. The exclusion from the aid scheme covered by the Government Decree may be applied for a limited period of time, up to a maximum of five years, as a legal consequence if the beneficiary intentionally or repeatedly implements the irregularity.

The information on the final decisions taken by the paying agency establishing that an irregularity has occurred, including the name of the beneficiary of the project concerned by the call and the amount of aid recovered as a result of the irregularity, is published on <https://www.mvh.allamkincstar.gov.hu/kozveteteli-listak-szabalytalansagok>.

If the most severe sanction is imposed – in accordance with Article 272/2014. (XI. 5.) Exclusion from aid covered by Government Decree No 118/2011, the details of those affected by this sanction will also be published.

7.3.2.2 Brief description of the control system for non-IACS (control methods, cross-checks, durability of investments and related ex-post checks, etc)

Non-IACS EAGF

As regards the implementation of **non-IACS market measures**, in general, all applications are subject to 100 % administrative checks by the Paying Agency, which is an individual assessment of each application in order to establish payment entitlements. There is no automatic criticism and decision-making (i.e.

without a case officer).

Administrative audit

In the context of the administrative check, we examine the applicant's general entitlement to check whether the boundary conditions laid down in Act XVII of 2007 governing our procedures and in the implementing decrees are met, such as whether the client has a client identifier at the Treasury and the corresponding classification data.

In the second part of the administrative check, we examine compliance with the specific conditions of the measure provided for in the implementing regulations, e.g. number of bee colonies, size of the area, supporting documents for the operation supported.

Administrative checks cover the form and content-related inspection of the documentation of the application. The method and date of submission of the application, the conformity of the application file, the completeness of the attached documents, and the completeness of the completed documents are examined. Each payment application is checked by two caseworkers independently of each other in conformity with 'the four eyes principle'. During the administrative check, the first administrator verifies the data of the application and its annexes, and then assesses the application and establishes the eligibility of the aid and the amount of the eligible aid. The results of the check are stored in the IT system. The second administrator shall also carry out the same checks if the result of the decision of the two administrators is the same, and after the approval of the second administrator, the decision is taken. If two caseworkers arrived at a different conclusion in their respective decisions, they discuss the cause of the difference and perform the necessary adjustments in the IT system. If discussions to reach an agreement fail, the decision is made by the competent senior officer. The agreed final result is also recorded in the IT system.

Importantly, all applications for market support are now submitted electronically by clients, which allowed the Paying Agency to detect certain errors already in the application process. This can be solved by installing built-in cross-checks, calculating fields on one part and displaying a warning message on the other (e.g. data gaps).

In the context of the administrative checks, we examine copies of specific documents supporting the entitlements, such as the purchase/service invoice, proof of origin of propagating material, official certificate, manufacturer's declaration, etc.

Support systems

The performance of administrative checks is supported by the IT framework, which is also used for the management of IACS measures. In practice, this means that IACS and non-IACS items use the same client or financial framework module, with the result that the evaluation modules designed for the items are linked to these horizontal functions.

Such a horizontal function, in order to avoid double financing, is that the unique identification number of each invoice is entered in the closed IT system of the paying agency, where the built-in cross-checks are used to check whether the invoice has already been recorded under another title or measure, so that it is easy to ensure that aid can be paid only once for a given item of an invoice.

Through the IT evaluation modules, the Paying Agency is able to carry out checks on the data of the individual scheme modules (e.g. use of the area declared to the EC in the case of vine planting aid) and to receive data from partner authorities, either online or offline.

Grape wine:

- map and geospatial data from the LPar
- land registry data from the real estate register
- production data from HEGYIR

Honey production:

- bee colonies numbers from TIR/ENAR
- producer members' data from OMME

School schemes:

- 11 01 02 01 – Number of pupils from the Education Office
- production area data from the Single Application

Inspection

The rules for on-the-spot checks differ from one measure to another. In the wine sector, we carry out on-the-spot checks on 100 % of applications, while for additional market items, selection for on-the-spot checks is carried out in accordance with the requirements of a random and risk-based method.

During the on-the-spot check, the copy of the documents submitted is compared with the original, the exact identification of the equipment purchased, the measurement of the eligible area and the examination of the details of the investment carried out (e.g. measuring the distance between rows in the case of vineyards).

On-the-spot checks are carried out by staff from a department separate from the department responsible for administrative checks. The results of the inspection shall be recorded in the report of the on-the-spot check.

Non-IACS EAFRD

The actors of the Hungarian control system established for the implementation of the Rural Development Programme, in accordance with EU and national regulations:

- Managing authority (tasks – 272/2014. (XI. Section 20 of Government Decree No 273/2007): Ministry of Agriculture, Deputy State Secretary for the Implementation of Rural Development Programmes
- Paying Agency (body within the meaning of Article 7 of Regulation (EU) No 1306/2013 of the European Parliament and of the Council and its tasks – 272/2014. (XI. Section 26 of the Government Decree: Hungarian State Treasury, Vice-President for Agricultural and Rural Development Subsidies
- Intermediate Body (Tasks – 272/2014. (XI. Section 27 of the Government Decree: Hungarian State Treasury, Vice-President for Agricultural and Rural Development Subsidies
- Certification body (body under Article 9(1) of the CAP Regulation): KPMG
- Competent authority (tasks – 272/2014. (XI. Section 25 of Government Decree No 601/2022 (XII. Section 2(1) of the Government Decree: Ministry of Agriculture, State Secretary for Public Administration

Regulation 82/2007 on the establishment and implementation of financial, accounting and control systems for programmes and measures supported by the European Agricultural Fund for Rural Development, the European Fisheries Fund and the European Agricultural Guarantee Fund. (IV. It is contained in the provisions of Government Decree No 25/2000.

The Hungarian State Treasury, as paying agency or intermediate body (hereinafter: The Treasury) participates in the performance of its tasks by the Departments of Agricultural and Rural Development Assistance (AVTF) of the county government offices as organisations involved in the performance of the tasks delegated by the MA, as the body performing the tasks delegated to it by the Paying Agency. The implementing manuals and aids approved by the Vice-President responsible for agricultural and rural development support and by the head of the managing authority shall set out the arrangements for the implementation of the Treasury's tasks and the persons responsible for the checks.

The Paying Agency is responsible for the legality and reality of the expenditure to be charged to the European Commission and therefore verifies whether the expenditure declared by the beneficiary can be financed by the EAFRD and complies with the EAFRD rules, that the corresponding invoices or other necessary documents are attached and whether the expenditure is incurred within the eligibility period.

Transparency, classification by enterprise size (SME), establishment/verification of farm size, verification of the data provided by the beneficiary, the Treasury uses, inter alia, data on other aids available in the IACS or external records (e.g. data from the Uniform Registration and Identification System (ENAR), requesting information from the National Chamber of Agriculture, the NFCSO, Microsec Sz Computer Development ZRt, the National Tax and Customs Administration (NAV), etc.

In addition to administrative checks, the paying agency also verifies the legality of payments before they are made by means of on-the-spot checks. On-the-spot checks are carried out by the county government offices as delegated tasks, and all aspects and conditions that can be physically checked at the implementation site are checked in addition to the administrative checks. In all cases, a report of the on-the-spot checks shall be drawn up, which shall be evaluated in the aid procedure and taken into account in the decision-making process.

7.3.2.3 Public procurement rules?

Brief description how the compliance with public procurement rules is fulfilled.

The applicant for support and the beneficiary shall send to the managing authority a written summary of the evaluation of the tenders, as well as all documents produced during the public procurement procedure and the public procurement rules. The verification of the regularity of public procurement procedures carried out during the use of grants – public procurement law, eligibility, eligibility and technical follow-up – is carried out by the managing authority. Aid may be paid to the beneficiary, with the exception of advance payment of aid, only if there is a report of a follow-up or ex-post check with the supporting content.

7.4 Conditionality

7.4.1 Control system for conditionality

7.4.1.1 Description of the control system for conditionality

A significant part of the controls subject to conditioning are carried out by the authority which otherwise acts in the field of expertise. The paying agency is the competent authority with regard to the GAEC requirements. A record of the results of the checks shall be drawn up and, on the basis of the provisions thereof, the Paying Agency shall establish the legal consequences at farm level, which may range from a certain reduction of the aid to the exclusion from the aid scheme. In accordance with the provisions of Act XVII of 2007 on certain aspects of the procedure relating to agricultural, rural development and fisheries aid and other measures, and Act CL of 2016 on general administrative procedures, the interested party has the right to appeal, both in relation to the findings of fact made during the inspection and the legal consequences laid down by the Paying Agency.

Review of the cross-compliance control system on an annual basis:

Under the leadership of a department under the authority of the minister responsible for agricultural policy, a professional body responsible for the annual review of the control systems referred to in Article 83(4) of Regulation (EU) 2021/2116 of the European Parliament and of the Council of 2 December 2021 on the financing, management and monitoring of the common agricultural policy and repealing Regulation (EU) No 1306/2013 has been established.

This body shall be chaired by the Ministry of Agriculture and shall be composed of members from the Paying Agency, the competent authorities and the organisations involved in the coordination and conduct of controls. The Board shall meet at least once a year. Each year, the panel shall carry out a full review of the previous year's cross-compliance control system on the basis of the following criteria:

1. Review of the legal environment and regulation

(including

— an overview of whether the domestic legislation on which the SMRs are based has been amended during the period under review in such a way as to affect the maintenance and control of the requirements relevant for conditionality;

— the application of the legislation providing the legal basis for conditionality has led to a need for amendment or clarification during the period under review, and whether this will be incorporated into the legislation.)

2. review of selection

(including inter alia

— examination of the need for a rate increase according to the assessment of non-compliances detected in a random sample of 20-30 %;

— taking the results of back-tests into account when reviewing and amending risk analysis models.)

Revision of the audit

(including

— review and update audit guidelines and guides;

— review of the implementation of the audit, review of the experience of quality assurance audits; examine, if necessary, the possibility of training/further training of inspectors, while ensuring professional supervision.)

4. Review of sanctioning methodology

(including

a summary of the rates of negligible non-compliances and particularly serious non-compliances and the percentages of reductions applied;

— an overview of whether customers have been adequately informed, including in the case of negligible non-compliance, of how they can correct the non-compliance identified;

— examination of the requirement that the penalties imposed are proportionate and dissuasive.)

Communication review

(including

between the regulatory body and the competent authorities;

— review and, if necessary, adapt communication channels to customers.)

Minutes of this meeting are drawn up containing the findings and recommendations related to cross-compliance aimed at optimising the control system, which, depending on the nature of the findings, will be incorporated into the procedures and practices of the audit authorities already in the current year.

7.4.1.2 Types of checks

SMR / GAEC	Types of checks
GAEC01 - Maintenance of permanent grassland based on a ratio of permanent grassland in relation to agricultural area at national, regional, sub-regional, group-of-holdings or holding level in comparison to the reference year 2018. Maximum decrease of 5% compared to the reference year.	On-the-spot control, Remote sensing
GAEC02 - Protection of wetland and peatland	
GAEC03 - Ban on burning arable stubble, except for plant health reasons	Remote sensing, On-the-spot control
GAEC04 - Establishment of buffer strips along water courses	On-the-spot control, Remote sensing
GAEC05 - Tillage management, reducing the risk of soil degradation and erosion, including consideration of the slope gradient	Remote sensing, On-the-spot control
GAEC06 - Minimum soil cover to avoid bare soil in periods that are most sensitive	On-the-spot control
GAEC07 - Crop rotation in arable land, except for crops growing under water	Remote sensing, On-the-spot control
GAEC08 - Retention of landscape features. Ban on cutting hedges and trees during the bird breeding and rearing season. As an option, measures for avoiding invasive plant species	Remote sensing, On-the-spot control
GAEC09 - Ban on converting or ploughing permanent grassland designated as environmentally-sensitive permanent grasslands in Natural 2000 sites	Remote sensing, On-the-spot control
SMR01 - Directive 2000/60/EC of 23 October 2000 of the European Parliament and of the Council establishing a framework for Community action in the field of water policy: Article 11(3), point (e), and point (h), as regards mandatory requirements to control diffuse sources of pollution by phosphates	On-the-spot control
SMR02 - Council Directive 91/676/EEC of 12 December 1991 concerning the protection of waters against pollution caused by nitrates from agricultural sources: Articles 4 and 5	On-the-spot control
SMR03 - Directive 2009/147/EC of the European Parliament and of the Council of 30 November 2009 on the conservation of wild birds: Article 3(1), Article 3(2), point (b), Article 4(1), (2) and (4)	Remote sensing, On-the-spot control
SMR04 - Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild flora and fauna: Article 6(1) and (2)	Remote sensing, On-the-spot control
SMR05 - Regulation (EC) No 178/2002 of the European Parliament and of the Council of 28 January 2002 laying down the general principles and requirements of food law, laying down procedures in matters of food safety: Articles 14 and 15, Article 17(1) and Articles 18, 19 and 20	On-the-spot control
SMR06 - Council Directive 96/22/EC of 29 April 1996 concerning the prohibition on the use in stockfarming of certain substances having a hormonal or thyrostatic action and beta-agonists, and repealing Directives 81/602/EEC, 88/146/EEC and 88/299/EEC: Article 3, points (a), (b), (d) and (e), and Articles 4, 5 and 7	On-the-spot control
SMR07 - Regulation (EC) No 1107/2009 of the European Parliament and of the Council of 21 October 2009 concerning the placing of plant protection products on the market and repealing Council Directives 79/117/EEC and 91/414/EEC: Article 55, first and second sentence	On-the-spot control
SMR08 - Directive 2009/128/EC of the European Parliament and of the Council of 21 October 2009 establishing a framework for Community action to achieve the sustainable use of pesticides: Article 5(2) and Article 8(1) to (5); Article 12 with regard to restrictions on the use of pesticides in protected areas defined on the basis of	On-the-spot control

Directive 2000/60/EC and Natura 2000 legislation; Article 13(1) and (3) on handling and storage of pesticides and disposal of remnants	
SMR09 - Council Directive 2008/119/EC of 18 December 2008 laying down minimum standards for the protection of calves: Articles 3 and 4	On-the-spot control
SMR10 - Council Directive 2008/120/EC of 18 December 2008 laying down minimum standards for the protection of pigs: Articles 3 and 4	On-the-spot control
SMR11 - Council Directive 98/58/EC of 20 July 1998 concerning the protection of animals kept for farming purposes: Article 4	On-the-spot control

7.4.2 Penalty system for conditionality

7.4.2.1 Description on the penalty system for conditionality

The penalty resulting from the condition shall be established by the Paying Agency on the basis of the results of the on-the-spot and administrative checks. The on-the-spot check report shall contain an assessment of all aspects of non-compliance (intention, severity, extent, permanence, reoccurrence, force majeure evaluation result) on the basis of which the level of the penalty can be clearly determined. The conditionality penalties shall apply to the total amount of aid covered by all the conditions of the beneficiary in a given year.

If the economic operator has notified it to the Paying Agency by electronic means or in the prescribed form and within the deadline, the operator has the possibility to indicate the unavoidable external cause (force majeure) during the on-the-spot check.

Non-intentional non-compliance

If the non-compliance determined is non-intentional, then for the first time the aid amount covered by the full condition is reduced by 1-10 %. The exact amount of the penalty shall be determined by the Paying Agency on the basis of the on-the-spot check report. The assessment will be carried out on the basis of the following criteria.

Severity: depends on the significance of the consequences of the non-compliance, having regard to the purpose of the requirement or standard in question.

Rate: to be determined taking into account whether the non-compliance has an extensive impact or whether its impact is limited to the holding itself (on-farm/off-farm).

Durability: it depends on the period of time during which the effect of the non-compliance is felt or on the possibility of bringing that effect to an end by reasonable means.

Where the non-compliance found has serious consequences for the objectives of the requirement or standard in question or constitutes an imminent danger to public or animal health, the Paying Agency may increase the level of the penalty up to 10 %.

If a non-compliance is established using the area monitoring system, the reduction may be reduced to 0.5 %.

Reoccurrence of non-intentional non-compliance

Repeated non-compliances are particularly sanctioned by the system. If an enterprise fails to comply with the same condition requirement or requirement at least twice within three consecutive calendar years, the sanction calculated for the second time shall be 10 %. However, this penalty percentage can only be applied if the first non-compliance is notified to the farmer. If, after the non-compliance re-identified (and sanctioned by 10 %), the same non-compliance occurs again in one of the following two years, it shall be considered intentional and the level of the penalty shall be set accordingly.

Intentional non-compliance

The perception of intentional non-compliance in the system of penalties for conditioning is much stricter than that which is not intentional. If the non-compliance determined is due to the intention of the farmer, the total amount of aid affected by the concentration shall be reduced by 15 % to 100 %. The exact level of the penalty shall be determined by the Paying Agency on the basis of the assessment of the non-compliance included in the on-the-spot check report. The assessment shall be based on the same criteria as in cases not affected by intent (severity, extent, durability). The 100 % penalty means that the farmer is excluded from all the aids affected by the condition for the year in question.

In summary, summary of several non-compliances occurring in the same calendar year:

Summary of penalties for multiple non-compliances that have not been intentional and have not been reoccurred

Method of summation: each non-compliance to be assessed individually and the sanction values established separately are added to each other

† Maximum sanction values where non-compliances include at least one of the non-compliances which have serious consequences for the objectives of the requirement or standard in question or present an imminent danger to public or animal health: 10 %

The maximum level of penalties where the non-compliances do not include any of the non-compliances which have serious consequences for the objectives of the requirement or standard in question or would constitute an imminent danger to public or animal health: 5 %

Summary of penalties for multiple non-compliances that occur again but were not intentionally affected

Method of summation: summation (same as in the previous point)

† Maximum sanction values: 20 %

Summary of penalties for multiple intentional non-compliances

Method of summation: summation (same as under the first point)

† Minimum value of sanctions: 15 %

† Maximum sanction values: 100 %

Summary of penalties for several different non-compliances

Method of summation: where several different non-compliances are found in the same calendar year, the sanction values established pursuant to the first three points shall be added together.

† Maximum sanction values: 100 %

Penalty system for interventions not covered by IACS

The Hungarian authorities intend to use the new technologies (analysis of satellite images, geo-referenced photos) as widely as possible in the CAP aid control process. To this end, we will examine how these methods can be included in the criticism of measures not covered by IACS. At the same time, the priority is currently to develop and implement the mandatory use of new technologies (i.e. for IACS measures).

Handling complaints, creating artificial conditions

With regard to complaint handling: we have a well-functioning and well-regulated and efficient complaint-handling system in place at the Hungarian paying agency. The handling of complaints is required by national legislation (Act) and the operational rules applicable to the Paying Agency are laid down in an internal instruction, which is also mandatory for the PA's staff and the staff performing delegated tasks. Complaints can be submitted to the PA on paper, by email, online, by phone or in person, including anonymously. Complaints received are coordinated, recorded and monitored by the dedicated department. Each complaint is a qualified submission and will be examined and answered by the specialised areas within 30 days of receipt. In the event of an infringement of a right as described in the complaint, the necessary measures shall be taken.

With regard to artificial creation of conditions:

In accordance with the criteria laid down in Article 62 of Regulation (EU) 2021/2116 of the European Parliament and of the Council of 2 December 2021 on the financing, management and monitoring of the common agricultural policy and repealing Regulation (EU) No 1306/2013, as regards the aid that may be claimed under the single application, the Hungarian Decree (15/2024) (IV. (Decree No 9)) states that 'in particular cases where land used by a farmer or a close relative within the meaning of the Civil Code is split up in order to benefit from the maximum amount of aid available should be considered as artificial

creation of conditions’.

Control and sanction system related to conditionality

Art. 83(6)(d) (risk analysis including a random part; control sample to cover at least 1 % of the beneficiaries):

In the system of conditionality, at least 1 % of the clients concerned shall be subject to on-the-spot checks. Between 20 % and 30 % of the clients selected for audit are selected by random sampling, with the remaining 70-80 % risk analysis. Where appropriate, certain SMRs may be pooled during the sample selection, thus forming a group of SMRs for the selection. In this case, the minimum ratio of 1 % must also be met for the population of the SMR group.

Art. 85(2) (the reduction shall be as a general rule 3 % of the total amount of the payments):

Where unintended, non-recurring and non-serious irregularities are found, a 3 % reduction shall be applied as a general rule. However, 1 % and 5 % respectively may be used in the assessment based on the criteria set out in Article 7 of Commission Delegated Regulation (EU) 2022/1172.

Art. 85(5) (when the non-compliance has ‘grave consequences’):

Where non-compliance has serious consequences for public or animal health, a minimum reduction of 5 % and a maximum of 10 % shall apply.

Hungary is also invited to specify the ‘type of checks’ envisaged for GAEC 2 (information provided for all other GAECs and SMRs):

The Hungarian Member State intends to use remote sensing and on-the-spot checks for GAEC2, as with other GAEC standards.

Article 86 Amounts resulting from administrative penalties for conditionality:

Member States may retain 25 % of the amounts resulting from the reductions and exclusions referred to in Article 85.

7.4.2.2 Definition and application of ‘reoccurrence’ (calculation and time span covered):

Reoccurrence of non-intentional non-compliance

Repeated non-compliances are particularly sanctioned by the system. If an enterprise fails to comply with the same conditioning requirement or requirement at least twice within three consecutive calendar years, the sanction calculated for the second time shall be 10 %. However, this penalty percentage can only be applied if the first non-compliance is notified to the farmer. If, after the non-compliance re-identified (and sanctioned by 10 %), the same non-compliance occurs again in one of the following two years, it shall be considered intentional and the level of the penalty shall be set accordingly.

7.4.2.3 Definition and application of ‘intentionality’

The perception of intentional non-compliance in the system of penalties for conditioning is much stricter than that which is not intentional. If the non-compliance determined is due to the intention of the farmer, the total amount of aid affected by the concentration shall be reduced by 15 % to 100 %. The exact level of the penalty shall be determined by the Paying Agency on the basis of the assessment of the non-compliance included in the on-the-spot check report. The assessment shall be based on the same criteria as in cases not affected by intent (severity, extent, durability). The 100 % penalty means that the farmer is excluded from all the aids affected by the condition for the year in question.

7.4.3 Indication of the application of a simplified control system for small farmers

The simplified verification is NOT used by Hungary as under the 2024 EU Simplification Package, conditionality checks are in principle exempted from conditionality checks for all farmers farming less than 10 hectares.

7.4.4 Competent control bodies responsible for the checks of conditionality practices, statutory management requirements

As a general rule, the paying agency coordinates all checks. It carries out some of them itself and delegates part to competent authorities – as shown in sub-chapter 7.4.1.

Due to the coordinating function of the Paying Agency, the head of expertise of the Hungarian State Treasury was indicated as contact everywhere.

SMR / GAEC	Paying Agency Name	Name of the Control body	Name of the responsible for the check	Address	Email

7.5 Social conditionality

7.5.1 Description of the control system for social conditionality

Regulation (EU) 2021/2115 of the European Parliament and of the Council establishing rules on support for strategic plans to be drawn up by Member States under the common agricultural policy (CAP Strategic Plans) and financed by the European Agricultural Guarantee Fund (EAGF) and by the European Agricultural Fund for Rural Development (EAFRD) and repealing Regulations (EU) No 1305/2013 and (EU) No 1307/2013 (hereinafter: Article 14 of Regulation (EU) 2021/2115 and Regulation (EU) 2021/2116 of the European Parliament and of the Council on the financing, management and monitoring of the common agricultural policy and repealing Regulation (EU) No 1306/2013 (hereinafter: In order to comply with Articles 87 to 89 of Regulation (EU) 2021/2116), we will put in place, from 1 January 2025 at the latest, a procedure whereby farmers and other beneficiaries receiving direct payments or annual payments will be subject to administrative penalties if they do not fulfil the requirements for specific working and occupational conditions.

Most of the rules in Annex IV to Regulation (EU) 2021/2115 are dealt with by the employment surveillance and health and safety authorities. The employment inspection and health and safety authorities register the labour and safety fines imposed as a result of inspections in a public database in which the main data of the decisions can be found. The register shall include the employer/employer's tax number/tax identification number, the employer's/employer's registered office/address, the decision number, the date of the decision, the date on which the decision became final or final, the date on which the decision became enforceable, the indication of the infringement, the legal consequence applied, the amount of the fine and the legal provision on which it was based and the court decision, if any, in the context of orderly labour relations and occupational safety fines decisions. The register is at the disposal of the Ministry of National Economy. The existing register provides a good basis for the implementation and operation of the social conditionality system, given that the data recorded can be matched with the data of the national paying agency's register, given that the MÁK is able to identify the registration number, i.e. the client concerned, on the basis of a tax identification number or a tax number.

Accordingly, the Ministry of National Economy can provide the national paying agency with information on the imposition of labour and health and safety fines. Act LXV of 2022 on the procedure for agricultural support from the Common Agricultural Policy and the national budget and Decree 601/2022 on the organisation and institutions for the implementation of the Common Agricultural Policy and agricultural subsidies from the national budget provide the legal basis for the data transfer. (XII. Provided for by Government Decree No 28/1999.

In addition to the above legislation, a cooperation agreement is concluded between the Ministry of National Economy and the national paying agency for the practical implementation of the data transfer. According to the draft agreement, the National Paying Agency requests information from the Ministry of National Economy in the form of a formal request. The Ministry of the National Economy shall inform the national paying agency of the individual labour and occupational safety fines and other necessary information, as set out in the cooperation agreement and in accordance with the Ministerial Decree on the introduction of social conditionality. The information will only include data related to defined TEÁOR numbers, i.e. employers engaged in agricultural activities.

7.5.2 Description on the penalty system for social conditionality

A ministerial decree ensures that each of the identified infringements is classified according to their extent, gravity and permanence. The classification system is designed taking into account the criteria to be applied when receiving support from the European Agricultural Guarantee Fund and the European Agricultural Fund for Rural Development. (IV. The characteristics and solutions of the system applied under the AM Decree. The following classifications are used for each type of classification:

Severity:

- negligible
- mild
- medium
- severe

Rate:

- in-farm
- off-farm

Durability:

- recoverable in the short term
- recoverable in the long term

Different scores are assigned to each grade in the Ministerial Decree and a percentage reduction is set for each combination of scores.

As described in the previous sub-chapter, the Ministry of National Economy, in accordance with these classifications and the cooperation agreement with the national paying agency, informs the national paying agency of each non-compliance in the field of employment and health and safety at work and its classification.

The national paying agency shall calculate the reduction to be applied to the beneficiary on the basis of the information received and the ministerial decree.

The establishment of the control and aid reduction procedure is carried out jointly by the Ministry of Agriculture, the Ministry of National Economy responsible for employment supervision and occupational safety and the national paying agency, the Hungarian State Treasury. The task will be carried out in cooperation between these three bodies. The National Chamber of Agriculture is actively involved in the working group designed to coordinate the design of the system. We also provide the Agricultural, Forestry, Food, Water and Food Workers' Union with the opportunity to comment and consult.

8 Modernisation: AKIS and digitalisation

8.1 AKIS

8.1 Overall envisaged organisational set-up of the improved AKIS

The interventions in support of AKIS are designed to be linked to other interventions of the Strategic Plan during implementation. For example, training and demonstration operational programmes or intervention of advisory services also contribute to green interventions where mandatory training or advisory services are required (e.g.: agro-environmental management, Natura, animal welfare, etc.), but this is also the combination of support for digitalisation developments and training and demonstration plant programmes to strengthen any other interventions by using digitalisation services alongside digital competence development.

In the context of knowledge-sharing systems, it should be seen that the intervention area B for advisory services is the first step to integrate into the AKIS 110.000 farmers, which are difficult to see and see, have a small economic size, are hard to reach and are of the order of magnitude. We move on the surface, trying to transfer basic knowledge, but with a large number of participants. It is in our fundamental interest to create a single AKIS and not only to those farmers who are reopened, easily noticeable, visible, previously actively involved in public life in the sector, but also to a wide range of farmers. The second step is to deepen the expertise so that otherwise open farmers are reached by the consultants under target C of the Advisory Services Intervention to find concrete answers to their specific problems. The third cross-cutting step is to support the education of both farmers and those who share knowledge through training and demonstration plant programmes.

The most effective way to reduce the gap between innovation services, knowledge flows and research and practice is through the EIP intervention and the Innovation and Digital Support Unit of the CAP Network. Furthermore, for each of the knowledge transfer, innovation and digitalisation interventions, the mandatory contribution of each actor to the work of the CAP Network is addressed. The National CAP Network is linked to the AKIS as a whole, thus ensuring synergies between actors. The seven-year and annual work plan of the CAP Network, as well as its annual report (including any revision thereof), the Managing Authority for the CAP Strategic Plan (hereinafter: (IH)

Interaction between individual AKIS actors and synergies between knowledge transfer, innovation and digitalisation interventions are facilitated by the CAP Network. By the support units responsible for networking in each thematic area and assisting in the implementation of interventions.

The CAP Network helps to collect the right knowledge, and the SAC, among other things, assesses the knowledge needs of producers. On the one hand, monthly meetings (see below) led by the AKIS coordination organisation, and the joint performance of certain tasks, as well as day-to-day contacts with each other and with the AKIS coordination organisation, provide the basis for the development of synergies between the support units and the SAC. The themes covered by the CAP Network, within and between which networking and synergy of relevant measures will be supported.

Timing and source: The above is also possible under the financial envelopes. Framework for Technical Assistance and the CAP Network: EUR 224657534

The SEC shall perform the back-office function. In practice, the National Chamber of Agricultural Economics, which implements the SZAK, already provides professional support to special advisers. The funding of this function is currently covered by the membership fees received as well as national funds. We intend to bring this to a higher level within the framework of the SEC.

The back-office function, based on existing expertise within the NAK, would be extended by integrating

the CAR into the CAP Network with the following tasks:

- valorisation of expert knowledge in support units;
- valorisation of knowledge generated by international projects through support units (e.g. synthesising of farmbook information);
- involve the knowledge of other professional partners (universities, research institutes, or experts directly, etc.).

The Chamber is responsible for the operation of SZAK, all the functions and tasks outlined above will be carried out by the Chamber, it will be responsible for implementing the above ideas and implementing it. As the Chamber keeps the register of special advisers, it is in direct contact with all the special advisers in the country. It provides them with information on topical issues on a daily basis, and the specialist advisers can already search for those responsible in the Chamber.

The National Chamber of Agricultural Economics (NAK) is responsible for coordinating technical advice at national level on a continuous basis from 2014 to today. This includes the registration (in the list of names) of the consultants carrying out market consultancy activities, the examination of the impartiality of the consultants, the maintenance of the register (name list), the verification of specialist rights, the maintenance of the expertise of the specialist advisors, and the international representation of the national expert advice. The Ministry of Agriculture (the Managing Authority for the Strategic Plan of the CAP and, since 2022, also the AKIS coordinating organisation) supervises its operation, in continuous contact. In addition, NAK is currently in charge of the National Agricultural Advisory Committee (hereinafter: NATaB) its secretariat. The Commission's membership is made up of decision-makers, higher education, research, market and professional organisations in the agricultural sector, effectively embodying potential actors in the AKIS. NATaB is responsible for commenting on and proposing measures for the development of the Hungarian AKIS. Based on the Strategic Plan, the function of this body will be taken over by the Presidency and Advisory Board of the CAP Network (see above: Institutional structure of the CAP network).

Increased ambition for the development of Hungary's AKIS system

Experience has shown that producers, when they need advice, tend to choose a villager or consultant already known to them and are reluctant to share their business data with others; therefore, there is little likelihood of using the services of a third or additional advisory network. The task of the AKIS is to take this national specificity above all into account when drawing up the strategy. The "farmer in the centre" approach is used to shape the structure of the national AKIS system. It is therefore necessary to structure the AKIS in such a way that the different components of the system work in synergy, in particular with a view to reducing the gap between farmers and researchers, so that technological advances in innovation and digitalisation can be integrated into the practical application of farmers. The aim is to achieve a well-functioning AKIS, in which knowledge transfer, research, innovation cooperation and advisory services are more responsive to the growing information needs of farmers and rural operators.

We would like to strengthen the AKIS system, in line with the expert work carried out in the framework of the SCAR and with the main objective of supporting the agro-ecological transition of SME producers. In 2021, we started with two very significant actions: the Digital Agricultural Academy's curriculum, as part of the implementation of our Digital Agricultural Strategy, and a measure for the digital transition of arable crop growers (2900 farmers, demand above EUR 500 million, mandatory 7 % knowledge content) as part of the transition period of the Rural Development Programme 2014-2020. In the first half of 2022, we plan to reinforce the operational function of the agricultural upper, secondary education and state animal testing stations.

The resources for the three funds AKIS (information and advice, training, innovation) would increase from 2.8 % to 3.2 % in the previous programming period, more than doubled to over EUR 246 million. In addition, the measures planned for digitalisation, including investment and cooperation, would be of a similar magnitude, so that, beyond the CAP network, more than 6 % of the total top-up budget would

contribute to the knowledge-based development of our agricultural economy through a strengthened AKIS system.

The unit supporting the CAP innovation and digitalisation network will conclude a formal agreement with the National Agency for Research, Development and Innovation, which provides the National Contact Point for Horizon Europe, Partnerships and the Soil Mission, and with the Express Innovation Agency. This cooperation will be the basis for creating synergies between the CAP and Horizon Europe.

Planned coordination of the implementation of CAP Strategic Plan AKIS interventions

We plan to start the development of the National CAP Network already in 2022, which would receive a dedicated support unit for innovation and green transition in addition to the current Hungarian National Rural Network (see SFC section 4.4 for details). Building on this, as of 2023, the planned interventions for training, information, advice, innovation and digitalisation, as presented in the CAP Strategic Plan, and the CAP network together serve the development of our producers. The AKIS coordination body oversees the CAP Network, which is an organisational unit of the Ministry of Agriculture, which is an umbrella body. The three support units of the national CAP network perform a support function for the most efficient design and implementation of CAP interventions. Training of trainers, training of specialist advisors, mentoring, communication and awareness-raising is also carried out in the framework of the network.

The CAP Strategic Plan interventions, as a dedicated tool to support training, advice, innovation and digitalisation in the fields of agriculture (agriculture, forestry, food) and rural development, pursue an overarching objective, support and strengthen the specific interventions of the CAP Strategic Plan through knowledge sharing. Knowledge production systems, adaptations and good practices are implemented through innovation collaborations, linked to national and international programmes (e.g. Horizon Europe, BIOEAST, etc.) The experience is passed on directly to farmers through the CAP Network (training of trainers) and through CAP interventions. The aim is to ensure that the professional who reaches the farmer has the widest possible and in-depth knowledge, and that farmers who are currently not present in the system are also addressed.

In order to provide advice, training and demonstration programmes (hereinafter: knowledge transfer services) are used effectively by the beneficiaries in order to achieve the stated objectives and to ensure that: transparency, traceability, auditability of activities, standard contractual conditions, quality services, measurement of the quantitative and qualitative level of services provided. The establishment and operation of a system integrating actors and processes is also an essential condition for monitoring processes and coordinating the above elements of effective knowledge transfer. This enables records, the transmission of information and the collection of monitoring data, complemented by prior accreditation to ensure professional quality and support the selection of beneficiaries. Thus, it supports the efficient, effective and orderly implementation of interventions. The register also allows for a common platform of opportunities on the service provider's website and for those interested in the services, thus broadening the take-up.

AKIS to support the green transition: AKIS contributes through training, advice and innovation (interventions code: RD58_A01_TRA_78, RD60_A04_ADP_78, RD61_A05_EIP_77).

- Erosion prevention measures
- Interventions to reduce nutrient pollution to reduce high levels of eutrophication of surface waters
- Development of good agricultural practices in drought-affected areas (drainage and ban on water-intensive crop production)
- Reducing the use of pesticides: to address needs and measures directly related to the reduction in the use of plant protection products
- Measures to reduce the use of antimicrobials (AMR)

8.2 Description of how advisory services, research and CAP networks will work together within the framework of the AKIS (Art.114)(a)(ii))

1.AZ AM AKIS coordination unit and CAP Network cooperation to integrate advisors into the knowledge network

As detailed in the chapter of the CAP Network's Organisational Description (SFC4.4), we plan to pay particular attention to strengthening cooperation between advisors and, more generally, knowledge providers. The CAP Strategic Plan was designed to always have sufficient independent consultants to cover each thematic area. This chapter summarises in particular our efforts to strengthen the consultants' cooperation with other AKIS actors.

Links between researchers, educators, consultants, producers and other rural actors will be strengthened through targeted support instruments and centrally coordinated events and cooperation initiatives. The tools are summarised in the following tables (with an emphasis on which actors are supported) and presented in more detail below.

The FaST (Farm Sustainability Tool) digital services platform is planned from 2024 to make agriculture, environmental and sustainability capabilities available to EU farmers, paying agencies, farm advisors and developers and users of digital solutions.

2.Interventions to strengthen EAIS cooperation in the CAP Strategic Plan

Therefore, **most elements of AKIS measures** (advice, training, innovation) can contribute directly to the cooperation of the advisory, research and CAP network (interventions code: RD58_A01_TRA_78, RD60_A04_ADP_78, RD61_A05_EIP_77).

Supported instruments					
Tools	researchers	educators	special advisors	farmers/processors	other rural actors
Training and demonstration plant programmes	X	X	X	X	X
Expert advice			X	X	X
EIP	X	X	X	X	X

3.AKIS coordination and CAP network tasks to enhance cooperation

In addition to increasing the financial envelope in the new period, our plan to increase the level of ambition is to better involve experts and organisations implementing AKIS-like measures not only in Pillar II of the CAP Strategic Plan but also in Pillar I sectoral programmes in the knowledge network. The **AKIS Coordination Unit and the CAP Network will play a major role** in this work, with the following **centrally implemented measures** for the integration of advisory services into the AKIS network.

Measures implemented centrally					
Tools	researchers	educators	special advisors	farmers/processors	other rural actors
Gathering of	X		X		

special advisers and researchers					
Reception of Special Adviser Questions	X		X		
Professional training	X	X	X		

Gathering of special advisers and researchers: biannually, depending on topicality, co-organised by the Innovation Support Unit of the CAP Network, the Green Support Unit. The aim is for the Special Advisers to present the practical problems they encounter and the challenges they face on the ground, while those conducting research in the field, either on the ground or in further research, will respond to them later. This is useful for both special advisers who can gain up-to-date knowledge for their work and possibly be aware of a specific alternative solution; researchers all have the opportunity to gain insight into the problems encountered by farmers and processors and to guide their own research on this basis. Regular gatherings ensure a continuous flow of knowledge and strengthen links between actors, encouraging them to look for each other on relevant issues outside the gatherings.

Reception of Special Adviser Questions: in addition to the above, special advisers have the opportunity to do so throughout the year, constantly asking their questions and proposing research topics for researchers.

Specialist training: for special advisers and trainers, on a continuous basis, the AKIS Coordination Unit is involved in the preparation of curricula, education and practical demonstrations, with the involvement of industry experts and researchers. This should ensure that, for example, it is up-to-date with the latest research results or new technologies available, but more generally, the flow of knowledge from the direction of research to the provision of advice and education.

8.3 Description of the organisation of all farm advisors according to the requirements referred to in Articles 15(2), 15(3) and 15(4)

1. Hungary's current rules on agricultural advice and the conditions laid down therein

In Hungary, the consultancy service is provided by operators (including non-profit operators) in the agricultural, forestry and food sectors. The advisory system consists essentially of two components:

- On the one hand, it consists of paid consultancy services (mixed natural persons and organisations) who carry out their activities independently, on a commercial basis, on a regular basis, with a view to obtaining a profit and taking economic risk, on the activities of special advisers in agriculture and rural development and on the agricultural farm advisory system. (I.14.) of the Minister for Agriculture (hereinafter: 1/2022. Act XXXVII of 2009 on forests, forest protection and forest management (hereinafter: Forest Act), Decree No 43/2010 of the Minister for Agriculture and Rural Development on plant protection activities (hereinafter: Decree No 43/2010 of the Minister for Agriculture and Rural Development). These include directory consultants and plant protection managers.
- On the other hand, advice, free of charge, consisting of the provision of expert advice by professional and interbranch organisations or in the context of producer cooperation, where that organisation assists its own members or operators in the sector concerned by providing advice and therefore no special compensation is required. In addition, professional organisations whose consultants also carry out their activities on a market basis are also registered in the register, in which case they are in the first category.

In the above structure, the system of expert advice in Hungary is already partly in line with the requirements of the EU (Regulations), but under the Strategic Plan we have foreseen further improvements of the system, stressing that in the system of subsidised expert advice, both specialist advisers providing free-of-charge services by default (1) and in the base case (2) are allowed to

participate. The operation of the system – as expected by the EU – will be the responsibility of the SZAK, under the supervision of the AKIS coordination body and the Managing Authority of the CAP Strategic Plan, and in the area of forest-based economy, we will strengthen the training and training of training providers in support of the successful implementation of the CAP.

Expertise

Expectation	Current safeguards	Further development plans
Art. 15(3) special advisers should be well-qualified and suitably qualified professionals	professional advisers on the register are expected to have an adequate level of education and a minimum of 5 years of experience, as well as their up-to-date knowledge in accordance with Article 1/2022. The training system (basic training, compulsory training, training related to assisted expert advice and credit system) set out in the Decree of the Minister for Agriculture provides	potential candidates will be required to undergo a pre-accreditation, including the appropriate expertise for non-listed consultants
Art. 15(2) consultants have up-to-date technological knowledge and knowledge of existing practices and latest research findings	In the field of forest-based management, we will set up an appropriate system of training and further training in the field of forest-based management, in support of the successful implementation of the CAP, in conjunction with the Forests Ágazati T Knowledgeás Központ Non-profit Kft.	organise training sessions for special advisers on how to meet the expectations of current EU strategies convening researchers and consultants every six months to present the practical problems they encounter and to enable those conducting research in the field to respond to them. all this is organised by the PSF

Impartiality

Expectation	Current safeguards	Further development plans
Art. 15(3) the advice provided by the Special Advisers is impartial and the Special Advisers are not considered to be incompatible	it can be derived from the directory who the ‘independent’ consultant (i.e. not ‘closely’ associated with a manufacturer/distributor of input materials) can be used to ensure that only an independent consultant can provide support in a subsidised form. the recognition of interbranch organisations is subject to the condition that they are not allowed to carry out commercial activities and that their advice is purely for the benefit of the sector and their members.	in the framework of the above-mentioned accreditation, impartiality and conflict of interest will also be examined for non-registered consultants (by the EAEC)

	We will also ensure the incompatibilities of the special advisers eligible for the CAP in the field of forest-based farming.	

Thematic coverage

Expectation	Current safeguards	Further development plans
Art. 15(2) consultancy services should also be able to cover the economic, environmental and social dimensions of farming	list topics and areas of expertise cover all expected topics at EU regulatory level In the area of forest-based management, we will also establish the appropriate thematic coverage to support the successful implementation of the CAP, with the assistance of Forests Ágazati T Knowledge Centre Non-profit Kft.	supported expert advice will in principle only be provided on the priority themes defined by the specialised wallet, which will in any case be defined in such a way that the topics required by the Regulation are also covered.
Art. 15(4) specialist advisory services should be available on each of the topics set out in the Regulation, tailored to the needs of the plant	advice provided by professional and inter-trade organisations covers topics relevant to the sector or group of members concerned	

2.Hungary's agricultural advisory management organisation (governance)

The current forms of domestic consultancy activities are presented below. In the context of the Strategic Plan, we intend to further develop them as set out above.

In particular, the National Chamber of Agriculture plays an important coordinating role in the system, which, as a public body, brings together all actors in agriculture, forestry and food processing since the introduction of compulsory membership in 2013 (about 400 thousand members). In the first place, it is responsible for advocacy of the sectors listed and for the provision of information and knowledge and, in the latter field, for the operation of the system of special advisers on the register, also acting as a National Advisory Centre (hereinafter: NSC), also playing a coordinating, registration and monitoring role in the provision of expert advice. Its related tasks are laid down in Decree No 1/2022 and Section 15/B of Act CXXVI of 2012 on the Hungarian Chamber of Agricultural, Food and Rural Development. The aim of the system is to ensure the quality of agricultural consultancy in Hungary by requiring specialist consultants to have a certain level of training and practical experience, and to keep them informed of current developments and, where necessary, to train them. The National Agricultural Advisory Committee (NATaB) is also part of the system, which is involved in the coordination of certain tasks related to agricultural and rural development consultancy, with the power of proposal and opinion. NATaB members are represented by all actors linked to the technical advice system, from decision-making level, agri-higher education, research, professional and advocacy level to practical participants. Based on the membership composition, NATaB can be said to cover AKIS actors. In addition, the Chamber itself provides advisory services free of charge and has close links with other professional and inter-professional organisations, generally taking a leading role in joint actions. It carries out its own advisory activities through a network of around 600 village promoters, helping its members to fulfil, among other things, the obligations laid down by the CAP. It also contributes to improving members' knowledge through events, trainings, study visits and publications.

3.Key actors in Hungary's agricultural advisory system

Cost-reimbursement consultancy services

Classic directory consultants: they include those who carry out their activities independently, on a commercial basis. Their staff distribution is shown in the table below:

	recorded	it works actively
Special advisors	1014	747
Specialised advisory organisations	55	47 of which 13 organisations provide subsidised services

Three-quarters of the special advisers carry out the activity exclusively individually, or a quarter of them carry out their activities in whole or in part through a special advisory organisation. In total, they serve around 40 thousand clients, half individually and half through a consultancy organisation. In the former case, there are on average 31 clients per special adviser, the latter on average 74 clients. The advisory service covers all topics of agriculture, forestry and food processing, combined with technical advice, such as technical advice (e.g. new technologies, precision farming tools, organic farming solutions, introduction of integrated pest management, improvement of irrigation) and administrative advice (e.g. by contributing to the submission of a single application by clients). Special advisers have a key role to play in achieving Common Agricultural Policy (CAP) support, meeting environmental and other specific requirements. This type of service is much needed as farmers are not always aware of the conditions laid down in the CAP. There are 595 independent consultants and 459 special advisers working on commercial interests. Anyone can turn to them for help.

Companies producing agricultural inputs (input material producers): a special group of special advisers on the register (459 mentioned above). They provide specialist advice on the basis of their individual interests and are thus not impartial, but their presence and influence in the Hungarian agricultural sector is significant. They play a leading role in technology support and knowledge transfer. They are mainly active in herbicides, fertilisers, seeds and the marketing of agricultural machinery.

In order to preserve the quantity and quality of forests and to fulfil the functions of forests in the public interest, where the forest manager does not have the necessary expertise in forest management, he may, under the legislation in force, manage only with the assistance of a forest manager. Forest management activity consists of requiring the involvement of a professional required in certain procedures before the forestry authority, e.g. forest planning, renovation planning, slaughter authorisation, on the basis of separate legislation (Regulation 244/2020). In particular, land-fragmented private forest management (approximately 850 thousand hectares of forest, 500 thousand forest owners and 38 thousand forest managers) is characterised by the fact that a significant part of the forest management is carried out by small farmers who are not technically trained, who, on the basis of the above, need to involve a specialist forest manager in their activities. This activity involves a total of around 1000 specialised forest management companies and around 1500 people, known as 'special forest personnel', at national level. The persons specialising in forestry is not necessarily a specialist manager: hundreds of foresters employed in forest holdings or even NPI have such a qualification, but they do not carry out specialist management or consultancy activities.

In the area of forest-based economy, the advice covers issues such as advice to support the organisation of private forest management (particularly in the case of joint ownership), the exercise of forest benefits, the professional renovation, upbringing and maintenance of forests, the protection of forests and the planning,

organisation and control of forest management activities in this context.

Plant protection managers, plant protection consultants: specialist plant protection specialists are natural persons who provide only plant protection services in accordance with Decree No 43/2010 of the Minister for Agriculture and Rural Development; and Plant Protection Special Adviser 1/2022. An individual who has acquired rights under the Decree and gives advice on that basis. In the course of plant protection management, as is the case for medical and veterinary activities, the specialist manager prescribes the plant protection product to be used (i.e. he takes the decision) or orders the date of application, the dose, etc. In the course of the specialist consultancy service, the specialist consultant sets out alternatives to the solution of a particular problem, technological options, the advantages and disadvantages of a particular problem, and then the client – the farmer – takes the decision himself. In all cases, plant protection consultants are included in the list of plant protection managers only if they provide advice on an independent and professional basis in relation to the agricultural activity of the client, in addition to the professional management activity.

Both groups of professionals are the Hungarian Chamber of Plant Protection Engineers and Plant Medicine (hereinafter: It operates under the professional coordination of the Chamber of Plants. The aim of the Chamber of Plant Medicine is to assist in the proper conduct of agricultural production and sound plant protection, while ensuring that the uniform and universal environment is not permanently affected under any circumstances, so as to preserve and enrich the diversity of nature, to detect harmful organisms that severely restrict economic production, damage the environment, causing disease to humans, animals (pollin, invasive plants, forest pests, plentiful butterfly, etc.). Under the aegis of the Chamber of Plant Medicine, there are nearly 3000 plant protection professionals, the organisation organises further training courses to keep their knowledge up to date, as well as other means to acquire the knowledge necessary for a higher level of professional activity. In the field of plant protection, the Chamber of Plants Acts as a background knowledge base and its plant protection forecasts can be accessed and exploited not only by specialist advisers but also by producers.

Special advisers from universities and research institutes: a special group of special advisers on the register. In the framework of national universities and research institutes, some teachers and researchers also act as specialist advisors, and the latest professional knowledge is passed on to interested producers through individual expert advice and demonstration plant programmes. The latter programmes are not necessarily organised in the institutions' own pilot facilities, but in farms operating independently of the institutions themselves. Examples of such demonstration networks are operated by the Institute for Organic Agricultural Research (ÖMKi) (with 100 to 120 holdings) and by the István Széchenyi University (SZE) (with 60 farms). They are in close contact with the members of the network, i.e. producers participate in experiments, give students the opportunity to gain practical experience and are prepared to host other producers (as part of the demonstration plant programmes mentioned above). In addition, training for specialist advisers is organised in some universities to improve their skills. In this respect, the Hungarian Agricultural and Life Sciences University (MATE) and the SZE highlight.

Free consultancy services

Breed societies and their associations: their role is particularly important in advising on genetics before shrinking. In total, 20 organisations (mixed breed societies and their associations) carry out advisory activities in this area with 80 consultants, that is to say, they describe the breeding and genetic conservation tasks for the conservation of protected indigenous, endangered and reconstructed agricultural animal breeds, draw up pairing plans to maintain lines and families, promote the conservation and promotion of the genetic stock of these breeds, promote the presentation of the valuable traits associated with the breeds in the context of the dissemination of knowledge, and establish conditions of utilisation in accordance with the genetic conservation principles and breeding regulations of the breeds. Professional organisations have the professional, technical (e.g. databases) and human resources necessary to preserve the genetic value of these breeds in their original geno and phenotipusos at the time of their formation, to

maintain the richness of the shape and to avoid interior breeding, and the professionals carrying out advisory activities have many years of professional experience, often even several decades, and very specialised expertise in the field of animal gene conservation. Advice is provided on a continuous, regular basis. The number of clients per advisor varies by organisation/type maintained and shows a territorial dispersion, with an average of 50-60 clients/advisors. The number of clients to whom advice is provided is approximately between 4 and 5 thousand.

Hungarian Association of Pig Breeders and Pig keepers (MSTSZ): the association brings together the activities of pig farmers and pig keepers in order to ensure that the domestic pig sector is competitive, sustainable and transparent and organised. To this end, it also operates a network of special advisers, employing 16 territorial officers (advisors). The consultants shall professionally support members' farming, encourage the cost-effective and GMO-free feeding of livestock and the production of final products in line with market needs, improve the quality of pigmeat produced and help producers fulfil their data obligations imposed by the authority. They are also involved in national and international research programmes to improve knowledge. They also carry out State delegated tasks, so that they play a key role on the pig product track in the tasks of animal marking and registration, in the certification of entitlements to animal welfare aid for breeding sows and fattening pigs, and in the performance of certain sub-tasks related to the High Quality Pigmeat mark. They have an active relationship not only with their own 1250 producers, but due to their tasks they provide advice to a total of 1700 partners in around 2000 sites.

Hungarian Apiculture Association (OMME): the association brings together Hungarian beekeepers, informs, acts, advises them and plays an advocacy role. As part of the consultancy, it subcontracts the activities of both members and non-member beekeepers with 21 consultants. They are associated with more than 20 thousand beekeepers (70 % are members). Particular emphasis will be placed on the adoption and development of new professional methods, the promotion of rapid practical application and the promotion and organisation of the economic activity of beekeepers in general. They also contribute to the development of knowledge through research programmes and provide professional presentations to disseminate good practices. The advisory activity is essentially provided in reception hours, but they are always present at all county beekeepers' events and are available to beekeepers.

Producer Sales Organisations (POs), Producer Integration Organisations (TISZs): their recognition shall be subject to the continuous provision to their members of techniques for rearing, rearing, integrated cultivation or integrated pest management, drawn up and monitored on the basis of the needs of the market, as well as a system of information and advice necessary for their implementation and for compliance with marketing standards. The POs are coordinated by around 70 special advisers, liaising with an average of 100 producers per consultant, providing on-the-spot advice several times a year. At the same time, some organisations highlight the emphasis they place on consultancy activities and their efforts to improve and keep up-to-date members' know-how, economics and other knowledge. For example, the Southern Great Plain Kerters' Cooperative (SouthKerTÉSZ) also works with universities to address the problems of several members, including those affecting PO, through joint research projects. They also co-organise internships for students. Gyümölcsért Kft. initiated cooperation with decision-makers, researchers and producers to jointly develop a solution against the phytoplasma disease of apricots. The MEGÉR-TÉSZ Co-operative also organises trainings for its members. The UTI system has not long been in place, along the lines of POs, and their organisations are still in a state of development.

Other non-profit organisations: there are also grassroots, non-profit organisations actively advising on some thematic areas. For example, in the field of agroforestry, the Zsörk Foundation encourages the development of alternative farming systems; the Hungarian Soya and White Medal Plants Association supports interested producers through targeted technological advice to increase the area of domestic protein crops that are free from genetic modification and to process them domestically; the Small-Scale Association is trying to increase opportunities for small farmers and provide them with advice; the Éltető Balaton Uppony Association has committed itself to regional rural development, helping farmers in

this context.

In January 2022, Fidészeti Ágazati Tudás Központ Nonprofit Kft. was registered at the Court of Registration. It is majority owned by the University of Soproni (SOE) and is also owned by: 21 State Forest Farming Zrt., TAEG Study Forestry Zártkörűen Működő Részvénytársaság, Forestry and Energy Propagating Material Product Board, National Federation of Private Forest Owners and Farmers, National Federation of Wood Economics and All 5 Vocational Centres: Local Agricultural Training Centre, Southern Agricultural Training Centre, Northern Agricultural Training Centre, Foreign Agricultural Training Centre, Central Hungarian Agricultural Training Centre.

With its unique ownership and the intellectual, organisational and infrastructure capital represented by the owners, the company is capable and capable of organising a wide range of yet high-quality knowledge transfer and knowledge-sharing tasks for the industry. It is also ambitious in terms of innovation management, first of all 'innovation brokers', and the provision of services. CAP relevance: it will be a key player for the forest-based economy to replace sophisticated opportunities, such as structured and qualitative knowledge enhancement, knowledge transfer and networking base and service offer, which are not used in the ÚMVP and the VP. This will be the responsible depositary of the CAP Strategy 2023-2027 to help prepare for its successful implementation and to ensure the continuous and quality support network in its implementation, with the appropriate cooperation of all stakeholders and stakeholders. Thus, the ESSK will be able to participate effectively in all levels, functions and cooperation of the AKIS.

Traditionally, there is a close relationship between professional and inter-trade organisations, knowing and, where appropriate, assisting each other in their activities. Their advice is characterised by the fact that producers are supported both in person and by telephone and e-mail.

8.4 Description of how innovation support is provided as referred to in Article 114(a)(ii)

1.Planned operation of the Innovation and Digital Support Unit of the CAP Network

Part of the innovation services in Hungary will be provided by the EIP Support Unit by organising knowledge transfer events along specific topics, providing an information service, communicating widely and publishing the results of relevant international and domestic projects (see the description of the CAP Network in chapter 4.4 of the SFC for a detailed description of its tasks). In addition, the EIP Support Unit plans to employ innovation brokers every year (in addition to additional innovation experts in the hub) who will become facilitators once the EIP Operational Groups are set up. The innovation broker works with farmers on pre-defined themes to identify innovation potential and encourage the formation of operational groups. In addition, the EIP Support Unit, in cooperation with the National Chamber of Agricultural Economics, will provide brokering and facilitator training with innovation content for specialist advisers to enable them to acquire the necessary basic knowledge of innovation (innovation-related funding opportunities) and techniques and methodologies. This will ensure that special advisers include innovation advice as a kind of horizontal topic in their portfolios. The training courses will be available to both fee-paid and free-of-charge advisory organisations, who are registered on the list of special advisers and provide impartial consultancy services. The AKI will synthesise the experience, knowledge, methodologies and good practices from knowledge production systems (Horizon Projects, BIOEAST) for the development of training materials, adapting them to the specificities of the Hungarian agricultural economy.

In Hungary, there will be a combined system for innovation, as the EIP Support Unit will organise the transfer of knowledge between consultants, researchers and practitioners on the basis of an annual work plan along the themes defined by the AKIS coordination organisation. The themes will be channelled through events, international projects, brokering/facilitation activities and an information service to strengthen innovation pathways. The topics will vary from year to year, depending on the evolution of

knowledge transfer and innovation performance.

There are a number of excellent initiatives and organisations in Hungary that contribute to stimulating the innovation performance of the agricultural economy, either thematically or horizontally. These initiatives and organisations fill the gap in Hungarian agriculture, which can help create a number of future operational groups and innovation ideas, as well as the related thematic knowledge transfer. The aim is for all organisations and actors to find their place in the domestic agro-innovation ecosystem to deliver real support for innovation ideas and partnerships.

Such organisations include the National Chamber of Agricultural Economics, special advisers from advisory organisations, breed societies, universities and research institutes, advocacy organisations and associations, which provide advice and often organise thematic knowledge transfer events. These organisations can help identify a number of new EIP Operational Groups and innovation ideas. Innovation start-up incubation programmes and initiatives have also been strengthened in recent years. Several thematic events have been used to showcase innovation/innovation outcomes.

In order to strengthen our domestic research participation in EU programmes, we need to make a strong sense of interest in planning. Against this background, experts from AM, AKI and NAK participate in a number of international RDI working groups. These are the working groups of the Standing Committee on Agricultural Research (SCAR) under the aegis of the European Commission. These working groups can influence not only the design of Horizon work programmes, but also the design, concrete planning and drafting of other EU RDI funding instruments. In order to establish an effective representation of domestic interests and to facilitate the flow of information between the relevant actors, NAK, in cooperation with AM, also operates mirror domestic working groups in the fields of animal health and AKIS, in co-ordination with the working groups. The aim of the latter is to build a pool of professionals (continuous convergence of research-education-advising practices, community building) by bringing together national stakeholders interested in agricultural research, innovation and knowledge sharing (e.g. researchers, educators, consultants, producers). Continually discussing the optimal framework for domestic and international policy and enabling environment in current affairs, so that the Common Agricultural Policy, Horizon Europe, is targeted; sectoral research objectives, agro-training, higher education, agricultural consultancy, innovation, better use of NAK infrastructure and potential. Participate in sharing information on current opportunities (e.g. proposals, funding, training, internationalisation) and good practices (e.g. how technology should be upgraded or how to build an international consortium effectively); they also represent the overall focus on domestic agricultural research, innovation and knowledge transfer, in particular in the following thematic focus areas: biomass economy, digitalisation, Food2030, horticulture, livestock farming, sustainable soil and water management.

The Innovation and Digital Support Unit's priority is to encourage and support the participation of consultants in the work of the EIP Groups.

2. Good practices supporting innovation intended to be used in the implementation of the CAP Strategic Plan

Thematic events where innovation was given space

ÖMKI and NAK Nato Land Days (<https://szantofoldinapok.hu/>) Event of more than tens of thousands of people with an active university background, organised annually.

Agriculture Conference <https://www.portfolio.hu/rendezvenyek/konferencia-agrar/agrarszektor-konferencia-2021/1232/atekintes> The two-day event is uniquely addressing the most important and current agricultural economic issues, the biggest challenges

Kaposvár Livestock Days (<https://kaposvarinapok.hu/>) The exhibition focuses not only on livestock farming but also on the Hungarian University of Agricultural and Life Sciences and vocational schools.

Agromash Expo (<https://agromashepo.hu/>), Hungary's largest agro-machinery professional event

Bábolna Farmdays (<https://babolnamentes.hu/2021/08/31/34-babolnai-gazdanapok/>) The 34-yearly

agricultural exhibition shows whether it is a field technology colour.

Lowland Animal Breeding Days (<http://hodmezogazda.hu/bemutakozas>) It is also impressive in appearance and hosts large numbers and a wide variety of native breeders, often not visible elsewhere.

PREGA (<https://www.prega.hu/>) is an event promoting Precision Farming, one of the largest agricultural conferences in the country.

OMÉK (<https://omek.amc.hu/>) National Agriculture and Food Exhibition and Fair, which lists a wide range of agricultural operators in Hungary.

Incubation programmes initiatives with a focus on innovation

Mr Tech Lab (<https://www.naktechlab.hu/>) The NAK TechLab incubation programme aims to find and embrace the most innovative solutions in Hungary.

Agrovirtus (<https://agrovirtus.hu/>) Hungarian simulation agricultural competition for university students.

Hungarian Grand Prize for Innovation. (<https://www.nak.hu/kamara/kamarai-hirek/orszagoshirek/103333-kiemelkedo-hasznot-hozo-vilagszinvonalu-teljesitmenyeket-ismertek-el-a-magyar-innovacios-nagydi-j-palyazaton>) A year -on-year competition to look for world-class innovation performances with outstanding benefits.

The Year's Agricultural Prize (https://www.agrotrend.hu/tag/az_ev_agrarembere_kitunteto_dij) Every year, the Agrotrend Group seeks 10 categories of agricultural professionals who are valuable to the public and benefit society.

Hiventures –equity investor (<https://www.hiventures.hu/hu>) Risk capital investment programmes open up new perspectives for domestic early-stage, innovative and traditional SME and large corporate financing.

The embedded nature of agricultural innovation in national innovation policy

Under the policy support and supervision of the Ministry of Innovation and Technology, the National Agency for Research, Development and Innovation is responsible for the development, coordination and implementation of the National Smart Specialisation Strategy (S3). The development of S3 for the years 2021-2027 started at the end of 2019. Between horizontal and national priorities: agriculture and food industry are also a priority for the national economy. This covers the entire agricultural and food innovation chain, including: forestry, horticultural technologies, plant breeding, plant protection, crop production technologies; animal breeding, animal husbandry, animal feed and grassland management; agro-biotechnology, food safety, processing technology solutions and healthy food. Agriculture and the food industry have the highest exposure to climate change in the sections of the sections, so the development of agricultural technologies to adapt to climate change, solutions to strengthen stress resistance is a priority. Reducing environmental pressures and mitigating the effects of climate change are essential elements of this priority, in synergy with the priorities of a resource-efficient economy and energy and climate change. The priority aims to support the development of the area in two directions, building on domestic conditions. On the one hand, the combination of environmental conditions and experience in crop production and livestock farming makes the sector suitable for producing premium products with innovative solutions. Another priority is that agriculture and the food industry contribute to promoting sustainability while at the same time increasing the permanence of the countryside. A strong focus on this priority is the development of the production of valuable indoor food and medicinal products in support of health promotion and the promotion of RDI and agricultural experiments to make their production more efficient.

National programmes that also affect agricultural innovation

Encouraging active knowledge and technology transfer between actors in the innovation ecosystem, including better exploitation of the knowledge brokering role of higher education institutions, is a priority among the overall goals of the National Renewable Research and Development and Innovation Strategy. The Ecosystem proposal (Programme of the University Innovation Ecosystem (2019-1.2.1 University

ÖKO)) concerned a single-gate business service. The programme also aims to create a web platform to support universities' RDI service portfolio meeting specific needs and needs from the business community. The match-making interface will facilitate contacts with universities and university-company collaborations. The S3 is linked to 3 thematic platforms, which have been adopted domestically and are awaiting approval by the EU: Agrifood, energy, industrial modernisation. In Agrifood, universities are encouraged to connect in order to create a domestic mirror group. Source: <https://nkfih.gov.hu/palyazoknak/innovacios-okoszisztema/egyetemi-innovacios>

The Territorial Innovation Platform (TIP) is a territorial organisation that provides both spatial and timely opportunities to develop, strengthen cooperation with local and international innovation ecosystem actors and create new professional foundations, while understanding direct innovation policy directions, thus contributing to the transformation of the Hungarian economy into a competitive and sustainable knowledge economy. The main objective of setting up innovation platforms is to enable university capacities, including training and research development, to deliver meaningfully to small and medium-sized enterprises, and to enable firms to take on board the results of universities in order to strengthen and cooperate with each other. Achieving this objective requires knowledge transfer both within and outside universities. In organised settings, students can use partner enterprises as placements and participate in dual, dual training courses. In addition to basic research, the aim is to launch research that is directly commercialised. They are organised around universities and there is a continuous 'conversation' between actors. Support for university innovation ecosystem.

If you join the TIP, you need to take part in education, after which you will receive a certificate, which is currently being developed. COVID has stopped a little momentum, the team was active between 2019 and 2020 and it can be raised. The University is the partner and there is a responsible person who brings together companies. The GINOP+ will be an attractive force. Science Park will be based on the TIPs. The national network of innovation platforms is now virtually complete. The TIP development initiative, launched in November 2019, aims to reach out to the main innovation actors in the regions – universities, research institutes, large companies, SMEs, start-ups, clusters, incubators, accelerators, and national chamber networks as widely as possible. The TIP creates cooperation between businesses in the regions and universities to foster innovation and competitiveness.

The Territorial Innovation Platform was set up at the University of Debrecen and Gödöllő, the Hungarian University of Agricultural and Life Sciences, in connection with agricultural economy, which already have many active members. Source: <https://nkfih.gov.hu/palyazoknak/innovacios-okoszisztema/teruleti-innovacios>

In the forest-based economy, Forest Ágazati T Knowledge Centre Non-profit Kft. is based on a collaboration aimed at providing more practice-oriented knowledge at all levels with the involvement of economic operators, while also providing opportunities for further training in different areas of expertise. To this end, the Knowledge Centre will also serve to coordinate, support, operate in a single system and innovate between educational establishments and farmers.

The NKFI Office has set up the National Laboratory Programme to support the creation and operation of knowledge centres that can become prominent scientific hubs in specific fields. Collaborative initiatives by the National Laboratory to open up a new international dimension of exploration and experimentation research. This included the establishment of the National Laboratory for Agricultural Technology, whose main objective is to establish a soil database, a nutrient management advisory system and a digital soil science database (TalajWeb). AKI is also a partner in the consortium. Source: <https://nkfih.gov.hu/palyazoknak/innovacios-okoszisztema/nemzeti-laboratoriumok>

The EIP Support Unit, in cooperation with the NKDI Office and with the involvement of other Hungarian agricultural operators, assists in the dissemination of the results of the above initiatives and in the development of networks. The above-mentioned initiatives, including TIPs, can be combined into

systems/networks that ensure the expectations of a multi-stakeholder approach.

International initiatives that have an impact on domestic agricultural innovation

Horizon Europe

Hungary is looking for the programme through research and innovation to shape its future. Focusing research and innovation on the ecological, social and economic transitions and related societal challenges Leveraging scientific strengths to take the lead in breakthrough and disruptive innovation. Ambitious targets on issues that affect our daily lives, such as skills development, harmful emissions and the state of the environment, are essential. Focus on cutting-edge research and innovation project, from research and innovation to deployment.

Soil Mission

The EJP SOIL National Hub has been established. The EJP SOIL project, building on the European research community, develops a research strategy, following the assessment of knowledge, tools and methods, which provides the scientific basis for the development of a policy for the sustainable use of agricultural soils in a climate-conscious manner. The project will take into account the views of stakeholders – farmers, researchers and decision-makers – both in the initial strategic planning phase and in the definition of detailed research tasks. At Member State level, the involvement of stakeholders and the flow of information between farmers, researchers and policy makers takes place through the creation and operation of national knowledge hubs. The EJP SOIL consortium, in cooperation with the hubs, can get an accurate picture of real research needs and thus produce science-based recommendations that are acceptable to all stakeholders. The domestic national hub was set up on 16 September 2020 at the national launch event of EJP Soil. The hub's membership shall be open.

Living Labs

The importance of living balls for agriculture will be strengthened in the coming period, as 100 living balls will be created under the Soil Mission, but the Eco-ecological Partnership will also support the implementation of agro-ecological projects through living balls. Hungary is currently working on the acceptance of the living-lab approach, but we believe that living-lab-type projects and ecosystems are by nature not distant from the ongoing EIP Operational Groups and from further innovation collaborations. The EIP Support Unit, in cooperation with the NKFI Office, will play an active role in bringing the opportunities offered by the Soil Mission and the different partnerships to the right and relevant domestic cooperation. In Hungary, there is a known living ball in the agricultural area, ÖMKI On-Farm [living labje \(https://www.biokutatas.hu/hu/page/show/omki-on-farm-elo-laboratorium\)](https://www.biokutatas.hu/hu/page/show/omki-on-farm-elo-laboratorium)

BIOEAST

Carbon neutrality cannot be achieved without the development of a biomass-based economy and it is important to encourage programmes to facilitate model change, in particular with regard to research and development. The importance of the biomass economy is immense here, which is why a national strategy is needed. It is important to strengthen R & D collaborations for the uptake of carbon-neutral technologies. The BIOEAST initiative focuses on 7 topics in terms of R & D partnerships: agroecology, food systems, forestry, freshwater aquaculture, bioenergy, education, training, advanced bio-based chemicals. Within BIOEAST, active networks have been developed along the defined themes to create further R & D partnerships, but also to work together between AKIS actors in the Member States, including EIP Operational Groups.

Renewable energy

As regards renewable energy, Hungary would like to achieve a share of at least 21 % of renewable energy in gross final consumption of energy.

Page 196 of the Hungarian National Energy and Climate Plan (https://ec.europa.eu/energy/sites/ener/files/documents/hu_final_necp_main_hu.pdf) illustrates that

energy use in the agriculture, forestry and fisheries sectors is increasing significantly, reaching 761 ktoe by 2030.

Evolution of the fuel mix of energy use in the agricultural sector, taking into account current measures, source of facts ktoe: Eurostat

We are currently seeking to reduce agricultural emissions through the standard of good agricultural practices and various support instruments. The basic rules on waste management are laid down in Act CLXXXV of 2012 on waste. The post-2020 targets and measures will be set out in the upcoming new waste strategy. In line with the National Forest Strategy, we will significantly increase the share of forest and other wood stands to increase CO₂ sink capacities and improve the resilience of forests to environmental factors in order to preserve the carbon sequestration capacity of forests. In addition to the above, a programme to create an energy and climate conscious society will serve to achieve our goals, including energy and climate awareness campaigns targeting different age groups, as well as awareness-raising measures focusing on young generations with educational content (see. AKIS interventions knowledge transfer and innovation).

8.5 Digitalisation strategy (Art.114)(b))

1.The need for a strategic approach based on an analysis of the situation

The SWOT analysis of the CCO shows that there is a need to strengthen the use of modern sustainability solutions and tools across the entire food production and food industry. This requires, in addition to the development of digital infrastructure for agri-food businesses, the interconnection, integration of existing databases, the development of monitoring and forecasting systems, and an increase in the qualification level of the workforce in order to use innovative technologies. Hungarian agroium modernisation options are supported by the fact that, in many of the specific objectives, environmental and economic societal demands for data collection and digital technologies, as reflected in the following needs analysis, are reflected in climate protection and healthy food needs (but in particular SO₂, SO₃, SO₅, SO₇, SO₉). SO₂: Increasing the operational and business efficiency of production by improving production technology, transforming and developing rearing technology, developing Post harvest technology, disseminating innovative technologies and sustainable approaches to agriculture; SO₃: Developing short supply chains (database, tool, infrastructure and competence development); SO₅: Technological change, taking into account tighter phytosanitary standards; SO₇: Making agricultural careers attractive to young generations; SO₉: Technological change, taking into account tighter phytosanitary standards; Development of digital solutions in quality assurance, certification, traceability, marking of goods.

2.Strategic approach to Hungary

The Hungarian government recognised the potential of digitalisation in good time and therefore adopted a comprehensive development plan, also responding to the DESI Index for sectors at national scale, which sets out future tasks in this area, called the Digital Welfare Programme. The tasks set out in the Digital Welfare Programme (<https://digitalisjoletprogram.hu/en>) aim to support conscious and value-creating internet use, the digital transformation of the Hungarian economy and thus the digital development of Hungarian society and the Hungarian national economy. Under the Digital Well-being Programme, an inter-ministerial task force, run by the Ministry of Innovation and Technology (ITM), was set up to coordinate digitalisation developments in different sectors. In the framework of the Digital Welfare Programme, the Government has professionally supported the concept of development in areas such as the Digital Education Strategy; Digital Export Development Strategy, Digital Startup Strategy and Digital Agricultural Strategy, Artificial Intelligence Strategy. The overall digitalisation objectives of those strategies and of the different sectors are set out in the National Digitalisation Strategy (NDS) 2021-2030, which specifically states that Hungary intends to put digitalisation efforts at the heart of competitiveness and modernisation efforts, recognising the necessity of the digital transformation. The priority objective of the NDS is that, thanks to the measures identified, Hungary's digital development will not only reach, but also above, the EU average by the middle of the decade.

This is why the Hungarian Ministry of Agriculture joined forces with the IT profession five years ago and started to jointly develop Hungary's Digital Agricultural Strategy (DAS 2019-2027). As a result of this long and thorough work, in 2019, Hungary's Government was among the first to adopt the Digital Agricultural Strategy, which is based on four pillars:

- 1) increasing the digital knowledge and preparedness of industry;
- 2) enhancing the digital innovation potential of the sector;
- 3) data-based development of public administration, and

And last but not least, to support the digital transition and investments of operators in the sector, i.e. producers.

For all four pillars, significant progress has already been made in the implementation of the DAS with the help of national funds, CAP measures for transitional years and EU research calls. Building on these achievements, we want to continue its strategic implementation, extending it to the measures developed in our CAP Strategic Plan. The purpose of implementing the DAS was to ensure that the data-based development of agriculture was achieved at production, farm and product line level, and therefore the development of a Digital Food Industry Strategy was included in the DAS action plan.

Hungary's Digital Food Industry Strategy (TD 2021-2028) was completed by the end of 2021 and could be taken into account in the development of the CAP Strategic Plan. It is based on two main pillars:

- 1) digitalisation of production technology, ensuring the monitoring and management of production processes, collecting production data and measuring product quality
- 2) the digital transition of training, ensuring the modernisation of secondary and higher education training and the development of digital competences for food business workers and managers. The implementation of the Treaty will start in 2022 and rely heavily on transitional years, as well as the new CAP measures and the opportunities offered by EU research calls.

Support from other EU funds (ERDF, ESF) contributes to achieving the digitalisation goals set out in the above strategies, but by delimiting these developments, the CAP Strategy Plan interventions contribute to digitalisation efforts in agriculture, food and forestry, as well as to the development of digital services also available from small municipalities in rural areas.

The CAP Strategic Plan was developed on the basis of Member States' progress in the Digital Economy and Society Index (DESI) reports. For the thematic chapters, the DESI 2020 report includes an analysis at European level of broadband access (59.8 %), digital skills (41.8 %), internet usage (55.9 %), digitalisation of businesses (25.3 %), digital public services (57.8 %), emerging technologies, cybersecurity, the ICT sector and its R & D expenditure, and the use of Horizon 2020 funds by Member States. According to the 2020 survey, Hungary ranks 21st among the 28 EU Member States. The

country's results have improved around the EU average over the past few years.

In line with the above DESI index, linked to the overall objective of digitalisation of the CAP Strategic Plan, an important starting point is that the Agrárcenzus achieved in 2020 aims to assess the structure of farms (with close to 234 thousand agricultural activities) and gather credible information on the situation of the Hungarian agroium. The survey showed that a significant proportion of farmers (72 %) do not have secondary education either. Agriculture digitalisation and generational renewal have also played a major role in the questionnaire. In the context of modernisation, it was assessed what efficiency-enhancing digital tools farmers are using or are planning to use. The results show that most of the precision technologies use the plant health assessment either with their own device or as a service (5.3 %), followed by automatic steering with 3.9 %. Only 3.4 % of farmers use differentiated work operations and about 3 % use decision support and corporate management software in their agricultural production. However, it is important to stress that the proportion of small and medium-sized farms using decision support software is growing, just like differentiated work operations for large farms. Increasing the Green Deal and the EU's climate ambition, as well as support and reporting obligations under the CAP ST, will encourage farmers to maintain efficient environmentally sound farming, modernise farms and use digital technologies. The CAP ST aims to increase the above indicators to 8 %, taking into account different farm sizes.

In line with the need for electronic administration, transparency and traceability, the Paying Agency introduced the mobile GAZDA application in 2021, benefiting both producers, village managers and the Treasury, as it speeds up and facilitates administration and reconciliation through mobile applications. Future changes in the share of downloaders and regular users of the application can be understood as an important competence indicator for the digitalisation of the CAP ST.

As a result of international trade and the appreciable development of global value chains, the producers of different continents are not in competition with each other for a long time. Therefore, a key issue for European and Hungarian agriculture, forestry and food systems is to increase the efficiency of production through digitalisation, i.e. "to produce more with less input", in a way that is consistent with the policy of the European and Hungarian agricultural model to strengthen small and medium-sized farms and with the high expectations of data security, integrating digital sector registers. Generational renewal is one of the most serious challenges in agriculture, forestry and the food economy, not by chance, as farming requires a serious and long-term commitment. For young people, our sector remains attractive only if it is profitable, environment and climate friendly and does not offer significantly worse working conditions than other sectors. Digitalisation, including precision farming, is precisely what we can help us address all of these challenges. Using the right knowledge, digitalisation increases production efficiency (SO1-3 and 9), while helping to protect our environment (SO4-6) and making our sector and rural life attractive to the younger generation of technology (SO 7-8).

Interconnection of databases

Hungary has several parallel projects to help create databases and clean data, thus reducing bureaucracy:

- Uniform Registration and Identification System (ENAR) <https://portal.nebih.gov.hu/enar>:
 - TIR – Farming Information System
 - Bovine ENAR
 - Pigs ENAR
 - Sheep/Kecske ENAR
 - Poultry Information System
 - Horse passport
- Establishment of an electronic system for the administration and control of the grape and wine sector and provision of the possibility to manage the electronic cellar book (ePincebook) <https://kifu.gov.hu/epince>
- Agricultural Parcel Identification System (LPIS) <https://mepar.mvh.allamkincstar.gov.hu/#/>

- Web Management Log Programme (webGN) <https://gn.eurofarmer.hu/home>
- Forest map <https://erdoterkep.nebih.gov.hu/>

3.CAP Strategic Plan interventions for digital transition

Within the framework of the rural development pillar set out in Article 69, modernisation and digitalisation are prominent elements, and the following basic support objectives have been set for the types of interventions for rural development.

On the basis of Article 73 of the CAP Strategic Plan Regulation, digitalisation developments are directly and indirectly reflected in the following interventions:

In support of the digital transition of agricultural holdings, we will provide funding to support farm-level digitalisation improvements and food and feed production farm-level digitalisation improvements, based on the experience of the transition period. The key objective of the farm sustainability development intervention is to increase farm competitiveness and added value by supporting the uptake and development of new, innovative and environmentally friendly production, breeding and production technologies. The intervention contributes to meeting the needs identified in the SWOTs by developing and improving the competitiveness of the agricultural sector. In order to achieve a cross-action thematic objective (Cross-cutting objective), among the selection criteria, stand-alone innovative or digitalisation content contributes indirectly to the overall objectives. The development of food processing, through interventions inside and outside the farm, provides the opportunity to develop and optimise a more competitive business, production and product structure to produce higher value-added products, as well as improvements to market access, where individual projects can contribute to digitalisation goals. Rural infrastructure development within small municipalities will directly contribute to digitalisation efforts by supporting infrastructure improvements for smart village projects, building/developing broadband internet and building rural WIFI networks, thus reducing the loss of rural areas (interventions code: RD01_E01_FRM_73, RD02_D01_FRM_73, RD03_E02_FON_73, RD04_E03_FOF_73, RD42_R01_RAN_73, RD43_R02_LOC_73).

More cooperation interventions under Article 77 of the CAP Strategic Plan Regulation include digitalisation as an overarching objective, with corresponding planned interventions:

- The development of digital services in forestry through cooperation through the use of solutions provided by digitalisation ensures predictable and traceable forestry activity, thus contributing to the improvement of rural environmental infrastructure.
- Rural development cooperation to support the digital transition of small municipalities (smart village) are rural collaborations that seek practical solutions to local economic, social and/or environmental challenges and seek to make the best possible use of digital technologies for the local population. Smart villages can also be linked to a rural centre in line with societal needs, which can bring elements of the system closer to people with a number of services.
- In the case of European Innovation Partnership (EIP) cooperation, partnerships are the task of the various actors involved in innovation, agriculture, forestry, food, rural development, research and consultancy to translate their existing knowledge into innovative, environmental-oriented solutions that can be applied in practice; these developments can be implemented through data-based decision-making processes using digital tools. (intervention code: RD61_A05_EIP_77).

The AKIS measures planned under Article 78 of the CAP Strategic Plan II Regulation all serve digitalisation (information service, advisory service, training, innovation). The most direct measure is training and demonstration programmes, under which mandatory and optional training is envisaged for recipients of other Pillar II aid, as in the current period, with an aid intensity of 100 %. (interventions code: RD58_A01_TRA_78, RD59_A02_INF_78, RD60_A04_ADP_78)

4.Other priority interventions: AGRI-EDIH

Digitalisation of agriculture and food includes hardware (e.g. sensors, drones, robots), data assets (e.g. registries, soil maps, weather data, pest and pathogen surveys), methods and software to provide analysis (e.g. artificial intelligence, decision support software), corporate governance systems, as well as e-government, e-commerce and online banking and digital solutions related to logistics. Digital solutions can help to use resources more efficiently, mitigate production risks, reduce losses, increase productivity, traceability and quality assurance, and address labour shortages in some areas. Increasing the efficiency of production has a positive impact on the environment and the climate. At the same time, the lack of information on new technologies and digital skills, as well as the limited availability of reliable cost-benefit analyses for their deployment, pose challenges for the deployment of digital applications. Hungary remains among the worst performing EU Member States when it comes to the integration of digital technologies by businesses, especially agricultural businesses. The services and activities of AEDIH aim to help businesses move to a higher degree of digitalisation, in the primary (farmers) and secondary target group (special advisers). Our main objectives are: (1) examining the digital maturity of the holding, (2) compiling a digital development plan, using economy calculations, (3) training courses for the development of human resources, organising demonstration visits, (4) ensuring the testing and testing of digital solutions that are a priority for the holding on the basis of the digital development plan (artificial intelligence, sensor technology, drone technology, data-based management decision-making, precision technology), (5) a digital solution and a catalogue of products, (6) providing data-based agricultural advice, (7) compiling a methodology for digital agricultural consultancy, (8) preparing special advisers on the basis of the methodology produced, (8) preparing the CX and UX plans for start-ups based on the experience of the digital agricultural advisory methodology, which includes customer-side expectations regarding the operation of customer-side processes and digital interfaces.

The aim of the AEDIH is also to make the digital public services and open data databases to be established in the coming years on the basis of the Digital Agricultural Strategy in Hungary available to producers, specialist consultants and start-ups participating in the programme. Among the objectives of the Digital Europe Programme, AEDIH primarily supports the use of artificial intelligence and the development of related digital skills and focuses on capacity building of new digital solutions. AEDIH will network existing AI-related testing and experimentation facilities. As part of the services, it provides farmers with access and testing. By developing the digital agricultural advisory methodology, the AEDIH provides the opportunity for start-ups developing the use of AI by accurately identifying and formulating user needs. The AEDIH provides training for farmers and special advisers based on the digital maturity test, complemented by demonstration visits and the use of the digital solution and product database. Training is also linked to the possibility of testing technologies and digital solutions for producers in their own operating conditions. The AEDIH develops the digital agricultural advisory methodology and provides its services to help understand, take up new business and administrative digital solutions, use digital public and business services, access and use open data. The AEDIH contributes to the uptake of precision agricultural technology, to the development of data-based agricultural decision-making, which support climate and environmental goals and the improvement of energy efficiency. It helps to spread modern, digital, open data-based public services included in Hungary's Digital Agricultural Strategy. The functioning of AEDIH and its services, with the planned digital agricultural advice methodology, will increase trust in the digital transformation among farmers and strengthen the network of Digital Innovation Hubs.

Broadband internet

Digital infrastructure of sufficient quality is essential for the strengthening of the digital economy, for the development of digital competences for citizens and businesses and for the uptake and use of public digital services. There is a need for permeability at all levels and across all subsystems of wired and wireless networks to ensure effective access to digital services and content, free of trade-offs, for all households, businesses and institutions in the country.

The steady increase in the number of users and the increase in average demand for bandwidth per user will lead to a multiplication of digital network traffic in Hungary over the next few years. The main drivers of growth will be the spread of mobile internet and smart phones, as well as the growth of digital on-demand video traffic, but specialised mobile applications (navigation, energy measurement, remote monitoring) may also become mass.

Although one of the strengths of the Hungarian digital ecosystem in international comparison is advanced (wire and wireless) digital infrastructure, both in terms of coverage and quality of service, which is sometimes above the EU average, achieving the target system requires further substantial improvements in the coming years as a continuation of the investments supported by the Superfast Internet Programme (SZIP), which requires appropriate cooperation between market actors and the State, and an enabling environment for investment.

A key element in the preparation of digital network development programmes (tenders) concerning residential, business and non-state institutional end-points and users, intended to be opened up to market players, has been extensively consulted in Hungary for several years on the needs to be developed, in order to ensure that State aid does not go where broadband development on a market basis is worthwhile.

The current total development needs to cover Hungary's VHCN include around 1.7 million households. It is necessary to calculate a higher unit cost than the NGA technology deployed under the SZIP, so the average amount per household is around HUF 250-300 000, so the total investment cost is estimated at around HUF 425-510 billion. If improvements in the following years are carried out under the pro-competitive tender scheme under the SZIP, the amount of aid is expected to be between HUF 320 billion and HUF 380 billion, calculated on the basis of an average State aid of 75 %.

Thanks to concentrated, state-supervised and supported developments, Hungary has been catching up with the EU average. According to the DESI 10 Connectivity Index, Hungary ranks 12nd out of the 27 EU Member States. With the introduction of the SZIP mobile service, the country has achieved full coverage of 30 Mbps next generation access networks and the use of fixed broadband services (in terms of household share) is 82 %, 4 % higher than the EU average. Under the SZIP, 19 000 km of fibre cables and 3 000 km of new network infrastructure (ducts) were built, providing access to nearly 400.000 households overall, together with market-based commitments.

However, the speed of the internet available in households remains a problem, as data traffic increased by more than 38 % in 2020. Currently, only 42 % of households have 1 Gbps internet connections, a value of which Hungary is in the middle of the EU, which is why the national roll-out of gigabit networks by 2030 is also the target. Analysing the demand coverage at the end of 2020, it can be seen that gigabit networks were typically built around large cities, resulting in a lack of Gigabit connectivity for approximately 70 % of demand.

Market mechanisms offer solutions in a number of cases, but in some cases, e.g. due to the solvency of demand or the significant amount of one-off investment, investments cannot be made on a market basis or can only take place with a significant loss of time. To this end, it is necessary to intervene in the form of grants with different aid intensities.

The EU has set a target for all Member States to promote the creation of a gigabit society. In order to strengthen digital connectivity, it is necessary to encourage the roll-out of networks to ensure equal access opportunities and future-proofing.

The necessary investments should be directed towards the Gigabitisation of residential and corporate broadband network termination points, the continuous improvement of the quality of broadband services, the development of the infrastructure needed to increase wireless network coverage and the development

of communication infrastructure. The **National Digitalisation Strategy (NDS)** for 2030, which is the source of the Digital Renewal Operational Programme (**DIMOP**) and the draft Recovery and Resistance Instrument (**RRF**), sets the objective of **having fixed and wireless digital infrastructure of sufficient service capability and quality by 2030, so that the lack of high capacity infrastructure** does not become a bottleneck in the development of the digital ecosystem.

The NDS has four specific objectives for network development:

- DI1: 95 % of households covered by a gigabit network by 2030
- DI2: The share of major transport routes and cities with county rights with 5G network should reach 100 % by 2023
- DI3: National Telecommunications Core Network (NTG) endpoints at district headquarters reach at least 80 % by 2025
- DI4: The share of public education and vocational education and training institutions with network connections of at least 1 Gbps should be 100 % by the end of 2025

We aim to achieve the objectives through the following measures:

Di I.1 Design and implementation of the network development programme “Gigabit Hungary 2030”

The objective of the measure is to design and implement the national network development programme ‘Gigabit Hungary 2030’ in order to achieve at least symmetric 1 Gbps connectivity across all demand areas by 2030. The action should achieve 75/70/65 % of residential/business/public sector needs by 2025. 95 % of residential needs by 2030 and 100 % of business and public institutional needs with internet access with a bandwidth of at least 1 Gbps. The NDS does not distinguish between rural and non-rural areas, and the developments concern the entire territory of the country.

The main elements of the measure are:

- Development of basic telecommunications infrastructure for next generation fixed and wireless networks;
- Support, in the form of a tender, in the form of tenders, for the development of energy, backhaul (zone) and local networks in areas where the market does not develop on its own;
- Operation of a superfast Internet Programme Office, a network of supervisory engineers and a Broadband Competence Office (BCO) for public support and professional monitoring of gigabit developments
- Where the tender does not involve development, an analysis of the involvement of state-owned enterprises, including, where necessary, financial instruments.

Di II.1 Geographical extension of the DJG network, connection of district headquarters, municipalities, capacity-building and connection of institutions

The objective of the measure is to develop and increase the capacity of the DJG users (e.g. public education and vocational training institutions) to connect to the backbone network at the closest possible point by using a short backhaul network. The development of the public network can reduce market exposure and achieve cost savings in the supervised network. Thanks to the development, the steady increase in bandwidth demand does not lead to an unjustified increase in costs.

The main elements of the measure are:

- Creation of traffic hubs in flood centres;
- Development of a network probe, monitoring of active traffic to increase availability;
- Further development of a network monitoring system to detect potential errors and their location more quickly and speed up the intervention. This will achieve a higher level of availability and a more cost-effective operation;
- Development of traffic management in order to achieve the best network traffic;
- The creation of channels with a capacity of 100 Gbit/s or more between backbone network assets, thereby increasing network permeability. In order to fully and seamlessly serve the growing endpoint needs and the expectations of DOS, research and the digitalisation of public collections, improvements are needed to ensure a single service at the endpoints, regardless of their geographical location;

- Deployment of assets in order to increase capacity through the acquisition of a more modern asset pool, the supervision and operation of which can be carried out in a more uniform and cost-effective manner;
- Creation of connection points, in each of the relevant service locations;
- Connecting endpoints to the network on a dark fibre fibre optic line;
- Providing pre-aggregation nodes;
- Create the possibility of networking solutions for research purposes (e.g. Quantum communication);
- Implementation of a digital education network and application platform

Di II.2 Deployment of Wi-Fi network infrastructures managed in educational and community spaces in public education and vocational training colleges

The objective of the measure is to implement the development of Wi-Fi networks for education in school education and vocational education and training colleges.

The main elements of the measure are:

- Deployment of centrally managed WiFi networks in learning rooms, public spaces and living rooms;
- Developing and developing economam and Guest networks;
- Design, installation and installation of training rooms for online group work (smart TV, camera, microphone, etc.)

Di III.1 National Telecommunications Gerinc Network (NTG) extension, bandwidth extension and related network developments

The objective of the measure is to develop the network of inpatient healthcare institutions, penitentiary institutions, district locations without the NTG endpoints, which hitherto do not have a fibre network. This enables municipalities and public bodies to provide up-to-date e-administration services. Another important objective is to ensure flexibility in meeting substantially increased and rising bandwidth needs by increasing capacity.

The main elements of the measure are:

- Further development of a district aggregation network;
- Enhancement of the NTG backbone capacity (including the development of NTG network capacities for government workers to work from home);
- Optical connection of hospitals;
- Optical connection of prison (BV) institutions;
- Other network and security developments necessary to safely service NTG connections.

Authority responsible for achieving the objectives

Government IT Development Agency (KIFÜ) acting under the authority of the Ministry of Innovation and Technology. (XII. (3) it carries out its activities in accordance with the provisions of Government Decrees. The activities of the KIFÜ can be broken down into two major areas:

- carrying out management and quality assurance of IT projects implemented from EU and domestic sources, from project preparation to implementation and completion;
- development and operation of IT infrastructure and the provision of services based on it for national public education, higher education, research institutions and public collections.

In recent years, the Agency has played a major role in the implementation of nearly 50 national ICT projects. It is currently involved in the implementation of 60 projects and in the preparation of 10 projects, with a total value of more than HUF 400 billion. In particular, in order to achieve the project objectives in a cost-effective manner, KIFÜ also carries out independent quality assurance in key IT and organisational development projects with a total of HUF 187 billion.

KIFÜ is implementing Hungary's largest broadband infrastructure development programme, the Superfast Internet Programme (SZIP).

In 2018, another big task was given to KIFÜ: in line with the principles set out in the Digital Education Strategy, the Student Net Programme will upgrade network access in thousands of schools to meet the

needs of the age, ensuring WiFi access for students and educators.

The KIFÜ has also developed the National Information Infrastructure Development Programme, which provides integrated national network infrastructure and services for the entire research, education and public collection system in Hungary.

The development of the broadband network was reinforced by the legislative amendment package adopted by Parliament on 6 July 2015, which removed legal obstacles to the development of communications networks, thus significantly simplifying and speeding up administrative procedures. It is also very much easier for operators to reduce the utility tax, which provides for a full exemption for five years in the case of utility lines installed on the new route and the upgrade of existing network sections to a speed of at least 100 Mbit/s.

5G network

No central measure or support scheme is planned for the development of the 5G network; the development of the network will be carried out by private service providers.

Cooperation in the use of data between farmers and the state: Farmers and public bodies are in partnership in the collection and use of data.

o The *State shall provide farmers* with data in order to produce as efficiently as possible by developing various monitoring networks and basic digital services linked to production (e.g. agro-meteorology, GNSS, LPIS and related basic digital maps, vine protection system, fruit register, etc.)

o *Farmers* assist the State in carrying out its planning and regulatory tasks *by providing data* generated during their production (e.g. Okos Test Plant, WebG Farming Log, National Food Chain Data Centre, specialised fish and game management systems, etc.).

The aim of agricultural policy is to create an environment in which precision farming data can be used in the most efficient way by both farmers and the state.

Importance of decision support and corporate governance systems in agriculture

Over the last decade, agriculture has developed so significantly with the rise of IT that efficient and sustainable farming is no longer possible without the means of digitalisation and the technological processes of precision farming.

In the 21st century, the systematic collection, storage and processing of data will also play a major role in crop production, livestock farming and other agricultural sectors. Competitive farming can no longer be achieved without the use of information that can be extracted from production data. However, it should be noted that a large number of data are generated on a daily basis (e.g. *weather forecasts, plant protection notifications, quality of operations carried out, data on the operation of machinery*, etc.) which are difficult for farmers to interpret on their own and to make findings that facilitate professional decision-making.

In order to address this challenge, in order to *make it easier for farmers to obtain the necessary information*, there is also an increasing number of management systems in agriculture, which can quickly and efficiently analyse the large number of data received from farmers. The information extracted from the data is transmitted to farmers in an easy-to-understand and comprehensible form (graphs, analyses) to make informed decisions. Major integrators and machine trading companies (e.g. KITE, axial, Agrotec, BAYER) have also tried to build their own system, experiencing farmers' demand for such software. A corporate governance system manages and evaluates agricultural specificities, while also facilitating accounting, keeping farm logs, systematising areas, machinery and inputs, and planning developments on the basis of the evaluation of measured data.

Link to Hungary's Digital Agricultural Strategy: cooperation between farmers and public bodies in the provision of data

The spread of digitalisation also generates more data at the level of individual farms, plants or product pathways, which have a strong national value. The collection, processing and access to public sector data is a direct competitive factor on the international market. Using the data collected – *linked to production* – we can draw conclusions that can be incorporated into cultivation in the coming years. On the state side, they help inform decision-making, target aid more effectively and legislate. As a result, informed sectoral data management of the agricultural economy is of strategic importance. The aim is to reduce the cost of access to data and to make the necessary changes to the legislative environment. Many public developments have already been implemented, facilitating and speeding up the administration of farmers through digitalisation.

(a) The strategy includes a number of measures to digitalise and integrate existing databases. Such as the *establishment of the National Agricultural Data Centre (NAAK – TS 2021) and the National Food Chain Data Centre (NÉAK)*, which aims to support the digital traceability of agricultural and food products, the social exploitation of agroium data, and the desired degree of sectoral data integration. The establishment of a food chain data centre at national level – on the basis of the National Food Chain Safety Office – is an effective support for strengthening the traceability and food chain surveillance system.

(b) It is also essential to continue public support infrastructure and institution building in order to enable the necessary improvements to be made in the context of digitalisation. This will also reduce the administrative burden on farmers.

—*Smart test plant and Okos PÁIR*: Further develop the software applications of the Small Testing System (Smart FADN) and the Market and Price Information System (Smart PÁIR) as part of the Agricultural Administrative Data Policy (MAAP).

Develop and further develop the IT systems that provide data for the evaluation and monitoring of the Rural Development Programme.

Development supports the planning, implementation, monitoring and evaluation of the Common Agricultural Policy (CAP) and related EU and domestic policies.

At the initiative of the European Commission, the FADN system, which collects economic and financial data from farmers, will be transformed into a FSDN (Farm Sustainability Data Network) system, with data related to environmental and social sustainability being added to data collections.

The European Union's Common Agricultural Policy (CAP) for the next budgetary cycle puts more emphasis on sustainability than ever before, in line with the European Green Deal, the Farm to Fork Strategy and the Biodiversity Strategy, also adopted in 2020.

When collecting sustainability data necessary for the development of the FSDN system, priority should be given to data transfer between existing data collections, in particular to reduce the administrative burden for farmers. Data from the Agricultural Statistics Information System (Asir) and external databases (e.g.: NFCSO: web-based Farming Log (webGN), Nitrate fiche) via data links.

The data to be taken over in the context of the development relate to the environmental performance of farmers:

- pesticide application,
- detailed antibiotic use;
- number of animals by age group,
- manure treatment, manure storage and manure application,
- in-house technology,
- feeding,
- grazing,
- fertiliser application,
- agrotechnological operations.

The data received can be used to estimate farmers' GHG emissions, nitrogen balances and ammonia emissions, while environmental data-based indicators can be used to calculate CAP indicators.

—*Mobile GASTE*: The Mobilgazda application, developed by the Hungarian State Treasury, offers great relief to applicants for agri- and rural development support. The app is also mutually beneficial for producers, village farmers and the Treasury, as it speeds up and facilitates administration and reconciliation.

—*E-pincebook*: The E-pincebook is not only limited to the electronisation of registers, but also makes it easier for the authorities to act by linking the various IT systems, which also contributes to making informed sectoral decisions and sees the data relating to the farmer's activities back to years.

—*Earth Observation Information System (GIS)*: The Copernicus European Earth Observation Programme project aims to achieve a single and integrated system providing up-to-date satellite earth observation data useful for public administrations and society. Earth observation data are of particular importance in the fields of agriculture, forestry, water, environment, defence and disaster management, since online, up-to-date Sentinel space images can be used to monitor, for example, changes in cultivated areas and forest cover or even the size of areas flooded by inland water, the cameras used by the Sentinel satellites (e.g. NDVI) are used to identify the crop development conditions of the various areas within the field, which can ensure the establishment of intervention zones over several years.

Subsidies

Taking these processes into account and in order to facilitate farmers' *digital transition, a call for support for precision farming* ('Support for precision improvements related to the digital transition of agriculture') was also launched under the Rural Development Programme (VP 2014-2020) in July 2021. Under the RDP, HUF 100 billion was available for the arable and horticultural sectors to support the digital transition and precision development. The main objective of the proposal was to ensure that, through modern machinery, equipment and services, agricultural companies and farms can develop more efficient and profitable production in a way that preserves the environment.

Farmers applied for HUF 212 billion for aid (a total of 2905 applications were received). As a result of the donor decisions taken so far, 1131 producers have now benefited from HUF 96 billion, but these figures will continue to rise. Hungarian farmers are open to using precision technologies as they have applied for aid for the purchase of a total of 8052 machines, of which 3360 have been supported so far. The second part of the table shows that the individual ineligible activities used in the application as a decision support service, which are the most used by farmers.

Self-supported instruments	Requested (number)	Supported (number)
Purchase of location-specific and precision agricultural machinery (including self-propelled sprayers), tractors	3011	1203
Purchase of site-specific or precision work combinets and associated adapters and cutting tables equipped with yield mapping systems, suitable for ocular harvest.	819	402
Purchase of other harvesting machines suitable for site-specific or precision work, equipped with performance-enhancing, yield mapping systems or other units that meet the requirements of precision farming.	93	38
Purchase of site-specific and precision machinery (including spraying machines and interlocking devices).	4129	1717
Modernisation of agricultural machinery, tractors and machinery produced less than 10 years old for site-specific cultivation	999	519

Actions not eligible on their own (decision support)	Requested (number)	Supported (number)
Precisiongeoreferred soil sampling and related advisory use of services	1924	820
Acquisition and analysis of satellite and near-ground remote sensing data and the use of related advisory services,	1122	545
Delimitation of management zones based on and based on various procedures use of related advisory services	815	464
Preparation of differentiated application plans and maps and use of related advisory services	598	261
Farm management,operation of farm decision support software and related consultancy services	766	400

Supporting the procurement of precision tools will also play a prominent role in the implementation of the CAP ST in the 2023-27 programming cycle.

Social context:

The Agrárcensus in 2020 also asked why farmers are not using precision tools. The results of this exercise show that:

—most farmers (123.3 thousand people) do not use such tools because they think they *do not need it in production*;

—the second most (22 thousand) said they did *not have the necessary knowledge*;

—third (8.9 thousand respondents) on the high price of digital devices;

-only 1500 people replied that they did not use precision tools because of *limited access to training and expert advice*.

Annexes

Annex I on the ex-ante evaluation and the strategic environmental assessment (SEA) referred to in Directive 2001/42/EC

1. Summary of ex-ante evaluation process and results

Ex ante evaluation summary

A. BACKGROUND

The ex-ante evaluation of the CAP Strategic Plan shall be responsible for monitoring the planning and evaluating the resulting in-work versions in the manner and in accordance with the criteria set out in Article 139 of the SPR.

This document is based on the Hungarian CAP Strategic Plan, which was already complete and formally submitted to the European Commission on 30 December 2021, the non-final and non-approved SFC export working version of 26 May 2022, which was formally submitted to the European Commission, and, in a number of cases, additional, even more recent documents.

The Ministry of Agriculture (AM), as the client, commissioned the ex-ante evaluation of the CAP Strategic Plan from a consortium led by Field Consulting Services Zrt. and Collective-Intelligence Kft., selected in the framework of a public procurement procedure, with the content defined in the Instruction Report approved by the AM, which the winning consortium performed with the assistance of external experts by the deadline of 5 July 2021. This concluded the contract providing the legal basis for the ex ante evaluation and the SEA process, which was prepared in 2019 in anticipation of the previous completion of the CAP reform. It became possible to provide a new legal framework, so that the ex ante evaluation and the SEA process could be resumed only after a new public procurement procedure had been carried out.

As one of the tasks of its contract of 4 April 2022 with a consortium led by Field Consulting Services Zrt. and Collective-Intelligence Kft., selected in the framework of the public procurement procedure, the Ministry of Agriculture (AM), as the client, commissioned an updated ex-ante evaluation of the CAP Strategic Plan, formally submitted to the European Commission on 30 December 2021, and the documents formally submitted to the European Commission on 26 May 2022, which the winning consortium carried out in a timely manner with the involvement of external experts.

Based also on the content of the previous evaluation reports, on the basis of the official documents and working versions of the CAP Strategic Plan submitted to the European Commission, and taking into account the working documents of the planning process, this document summarises the evaluators' previous and current planning support findings and proposals, and its activity takes over the planning period without official ex ante evaluator support (6 July 2021). 3 April 2022), thus bringing together the ex ante (ex ante) evaluation of the CAP Strategic Plan carried out by 15 July 2022.

B. WHAT AND HOW DID WE ASSESS?

The ex-ante evaluation related to the design of the CAP Strategic Plan has been carried out as a continuous, formative evaluation from 2020 onwards. The three evaluation reports produced as a result of the evaluation covered the overarching topics expected by the SPR and ENRD, which are necessarily to be examined (1: situation analysis, SWOT and needs; 2: an intervention strategy; 3: monitoring, data collection and implementation), then summarised in a fourth synthesis report. This synthesis report and the results of the coherence analysis of the priority interventions constituted Annex 1 to the CAP Strategy Plan, which was formally submitted to the Commission at the end of 2021.

This report presents in detail the observations and suggestions related to each topic, based on the official planning document and typically the working version of 26 May 2022. At the same time, it should be pointed out that the CAP Strategic Plan is still in the process of being planned until its adoption by the European Commission, and that the elements of the CAP Strategic Plan that have already been examined may change until it is completed.

In structuring the document, we have taken into account the ENRD recommendations, evaluation questions, proposed methodologies and evaluation support tools, which typically provide the document's chapter structure, which have been fully followed during the evaluation process. Within each chapter, the topicalisation was based, wherever possible and relevant, on the evaluation questions and criteria proposed by the SO structure, including ENRD.

The target group of this document is primarily experts directly involved in planning and policy makers, and not the general public, as it aims to support the planning process by providing constructive feedback on the design outcomes. The report therefore typically uses technical terms and many parts are less understandable.

The content presented in this document already reflects the views of the evaluators in the parts of the clients, which have not yet been fully agreed. The findings and proposals will be discussed with the designers on an ongoing basis and full consultation is expected after the submission of this report.

C. SUMMARY FINDINGS

The working documents taken over for the evaluation are typically high-quality professional background documents, the organic alignment of which and the further development of the previously proposed ex ante evaluators' addenda provided, in our opinion, a good basis for continuing the planning of the CAP Strategic Plan in line with ENRD recommendations.

Due to the capacity and experience of the institutional system in charge of the policy and implementation, the planning of the CAP Strategic Plan necessarily builds on previous practices, in particular the VP and, to a lesser extent, the ÚMVP, and takes them as a reference point. This is an important starting point for organisational learning and reflects the Commission's expectation of using previous experiences. An exceptional opportunity to take stock of these past experiences was created by the 19 thematic evaluations of RDP results carried out in 2020 and 2021, one of the key objectives of which was to support evidence-based planning.

However, with the VP as a stable planning starting point, the CAP Strategic Plan should in many points be more or different than the RDP. Regulatory changes, the new performance-linked delivery system, CAP I planning expectations, a significant increase in green expectations and separate planning for the transition period 2021-22 all pose challenges to institutional actors.

It is therefore understandable that the need for capacity in the planning process has increased: planning did not only require many internal-external coordination and partnerships, but also took place at a time when human planning capacity was extremely demanding. In addition to the core activity, the closure of the 2020 period (AIR), the publication of new calls in the transition years 2021-2022, the evaluation of the previous period (19 thematic evaluations), the ex ante and SEA processes in parallel with the planning, and the organisational changes that started in mid-2022, have simultaneously tried to plan a regular, robust and enforceable programme and implementation system of good national interest for 2023-2027.

In addition to the involvement of external competence and capacity (ex ante evaluators, SEA evaluators, external experts, environmental impact monitors), designers were also supported by innovative IT-based design support tools. IT solutions were already available, social media offered opportunities to reach target groups quickly and even representatively (e.g. social impact monitoring (PSM) and the results of thematic evaluations provided designers with up-to-date thematic knowledge and figures that were able to meaningfully support position-making and preparation of management decisions between options.

In summary, on the basis of the CAP Strategic Plan v.1.0 formally submitted on 30.12.2021 and the sub-materials and working versions that have not yet been finalised and approved, we see that the planning process has delivered acceptable results as expected, in line with the regulatory options and despite the challenges posed by the planning environment, but if possible, it can be further developed along the lines of the proposals made.

D. DETAILED FINDINGS OF THE ASSESSMENT OF THE SITUATION, SWOT AND NEEDS ANALYSIS

1. The SWOT and the range of needs, i.e. the strengths, weaknesses, opportunities and dangers of agriculture, and the underlying needs, remain agro-dominant. At the same time, rural development, environmental, natural and forestry aspects are not represented, although it should be pointed out that the

presentation of these topics has improved significantly during the planning process.

2. The situation assessments and the relevant sections of the Environmental Strategy Papers have been fundamentally aligned. The inclusion in the CAP Strategic Plan of the EU Green Deal, the EU Biodiversity Strategy 2030 and the Natura 2000 PAF, which has been developed in the meantime, could have been further strengthened.
3. The consistency between CAP I and II is addressed in the descriptions of SOs only in one case, although the impacts of Pillar I have a fundamental impact on the national environmental conditions. The direct findings on Pillar I of the CAP could have been reflected in the relevant places and emphasis.
4. The greening and good environmental and climate performance incentive plans, the network plans and the content elements necessary to underpin the Agricultural Knowledge and Innovation Scheme (AKIS) plans are of sufficient quality and quantity. These essentially provide the basis for technically justified innovations in the next programming period in these areas.
5. As regards the management and development of disadvantaged regions and the strategic territorial differentiation of the CAP, the descriptions of SOs show real points of analysis for few SOs. The assessment of the situation and the SWOT, and thus the range of needs, contain overwhelmingly national findings, despite the very different agricultural and other characteristics such as education.
6. After several developments, rural development remains under-represented in SWOT, despite the fact that rural development and the ability to live in villages are an essential, long-term factor in retaining young farmers and making agrobiznis attractive. The Hungarian Government's decision to exclude any Hungarian region among the EU's 20 poorest regions (Country Building Goal 5) is well linked to this.
7. As regards the consistency and delineation of the CAP Strategic Plan with the Hungarian Operational Programmes and their possible and proposed management mechanisms, the SWOT continues to provide minimal guidance. A number of problems have arisen in the past, e.g. by providing resources to the food industry and rural settlements below 5000 inhabitants, where in many cases sub-optimal solutions have been found, which should not be repeated.
8. Overall, the SWOT analysis is comprehensive and its coherence is appropriate, interpreted within the framework provided by the European Commission.
9. It remains the case that not all SWOT elements are directly derived from the findings of the assessments of the situation, often focussing on an essential aspect, in some cases missing. This is not surprising given the long and multi-stakeholder process of developing SWOT. The coherence of the assessment of the situation and of the SWOT findings has significantly improved in several stages during the planning process, but the fragmentation of tasks during the final planning period is unlikely to allow for the complete clean-up of structures and logical chains.
10. The quality of SWOT documents is different, but all fulfil its core function. The substantiation and level of detail of the findings are not evenly solid, but this is not easy to achieve given the different complexity or thematic volume.
11. In addition to the exemplary SWOT partnership, there was little involvement of green and environmental organisations in the discussions and little involvement of rural development organisations. The partnership, which follows the planning process, shows that the partnership involvement in the agricultural sector (including forestry and food operators) has been so extensive that it may have weakened rather than strengthened the coherence of SWOT and Situational Assessment. By contrast, this area is also under-represented in relation to agricultural land from a partnership perspective, which may also be the cause of lack of content and disproportionality.
12. The quality and adequacy of needs in themselves is fundamentally good. As a result of the reclassification of needs prior to the prioritisation of needs (among SOs, main needs vs. sub-needs, aggregations and disaggregations), the quality of the needs has significantly improved, as well as a significant proportion of the results of previous evaluations have been integrated into the planning. Since the needs are a direct basis for interventions, which are likely to have been prioritised in the last period of planning, compared to the more far-reaching SWOT and situation analysis items.
13. The main themes identified for further development in the context of needs, in line with and reinforcing the results of the situation analysis and the SWOT evaluation, are green and environmental themes, rural development (including: disadvantaged areas) and forestry. We recommended that planning meetings take place at strategic level and with a thematic focus (i.e. not based specifically and

technocratically on each SWOT and Needs item or on the evaluation comments on them, but rather on the subject as a unit and focussed on the topic only), but it was no longer possible to conduct these discussions in a meaningful way due to lack of time. In the absence of separate consultations, the evaluators' requests, which were documented with a reasoned and concrete proposal, were carried over.

14. The working method related to the prioritisation of needs was realistic and well documented, but the outcome in itself is necessarily subjective, which, after consultation with the factual justifications (SWOT), was capable of supporting interventions. Prioritisation and assessment of needs (see: ENRD 1.7) suggests the importance of each theme, given that the priority of needs is also an important factor in determining the importance and framework of interventions. The optional ranking shows even more: it gives visibility to which areas of intervention are expected to play a role in the strategy's portfolio, regardless of the themes. According to the method used for ranking, the values used as a basis for prioritisation were determined from the average of the scores of the working group participants (or the average of the averages), with several personal and organisational duplications being eliminated.

15. The outcome of the needs ranking follows well the evolution of agricultural and rural development and is in line with global and EU expectations and trends in the sector. Based on our assessment, it explicitly welcomed the high priority given to competitiveness, digitalisation and sustainability goals, while recognising the social aspect.

16. The ranking intervention structure created not only an organic continuation, but also a historic opportunity: it is a unique opportunity, exceptionally, not to harm each other, to meet the growth and development goals and to meet sustainability and green expectations, but to support each other through digitalisation and innovation, to set the domestic agroium on a new development path, for which the multiplication of top-up support resulting from the exceptionally high domestic co-financing rate of 80 %, announced in accordance with the government decision, is an unprecedented opportunity.

In the context of the analysis of the situation, the SWOT and the prioritised needs, the key findings of the evaluators, based on the official CAP Strategic Plan submitted for formal evaluation, are the above.

In summary, we see that the SWOT included in the CAP Strategic Plan has substantially changed and benefited from the changes compared to the previous first report of the ex-ante evaluation of 5 July 2021: SWOT is more mature and has become capable of supporting intervention planning by updating needs. At the same time, please note that, in line with the expected further changes in interventions, the previously established intervention logic (situation analysis, SWOT and needs) may require further changes that may affect the entire intervention logic system.

E. FINDINGS ON INTERVENTION LOGIC, TARGETS AND MILESTONES

The new challenge of the CAP Strategic Plan, compared to previous programming periods, is the introduction of a unit amount system for both the monitoring system and the annual accounts. This element is also of great importance at the planning stage, as the subsequent factual value (with the exception of some of the additional options provided for in the legislation) will in principle be compared to the design values, and it is therefore particularly important to include in the CAP Strategic Plan an appropriate, prudent and later meaningful planning calculation.

A detailed proposal for the design of the methodologies for the calculation of unit amounts recorded in the SFC has been set out, the main elements of which are: in addition to the unit amount calculation, the minimum and maximum values should be explained (if they appear); For IACS intervention and average unit amount, a detailed justification shall be provided for the reason why the uniform unit amount has been discarded; the data sources underlying the calculation and the correction methods used shall be specified. Most of these were still under review at the time of preparation of this document;

We recommend that databases and calculation tables with detailed background calculations be kept in a structured way, under the supervision of the Monitoring Unit.

Most of the CAP ST fulfilled the expectations and legal requirements in relation to the combination of R indicators and interventions. In some cases, insufficient information was available to assess compliance with the requirement, and in some other cases there were questions about compliance; in the related chapter, these suggestions and proposals are set out in detail.

All elements of the Specific Objectives (SO) – R Indicators – Interventions – Necessities are characterised

by a broad association, which includes not only the very relevant links but also the more partial, minor links. This association technique masks true, substantial, essential relationships. In order to show clearly the intervention logic and relevance, it is suggested to “clean” the combinations and to indicate only those links where the link is direct and significant, as is the case for interventions and R indicators. The intervention logic is also a condition for a coherent presentation of the justification for objectives in Chapter 2 of the CAP.

The future CAP ST performance assessment will focus on R indicators, including result indicators marked “PR”; failure to comply with the plan values results in serious sanctions. Accordingly, we considered the risk of fulfilling each result indicator in several respects (e.g. strong dependence on an intervention; TOP-up ratio; on the basis of novel intervention; calculation challenges). A total of 18 (including 7 “PR”) R indicators present a core risk: while their value is strongly influenced by an intervention, other interventions also contribute to achieving their value, albeit at a much lower intensity.

The risk is much higher than 5 R (namely: R.02, R.11, R.38, R.40, R.43PR) which rely on a single intervention. When finalising the planning, consideration should be given to at least one additional intervention with a direct and strong link to the indicators indicated, if any. And mitigation of this risk should in any case be given particular attention in the implementation of interventions, especially in the case of the R.43PR indicator.

A top-up ratio well above 50 % appears for the following indicators marked ‘PR’: R.01PR (59 %), R.19PR (83 %), R.17PR (61 %), R.41PR (70 %). In the event of a decrease in resources, the profit or loss indicators are expected to decrease; it is suggested that consideration be given to significantly reducing the top-up share of interventions that have a specific impact on the achievement of result indicators in order to avoid future sanctions.

Presents a higher risk than any other intervention (already highlighted in the past):

- Compensatory payment for the fight against antimicrobial resistance RD33b_G17_AMR_70 is the sole responsibility of the R.43PR indicator and the intervention itself is novel.
- Special attention is also given to 3 interventions for the fulfilment of the “PR” result indicators:
 - o DP17_G01_ECOS_16 Agro-Ecology Basic Programme (AÖP, Ecoscheme) – among several interventions, but it is the only one to provide value in relation to R.14PR and R.12, in addition to which 7 (!) flagship result indicators also play an important role, with the intervention itself being novel.
 - o RD19_G01_AEC_70 Agricultural Environmental Management Payments (AKG) – its single influence appears in the case of R.33, but in addition, if not unique, has a strong influence on the value of 7 (!) key result indicators.
 - o RD20_G02_ORF_70 Support for organic farming – In the case of the R.29PR indicator, it has sole influence and two other key results indicators strongly build on it in terms of outcome.

F. FINDINGS ON THE COHERENCE OF THE STRATEGIC PLAN

In the framework of the ex-ante evaluation, coherence was examined along the whole planning logic, based on needs based on the analysis of the situation and the findings of the SWOT, through the availability of indicators, targets and the necessary financial envelopes through the building of interventions on them.

The study has been grouped around priority themes, in order to be able to react quickly and to help on the most prominent issues, continuing the ex ante evaluation thinking that started in the years 2020-21. In selecting themes, we have previously taken into account the thematic focus at EU level, the domestic policy needs and expectations, as well as the groups of interventions that, based on their financial weight and/or their potential overall impact on the implementation of the plan, their novelty and their multiplier effect, were considered to be a priority area for ex ante evaluation.

Accordingly, the thematic subjects for the evaluation of coherence are:

- Renewable energy
- Antimicrobials
- Generational renewal
- LEADER

- Digitalisation
- Green interventions
- Investments

In most cases, each thematic coherence analysis follows a standard structure – logically, it follows the main milestones of the planning process and the resultant outputs. However, in the case of the green architecture, the analysis has been presented in a simplified way, given that this topic has been extensively addressed in the parallel report of the Strategic Environmental Assessment.

Our analysis shows that intervention coherence within each theme tends to be much more advanced than in previous versions, but the data content is even more deficient to assess the details. The lack of a final version of the intervention logic is limited to the proper presentation of the logical links.

Detailed feedback (positive feedback and criticism) was also provided for each intervention to allow designers to check the coherence of intervention plans from a different perspective as a result of a cross-sectional analysis.

G. FINDINGS ON THE FINANCIAL PERSPECTIVE

The financial plan for the CAP Strategic Plan has not yet been finalised, but the audited version of 2022/05/10 was already in the possession of management decisions on the basis of which the designers and evaluators did not expect substantial movements at that time.

In drawing up the financial plan, the designers took into account and applied the financial planning requirements, limitations and ring-fencing criteria of the SPR. The audited financial plan meets these conditions.

EU absorption expectations apply to the EU-funded side of the Financial Perspective. As CAP Pillar I support is expected to be disbursed with a relatively high degree of certainty (or, according to experience so far, only the uncertainty expected for the new AÖP intervention within Pillar I), the allocation of EU funds (without co-financing and own resources) in Pillar I also has a low risk of absorption and exposure. As beneficiaries are expected to be self-sufficient in the implementation of projects in Pillar II of the CAP, any difficulties in absorbing CAP Pillar II interventions do not jeopardise the payment of EU funds.

It is difficult to make a substantiated estimate of the borrowing situation in the agricultural sector until 2027 in the current turbulent period. Planners are not in an easy position, as they would need to prepare financial models for absorption of CAP Strategic Plan funds, building on and responding to realistic macroeconomic projections in advance, which are largely determined by the possibility of securing co-financing and thus by borrowing opportunities.

In the economic environment currently projected by the central government to be uncertain, including post-COVID demand predominances, the direct effects of high energy prices partly as a result of the Ukraine-Russia war and the direct effects of high wages as a result of past economic activity, and the resulting inflation, among others, as well as difficulties in accessing a number of external markets, companies are expected to invest less in the years of the CAP Strategic Plan implementation period (2023-27) than those projected in the first years of the planning period.

During the implementation period of the RDP, which lasted virtually from 2014 to 22, the companies made a very large amount of investments, thanks to the capital accumulated during the economic cycle at the time, which was available and earned, and to a globally favourable, low interest rate environment at market level. After completion, and due to the macroeconomic outlook described in the previous paragraph and the uncertainties in some important export markets, companies' capital position and revenue expectations are weaker, their new capacity-building investments tend to operate at higher overall cost levels and borrowing rates are high (except for favourable borrowing opportunities for the State-supported sector, mainly for SMEs, such as the Agricultural Széchenyi Card).

The CAP Strategic Plan is in a difficult situation when it should anticipate years ahead of the challenges of the years ahead. Some indications of this can also be seen in the text (e.g. at the start of the design, the 'Training credit environment' included in the SO2 SWOT items has already been deleted by designers on the basis of the situation known today). Especially in the case of interventions supporting investments (LEIPs, farms, forestry), there is a risk of difficulties in spending high envelopes properly. This is

counterbalanced by the fact that these investment interventions are located in Pillar II of the CAP, which is more advantageous in terms of EU absorption rules, and that a significant part of the envelope is made up of top-up resources, which can be adapted to demand in a flexible, dynamic and national context. Although no ex ante evaluation task was required, we examined which groups of interventions were affected by top-up funding to help identify the management margin of AM during the implementation period. Top-up resources amount to EUR 4.232 billion according to the Financial Perspective of 10.5.2022. There is a significant concentration of source allocation. 55 % of top-up funds are linked to two groups of interventions (ÉLIP, farm development), while almost 80 % of the funds relate to these two interventions and forestry interventions, business development and digitalisation.

Top-up resources account for the vast majority of the funds for these interventions. The top-up resources allocated to them amount to around EUR 2.9 billion, i.e. almost HUF 1.200 billion in current prices. Depending on the investment intervention under consideration, its share of the top-up total may be above 90 % (around 90 % for the two interventions with the highest funding envelopes). Governments around the world are starting to prepare for a global crisis, which may have an impact on top-ups financed by budgetary resources. If the domestic budget situation is forcing, it may be possible to reduce the framework for interventions that are predominantly planned from top-up resources or to defer the use of the envelopes. Given that top-up resources have been taken into account by planners when planning O indicators in general, and thus indirectly in the R-indicators' targets, a possible reduction of the top-up framework would result in the expected absence of the R indicator values planned for the top-up framework, which could also increase the risk of financial sanctions.

It is proposed to review the funding framework for agricultural holdings with the largest financial envelopes, LIFPs and forestry interventions in line with the current macroeconomic situation and projections, taking into account external environmental and corporate financial conditions and opportunities. Should it be decided that part of the funds may be reallocated to other interventions, it is proposed that the beneficiaries of these should be AKG or NPIs. Our analysis of the AKG identified a deficit of around HUF 218 billion for the period 2025-27 (maintenance), which needs to be resolved and re-allocated until the formal resubmission of the CAP Strategic Plan. In our view, the NTB is the most effective way of protecting the environment/nature while meeting the related R-indicators, so that the increase in resources can lead to a specific benefit of absorption and an increase in indicator value.

It is proposed to consider which proposed conceptual scenarios are possible for the use of support funds used for planning purposes and interpreted in higher forint-forints based on the expected weaker forint-euro exchange rate during the implementation period. One way of using potential exchange rate gains is to consider AKG maintenance and NTB financing.

H. PROPOSALS ON INSTITUTIONAL CAPACITIES, DATA COLLECTION AND IMPLEMENTATION

1. In the new rules of procedure, it is proposed to clearly separate the roles of Paying Agency (PA) and Intermediate Body (IB) and to create the possibility to designate several intermediate bodies. In the case of intermediate organisational functions, it must be ensured that both the legal-contract and process-side conditions for flexible use of the services requested by the MA are in place. This is extremely important if the same body is designated in both roles, but there would be significant benefits of a set-up in which several intermediate bodies are available to the MA.

2. It is proposed to designate IBs from the background organisations managed by the Wallet for interventions requiring specific professional competences and to designate the MÁK as IB for the management of area-based and investment interventions. In this way, the PA would be able to allocate more capacity to handle single applications and payments. If more than one IB were to be designated, the project selection may involve capacities with expertise corresponding to the theme area concerned, or, in the case of several IBs, the overall restrictive effect of one or two bottlenecks should be reduced.

3. It is proposed to include in the IB functions activities for which the implementation system is currently unable to provide sufficient capacity to achieve the objectives of the CAP Strategic Plan. This could include targeted outreach to potential beneficiaries, support for project generation and the development of project ideas by providing advice and mentoring.

4. We recommend that functions to improve the qualifications and skills of beneficiaries, in particular the Green Support Network, be available at the beginning of the new implementation period. This will allow applicants to make development decisions and develop project proposals on the basis of appropriate information (in particular in the green area, where there is a strong demand).
5. It is proposed to further develop the current system in response to changes in reporting expectations (increased volume, granularity and tightening). In this context, it is proposed to prepare and conclude a cooperation agreement between the MA and the PA on the division of labour in the monitoring tasks of the CAP Strategic Plan, setting out the methodology for the production of indicators with reference to the data processing manual of the CAP Strategic Plan.
6. It is proposed to lay down in a ministerial order or in the Ministry's SMSP the designation for professional contact with the indicators of the CAP Strategic Plan. It is also proposed to publish the Data Processing Manual of the CAP Strategic Plan prepared by the Indicator sub-working group as a ministerial instruction, thereby laying down the definition of indicators and the methods for calculating targets.
7. We recommend launching the planned IT procurement in order to launch IT developments to support increased and more complex data needs as soon as possible. The requirements are currently being drafted. The necessary project resources and contractual framework are in place. The financial framework for IT development is also provided, and the procurement of the developer is in a preparatory phase.
8. As soon as possible, it is proposed to make the least possible change to the established and consolidated system in the 2014-20 period, so as to minimise the time needed for learning and migration and the resulting number of errors. It is proposed to create rules that ensure the regulatory autonomy of rural development, as much as possible with the legal solution applied in the 2014-2020 period. This is also important because a significant change in the legal framework would require a significant change in the rules of procedure of the Paying Agency, and thus a major overhaul of the supporting IT system. This is expected to cause a slippage that the tight implementation schedule of the CAP Strategic Plan does not allow for.
9. It is proposed to include in the rules of procedure of the CAP Strategic Plan the Forum for the Preparation of Applications (PEMCS) and to involve the Monitoring Department of the MA and the Paying Agency and the IB as a mandatory member. When establishing the procedure for the new period, the process of preparing and amending calls for proposals should be regulated in such a way as to include both those responsible for the indicators concerned and the bodies responsible for monitoring.
10. The rules of procedure should provide the basis for the use of grant management solutions that preserve implementation capacities and reduce the administrative burden. Examples of such simplifications include, but are not limited to, the pre-qualification system, objective ("automatic") criticism, unsecured advance payments and simplified cost options.
11. It is proposed to maintain and strengthen environmental impact monitoring beyond 2023. In this context, it is proposed to include in calls for proposals and article decrees an obligation to tolerate environmental monitoring activities and to give priority to the areas concerned in the selection of projects in order to increase the willingness of farmers to cooperate.
12. It is proposed to achieve a higher level of data transparency in order to ensure a more efficient functioning of the monitoring system. This could be an opportunity, for example, to provide a coverage of assisted areas to data collection organisations.
13. It is recommended to develop and conclude long-term cooperation agreements with partner organisations involved in environmental data collection (e.g. Hungarian Association for Made and Nature Conservation) at the beginning of the funding cycle.
14. Existing external capacities are recommended (e.g.: national park directorates) further involvement in on-the-spot checks in the new funding period. For example, when monitoring High Natural Value Areas, this ensures the necessary competence to properly assess the state of the environment. It would be appropriate to broaden the scope of such professionals, taking into account that this is in itself also limited by a significant shortage of professionals.
15. It is recommended that the Territorial Monitoring System be further developed in order to support on-the-spot checks. The continuous improvement of the system and methodologies will require further efforts to ensure that the widest range of standards can be followed and checked by remote sensing.

16. It is proposed to create a dedicated department (e.g. a unit) within the MA for the management of evaluations and to reinforce the new function with at least three staff members. The new department could be responsible, inter alia, for drawing up the evaluation plan (implementing the principle of continuous evaluation), launching and operating knowledge management and disseminating activities for evaluations in the 2014-2022 period.

17. It is recommended to provide training and development opportunities for staff working in the monitoring and evaluation function on good practices in monitoring and evaluation through the ENRD.

18. It is proposed to further increase the number of staff for both the MA and the intermediate organisational function, in line with the increase in the volume of cases that can be planned in the coming years.

19. It is proposed to increase wages and minimise organisational changes in order to stabilise and reduce turnover. The continuous adjustment of wages to market conditions alone is expected to reduce fluctuations. In addition, organisational changes should be limited to what is strictly necessary and accompanied by active change management in order to retain and maintain the motivation of staff with experience in the system.

20. It is proposed to set up a human resources management organisational unit in the MA and in the bodies performing the intermediate organisational function in order to meet the challenges posed by the increasing number of staff and the HR functions that have not been institutionalised so far. One of the most important new tasks is the introduction of a performance evaluation system for the MA and PA staff (using Technical Assistance resources), which also acts as a financial incentive to reward maintenance.

I. PROPOSALS FOR SIMPLIFICATION OPTIONS

Institutional system workload

1. It is proposed that after the next version of the CAP Strategic Plan, a capacity model is drawn up to anticipate the capacity needs of each institutional system function. By running this model on a regular basis, capacity forecasts can be updated. This will give managers an accurate picture of whether individual decisions are taken (e.g.: publication date) impact on the required capacities and their timing. In many cases, minor timing changes or periodic reallocation of capacity can lead to significant accelerations in lead times. Such a capacity model has already been prepared in Hungary on behalf of the Prime Minister's Office, so there is also a technical, methodological history and benchmarking basis.

2. It is proposed to increase human resources in line with the increase in pressure, possibly as a result of sound capacity planning (see our previous proposal). At the same time, it is only a solution to deal with the sudden increase in workload, but the peaks are not constant, making it unnecessary to scale up permanent capacities. Due to the long training time, it is not always possible to achieve adequate expansion within the time available.

3. It is proposed to set up a pre-qualification system for development topics involving large-scale sources with complex award criteria, such as investments in food, innovation projects, livestock investments, horticultural investments, crop storage and dryers, short supply chains.

4. It is proposed to examine the possibility of including the FADN as part of the pre-qualification for agricultural investment aid, thus allowing for a transparent understanding of a number of valuable farming data, offering better targeting for future interventions and fine-tuning of tender parameters. It is recommended that a call for proposals be developed and published.

Simplified cost option

5. For 12 rural development interventions, it is proposed to examine whether flat rates or flat rates can be used in addition to the payment options already indicated.

6. For 12 rural development interventions, it is proposed to revise the indication of the payment modalities as it only covers flat-rates. We consider it possible that some cases may involve lump sums or it may be necessary to indicate the category of reimbursement of costs actually incurred by the beneficiary.

7. For 2 rural development interventions, it is proposed to revise the inclusion of the unit cost option. These interventions typically finance investments whose cost structure is concentrated, with relatively few supporting documents. In such a case, the benefits of simplified cost options are not so significant as to

justify additional resources and risk-taking. Flat-rate financing is also considered justified in these cases.

8. For 5 rural development interventions, we propose not to solve the unit cost in view of the expected significant number of municipal beneficiaries, as it is difficult to manage the expected losses and profits under unit costs in municipal accounting. In such a case, the itemised accounting and the combination of flat-rate costs are less risky.

9. We recommend a comprehensive reconciliation and revision of the indications for payment solutions for sectoral interventions. On the basis of this information, we do not see an absolute reason to indicate all payment options for this number of interventions.

10. In the case of apiculture and oenological interventions, the indications are still missing and it is proposed to replace them.

Support for farmers' applications

11. In the context of monitoring and IT development, it is proposed to develop a functionality in 2022 to provide tailor-made and informed support to farmers in decisions on green architecture grants. In this context, we recommend that the LPIS base the data requirements for this function on the natural assets coverages and the previous grants already used. It is recommended that the functionality is designed to ensure that recommendations reach farmers in the most immediate and rapid way possible. To this end, we recommend using the channels of the National Chamber of Agriculture, which operates the Green Support Network. In such a system, it is proposed to create a strong basic package for those for whom a specific recommendation is not induced, because it is common for customers to choose the basic package.

12. It is proposed to use the system to further support policy objectives after the introduction of business case support. In this context, it is proposed to increase the environmental performance level of the proposed standards from one year to the next. Typically, after an initial commitment, customers accept the next step more easily than they would need to take a larger step immediately. We also recommend that the system provides positive feedback on the environmental impact of decisions. Feedback will shape a sense of satisfaction about delivery, the loss of which is already expected to be counteracted by those concerned.

J. FINDINGS ON THE IMPLICATIONS AND SYNERGIES OF THE STRATEGIC PLAN WITH OTHER (OPERATIONAL) PROGRAMMES

Virtually all 2021-27 OPs, the Recovery and Resilience Plan and the Hungarian Village Programme have identified areas, topics and target groups that potentially overlap with the interventions foreseen in the CAP Strategic Plan.

In these cases, the solution is to adjust the delineation accordingly, where possible in such a way that the delineation does not only create flexible capacity for both demand and supply-side actors in the aid policy system, but also leads to mutually supportive, synergistic solutions by ensuring their complementarity and mutualisation.

The programmes are currently under planning. On the basis of the experience of the previous period, designers already have ideas for delineation, but neither their final coordinated inclusion in both relevant programmes, nor the coordinated coordination and fixing of synergies that the Commission often lacks, have been fully implemented.

The process of consultation with other OP designers initiated in the framework of the ex ante evaluation of the CAP Strategic Plan was sincerely welcomed by all relevant ministries. The identification of managers and experts in potentially overlapping areas has started but has not yet been completed, so there is still room for constructive solutions to be shared.

As a co-ordinated and synergistic solution, it is proposed to treat certain calls in the CAP Strategic Plan and Operational Programmes as complex projects and to use innovative and coordinated procedural elements to support this, avoiding demarcation problems in order to exploit the potential synergies that can be presented to the European Commission in all relevant programmes.

The use of "one-size-fits-all calls" could be used as a tool for multiple pairs of calls: in the event of two overlapping interventions, a (information) document presenting a brief summary of both calls and the relationship between the two calls may be published on the application interface together with the second call. The proposed document would have an informative role and would not create a legal obligation for

the Managing Authorities. Official information related to the calls would continue to be included in the relevant calls for proposals, which will be referred to in the factsheet. A call/legal title regulation involved in a given link between the two programmes could give an extra point during project selection/application evaluation to the beneficiary who also submits a grant application for the other call until the evaluation, and thereby participates in the use of synergistically matched funding opportunities – in line with the policy intention thus embodied as a result of inter-ministerial coordination. According to preliminary information, this solution can be applied to several programmes.

SEA summary

Social consultation of the SEA

The involvement of relevant organisations and the public is particularly important in the SEA process. As part of the SEA team, this activity was carried out by the Association of Hungarian Conservationists (MTVSZ), which has significant references and credibility on the subject.

During the preparatory phase of social consultation, the relevant social groups were identified, during which more than 300 civil, professional, scientific, agricultural and business organisations were made available on the basis of previous experience and the relevant ENRD recommendation. The Hungarian Association of Conservationists, as the organisation responsible for social consultation, has set up a subpage on its website (www.mtvsh.hu) for the social coordination of the SEA process of the CAP Strategic Plan, as well as a closed group on www.facebook.com.

During the consultation of the SEA Thematic Report, the bodies responsible for the protection of the environment and the National Environment Council (hereinafter: Oct) and the National Council for Sustainable Development (hereinafter referred to as NFFT) were consulted in January 2021. The thematic report of the SEA was finalised by processing and summarising the opinions received.

During the consultation of the SEA environmental assessment, the Ministry of Agriculture, which was responsible for preparing the CAP Strategic Plan at the end of August 2022, sent the consultation documentation of the CAP Strategic Plan together with the environmental assessment to the bodies responsible for the protection of the environment, as well as to the OAP and the NFFT. In parallel, a press release was issued by the Ministry and a press release was published on 2 September in the Hungarian National newspaper. News about the process were published on the website of the Ministry of Agriculture, on the website of the concertating Hungarian Association of Conservationists and in the above-mentioned Facebook group. The Ministry also asked 317 civil, professional, scientific, agricultural and business stakeholders and members of the Monitoring Committee of the National Environment Council and Rural Development Programme to comment by direct email. Public authorities and social partners had 31 days to comment.

To ensure face-to-face feedback, a partnership workshop was organised on 27 September 2022 by the Ministry of Agriculture at the Ministry's building in Budapest. 18 participants participated in the nearly 3 hours forum, a detailed reminder of the Forum can be found in Annex 4.

During the consultations, the following bodies responsible for the protection of the environment were consulted:

- national environmental and nature protection authority
- national Chief Medical Officer
- Minister for Forestry, Soil Protection, Quantitative Protection of Land and Agri-environment
- Ministry of the Interior National Directorate-General for Disaster Management
- Minister for Mining
- Budapest Government Office
- Minister for the Protection of Cultural Heritage
- Ministry of the Interior National Directorate-General for Disaster Management

The organisations directly involved in the consultation process are:

- The National Environment Council and its members
- Organisations represented in the Rural Development Programme Monitoring Committee
- The National Council for Sustainable Development
- Office of the Commissioner for Fundamental Rights
- Nature protection and environmental NGOs
- County Directorates of the National Chamber of Agriculture
- Other public, farming, civil society and municipal organisations and organisations representing interest groups affected by the objectives and interventions of the CAP Strategic Plan

Place of publication of SEA results

The submitted version of the SEA, together with a summary of the opinions received and how they are dealt with, will be published at the end of October 2022 on www.mtvsh.hu, slatezat.gov.hu and am.gov.hu website. The authorities involved in the process, listed above, will receive a detailed reply to their comments.

Effects of CAP Strategic Plan interventions on climate change mitigation, adaptation and dissemination of sustainable energy

Overall, the expected balance of the CAP Strategic Plan from the point of view of climate change mitigation cannot be clearly established at this stage. The Plan contains a significant number of support elements that can reduce agricultural emissions and increase the carbon sequestration capacity of the domestic territory. At the same time, supported investments can further increase the intensity of raw material production, which may have a greater negative impact than the result of emission reductions. The result depends on the technical details of the supported projects and the incentives for farming practices. These will be truly impacted by the calls for proposals, which are not detailed according to the CAP Strategic Plan. It is therefore important to prioritise climate change mitigation when developing detailed rules for support schemes in the implementation of the Plan and to measure its effectiveness through environmental impact monitoring.

Effects of CAP Strategic Plan interventions on protecting soil quality and preventing soil erosion

The CAP Strategic Plan is expected to be a step forward in protecting soil quality and preventing soil erosion. This requires farmers to choose standards to maintain soil quality in a significant area, in particular under the Agroecological Fund Programme, and to reduce soil erosion through changes in conditioning and the emergence of payments to encourage agro-ecological land use change and maintenance. As soil regeneration can only be measured over a long period of time, it is of utmost importance that significant progress is already made in this area during this funding period. Therefore, from the first years of implementation, once applications have been supported, it will be worthwhile to assess potential impacts, and from the second half of the cycle to monitor the real effects of soil conditions through impact monitoring. The strengthening of the conditions for support should be stepped up until agriculture achieves sustainability in terms of soil status.

Effects of CAP Strategic Plan interventions on the protection and quantitative protection of surface and groundwater from nutrient and pesticide pollution

In conclusion, it can be concluded that the CAP Strategic Plan will have both a negative and a positive impact on water quality. The result cannot be established in advance. A positive overall impact can be achieved if water protection aspects are integrated into the detailed rules and award criteria of the aid

schemes. Here too, it is important to estimate both the potential impacts and the back-testing of impacts already during implementation.

Impact of CAP Strategic Plan interventions on improving air quality, sustainable waste management and promoting the circular economy

Some management practices, where sustainability considerations are considered to be relevant, can contribute to reducing air pollution, especially for solid particles and airborne pesticides. In particular, the 'Basic Agro-Ecology Programme', which among its optional requirements helps to protect air quality by minimising uncovered soil surface, winter soil cover, non-rotational tillage and cover of plantations. Some elements of 'Agro-ecological non-productive investments', 'Agro-ecological land use change payments' and 'Support for agricultural irrigation communities that improve water use efficiency' can contribute locally to reducing air dust contamination by increasing soil cover, reducing wind speed and increasing the area of irrigable areas.

Overall, the CAP Strategic Plan is expected to have a positive impact on air quality, sustainable waste management and the achievement of a circular economy, especially if awareness-raising actions are able to change farmers' attitudes in addition to compliance and have a meaningful impact on farming practices.

Impact of CAP Strategic Plan interventions on protecting biodiversity, enhancing ecosystem services and protecting habitats and Natura 2000

Among the interventions of the Strategic Plan, the highest value in terms of biodiversity and ecosystem services is those that include measures with a proven positive impact on mitigation of adverse impacts on ecosystems and habitat restoration, while being most trade-off-free, few of them having a neutral impact, or increasing pressures and intensification of production.

The AKG's targeted measures have the potential to mitigate adverse impacts on habitats and species, based on the experience of recent cycles. In this cycle, it is important to refocus and expand the range of support for 'High Natural Areas', as it has been demonstrated that these targeted aids have the highest environmental added value. In this context, priority should be given to producers with the highest level of pledges in the selection process. The provisions of the AKG should be aligned with the additional elements of the CAP's green architecture (conditionality, AÖP, Natura 2000 compensation, non-productive investments), so that mandatory and voluntary standards can complement each other in order to provide farmers with the highest possible, most significant territorial coverage and the longest possible impact.

Compensatory payments to maintain the ecological status of Natura 2000 grassland and forest areas and to conserve grasslands as grasslands are also a highly successful form of support in international comparisons.

A payment to encourage agro-ecological land-use change is key to restoring the ecological network and landscape features of agricultural land, as well as encouraging land-use change in areas with limited suitability for arable farming, with ecological benefits in all its elements. Support for organic farming and certain measures for apiculture interventions are intended to reduce the environmental impact of farming, in particular to reduce the range of chemical pesticides and to reduce the amount of chemical pesticides. In the case of the latter, particular emphasis should be placed on support for bee health and environmental exposure tests, which will contribute to the identification and monitoring of the impact of pesticides that are dangerous to bees.

All the requirements of the basic agro-ecological programme can contribute to changing agricultural practices, including reducing environmental pressures, in the case of arable land, grassland and plantations, although the expected degree of impact may vary considerably.

The effects of climate change have become increasingly evident in recent years, and adaptation to them is unthinkable without preserving and maintaining diverse biological bases. In addition to natural biodiversity, these objectives are highly served by interventions to preserve agro-biodiversity, i.e. the diversity of plant and animal genetic resources.

Among the interventions that are expected to have a significant negative conservation impact, support for agricultural irrigation communities, aimed at improving water efficiency, is a priority. Irrigation and associated infrastructure (linear, irrigation ditches) have direct negative conservation effects (e.g.: destruction of nests and branches of bird species nesting on the ground, risk of collision, creation of ecological traps). Irrigation also opens up the possibility for intensive arable and horticultural crops to be grown in areas where there has been a predominant extensive cultivation of arable land, with the result that suitable habitats continue to shrink. In water-scarce areas, irrigation can lead to further depletion of surface and groundwater resources, increasing water scarcity.

The achievement of a farming activity as one of the basic conditions for the basic and redistributive income support for sustainability should encourage those concerned to use areas with unfavourable production conditions and thus limited suitability for arable farming (drought, inland water and erosion) and to maximise the cultivated area, such as the use of elements of the agricultural ecological network for farming purposes, which should be assessed as a direct and significant negative impact and is contrary to the objectives of the biodiversity strategies. That effect is cushioned by the fact that the farmer is also entitled to receive that aid by maintaining the area in the state of culture ('maintenance').

The energy use of agricultural waste (biomass) in the context of rural development cooperation for the development of a biomass-based economy can have a positive impact in terms of reducing GHG emissions, while biomass production primarily for energy purposes can also generate significant additional environmental pressures through intensification of production (soil degradation, crop protection), habitat conversion and loss.

Support for the control of endo- and ectoparasites in animal welfare interventions in the small ruminants and cattle sectors may have a direct negative impact on the invertebrate fauna of agricultural land and on the protected vertebrate species that feed them. Insect control by non-selective agents (piretroides) reduces the food source of bird and bat species that feed on flying insects, and active substances (e.g. ivermectin) entering the soil with faeces can have adverse effects on the soil and/or on the soil surface.

It is hoped that the CAP Strategic Plan should restore a number of previously dead agricultural habitats and protect them in a meaningful way. If this can be achieved and interventions characterised by direct and indirect negative impacts are redesigned, it is also expected to have a positive impact on biodiversity developments.

Impact of CAP Strategic Plan interventions on the preservation of the landscape, the protection of landscape features and cultural heritage

Overall, it is hoped that the CAP Strategic Plan will have a positive impact on the preservation of the landscape, but this also requires increasing farmers' environmental and landscape awareness in this area and not only achieving minimum standards, but also the value of the landscape, natural and cultural values that the farmer hosts in the area he is cultivating. This can be expected from awareness-raising actions.

Impact of CAP Strategic Plan interventions on sustainable development, human health protection, social justice and cultural heritage

The CAP Strategic Plan can contribute to a more sustainable and just society in several areas. At the same time, the resources provided for this are not sufficient in themselves to address the existing problems. There is therefore a need for strong support from other development programmes in this area.

General assessment

Overall, as a result of the evaluation of interventions, the implementation of the CAP Strategic Plan creates environmental safeguards with the guarantee elements of the green superstructure, in particular the mandatory requirements for enhanced conditionality. By requiring compliance with the environmental directives and the basic environmental conditions of strategic importance, deterioration of the environmental condition of utilised agricultural areas can, in principle, be prevented.

By supporting voluntary elements of the green superstructure, the Common Agricultural Policy also provides an economically realistic alternative for farmers engaged in environmentally sound land use. These subsidies can contribute to the improvement of the environmental status of almost all environmental aspects.

In addition, the support of the Common Agricultural Policy can contribute, directly or indirectly, to the intensification of agricultural production. Agricultural production with higher inputs and more efficient technology is the cause of many environmental problems. The irrational land use and erosion of the elements of the agricultural ecological network, which are heated by the aid, are also partly attributed to the negative environmental impacts of the plan.

The assessment of the situation without a CAP Strategic Plan is therefore twofold. On the one hand, the absence of environmental guarantees and voluntary environmental subsidies would reduce the scope for environmentally friendly land use. On the other hand, in the absence of any impact on the intensity of agricultural production, it is conceivable that there is a reduction in the use of inputs and a failure to cultivate unsuitable land. This would certainly have environmental benefits. In addition, a strong differentiation in land use intensity is likely to be a consequence of the absence of the plan: the cultivation intensity of high-quality arable land would be further strengthened, inter alia due to the lack of environmental guarantees, while the abandonment of cultivation on low-quality fields could be envisaged in the absence of the plan.

1. - Description

It is proposed to revise the intervention logic as follows:

- allocate a needs-based objective in Chapter 5 to interventions responding to SO underlying needs
- when assigning the R indicator to the intervention, (3) establishing the link between SOs and R indicators, particular attention should be paid to ensuring that the results of interventions planned to achieve the objectives are representative and that the response to needs can be justified.
- when combining any of the two elements of the intervention logic, the most important criterion should be that only and explicitly direct and substantial links should be specified.

While the overall intervention logic of the CAP Strategic Plan is understandable, chapters 2 and 5 of the

SFC (version 26.5.2022) show that coherence can be further developed:

- The range of interventions responding to the objectives set by the needs and the feedback of the result indicators to the corresponding specific objective in several cases does not constitute a completed logical chain
- Indicators showing the results of interventions responding to the needs underlying the specific objectives have not always been combined with the relevant SO

In the annexes to the ex ante report, a separate chapter and detailed tables present the findings and suggestions concerning the coherence of each intervention theme.

1. - Justification

The detailed proposals are constantly being taken into account in the further development of the CAP Strategic Plan by planners.

10. - Description

The environmental added value of the practice of non-rotational cultivation is undeniable, but it is important to provide for restrictions on the use of plant protection products at the same time.

The use of non-rotational tillage can sometimes lead to significant pesticide use. In formulating the standard, efforts should be made to define the use of plant protection products which is still technologically acceptable but which has a minimum environmental impact.

10. - Justification

The technical direction of the proposal is agreed by the designers. The feasibility of the specifications needs to be further analysed prior to their introduction.

11. - Description

Introduction of a complementary package of measures to halt biodiversity loss: **introduction of** compensation payments for Natura 2000 arable land.

The proposed missing support element can make a significant contribution to changing trends affecting biodiversity with a persistent negative trend. The proposed support element will contribute to the strategic goals of reducing pesticide use and will lead to habitat changes that benefit several sectors (wild game management, beekeeping). The proposed intervention facilitates the possibility of a higher level of consistency between the CAP Strategic Plan and the Natura 2000 PAF. The introduction of the intervention contributes to Article 28/2017. (X. 25.) for the implementation of Decision AB.

11. - Justification

The technical direction of the proposal is agreed by the designers, but the financial and implementation conditions for its introduction during the current planning period have not been met. The introduction of a new payment in the next planning cycle is realistic.

12. - Description

Introduction of a compensation payment under the Water Framework Directive.

In order to preserve and improve the status of domestic surface and groundwater, it is appropriate to introduce an aid measure similar to the Natura 2000 compensation scheme.

12. - Justification

The technical direction of the proposal is agreed by the designers, but the financial and implementation conditions for its introduction during the current planning period have not been met. The introduction of a new payment in the next planning cycle is realistic.

13. - Description

Introduction of a complementary package of measures to halt biodiversity loss:
Introduction of long-term fallow rearing/bee-preservation TECS and Gyepreservation TECS in High Natural Value Areas.

The proposed missing support element can make a significant contribution to changing processes affecting biodiversity with a persistent negative trend. The proposed support element will contribute to the strategic goals of reducing pesticide use and will lead to habitat changes that benefit several sectors (wild game management, beekeeping). The two above-mentioned sets of thematic specifications of the High Natural Areas Programme have been proposed under the [Birds & Farmland Initiatives](#) supported by the EU Commission in the initiative of the Domestic Partner (MME).

13. - Justification

The technical direction of the proposal is agreed by the designers. The new AKG will be launched as of 2024. It will be possible to enforce the proposal.

CAP ST does not exclude the possibility of introducing a new TECS.

14. - Description

Separate renewable energy generation intervention

It is proposed to launch a specific intervention to support renewable energy investments, to be decoupled from the envelope for investment interventions in agriculture, food and small municipalities, Teachas, for the purpose of increasing the dedicated renewable energy generation capacity linked to R.15.

It is proposed to set the envelope for the intervention at least HUF 90 billion so that the CAP Strategic Plan, like other programmes, contributes to the objectives of carbon neutrality of domestic energy production in the National Energy and Climate Plan (NECP), in proportion to the resources available to it. An envelope of HUF 90 billion allocated to a new separate renewable energy investment intervention will allow the implementation of approximately 300 MW renewable capacity (R.15) with a support rate of 50 %, i.e. 10 % of the difference between the current and the target NECP. The new intervention will allow the R.15 target to be doubled (currently: 151 MW).

In line with EU and domestic policy objectives and in order to ensure the achievement of the target related to indicator R.15, it is proposed to make funds directly available for this purpose. Market developments – green transition, high fossil energy prices, security of supply – are all leading to increasing market demand, with entrepreneurs' willingness to invest on the rise.

In line with the above approach, the three relevant interventions were used for modelling investments to support separate renewable energy production ((1) development of agricultural holdings, (2) development of food processing by adding value to agricultural products, (3) development of small municipalities and farmyard infrastructure). On the basis of the RDP thematic evaluation on energy efficiency and renewable energy, it is assumed that 20 % of corporate beneficiaries (1-2) and 80 % of small municipal beneficiaries (3) will carry out real estate renovations or new developments that also require energy development. Also based on previous assessments, we estimate that an average of 15 % of each property's investment amount will be spent on renewable energy development.

Along this logic, an envelope of HUF 90 billion allocated to a new separate renewable energy investment intervention will allow the implementation of a nominal installed capacity of around 300 MW with a subsidy rate of 50 %. Taking into account the requirement of the National Energy and Climate Plan (based

on which the extension of solar capacity is the central element of Hungary's renewable energy production and which should increase from 680 MW in 2016 to 6 500 MW in 2030), this represents almost 10 % of the difference between the current 3 000 MW target and the 6 500 MW target.

Based on experience and due to its widespread applicability, simple installation and accounting, renewable energy generation capacity is expected to support predominantly solar panels, to a lesser extent solar collectors, biomass boilers and geothermal development. Accordingly, the proposed envelope is based on solar development, taking into account that the capacity installed in the development must not exceed the economy's own energy use.

14. - Justification

The proposal was accepted by the designers and a specific intervention was created in the CAP ST.

15. - Description

Mandatory renewable energy production in case of land development (new construction or renovation) Specific wording for renewable energy production is proposed. In this context, it is proposed to require the use of renewable energy generation development to cover at least 50 % of the energy use of the new/renovated building (heat and/or electricity) in case of site development, building renovation, both new construction and deep renovation.

As of 30 June 2022, Decree No 31/2022 requires compliance with the nearly zero-energy (NZ) requirement level for newly built properties and renovations reaching at least 50 %, which is practically impossible to achieve without the use of renewable energy generation. In addition to residential buildings, similar requirements should apply to farm buildings and municipal properties. Taking into account the domestic NECP's energy strategy targets in line with the EU Fit for 55 targets (6 500 MW nominal solar panel capacity by 2030), as well as the multiplication of fossil fuel costs in the context of the current war situation and aspects related to the enhanced security of supply and self-sufficiency, we consider it appropriate to use the support, in addition to the objectives of the CAP Strategic Plan and the underlying EU greening requirements, to serve domestic policy and long-term national goals, as well as the safe and sustainable operation of businesses. The mandatory requirement could ensure that the renewable energy intervention framework is used and the target R.15 indicator is increased.

15. - Justification

The designers agree with the technical direction of the proposal.

Energy development will be mandatory for developments financed by green investment interventions. At the same time, it is not possible to extend this requirement to all investments because there will be developments that do not concern, for example, buildings, so that connecting with renewable energy requirements would be unrealistic.

16. - Description

Use of unit costs in indicator calculation based on EDIOP benchmark values

It is proposed to use unitary values of EUR 1100/kWp for installed renewable energy production capacities under the support of green investments in agricultural holdings that are dedicated and strongly supportive of renewable energy production (RD01c_E01_FRM_73). This value takes into account the unit values used in the EDIOP, adjusted for the current and expected HUF/EUR exchange rate and inflation, predominantly based on the installation of solar panel systems as the expected determining technology. When setting the target value for R.15, in addition to the specific value, designers are invited to take note of the draft legislation which, once in force, requires adequate storage capacity to be provided for the authorisation of additional solar panel systems, in order to prevent network anomalies and overload. Depending on the system size, this may amount to between 30 % and 60 % of the investment value of a given scheme, so it is recommended to calculate an average value of 40-50 %.

The above, which has been applied in the EDIOP for several years and has been revised several times (see last version. GINOP-4.1.5-22) is technically justified and validated on the market side. From a support policy perspective, it is beneficial that similar values in CAPST and EDIOP do not require further explanation in any programme (NB: EDIOP Plus no longer continues to support renewable energy for businesses) to the EU Commission. The specifics reflect market realities, for which the associated overall payback times have been significantly reduced by high fossil energy prices over the past period, so they cannot be seen as limiting market mechanisms but serve only to determine realistic prices.

16. - Justification

The proposal was taken into account by the designers in the planning of the financial envelope and unit amount of the interventions concerned and the related indicator R.

17. - Description

LAGs excellence programme to increase local synergy of development resources

Leader Local Action Groups represent a key element of the Hungarian territorial development system. The only organisation system covering the entire rural area of the country, with a dedicated task to increase synergies between development resources at local level. The LEADER approach and the LAG “infrastructure” are ideal to increase synergies between different development programmes at local level. At home, this should be prioritised among LEADER’s strategic objectives and supported by the CAP Strategy as well as towards the co-ministries.

In order for LAGs to have a sufficient impact on their environment development programmes, they need more capacity in this respect.

The LAGs currently have 2 full-time employees, all in the country’s 105 LAGs. As part of the implementation of the CAP Strategic Plan, these LAGs will have to resubmit their Local Development Strategy (HSF) in order to renew their status. In the preparation of the 2023-2027 LFS, it is important to require LAGs to promote local synergies as a priority. On the basis of our proposal, well performing LAG organisations could, on the basis of effectiveness for 2014-20 and increase local coordination and synergy with non-VP programmes 2014-20, add one to three additional persons/HACS 3 to 5 persons, tailored to the needs, while maintaining the current system of 2 persons/HACS. It is proposed to open this option to LAGs meeting the main thresholds, known as the ‘HCS Programme of Excellence’, by requiring LAGs to declare their intention to participate in the LAGs in the programme of excellence in relation to the LFS, presenting the relevant results of the 2014-20 period as a justification. In the LAG excellence programme, the amount of aid obtained in previous years through the LAG (not only VP) and the amount of aid obtained from other OPs and domestic programmes could be a selection criterion, which should be accompanied by a sufficiently motivating threshold for those who actually perform well.

Provided that the eligibility limits for the LAG Excellence programme are set at 30 % of LAGs successfully and plan to employ an average of + 2 for each of them (i.e. 4 instead of the current 2), the estimated resource needs are as follows over the whole time horizon of the CAP ST: 30 LAGs x 2 persons x 5 years x HUF 12 per year total employer expenditure = HUF 3.6 billion.

Differentiated development of LAGs is justified. Positive discrimination against well-functioning LAGs on the basis of excellence in a way that does not infringe the acquired rights of existing LAGs can help to further develop high performers. LAGs can play an essential role in creating different resources locally and in a coordinated way, thereby facilitating decentralised and local synergies with other programmes, which the Commission has repeatedly called into question in connection with the RDP.

17. - Justification

The designers agreed to the proposal.

Linked to the proposal, LAGs will be able to implement development projects from LAG-managed funds during the CAP ST period. The implementation of the projects will also provide resources for recruiting colleagues in the development and facilitative work.

18. - Description

Promoting better coordinated rural development.

Under LEADER, it is also possible to facilitate coordination and even better use of rural development within the framework of the CAP Strategic Plan. If proven alignment with a LAG's LAG could provide additional points for the evaluation of CAPST Pillar II rural development and agricultural applications, this would also contribute to the needs-based and coordinated nature of local interventions, and thus their feasibility and sustainability.

By increasing the role of the LAG's HFS, the targeting and local acceptance of LAGs can be greatly improved. Local actors would see even more tangible value in matching with local strategy and individual involvement in promoting local strategic goals. LAGs also play a pre-screening role by awarding extra points, which tends to increase the reflection of grant applications, their overall quality and a greater degree of decentralisation of the preparation of individual applications. Thus, the LEADER approach and the LFS could have a development impact beyond the resources allocated to the LAG, in order to address problems in terms of social, employment and local quality of life.

18. - Justification

In the project selection procedure, the assessment of compliance with the HFS may be problematic and we do not support the proposal.

19. - Description

Launch a LEADER training and mentoring programme within the framework of the CAP Network
There would be an opportunity to increase their role in addressing local social, employment and competitiveness issues through targeted and continuous training of staff working in LAGs in order to exploit local synergies. It is proposed to provide a continuous training and information programme for LAG staff, which will increase their preparedness and hence the positive impact of LAGs in these areas.
A good example and analogy of the training and mentoring programme could be the National Entrepreneurial mentoring programme carried out by the MKIK with EU funding of HUF 3.6 billion since 2018. This includes access to information, training, mentoring and even individual counselling services for the smallest businesses. Experts and mentors in participating enterprises (medium or large companies with experience in similar developments) with support, guidance and local MKIK coordinator support. A LEADER training and mentoring programme could be run with a similar principle, processes and envelopes, which would open up new opportunities for exploiting local synergies, while at the same time providing a synergy tool to be presented to the European Commission, from which all local development would benefit, regardless of programme and funding opportunities.

Funds for rural development are expected to increase significantly over the period 2023-2027. For this resource to be effective, there is a need for an appropriate level of knowledge and good practice on rural development among stakeholders. A good platform for this is the LEADER LAG network, which can provide information through its contacts with local actors and use it as regards its own resources. Thus, a significant multiplier effect can be achieved by training LAGs.

19. - Justification

The designers agreed to the proposal. During the CAP ST period, the CAP Network has a strong role to play in training and mentoring LEADER LAGs.

191 - Description

In order to ensure the flow of information related to interventions, in particular to small-scale applicants, it

is appropriate to provide advice free of charge.

The proposal aims to further develop the CAP Strategic Plan.

191 - Justification

This is one of the reasons for the creation of the Green Support Network under the AKIS.

192 - Description

It is suggested that consideration be given to the introduction of results-based approaches for certain objectives (e.g. biodiversity conservation, water retention).

The proposal aims to further develop the CAP Strategic Plan.

192 - Justification

We will be treated in the course of implementation.

193 - Description

Through agri-environmental management measures, the development of floodplain landscape management in suitable areas should be promoted.

The proposal aims to further develop the CAP Strategic Plan.

193 - Justification

We will be treated in the course of implementation.

2. - Description

Acknowledging the many positive progress already made in the areas of nature and environment, we see a need to further increase the level of environmental ambition of the CAP Strategic Plan compared to Option 1.0.

We see a significant increase in the framework for non-productive investments in Agro-ecological as a good opportunity to improve biodiversity, soil and water protection and pollinators at the same time.

It is proposed to triple the budget of EUR 19910349 (total public expenditure) in the financial plan of 05.10 of the CAP Strategic Plan. In parallel, the targets for the related output indicators R17, R26, R32 and O21 should be increased. There is also a need to increase the envelope for maintaining these investments to a sufficient extent.

Agro-ecological non-productive investments (NPIs) are an element of the CAP Strategic Plan that can specifically achieve nature, environmental objectives and related indicators (including the level of environmental ambition) in one of the most effective ways.

A further advantage of the amendment could be that it does not affect the current rather complex system of green architecture, thus reducing the risk of splitting the coherence of aid.

2. - Justification

The technical direction of the proposal is agreed by the designers. The INST envelope for CAP ST is more than seven times higher than the funding used in 2014-2020.

In addition to the current constraints on the allocation of funds, there is no further possibility to increase the AÖNTB envelope, but if there is sufficient farmer interest and sufficient resources to be used during implementation, AÖNTB will be a priority for transfers.

20. - Description

Management of certain funds in the CAP Strategic Plan and Operational Programmes in complex calls

The planning identified a number of CAP ST interventions with a pair of synergies in one of the OPs. In such cases, it is recommended that a new information document be published in addition to the usual calls for proposals: call for complex projects, presenting the two calls, highlighting links. We recommend that additional points be awarded to applicants who also submit an application for the other call for proposals in the framework of the award criteria for these calls.

Proposed grant management steps:

- Together with the second call, a document presenting a short summary of both calls and the link between the two calls (invitation to complex projects) may be published on the application form. This document is limited to a substantive presentation of the grants and links, and the detailed elements will continue to be included in each call for proposals.
- Both calls could award an extra point to the beneficiary who submits an application for the other call until the evaluation, thus taking part in the use of synergistically matched funding opportunities.
- The Managing Authorities undertake to inform each other of the applications submitted.

Call pairs identified during the CAP ST-OP consultation:

- CAP Strategic Plan: digitalisation of agricultural and forestry enterprises – DIMOP Plus: SME digital skills development
- CAP Strategic Plan: animal husbandry developments – KEHOP Plus: biogas production based on manure
- CAP Strategic Plan: rural infrastructure development – DIMOP Plus: public service app development
- CAP Strategic Plan: local Wi-Fi Access- DIMOP Plus: broadband development
- CAP Strategic Plan: digitalisation in agriculture, food – DIMOP Plus: Big Data, AI
- CAP Strategic Plan: maintenance of NPIs – KEHOP Plus: habitat development and reconstruction

It is also proposed to add these possibilities for cooperation to Chapter 4.5 of the CAP Strategic Plan, which deals with the coordination of the CAP Strategic Plan between the Funds.

The CAP Strategic Plan, the Operational Programmes and the Recovery and Resilience Plan will finance developments in a number of areas in a number of ways. In such cases, it should be ensured that grants can be taken into account in synergy. The proposed method is relatively simple to implement and does not require any procedural or IT development on either side.

20. - Justification

The proposal was accepted by the designers. Chapter 4.5 of the CAP is already designed in line with the proposal.

As part of the finalisation of the CAP ST, the designers of the other programmes have been contacted and links identified.

21. - Description

Improving the coordination of rural development support in the review of LEADER LFSs

It is proposed to specify in the CAP Strategic Plan that for rural development interventions, synergies will be implemented at local level through the planning work of LEADER LAGs. To this end, the review of the LEADER LFSs would require LEADER LAG to examine the Integrated Territorial Programme of the counties concerned and to develop its own goals in a complementary way, seeking synergy. It is also proposed to specify in TOP Plus that the counties should be given a mandatory consultation opportunity

for LEADER LAGs in the county with a view to coordinating planned developments.

In the area of rural development, there is a significant overlap between the objectives and areas supported by the CAP Strategic Plan and TOP Plus. This provides an opportunity to coordinate the two sources to multiply each project's impact across the entire value chains. To this end, it is essential to have a coordination mechanism in place. The present proposal provides a forum for this.

21. - Justification

The designers accept the proposal.

As part of the finalisation of the CAP ST, the designers of the TOP have been contacted and cooperation initiated.

22. - Description

It is proposed to revise the SCO plans in the CAP Strategic Plan as follows:

- For 12 interventions for rural development, it is proposed to examine whether flat rates or flat rates can be used in addition to the payment options already indicated.
- For 12 interventions for rural development, it is proposed to revise the indication of the payment modalities as it only covers flat-rates. We consider it possible that in some cases lump sums may be involved or it may be necessary to indicate the category of reimbursement of costs actually incurred by the beneficiary.
- For 2 interventions for rural development, it is proposed to revise the inclusion of the unit cost option. These interventions typically finance investments whose cost structure is concentrated, with relatively few supporting documents. In such a case, the benefits of simplified cost options are not so high as to justify the necessary resources and risk-taking. Flat-rate financing is also considered justified in these cases.
- For 5 interventions for rural development, we propose not to solve the unit cost in view of the expected significant number of municipal beneficiaries, as it is difficult to manage the losses and profits expected under the application of unit costs in municipal accounting. In such a case, the itemised accounting and the combination of flat-rate costs are less risky.
- We propose a comprehensive reconciliation and possible revision of the indications of payment solutions for sectoral interventions. On the basis of this information, we do not see an absolute justification for indicating all payment options for this number of interventions, which are currently missing in the case of apiculture and oenological interventions.

It is clear from the CAP Strategic Plan that Hungary plans to make significant progress in simplifying payments. A simplified payment is expected for a significantly higher number of interventions compared to the Rural Development Programme. Based on the experience with simplified payment solutions in other operational programmes, it is proposed to revise the flags used in the current plan version for certain types of interventions. As part of the ex ante evaluation report, we prepared a detailed table of types of payments and our proposals.

22. - Justification

The proposals were reviewed by the designers in the relevant interventions.

23. - Description

In addition to the positive impact of the intervention on the livestock sector, addressing the potentially increased environmental impacts (GHG emissions, increase in noise, odour, waste load) in synergy with other CAP Strategic Plan interventions is an important task (e.g. by supporting investments to reduce the environmental burden on livestock farms).

The proposal aims to further develop the CAP Strategic Plan.

23. - Justification

To be treated during implementation.

231 - Description

It is proposed to carry out a comprehensive evaluation that examines the social impact of the implementation of the domestic CAP Strategic Plan and provides for the possibility of feedback in order to increase the contribution of the support system to social justice.

The operation of the aid scheme can change income conditions at the level of beneficiaries and affect the profitability of farming. Although the support scheme includes checks and balances to address, for example, economic-size biases, it is necessary to review the social impact from time to time.

231 - Justification

We will be treated in the course of implementation.

24. - Description

It may be appropriate to measure variable GHG emissions under the intervention in order to monitor the balance between economic/sectoral benefits and environmental burdens, in addition to monitoring the increase in product diversity of animal origin.

The proposal aims to further develop the CAP Strategic Plan.

24. - Justification

To be treated during implementation.

25. - Description

Domestic fruit and vegetables contain more hazardous pesticide residues than the EU average. Investments aimed at a meaningful and substantial reduction in pesticide use or in support of the ecological transition should therefore be given a special focus in the conditionality of interventions and in the selection of applications.

The proposal aims to further develop the CAP Strategic Plan.

25. - Justification

To be treated during implementation.

26. - Description

In the fruit and vegetables sector, irrigation is an essential element of technology, and it is therefore proposed to support primarily those farms where irrigation planning has taken into account the provisions of the regional river basin management plans, in terms of the source, volume and potential pollution of surface and groundwater resources.

The proposal aims to further develop the CAP Strategic Plan.

26. - Justification

To be treated during implementation.

27. - Description

With regard to the development of apiculture training material, it is appropriate to involve public and non-governmental actors in the nature conservation sector, on the one hand, to highlight common objectives and to develop joint programmes (e.g. a strict ban on the use of plant protection products dangerous to bees) and to clarify professional conflicts (e.g. the perception of certain highly honeying alien and invasive plant species, damage to certain protected bird species).

The proposal aims to further develop the CAP Strategic Plan.

27. - Justification

To be treated during implementation.

28. - Description

When replanting and replanting, preference is given to environmentally friendly agro-technical solutions: e.g. minimisation of soil disturbances, development of grassland queues, reduced use of pesticides.

The proposal aims to further develop the CAP Strategic Plan.

28. - Justification

To be treated during implementation.

29. - Description

The elimination of natural habitats (e.g. grasslands) in the planning and authorisation of replanting is not eligible, or the removal of habitats in order to re-establish former vineyard areas cannot be considered as replanting/conversion.

The proposal aims to further develop the CAP Strategic Plan.

29. - Justification

To be treated during implementation.

3. - Description

We propose to significantly reduce the administrative burden related to the use of the Agro-ecological Basic Programme and Agro-ecological NPIs by significantly simplifying the application solution.

We recommend that these aids be shown in the single application in such a way that the farmer proposes requirements on the basis of the specificities of the area claimed. This can be done by developing an algorithm based on the LPIS covers.

It is also proposed that agro-ecological non-productive investments can be applied for each year as long as the framework lasts. This will ensure that farmers' interest reaches what is necessary to achieve the intended positive natural and environmental impacts.

Interventions to achieve the environmental objectives of the CAP Strategic Plan constitute a complex system that is difficult to understand by farmers with a number of rules. These commitments and developments are not necessarily linked to the immediate interests of the economy, so applicants spend less energy on understanding them. It is therefore possible for farmers to use the necessary number of aids if they are easy to see and use. The proposed solution can be developed on the basis of the appropriate

coverage of the LPIS and the data of the Territorial Monitoring System can be used for monitoring the use of grants. These IT developments can be covered in the framework of the already launched CAP Strategic Plan Monitoring IT development.

3. - Justification

The technical direction of the proposal is agreed by the designers. However, it is not recommended to add this new functionality to the single application system.

This functionality is planned to be implemented in accordance with the proposal, but as a separate system, so that the farmer receives a proposal on the relevant subsidies/standards through the IT system.

The preparation of the function is part of the already launched IT preparation project.

30. - Description

We propose to abolish the green harvesting premium. This purely market-regulating form of aid cannot be justified from the point of view of environmental sustainability, since the environmental externalities of cultivation (machinery emissions, plant protection) occur but are not offset by any economic return: the aid therefore creates a net environmental burden.

30. - Justification

To be treated during implementation.

31. - Description

Agri-environmental payments should provide for possibilities to support environmental problems requiring specific land use.

The proposal aims to further develop the CAP Strategic Plan.

31. - Justification

To be treated during implementation.

32. - Description

Support for the use of High Natural Value Areas for nature conservation purposes should continue to be ensured. The necessary revision and expansion of the ATN programme will contribute to slowing down biodiversity loss. It is appropriate to extend the system with a set of thematic standards for the protection of species requiring specific land use (e.g. introduction of a set of standards for the protection of cancer vipers, further development of the package of standards to promote the use of hostages, launch of a set of standards called “earpreserve standards”, integration of the results of the Birds@Farmland project).

The proposal aims to further develop the CAP Strategic Plan.

32. - Justification

To be treated during implementation.

33. - Description

Further support for solutions to environmental problems of a zonal nature (e.g. drought, inland water, erosion) should be prioritised within the framework of the intervention.

The proposal aims to further develop the CAP Strategic Plan.

33. - Justification

To be treated during implementation.

34. - Description

It is necessary to preserve and expand the set of water retention standards, especially in areas where guidance is provided in the relevant strategic documents (e.g. River Basin Management Plans).

The proposal aims to further develop the CAP Strategic Plan.

34. - Justification

To be treated during implementation.

35 - Description

In the context of horizontal thematic sets of specifications, a strong representation of the standards for the protection of small wild game and pollinators, including in the form of a stand-alone set of thematic specifications, is required.

The proposal aims to further develop the CAP Strategic Plan.

35 - Justification

To be treated during implementation.

36 - Description

In the context of agri-environmental payments, it is justified to maintain the system of optional provisions.

The preliminary results of the impact assessments indicate that they may be relevant to environmental performance and should therefore be maintained/extended.

36 - Justification

To be treated during implementation.

37 - Description

In order to maximise the environmental impact, consideration should be given to implementing longer-term support for an area (beyond the five-year funding cycle) within the framework of the intervention. This can be done either by extending the duration of grant agreements or by prioritising previously assisted areas in the selection criteria.

The proposal aims to further develop the CAP Strategic Plan.

37 - Justification

To be treated during implementation.

38 - Description

It is necessary to align the call for proposals with other support for environmentally friendly land use and land use change (e.g. non-productive investments) in terms of scope, content and implementation of the CAP Strategic Plan.

The proposal aims to further develop the CAP Strategic Plan.

38 - Justification

To be treated during implementation.

39 - Description

In the selection criteria, the priority of farmers with the highest environmental commitments should be guaranteed overall (by non-thematic set of standards) for all sets of intervention standards.

The proposal aims to further develop the CAP Strategic Plan.

39 - Justification

To be treated during implementation.

4. - Description

Increase the vertical coherence of the CAP Strategic Plan in order to increase the coverage of non-productive areas and achieve environmental objectives.

To this end, it is necessary to increase the mandatory levels of conditionality as follows:

GAEC1 Further tightening of the requirement to conserve permanent grassland (not just national ratios) is justified, as follows:

- *the maintenance of grassland at farm level is mandatory, or*
- *hacking of grassland is prohibited*

GAEC4 Specifications for buffer strips:

We consider that there is a need to tighten the rules currently in place when establishing buffer strips along water courses. Subject to restrictions on the application of feed materials and plant protection products used in the fertilisation process, or

1. by increasing the width of the buffer strip (min. 5 m as a general rule), or
2. to ensure that direct and diffuse water pollution is prevented by changing the cultivation method (e.g. 6 m wide pilds, grassland strips)

The size of the coastal buffer strips should be synchronised in Act LVII of 1995 on water management, as well as in Government Decree No 83/2014. (III.14.) with widths for specific coastal lanes specified in Section 1(11) of Government Decree No 14/1999, which ensure that water-maintenance and water damage control works can be carried out. The implementation of this limitation in the public interest by farmers would also be ensured by requiring a mandatory design as a condition for aid (the width of the coastal strip is 3, 6 and 10 metres from the coastline depending on the classification of the waters).

Consideration should be given to banning the drainage of inland water and rainwater in vulnerable and drought-sensitive areas, as well as a ban on water-intensive crops in drought-sensitive areas.

The expansion of areas subject to erosion measures (possibly including drought- and inland water-sensitive areas) and land-use change areas are justified in order to reduce complex environmental problems (erosion, deflation, drying, loss of biodiversity). This will lead to a reduction in the area of forced cultivation. To this end, it is proposed to add the following provision to the GAEC5 specifications: 'Rotational tillage in target land use change areas shall not be permitted.'

For GAEC 8, it may be justified to *increase the share of landscape features/non-productive elements* (from 3 % to at least 4 %) and to apply a sufficiently high weighting factor to areas created with non-productive investments.

At the same time, it is justified to *reduce the weighting factor for nitrogen-fixing crops* (from 1 point to a maximum of 0.5 points), as it can be assumed that a significant proportion of farmers intend to meet the GAEC requirement by growing these species – on the basis of previous greening experience.

We propose to include in the specifications of non-productive landscape features a *requirement for the conservation of archaeological sites located on agricultural land, which contributes to the long-term preservation of our cultural heritage*.

It is also proposed that *consideration be given to the introduction of a requirement to preserve tensile and border-marking stones located in utilised agricultural areas*.

Land use that does not meet the conditions of the production area causes a number of environmental problems. The proposal complements the multi-component set of instruments currently included in the CAP Strategic Plan for the establishment and maintenance of non-productive areas (AÖP, NTB establishment and maintenance aid) in a way that ensures that environmental damage is avoided and that helps farmers to join.

The increase of non-productive areas contributes significantly to achieving the strategic goals of reducing pesticide use. The proposed changes to the Good Agricultural and Environmental Conditions will result in a higher environmental contribution to the basic requirements of the CAP, justified by deteriorating environmental parameters.

4. - Justification

The proposals were discussed in detail. There is consensus in the technical direction, but the way in which it is implemented is proposed by the CAP ST.

Incentivising land-use change through conditionality can lead to social problems, as it typically affects producers who manage with low profitability and the areas concerned play a significant role in their livelihoods.

In view of the above, the policy aims to stimulate land use change through the AÖP and the AÖNTB.

40 - Description

In the selection criteria, preference should be given to farmers applying for agri-environmental support to maintain land use change for environmental purposes.

The proposal aims to further develop the CAP Strategic Plan.

40 - Justification

To be treated during implementation.

41 - Description

In the selection criteria, preference should be given to farmers applying for areas that have received agri-environmental payments in the past.

The proposal aims to further develop the CAP Strategic Plan.

41 - Justification

To be treated during implementation.

42 - Description

Support for organic farming: It is proposed to include as much territorial space as possible under support in order to achieve a higher environmental positive impact. The reduction of areas during the planning period should be avoided.

The proposal aims to further develop the CAP Strategic Plan.

42 - Justification

To be treated during implementation.

43 - Description

Prioritise water sensitive areas (erosion, inland water, drought, nitrate vulnerable areas), including target drinking water protection areas.

The proposal aims to further develop the CAP Strategic Plan.

43 - Justification

To be treated during implementation.

44 - Description

Agro-ecological land use change: Overall, farmers with the highest environmental pledges should be guaranteed in the selection criteria for all the areas targeted by the intervention.

The proposal aims to further develop the CAP Strategic Plan.

44 - Justification

To be treated during implementation.

45 - Description

Agro-ecological land use change: Favouring agro-ecological non-productive investments on the impact areas of activities supported under other operational programmes (e.g. KEHOP habitat development or water investments) in the selection criteria of the application (e.g. by attaching a statement of support from the relevant nature conservation or water bodies).

The proposal aims to further develop the CAP Strategic Plan.

45 - Justification

To be treated during implementation.

46 - Description

Agro-ecological land use change: In the case of non-productive investments, in particular for measures to preserve surface water, the introduction of a so-called result-based payment system should be considered.

Given that investments in water conservation and their maintenance are unique and highly dependent on the characteristics of the area in question, the payment system would need to be adapted accordingly. Examples of potential indicators of the result-based payment system could be the amount of water preserved (m³) that is not relevant or the extent of soils with water cover and permanent moisture (ha) or the duration of the water cover.

46 - Justification

To be treated during implementation.

47 - Description

Agro-ecological land use change: For non-productive investments for water protection purposes, priority

should be given to farmers in areas sensitive to water protection, as well as to land managers in surface water bodies and groundwater areas that are not in good condition due to diffuse pollution, in order to achieve the WFD targets set by 2027.

The proposal aims to further develop the CAP Strategic Plan.

47 - Justification

To be treated during implementation.

48 - Description

Agro-ecological land use change: It should be considered that some of the interventions for water protection should be combined with irrigation investments and only the development of complex water management systems should be supported.

The proposal aims to further develop the CAP Strategic Plan.

48 - Justification

To be treated during implementation.

49 - Description

Agro-ecological land use change: When defining the eligible areas or establishing the selection criteria, we propose to take into account the geospatial databases and technical results produced in the framework of the national strategic nature planning projects (KEHOP Nöszép, Green Infrastructure and Land Characteristics).

The proposal aims to further develop the CAP Strategic Plan.

49 - Justification

To be treated during implementation.

491 - Description

Payment to encourage agro-ecological land use and maintenance: The intervention justifies the promotion of floodplain landscape management in agricultural and forest areas.

The proposal aims to further develop the CAP Strategic Plan.

491 - Justification

We will be treated in the course of implementation.

492 - Description

It is proposed to promote the economic exploitation of these breeds for breeds supported in the context of the conservation of animal genes. Accordingly, participation in branded/trademark production schemes or the inclusion of a geographical indication in the selection criteria should be considered.

The proposal aims to further develop the CAP Strategic Plan.

492 - Justification

We will be treated in the course of implementation.

5. - Description

In line with the previous SEA proposal for conditioning, it may be justified to reduce the maximum plate size to around 30 hectares.

The introduction of practice can be of great importance in adapting to climate change and reducing wind erosion.

5. - Justification

The proposal is accepted by the designers and moved to the CAP ST.

50 - Description

Animal welfare: When using internal parasite control, it must be guaranteed that harmful active substances (Ivermectin) are not released into the environment.

The proposal aims to further develop the CAP Strategic Plan.

50 - Justification

To be treated during implementation.

501 - Description

The intervention should avoid supporting activities that cause immediate environmental problems (e.g. insecticides on livestock farms).

The proposal aims to further develop the CAP Strategic Plan.

501 - Justification

We will be treated in the course of implementation.

51 - Description

Animal welfare: In the context of the intervention, it may be appropriate to examine how it can help maintain domestic grassland by grazing livestock. This solution can benefit both animal welfare and the environment and nature conservation. The proposal aims to further develop the CAP Strategic Plan.

51 - Justification

To be treated during implementation.

52 - Description

Forest-environment: In the case of reconstructing cleansing, it is proposed to include, in addition to a habitat function for at least three protected species, the visual perception of the high landscape features of the landscape features, and the reason for the preservation of cleansing functions as a point of view.

The proposal aims to further develop the CAP Strategic Plan.

52 - Justification

To be treated during implementation.

53 - Description

Forest-environment: In some stocks that do not have NATURA 2000 designation, it is proposed to include the conservation of ‘treasures of significance for the landscape and/or landscape’ in certain environmental value-adding farmers’ pledges.

The proposal aims to further develop the CAP Strategic Plan.

53 - Justification

To be treated during implementation.

54 - Description

It is recommended that the purchase of equipment for non-rotational cultivation (no till) is eligible.

The proposal aims to further develop the CAP Strategic Plan.

54 - Justification

To be treated during implementation.

55 - Description

Farm development: It is proposed to include among the selection criteria solutions that mainstream sustainable water management, water use and protection.

The proposal aims to further develop the CAP Strategic Plan.

55 - Justification

To be treated during implementation.

56 - Description

Farm development: We recommend that brownfield investments and/or landscape-specific architectural solutions (placement, size, shape, material, colour) be prioritised when building, developing or renovating buildings and structures.

The proposal aims to further develop the CAP Strategic Plan.

56 - Justification

To be treated during implementation.

57 - Description

Farm development: It may be appropriate to include in the selection criteria a preference for production to the local market, for example through the producer’s participation in local, community-supported farming systems, short supply chains or participation.

The proposal aims to further develop the CAP Strategic Plan.

57 - Justification

To be treated during implementation.

58 - Description

Farm development: The application of the DNSH principle could be a good tool and reference for comprehensive sustainability mainstreaming.

Under the EU Regulation 2020/852 (Taxonomy Regulation), an economic activity is considered sustainable if it contributes substantially to one of the specified environmental objectives and does not at the same time cause significant harm to any of the environmental objectives.

58 - Justification

To be treated during implementation.

59 - Description

Afforestation: Quality objectives and management guidelines for a given natural habitat, a Natura 2000 site, a protected site, a landscape unit and a green infrastructure area must be taken into account when determining the location of the planting, the choice of tree species composition and the way in which it is cultivated.

The proposal aims to further develop the CAP Strategic Plan.

59 - Justification

To be treated during implementation.

6. - Description

The use of soil conditioning, plant conditioning or microbiological or N-fixing products makes it possible to meet the requirements of the AÖP using additional/substitute inputs. It is proposed to delete or supplement the standard in such a way as to ensure the exclusion of other nutrient substitutes used.

Without complementing the practice, a reduction in the input of environmentally justified input cannot be guaranteed.

6. - Justification

The technical direction of the proposal is agreed by the designers. The AÖP scoring system has been amended as suggested.

60 - Description

Afforestation: It is necessary to take greater account of the climatic aspects when determining support for deployments.

Afforestation of areas with inadequate climatic conditions may have a negative impact on the water content of the soil and on the amount of groundwater.

60 - Justification

To be treated during implementation.

61 - Description

Afforestation: Priority support is proposed for the planting of woody plant communities that are close to nature and connect elements of the ecological network, with spatial focus on the results of the mapping of domestic green infrastructure (NÖSZTÉP).

The proposal aims to further develop the CAP Strategic Plan.

61 - Justification

To be treated during implementation.

62 - Description

Afforestation: From a water protection point of view, it is essential that installations take place in areas sensitive from the point of view of water protection and water base protection, in particular in areas of multiple sensitivity, both with additional points in the selection criteria and with an increase in aid intensity.

The proposal aims to further develop the CAP Strategic Plan.

62 - Justification

To be treated during implementation.

63 - Description

Afforestation: In addition to the primary examination of climatic conditions and their definition as eligibility criteria in the context of afforestation aid, it is proposed to give priority to the following areas in the selection criteria:

- Natura 2000 network sites, protected natural areas,
- designated areas of the ecological and green infrastructure network;
- water and water base sensitive areas,
- areas affected by wind or water erosion,
- areas of particular sensitivity.

The proposal aims to further develop the CAP Strategic Plan.

63 - Justification

To be treated during implementation.

64 - Description

Forestry: For all activities, it is important to protect soil quality and use minor interventions for soil erosion (e.g. small machinery, avoidance of slope work). Another important task is the proper management of forests (rather water retention techniques, small spatial planning).

The proposal aims to further develop the CAP Strategic Plan.

64 - Justification

To be treated during implementation.

65 - Description

Rural infrastructure: It is recommended to specify among the principles governing the establishment of selection criteria that the maintenance and operation plan and the feasibility study should include how the investment in question serves the local and regional objectives of environmental, nature conservation and climate protection.

The proposal aims to further develop the CAP Strategic Plan.

65 - Justification

To be treated during implementation.

66 - Description

Rural infrastructure: In order to increase the environmental efficiency of infrastructure developments, it is proposed to prioritise investments based on existing infrastructure (e.g. use of brownfield sites) and to limit the installation of green surfaces.

The proposal aims to further develop the CAP Strategic Plan.

66 - Justification

To be treated during implementation.

661 - Description

Due to the impact of ICT technologies on the landscape, landscape integration criteria should be prioritised in their design.

The proposal aims to further develop the CAP Strategic Plan.

661 - Justification

We will be treated in the course of implementation.

662 - Description

We recommend that consideration be given to reducing the minimum required farm size in the case of young farmers' start-up aid, in order to ensure that the intervention also supports newcomers.

The proposal aims to further develop the CAP Strategic Plan.

662 - Justification

We will be treated in the course of implementation.

67 - Description

Support for on-farm investments improving water efficiency and for agricultural irrigation communities that improve water efficiency: Only after adaptive processes, land-use changes and the potential of biological funds have been exhausted, irrigated areas should be expanded and technical equipment for irrigation water installed.

The proposal aims to further develop the CAP Strategic Plan.

67 - Justification

To be treated during implementation.

68 - Description

Support for on-farm investments improving water efficiency and for agricultural irrigation communities that improve water efficiency: As a mandatory activity, we propose to create technical conditions for water retention best suited to the local conditions (e.g. construction of reservoirs, installation of controllable artefacts, removal of drainage ditches).

The proposal aims to further develop the CAP Strategic Plan.

68 - Justification

To be treated during implementation.

69 - Description

Investment in agricultural holdings to improve water efficiency and support for agricultural irrigation communities that improve water efficiency: Only water efficient technologies are proposed.

The proposal aims to further develop the CAP Strategic Plan.

69 - Justification

To be treated during implementation.

7. - Description

Changing the inclusion of nitrogen-fixing crops and organic duplicates between non-productive elements defined under GAEC 8 in such a way that they are either deleted or the point of delivery with these crops is reduced to 1 point.

According to the experience of greening, farmers are encouraged to replace their obligations to reduce production (e.g. greening organic focus areas) by producing nitrogen-fixing crops or organic secondary crops. This solution does not lead to the necessary change in the agricultural environment and the proposed amendment is therefore justified.

7. - Justification

The technical direction of the proposal is agreed by the designers. The AÖP scoring system has been amended as suggested.

70 - Description

Support for on-farm investments improving water efficiency and for agricultural irrigation communities that improve water efficiency: When developing complementary infrastructure for irrigation development, in particular when setting up the flooding and sewerage system that transports irrigation water, it is appropriate to avoid ecological trap solutions.

Plastic-lined sewers can cause the death of individuals from many animal species.

70 - Justification

To be treated during implementation.

71 - Description

Support for on-farm investments improving water efficiency and for agricultural irrigation communities that improve water efficiency: Investments in irrigation development in protected natural areas and Natura 2000 sites are incompatible with national conservation objectives and with the EU Birds and Habitats Directives due to their direct habitat conversion effect. We consider investments in irrigation development in these areas to be ineligible.

71 - Justification

To be treated during implementation.

72 - Description

Support for on-farm investments improving water efficiency and for agricultural irrigation communities that improve water efficiency: Higher incentive support in the application selection process, priority for selection criteria is proposed if the applicant undertakes to develop the entire farm water supply system for integrated landscape management through territorial water retention and water retention, especially when implemented in cooperation e.g. by the proposed landscape management community.

The proposal aims to further develop the CAP Strategic Plan.

72 - Justification

To be treated during implementation.

73 - Description

Support for on-farm investments improving water efficiency and for agricultural irrigation communities that improve water efficiency: When setting eligibility criteria for irrigation development interventions, it is appropriate to exclude protected and Natura 2000 sites.

The proposal aims to further develop the CAP Strategic Plan.

73 - Justification

To be treated during implementation.

74 - Description

Support for on-farm investments improving water efficiency and for agricultural irrigation communities that improve water efficiency: In the selection principles, 3. The environmental, climate and adaptation aspect is proposed to be expanded as follows: 3. "Implementing environmental, climate, landscape management and adaptation aspects"

The proposal aims to further develop the CAP Strategic Plan.

74 - Justification

To be treated during implementation.

75 - Description

Support for on-farm investments improving water efficiency and for agricultural irrigation communities that improve water efficiency: In water-scarce areas, irrigation development should only be supported by territorial restrictions on water-intensive crops, or only if the necessary water resources are retained in the reservoir.

The proposal aims to further develop the CAP Strategic Plan.

75 - Justification

To be treated during implementation.

76 - Description

Support for on-farm investments improving water efficiency and for agricultural irrigation communities that improve water efficiency: It is necessary to include in the selection criteria that an investment is eligible (Article 74 of the CAP Strategic Plan) if “the water body concerned has not been classified less than good in the relevant river basin management plan for reasons related to water quantity”.

The proposal aims to further develop the CAP Strategic Plan.

76 - Justification

To be treated during implementation.

77 - Description

Forest fires: We recommend that the project plan and the maintenance plan, which form the basis for the evaluation of applications, include an assessment of the expected environmental impacts. Conservation interests must be safeguarded in the design of exploration and firebreaks and water retention facilities, and attention must be paid to the welfare of the soil and of the large trees (biotope trees) in the forest stands.

77 - Justification

To be treated during implementation.

78 - Description

Cooperation: In particular, it is proposed to support the development, further development or introduction of quality schemes that account for the environmental and social parameters of the production of the products in addition to proof of geographical origin or traditional cultivation/processing methods, i.e. the certification will make it possible to understand the sustainability performance of the farms producing the products.

The proposal aims to further develop the CAP Strategic Plan.

78 - Justification

To be treated during implementation.

79 - Description

Training, advice: In order to improve the environmental impact of training and advisory programmes, it is expected that all trainers and advisors have comprehensive and specialised knowledge of sustainability and environmental integration, including knowledge of the environmental system linked to EU agricultural policy.

The proposal aims to further develop the CAP Strategic Plan.

79 - Justification

To be treated during implementation.

8. - Description

The exclusive use of biological agents authorised in organic farming on at least 50 % of the plantation area.

Use only soil conditioning, plant conditioning or microbiological preparations on at least 30 % of arable land.

8. - Justification

The technical direction of the proposal is agreed by the designers. The feasibility of the specifications needs to be further analysed prior to their introduction.

80 - Description

REL: Priority should be given to supporting REL schemes in which appropriate certification systems are able to prove the origin of products and ensure full transparency in the short supply chain, as well as to make consumers aware of the environmental (or social, economic) sustainability performance of farmers involved in the sale of RELs.

The proposal aims to further develop the CAP Strategic Plan.

80 - Justification

To be treated during implementation.

81 - Description

Social Entrepreneurship: We recommend that preference be given to farms or social cooperatives which manage in an environmentally sound manner (e.g. non-chemical and/or organic farming) or to mainstream environmental aspects in processing and providing services.

The proposal aims to further develop the CAP Strategic Plan.

81 - Justification

To be treated during implementation.

82 - Description

Ecotourism cooperation: For developments in protected areas and Natura 2000 sites, the relevant impact assessments and impact assessments are mandatory. Independently of these, it is proposed to draw up a guide to the intervention to guide the integration of active and eco-tourism developments with natural and landscape conditions and local load capacity, as well as environmental sustainability aspects.

The proposal aims to further develop the CAP Strategic Plan.

82 - Justification

To be treated during implementation.

83 - Description

Ecotourism cooperation: Tenders should exclude tourism events with landscape and environmental pressures (e.g. large regional festivals).

The proposal aims to further develop the CAP Strategic Plan.

83 - Justification

To be treated during implementation.

84 - Description

Ecotourism cooperation: Large-scale accommodation should be avoided for investments.

The proposal aims to further develop the CAP Strategic Plan.

84 - Justification

To be treated during implementation.

85 - Description

Ecotourism cooperation: In the case of developments affecting protected areas, it is recommended that the relevant National Park Directorate be consulted on the project plan.

The proposal aims to further develop the CAP Strategic Plan.

85 - Justification

To be treated during implementation.

86 - Description

Biomass cooperation: Bioenergy production should be based as much as possible on agricultural waste and residues. We recommend including it in the selection criteria and taking into account, as a first priority, the origin and production conditions of the raw materials used as energy sources. We recommend that biomass from intensive farming that is primarily produced for energy use should be assessed negatively against agricultural waste.

86 - Justification

To be treated during implementation.

87 - Description

Biomass cooperation: Under the cascade principle, the energy use of biomass of wood origin can only be supported if the wood in question (e.g. wood chips, woodwork waste) cannot be used as a secondary input for the production of preserved products (e.g. particle board).

The proposal aims to further develop the CAP Strategic Plan.

87 - Justification

To be treated during implementation.

88 - Description

Biomass cooperation: It is proposed to include in the evaluation criteria for each proposal the calculation of the expected GHG savings and to include a minimum saving value in the tender specifications. The Annexes to RED II 2018/2001 may be used for the calculation.

The proposal aims to further develop the CAP Strategic Plan.

88 - Justification

To be treated during implementation.

89 - Description

Hunting management: It is appropriate to establish co-operations which have a combined benefit for both agricultural production and the conservation of biodiversity. Therefore, it is necessary to focus primarily on resolving conflicts with huntable species whose populations are sensitive and show signs of decline in the long term (e.g. hares, huntable wild geese species).

The proposal aims to further develop the CAP Strategic Plan.

89 - Justification

To be treated during implementation.

9. - Description

It is appropriate to complement practices on grassland (e.g. extensive grazing, grazing of native farm animal breeds) and to impose the current standard under condition or to reduce its score.

It may be appropriate to complement grassland practices in the following areas (also taking into account the overlap with the AKG measure):

- Legislation requiring extensive grassland use (avoiding grazing adapted to the type of grassland)
- Standard to encourage the use of grazing (e.g. grazing with native livestock)
- Specification for preference for nature-friendly mowing methods (prohibition of dry-inflicted cases, requirement of alternative cascades)
- In the case of grasslands, it is proposed to regulate the minimum stubble height as a separate provision, as follows: The minimum tensile height of 10 centimetres during mowing is mandatory.

Currently, the grassland practice only limits the ploughing of grasslands, which is otherwise undesirable, which essentially leads to the avoidance of direct environmental damage, and it is therefore necessary to raise the level of ambition. The types of specifications listed will make the range of practices of the AÖP for grasslands more flexible and at the same time increase its environmental added value.

9. - Justification

The technical direction of the proposal is agreed by the designers. Certain provisions of the AÖP have been amended accordingly.

90 - Description

LEADER: It is proposed to include as eligible objectives: protection of local natural assets and natural resources, preparation for local designation of sites, maintenance of local protected areas, local awareness-raising on nature protection.

The proposal aims to further develop the CAP Strategic Plan.

90 - Justification

To be treated during implementation.

91 - Description

LEADER: We recommend that the integration of environmental and climate aspects be a priority when assisting and mentoring LEADER groups, and that mentors should be prepared for specific integration opportunities.

The proposal aims to further develop the CAP Strategic Plan.

91 - Justification

To be treated during implementation.

92 - Description

LEADER: Where local natural assets are exploited as tourist attractions, involve the regionally competent national park directorates and nature protection NGOs active locally and nationally active in community planning. In addition to possible legal obligations (environmental impact assessment and Natura 2000 impact assessment), prepare a detailed impact assessment of the scale and effects of the expected additional load (e.g. increase in traffic) and include mitigation measures in the planning.

The proposal aims to further develop the CAP Strategic Plan.

92 - Justification

To be treated during implementation.

93 - Description

LEADER: In the case of investments involving more land take, prioritise brownfield development, minimise the loss of green areas and use environmentally sound, sustainable construction and operation solutions.

The proposal aims to further develop the CAP Strategic Plan.

93 - Justification

To be treated during implementation.

94 - Description

Development of a pre-qualification system

(a) It is proposed to set up a pre-qualification system for development topics involving large sources with complex award criteria, such as:

- investments in the food industry;
- innovation projects
- investments in livestock,
- investments in horticulture,
- crop storage and dryers,
- short supply chains.

(b) It is proposed to examine the possibility of pre-qualification for agricultural investment aid by launching a call for proposals. Sorting the aid applications received in 2014-2020 in descending order on the basis of resource requirements, it can be established that the largest 500 aid applications (around 5 %) cover 25 % of the aid applied for. The concentration is even higher when looking at the registration numbers.

This is also an opportunity, as it is almost certain that beneficiaries currently active in the RDP will apply also during the CAP Strategic Plan period.

In the implementation system for business development operational programmes (GOP, EDIOP, EDIOP+), the pre-qualification system is playing an increasing role. This is applied to calls for proposals where high-value projects are expected and where the applicant's eligibility can be assessed in a complex, time-consuming activity. The important advantage of pre-qualification is that it can start before the call for proposals is elaborated, so that time-consuming processes can take place before submission and the project selection can be carried out quickly with the qualification. Another option is if the pre-qualification is not carried out by the institutional system, as this could lead to the inclusion of additional capacity in the implementation.

In addition, in the case of agriculture, the fact that there is a database of representative sector benchmarks, the FADN (Farm Accountancy Data Network), which has an established methodology, organisational, IT and procedural framework, could benefit from the specificity of the sector.

94 - Justification

To be treated during implementation.

95 - Description

Developing the role of an intermediate organisation (CS)

(a) It is proposed to designate Intermediate Bodies (IBs) from among the background organisations managed by the Wallet for interventions requiring specific professional competences, and to designate the Hungarian State Treasury (MÁK) as IB for area-based and investment interventions.

(b) It is recommended to include among the IB functions activities for which the implementation system is currently unable to provide sufficient capacity to achieve the objectives of the CAP Strategic Plan, such as:

- project generation,
 - pre-qualification
 - targeted information to potential beneficiaries;
 - support the development of project ideas by providing advice and mentoring. In the 2014-2020 period, the management of the project selection procedure was carried out exclusively by the PA for the MA. Under Community legislation, this is not an unconditional dedicated task of the PA, and the MA may delegate this to IBs.
- The designation of IBs would be appropriate for a number of reasons:
- the PA would be able to allocate more capacity to handle the single application and to allocate payments,
 - if more than one IB is designated, capacities with expertise corresponding to the subject area may be included in the project selection and, in the case of several IBs, the overall paralysing effect of one or two bottlenecks should be less respected.
 - The use of the IB role would also allow for under-resourced functions in the 2014-2020 period, such as professional support for beneficiaries, mentoring (e.g.: EIP, REL, LEADER) can be implemented without compromising the tasks of the PA. The role of the IB could be established by contract or by law, which would also provide the wallet with an additional regulatory tool.

95 - Justification

To be treated during implementation.

96 - Description

Development of the new rules of procedure

It is also proposed to launch a legislative preparation/review project in Q2-2022 to establish the rules of procedure for rural development support for the period 2023-2027, using the basis of the 2014-2020 rules of procedure. At the beginning of the 2014-2020 period, the uncertainty surrounding the procedure for rural development support and the late development of IT systems caused a significant delay. The

institutional system was able to complete this delay almost only until the end of the programming period, and IT developments were still subject to long waiting times. It is critical for the success of the 2023-2027 period that this problem is not repeated. This requires the swift establishment of the procedure for the implementation of the CAP Strategic Plan and the start of the adaptation of the IT framework to the structure of the new programme and to the new rules of procedure. It is worth taking into account the experience that the smaller the procedural change, the less lead time the institutional system can move to the new system, so it is worth making only the necessary changes. At the same time, a new procedure for the management of Pillar II of the CAP is worthwhile in order to ensure that the portfolio can control the performance of the institutional system on its own and respond quickly to new challenges.

96 - Justification

To be treated during implementation.

97 - Description

Regulating the tasks related to reporting obligations

(a) It is necessary to prepare and conclude a cooperation agreement between the MA and the PA on the division of labour in the monitoring tasks of the CAP Strategic Plan or to lay down detailed rules for cooperation at legislative level.

(b) The methodology for the production of indicators shall be laid down in the regulation with reference to the data processing manual document of the CAP Strategic Plan. In the 2014-2020 period, despite the plans, the division of labour between the departments concerned was not regulated in relation to the tasks required to fulfil the reporting obligations.

This has caused a number of problems that could typically be overcome by additional individual commitments by professionals working in the theme area. For example, the PA supported the preparation of reports in this area beyond EU and domestic legal obligations. Due to the lack of a regulatory framework, monitoring tasks are difficult to predict and this has contributed to the inadequacy of the resources of the departments concerned for the full performance of the tasks. The 2023-2027 period should not start in the absence of this regulation, and if possible, this should be done earlier. Given that in the 2023-2027 period, the achievement of the targets is accompanied by much more severe financial sanctions than at present, monitoring and control areas should be given more prominence. Regulations in the form of contractual or government decrees should cover which institutional unit's tasks, responsibilities and deadlines for each reporting obligation are to be performed. In view of the above, it is necessary to start working on the regulation of the distribution of tasks in relation to the monitoring function, also considering that some monitoring tasks should be carried out in an intermediate organisational role.

97 - Justification

To be treated during implementation.

98 - Description

Regulate the procedure for the publication of calls for proposals in the new period

a) In the rules of procedure of the CAP Strategic Plan, it is proposed to include the Forum of the Preparatory Task Force (PEMCS) and the Monitoring Department of the MA and the Paying Agency as a mandatory member.

(b) It is proposed to support the process of preparing the grant scheme with a workflow software solution. In order to meet the commitments of the CAP Strategic Plan, the call for proposals should take into account the indicator targets that the respective calls contribute to. The selection criteria should be set in such a way that the spending of the respective envelope ensures that the targets are met proportionately and the accounting rules should also take into account the milestones assigned to the targets. Where reporting obligations related to specific indicators make it necessary, the call for proposals shall require

beneficiary data to be provided.

During the RDP period – typically due to short deadlines – the criterion of achievement of the indicator targets was not properly considered during the preparation of the calls for proposals, nor the related project selection criteria, the optimisation of commitments and the requirement for beneficiary data to be provided. However, these aspects will still lead to a slowdown in programme implementation due to the amendment of the call and the slowdown of project closures, so it is more appropriate to manage all at the beginning of the call's life cycle. In order for calls for proposals to meet the above criteria, the monitoring function should also be integrated into the process of preparing and approving calls for proposals. When establishing the procedure for the new period, the process of preparing and amending calls for proposals should be regulated in such a way that there is a forum (e.g.: PEMCS), where those responsible for the relevant indicators and the organisational units responsible for monitoring (MA, PA, possibly Intermediate Body) are included.

98 - Justification

To be treated during implementation.

99 - Description

Development of a human resources management function

(a) utilising technical assistance resources to implement a benchmarking system for the MA and PA staff, which also acts as a financial incentive to reward maintenance.

(b) Establishment of a human resource management organisational unit in the MA and the PA. The most important element of any aid policy institutional set-up is the trained staff who manages the processes. The European Union's aid policy is complex and the experience gained is therefore of great importance. The RDP's institutional system was constantly understaffed and almost unmanageable in the 2014-2020 period due to multiple organisational changes, subdued salaries to market opportunities, the move of the MA to Kecskemét and the almost complete lack of human resources management function. Failure to eliminate this would pose a significant risk to the drawdown performance of the 2023-2027 period.

It is therefore important, on the one hand, to ensure organisational stability and, on the other hand, to establish a well-designed financial incentive system and a human resources management department in the MA and the PA. Without these, it is also difficult to imagine an increase in the planned number of staff following an increase in tasks.

99 - Justification

To be treated during implementation.

3. Ex-ante evaluation report

c) where relevant, information as regards the reference period modified in accordance with the Article 147(2) second subparagraph

Sector	informations as regards the reference period modified
Tej	NOTE: The specific values are expressed in euros.

	<u>NOTE:</u> The indicative specific values are given below, as the data are received only to two decimal places. 2023: EUR 0,016391; 2024: EUR 0,014752; 2025: EUR 0,013113; 2026: EUR 0,011474; 2027: EUR EUR 0,009834. <u>CHANGE OF REFERENCE PERIOD:</u> For the dairy premium, the actual historical reference was the milk quota available to producers on 31 March 2007. The revision of the reference period is complicated by the fact that since 2015, i.e. since the end of the milk quota system, farmers are not obliged to report on their actual milk production and delivery, so there is no such statistical source for 2018. The appropriate equivalent approximation reference is to use the data available under the Voluntary Coupled Support Scheme (VCS) for dairy cows. In practice, this means a change in the calculation method. The old production data, based on quotas, would be replaced by a calculated value obtained by multiplying the national average annual milk yield for 2018 (7 809 litres/individual) by the number of dairy cows (211659) paid under the VCS scheme in 2018. The revised value of each entitlement would be based on this new production figure. Old entitlements will be withdrawn and redistributed to those who benefited from the VCS scheme in 2018 for dairy cows according to the number of animals covered by the payment. According to our analysis, this represents the approach closest to quota-based statistics, even if the average milk yield varies from one breed to another. NOTE: The support would remain decoupled as it would cover a previous reference period (2018), but would still allow beneficiaries to be updated, allowing for a better targeting of the NPH. Other conditions would remain unchanged. The maximum financial envelope will be respected. Impact of the update: The number of entitlements is reduced by 15 %, but this changes the possible specific value to a minimum. <i>In the allocation of historical base entitlements updated on the basis of the 2018 base year, a small part of the potentially eligible entitlements (nearly 306000 entitlements) were not claimed by the producers. In order to maximise the positive effects of the base update, farmers who are already eligible would be able to claim unallocated entitlements, subject to objective criteria.</i>
Fattened bulls	NOTE: The specific values are expressed in euros.

	Entitlements were allocated on the basis of the year 2006. Farmers were eligible for this aid, provided that they received coupled bulls in 2006. Taking into account that a similar item exists under VCS, this appears to be the most appropriate proxy source for updating the reference period in 2018. Old entitlements will be withdrawn and redistributed to those who received the coupled bull in 2018, according to the number of animals covered by the payment. NOTE: The support would remain decoupled as it would cover a previous reference period (2018), but would still allow beneficiaries to be updated, allowing for a better targeting of the NPH. The maximum financial envelope is respected and the support rate is limited to the ratio between the envelope and the entitlements of farmers who are eligible and who fulfil the conditions for support in the current year. Impact of the update: The number of entitlements is reduced by 10 %, resulting in an increase in the possible specific value. <i>In the allocation of historical base entitlements updated on the basis of the 2018 base year, a small proportion of potentially eligible entitlements (225 entitlements) were not claimed by farmers. In order to maximise the positive effects of the base update, farmers who are already eligible would be able to claim unallocated entitlements, subject to objective criteria.</i>
Suckler cows (coupled)	NOTE: The specific values are expressed in euros. This envelope is paid in coupled form, and the review of the reference period may still be useful and increase targeting. The maximum number of eligible units is currently 117000 animals, which was laid down in the Accession Treaty of Hungary in 2003, as it was the highest number of suckler cows for which coupled aid could be granted. The value itself was determined in the accession negotiations on the basis of the average number of suckler cows between 1998 and 2000. In 2004, Hungary introduced the SAPS system rather than the standard system, but had to respect the aid ceilings established for the standard scheme when designing sector-specific complementary national aids (top-up envelopes). This is therefore a base of more than 20 years. This value should therefore be updated. As the number of suckler cows has increased over the last decade, 117000 animals represent only around half of the potentially eligible population. Taking into account that VCS includes a similar item, this seems to be the most appropriate proxy source for updating the reference period in 2018. Old entitlements (individual aid ceilings) will be withdrawn and then redistributed to farmers keeping suckler cows in 2023 up to the number of animals that received suckler cow payments in 2018 under the VCS scheme (229215). Where a farmer keeps a suckler cow animal during the reference year under the premium conditions, he shall be entitled to a

	premium for those animals, but no more than the amount of the entitlements available to him. Whereas the number of new entitlements (229215) exceeds the number of current entitlements, the rate of the unit payment will decrease significantly NOTE: The update would make it possible to divide the entitlements into more animals and thus to better target the NCP. Other conditions would remain unchanged. The maximum financial envelope as well as the specific ceiling set in the 2013 Decision are respected. Impact of the update: The number of entitlements increases by 118 %, which in turn results in half of the possible specific maximum value.
Bovine extensification	NOTE: The specific values are expressed in euros. Entitlements were allocated on the basis of the year 2006. Farmers were eligible for this premium, provided that they received an extensification payment for coupled cattle in 2006. Rearing is considered to be extensive if the livestock density on the holding does not exceed 1.4 livestock units per hectare. The calculation was carried out in accordance with the rules provided for in Article 132(3a) of Council Regulation (EC) No 1782/2003. The forage area was calculated from the SAPS area of the holding minus arable land and CNDP energy crops. The revision would take place on the basis of VCS data for 2018 for fattening bulls and suckler cows, allowing farmers to receive payment entitlements for established animals if they are kept extensively. The livestock density of holdings would be determined by taking into account the presence of male bovine animals, cows and heifers present in the calendar year in question and the ewes for which coupled support (VCS) has been established for the same calendar year. Old entitlements will be withdrawn and new entitlements allocated to those who fulfil the density criterion of 1.4 livestock units/ha mentioned above. Since the geospatial application (GSAA) provides better data on the actual forage area, pasture is used as forage area for the calculation of density. NOTE: The support would remain decoupled as it would cover a previous reference period (2018), but would still allow beneficiaries to be updated, allowing for a better targeting of the NPH. Other conditions would remain unchanged. The maximum financial envelope will be respected. Impact of the update: The number of entitlements would increase by 7 %, resulting in a slight decrease in the possible unit value.

	<i>In the allocation of historical base entitlements updated on the basis of the 2018 base year, a small part of the potentially eligible entitlements (nearly 1000 entitlements) were not claimed by the farmers. In order to maximise the positive effects of the base update, farmers who are already eligible would be able to claim unallocated entitlements, subject to objective criteria.</i>
Tobacco (Virginia)	NOTE: The specific values are expressed in euros. Entitlements were allocated on the basis of the year 2006. Farmers who received coupled tobacco support in 2006 were eligible for this support. Although, as a result of the restructuring programme, the tobacco production area has almost halved over the last decade, this sector continues to play an important social role by providing employment opportunities for low-skilled workers in less developed regions. Actual production differs greatly from the reference data. In the case of Virginia tobacco, 4 058 hectares are compared to the actual ~2 878 ha. Old entitlements will be withdrawn and new entitlements will be allocated to those who produced Virginia tobacco in 2018. The tobacco area of each producer is established on the basis of the area indicated as Virginia tobacco production area within the approved 2018 SAPS area. NOTE: The support would remain decoupled as it would cover a previous reference period (2018), but would still allow beneficiaries to be updated, allowing for a better targeting of the NPH. Other conditions would remain unchanged, i.e. the conditions approved in 2012 should apply. The maximum financial envelope will be respected. Impact of the update: The number of entitlements is reduced by 29 %, resulting in a significant increase in the possible specific value. <i>In the allocation of historical base entitlements updated on the basis of the 2018 base year, a small proportion of potentially eligible entitlements (132 entitlements) were not claimed by farmers. In order to maximise the positive effects of the base update, farmers who are already eligible would be able to claim unallocated entitlements, subject to objective criteria.</i>
Ewes (coupled)	NOTE: The specific values are expressed in euros. <u>NOTE:</u>

	The indicative specific values are given below, as the data are received only to two decimal places. 2023: EUR 0,05; 2024: EUR 0,045; 2025: EUR 0,04; 2026: EUR 0,035; 2027: EUR 0,03. In the case of milk production: 2023: EUR 0,04; 2024: EUR 0,036; 2025: EUR 0,032; 2026: EUR 0,028; 2027: EUR 0,024. <u>CHANGE OF REFERENCE PERIOD:</u> We do not make any changes to the reference period, and the title will be continued under the conditions previously approved.
Ewe supplementary	NOTE: The specific values are expressed in euros. We do not make any changes to the reference period, and the title will be continued under the conditions previously approved.
Tobacco (Burley)	NOTE: The specific values are expressed in euros. Entitlements were allocated on the basis of the year 2006. Farmers who received coupled tobacco support in 2006 were eligible for this support. In the last decade, tobacco production area has almost halved, and this sector continues to play an important social role by providing employment opportunities for low-skilled workers in less developed regions. Actual production differs greatly from the reference data. For Burley tobacco, 1 800 hectares are compared to the actual 733 hectares. The old entitlements will be withdrawn and new entitlements will be allocated to those who produced Burley tobacco in 2018. The tobacco area of each producer is established on the basis of the area indicated as Burley tobacco area within the approved SAPS area for 2018. NOTE: The support would remain decoupled as it would cover a previous reference period (2018), but would still allow beneficiaries to be updated, allowing for a better targeting of the NPH. Other conditions would remain unchanged, i.e. the conditions approved in 2012 should apply. The maximum financial envelope will be respected.

	Impact of the update: The number of entitlements is reduced by 55 %, resulting in a significant increase in the possible unit value. <i>In the allocation of historical base entitlements updated on the basis of the 2018 base year, a small proportion of the potentially eligible entitlements (46 entitlements) were not claimed by the producers. In order to maximise the positive effects of the base update, farmers who are already eligible would be able to claim unallocated entitlements, subject to objective criteria.</i>

d) a brief description of the complementarity of the transitional national aid with CAP Strategic Plan interventions

Transitional national aids (TNAs) were also an important element of the Hungarian agricultural support scheme in the previous aid period 2015-2022. Despite the smaller size of the NDP compared to the direct aid envelope, these amounts, together with the related direct aids, were able to achieve the desired objectives in the sectors concerned. However, it is important to see that these objectives were typically not to increase emissions, but to prevent the sector from shrinking (e.g. sheep farming) or even eliminating it completely (e.g. the tobacco sector). The vast majority of the beneficiary sectors are livestock sectors and, from a social point of view, through jobs in disadvantaged areas (around 20 thousand people, including those employed in processing), tobacco production is a priority.

In the case of dairy and meat cattle rearing and sheep farming, this form of aid, financed from the national budget, complements the resources from coupled aid on a similar basis, although the beneficiaries are not entirely the same. However, in the case of tobacco production referred to above, the NCP provides almost half of the targeted support to the sector.

Based on the findings of the SWOT analyses, the identified needs and the experience of the social consultation, it was decided to continue granting transitional national aid in order to support sensitive sectors, making use of the option provided for in Article 147 of Regulation (EU) 2021/2115, with a phasing out.

Based on the results of the preliminary analyses, it is considered useful to update them for reference periods in 2006 or earlier. This could significantly improve the targeting of the NCP for certain sectors. Improved targeting will enable the NCP to contribute to the common objectives of the CAP, first, SO1 and, secondly, SO8, by complementing coupled aid more effectively and by reaching a closer circle of beneficiaries to genuine production.

Given that the conditionality of the NCP is in line with coupled aid, these funds also contribute to the achievement of the specific objectives of the CAP in response to the following identified needs:

- SO1: Sub-demand 1.1.1: A predictable basic income for farmers;
- SO1: Sub-demand 1.1.3: Improving the profitability of small farms;
- SO1: Principal requirement 1.2: Reducing income fluctuations due to natural (weather) and market risks;

Description of complementarity

In general, the purpose of transitional national aid is to contribute to the achievement of SO1 objectives through the fulfilment of identified needs through complementarity. However, this complementarity is gradually weakened, given that the maximum size of sectoral envelopes is reduced from year to year.

1. Ewe rearing:

In the case of ewes, the premiums come from two sources: EU-funded coupled premiums and transitional national aids financed by national funds. Both schemes operate in a form linked to production, so that the number of beneficiaries is virtually the same. Of the two items, EU funds account for the largest part (EUR 28.4) and the unit value of the transitional national aid is marginal, i.e. only EUR 0,05 per animal. It is worth mentioning that the specific value for ewes involved in milk production is lower (EUR 0.04), but producers of sheep's milk may apply for an additional payment in Pillar II in case of additional animal welfare commitments.

As indicated in the presentation of the ewe premium, it is of utmost importance for ewe farmers and their families that coupled coupled payments that specifically support genuine production and transitional national aid together constitute a genuine safety net ensuring the required level of resilience even in the event of fluctuations in income due to weather and market risks.

This is the basis for the additional transitional national aid scheme for animals kept in less-favoured areas in decoupled form, with a specific amount of EUR 4.83. However, the complementary nature of the aid can be seen at sectoral level, as it reaches only a limited number of ewe farmers.

The support under these three schemes is intended to contribute to the economic and environmental sustainability of the sector and, by requiring the use of registered fanners, to guarantee a quality product base.

2. Foie grip bulls

In the case of bulls, premiums come from two sources: EU-funded coupled subsidies and transitional national aids financed by national funds. While the EU leg is coupled to production, the transitional national aid scheme operates in a decoupled form, so that the number of beneficiaries does not overlap completely. This part will be improved by the amendment of the reference period. Of the two items, the EU budget is more certain (EUR 54.35) and the unit value of the transitional national aid varies depending on current national budgetary possibilities, around EUR 60 per entitlement over the last 2 years. However, this is significantly below the indicative EUR 101,07. The use of the approved financial envelope is not close to the approved maximum value, which has been below 80 % in recent years.

As indicated in the presentation of the foie gripped bull premium, it is of utmost importance for fattening farmers and their families that coupled coupled payments that specifically support genuine production and transitional national aid together constitute a genuine safety net ensuring an expected level of resilience even in the event of fluctuations in income due to weather and market risks.

This is the basis for the decoupled transitional national aid for cattle extensification, the amount of which varies according to current national budgetary possibilities, around EUR 60 per entitlement over the last 2 years. At the same time, the complementary nature of this can be seen at sectoral level, as only a part of the cattle farms keeps their herds extensively.

3. Suckler cow premium

In the case of suckler cows for meat production, premiums come from two sources: EU-funded coupled premiums and transitional national aids financed by national funds. Both schemes operate in a production-linked form, although the number of beneficiaries is not the same. This is because for the transitional national aid there is a cap on the number of eligible animals, which is capped at 117000 animals. Using the option provided for in the Strategic Plan Regulation, the ceiling on the number of eligible animals will be increased to the number of suckler cows receiving support under the Voluntary Coupled Support Scheme in 2018 (229215), which will significantly bring the number of beneficiaries in line with each other. Of the two items, the EU budget is more predictable (~EUR 140), the unit value of the transitional national aid varies according to current national budgetary possibilities and will be halved (to a level of around EUR 30) as a result of this update.

As indicated in the presentation of the suckler cow premium, it is of particular importance for suckler cow farmers and their families that coupled coupled payments for genuine production and improved targeted transitional national aid constitute a genuine safety net ensuring an expected level of resilience even in the event of fluctuations in income due to weather and market risks.

This is the basis for the decoupled transitional national aid for cattle extensification, the amount of which varies according to current national budgetary possibilities, around EUR 60 per entitlement over the last 2 years. At the same time, the complementary nature of this can be seen at sectoral level, as only a part of the cattle farms keeps their herds extensively.

4. Dairy premium:

In the case of dairy cows, the premiums come from two sources: EU-funded coupled premiums and transitional national aids financed by national funds. While the EU leg is coupled to production, the transitional national aid scheme operates in a decoupled form, so that the number of beneficiaries does not overlap completely. As a result of the review of the reference period, the overlap between the beneficiaries of the two schemes will be improved. Of the two items, the EU budget is more predictable (~EUR 317) and the unit value of the transitional national aid varies depending on current national budgetary possibilities. Comparison/complementarity is made difficult by the fact that coupled aid is paid on an animal basis and transitional national aid is paid per kilogram of milk calculated.

As indicated in the presentation of the dairy cow premium, it is of utmost importance for dairy farmers and their families that coupled payments that specifically support genuine production and transitional national aid together constitute a genuine safety net ensuring an expected level of resilience even in the event of fluctuations in income due to weather and market risks.

The aim of the intervention is to maintain the economic, social and environmental services provided by the sector by maintaining the profitability of milk production and, indirectly, to supply the raw material for milk processing in Hungary within a reasonable transport distance.

It should also be pointed out that even before 2023, the support for dairy cow farms was supplemented by an animal welfare intervention in Pillar II, where additional payments may be requested in case of additional animal welfare commitments. This will continue under the CAP Strategic Plan.

5. Support for the tobacco sector:

Complementarity is limited in the case of tobacco production, given that targeted support under the CAP Strategic Plan will only be channelled through transitional national aid. At the same time, the update of the reference period will provide an opportunity to improve the link between the holders of entitlements and the number of farmers who become active in tobacco production.

Other annex: Consistency with and contribution to the Union targets for 2030

National contribution to the EU 2030 target of 50% reduction of nutrient losses, while ensuring no deterioration in soil fertility

Hungary is committed to efforts towards environmental and climate goals. The interventions operated outside the CAP Strategic Plan and beyond are reported in detail in Chapter 3.

National contribution to the EU 2030 target of 10% of agricultural area under high-diversity landscape features.

Hungary is committed to efforts towards environmental and climate goals. The interventions operated outside the CAP Strategic Plan and beyond are reported in detail in Chapter 3.

National contribution to the EU 2030 target of 25% of the EU's agricultural land under organic farming

Hungary is committed to efforts towards environmental and climate goals. The interventions operated outside the CAP Strategic Plan and beyond are reported in detail in Chapter 3.

National contribution to the EU 2030 targets of 50% reduction of the overall use and risk of chemical pesticides, and use of more hazardous pesticides

Hungary is committed to efforts towards environmental and climate goals. The interventions operated outside the CAP Strategic Plan and beyond are reported in detail in Chapter 3.

National contribution to the EU 2030 target of 50% reduction of sales of antimicrobials for farmed animals and in aquaculture

Hungary is committed to efforts towards environmental and climate goals. The interventions operated outside the CAP Strategic Plan and beyond are reported in detail in Chapter 3.

National contribution to the EU 2025 target to roll-out of fast broadband internet in rural areas to achieve the objective of 100% access

Hungary's National Digital Strategy (NDS) for 2030 sets out four specific targets for network development:

- DI1: 95 % of households covered by a gigabit network by 2030
- DI2: The share of major transport routes and cities with county rights with 5G network should reach 100 % by 2023
- DI3: National Telecommunications Core Network (NTG) endpoints at district headquarters reach at least 80 % by 2025
- DI4: The share of public education and vocational education and training institutions with network connections of at least 1 Gbps should be 100 % by the end of 2025

We aim to achieve the objectives through the following measures:

Di I.1 Design and implementation of the network development programme “Gigabit Hungary 2030”

The objective of the measure is to design and implement the national network development programme ‘Gigabit Hungary 2030’ in order to achieve at least symmetric 1 Gbps connectivity across all demand areas by 2030. The action should achieve 75/70/65 % of residential/business/public sector needs by 2025. 95 % of residential needs by 2030 and 100 % of business and public institutional needs with internet access with a bandwidth of at least 1 Gbps. **The NDS does not distinguish between rural and non-rural areas, and the developments concern the entire territory of the country.**

The main elements of the measure are:

- Development of **basic telecommunications infrastructure** for nextgeneration fixed and wireless networks;
- Support for the **development of Gerinc, backhaul (zone) and local** networks in the form of tenders in areas where the market does not develop on its own;
- **Operation of a ultrafast Internet Programme Office, a network of supervisory engineers and a Broadband Competence Office (BCO) for public support and professional monitoring of Gigabit developments**
- If the tender does not involve development, the involvement of **state-owned enterprises** is analysed, including, if necessary, financial instruments.

Di II.1 Geographical extension of the DJG network, connection of district headquarters, municipalities, capacity-building and connection of institutions

The objective of the measure is to develop and increase the capacity of the DJG users (e.g. public education and vocational training institutions) to connect to the backbone network at the closest possible point by using a short backhaul network. The development of the public network can reduce market exposure and achieve cost savings in the supervised network. Thanks to the development, the steady increase in bandwidth demand does not lead to an unjustified increase in costs.

The main elements of the measure are:

- Creation of **traffic hubs** in flood centres;
- Development of a network probe, **monitoring of active traffic** to increase availability;
- Further develop a **network monitoring system** to detect potential errors and their location more quickly and speed up the intervention. This will achieve a higher level of availability and a more cost-effective operation;
- Development of **traffic management** in order to achieve the best network traffic;
- **Creation of channels with a capacity of 100 Gbit/s or more** between backbone network equipment, thereby increasing network permeability. In order to fully and seamlessly serve the growing endpoint needs and the expectations of DOS, research and the digitalisation of public collections, improvements are needed to ensure a single service at the endpoints, regardless of their geographical location;
- **Equipment replacements** in order to increase capacity through the acquisition of a more modern set of equipment, the supervision and operation of which can be carried out in a more uniform and cost-effective manner;
- **The establishment of access points**, at each of the relevant service locations;
- **Connecting endpoints to the network** on an optical line with dark fibre rental;
- **Provision of pre-aggregation nodes**;
- **Enabling network** solutions for research (e.g. Quantum communication);
- Implementation of a **digital education network and application platform**

Di II.2 Deployment of Wi-Fi network infrastructures managed in educational and community spaces in public education and vocational training colleges

The objective of the measure is to implement the development of Wi-Fi networks for education in school education and vocational education and training colleges.

The main elements of the measure are:

- The deployment of **centrally managed WiFi networks in learning rooms, public spaces and living rooms**;
- **Establishment and development of eduroam and Guest networks**;
- Installation, installation and installation of training rooms suitable for **online group work** (smart TV, camera, microphone, etc.)

Di III.1 National Telecommunications Gerinc Network (NTG) extension, bandwidth extension and related network developments

The objective of the measure is to develop the network of inpatient healthcare institutions, penitentiary institutions, district locations without the NTG endpoints, which hitherto do not have a fibre network. This enables municipalities and public bodies to provide up-to-date e-administration services. Another important objective is to ensure flexibility in meeting substantially increased and rising bandwidth needs by increasing capacity.

The main elements of the measure are:

- Further development of district aggregation network;
- NTG backbone capacity expansion (including development of NTG network capacities for government workers to work from home);
- Optical connection of hospitals;
- Optical connection of penitentiary (BV) institutions;
- Other network and security developments necessary to safely service NTG connections.
