

CAP Strategic Plan

CCI	2023HU06AFSP001
Title in English	CAP Strategic Plan Hungary, 2023-2027
Title in national language(s)	HU - Magyarország KAP stratégiai terve, 2023-2027
Version	7.0
Status	Adopted by MS
First year	2023
Last year	2027
Eligible from	22 Apr 2025
Eligible until	
Commission decision number	C(2025)6207
Commission decision date	15 Sept 2025
Fund(s) concerned	EAGF, EAFRD
Report generation date	03/12/2025 13:15

Table of Contents

Type of modification	39
1 Strategic Statement	40
2 Assessments of needs and intervention strategy, including target plan and context indicators	43
2.1 Assessments of needs and intervention strategy	43
2.1.SO1 Support viable farm income and resilience of the agricultural sector across the Union in order to enhance long-term food security and agricultural diversity as well as to ensure the economic sustainability of agricultural production in the Union	59
2.1.SO1.1 Summary of the SWOT Analysis	59
2.1.SO1.1.1 Strengths	59
2.1.SO1.1.2 Weaknesses	59
2.1.SO1.1.3 Opportunities	59
2.1.SO1.1.4 Threats	59
2.1.SO1.1.5 Other comments	60
2.1.SO1.2 Identification of needs	60
2.1.SO1.4 Intervention logic	60
2.1.SO1.5 Where relevant, a justification for the use of InvestEU, including the amount and its expected contribution to the Specific Objective/Cross-Cutting Objective	63
2.1.SO1.8 Selection of the result indicator(s)	63
2.1.SO1.9 Justification of the financial allocation	66
2.1.SO2 Enhance market orientation and increase farm competitiveness, both in the short and long term, including greater focus on research, technology and digitalisation	67
2.1.SO2.1 Summary of the SWOT Analysis	67
2.1.SO2.1.1 Strengths	67
2.1.SO2.1.2 Weaknesses	67
2.1.SO2.1.3 Opportunities	67
2.1.SO2.1.4 Threats	68
2.1.SO2.1.5 Other comments	68
2.1.SO2.2 Identification of needs	68
2.1.SO2.4 Intervention logic	69
2.1.SO2.5 Where relevant, a justification for the use of InvestEU, including the amount and its expected contribution to the Specific Objective/Cross-Cutting Objective	77
2.1.SO2.8 Selection of the result indicator(s)	77
2.1.SO2.9 Justification of the financial allocation	79
2.1.SO3 Improve the farmer' position in the value chain	81
2.1.SO3.1 Summary of the SWOT Analysis	81
2.1.SO3.1.1 Strengths	81
2.1.SO3.1.2 Weaknesses	81
2.1.SO3.1.3 Opportunities	81
2.1.SO3.1.4 Threats	81
2.1.SO3.1.5 Other comments	82
2.1.SO3.2 Identification of needs	82
2.1.SO3.4 Intervention logic	82
2.1.SO3.5 Where relevant, a justification for the use of InvestEU, including the amount and its expected contribution to the Specific Objective/Cross-Cutting Objective	85
2.1.SO3.8 Selection of the result indicator(s)	85
2.1.SO3.9 Justification of the financial allocation	88
2.1.SO4 Contribute to climate change mitigation and adaptation, including by reducing greenhouse gas emission and enhancing carbon sequestration, as well as promote sustainable energy	89
2.1.SO4.1 Summary of the SWOT Analysis	89
2.1.SO4.1.1 Strengths	89
2.1.SO4.1.2 Weaknesses	89
2.1.SO4.1.3 Opportunities	89
2.1.SO4.1.4 Threats	90

2.1.SO4.1.5 Other comments.....	90
2.1.SO4.2 Identification of needs	90
2.1.SO4.3 Identification of the relevant (elements of) national plans emanating from the legislative instruments referred to in Annex XI of the CAP plan Regulation that have been taken into account in the CAP plans' needs assessment for this specific objective	91
2.1.SO4.4 Intervention logic.....	95
2.1.SO4.5 Where relevant, a justification for the use of InvestEU, including the amount and its expected contribution to the Specific Objective/Cross-Cutting Objective.....	100
2.1.SO4.7 Are you planning CAP contribution towards the LIFE programme (only for SO4, SO5, SO6).....	100
2.1.SO4.8 Selection of the result indicator(s).....	100
2.1.SO4.9 Justification of the financial allocation.....	106
2.1.SO5 Foster sustainable development and efficient management of natural resources such as water, soil and air, including by reducing chemical dependency	108
2.1.SO5.1 Summary of the SWOT Analysis	108
2.1.SO5.1.1 Strengths	108
2.1.SO5.1.2 Weaknesses.....	108
2.1.SO5.1.3 Opportunities	109
2.1.SO5.1.4 Threats	109
2.1.SO5.1.5 Other comments.....	110
2.1.SO5.2 Identification of needs	110
2.1.SO5.3 Identification of the relevant (elements of) national plans emanating from the legislative instruments referred to in Annex XI of the CAP plan Regulation that have been taken into account in the CAP plans' needs assessment for this specific objective	111
2.1.SO5.4 Intervention logic.....	118
2.1.SO5.5 Where relevant, a justification for the use of InvestEU, including the amount and its expected contribution to the Specific Objective/Cross-Cutting Objective.....	122
2.1.SO5.7 Are you planning CAP contribution towards the LIFE programme (only for SO4, SO5, SO6).....	122
2.1.SO5.8 Selection of the result indicator(s).....	122
2.1.SO5.9 Justification of the financial allocation.....	125
2.1.SO6 Contribute to halting and reversing biodiversity loss, enhance ecosystem services and preserve habitats and landscapes	127
2.1.SO6.1 Summary of the SWOT Analysis	127
2.1.SO6.1.1 Strengths	127
2.1.SO6.1.2 Weaknesses.....	127
2.1.SO6.1.3 Opportunities	128
2.1.SO6.1.4 Threats	129
2.1.SO6.1.5 Other comments.....	129
2.1.SO6.2 Identification of needs	129
2.1.SO6.3 Identification of the relevant (elements of) national plans emanating from the legislative instruments referred to in Annex XI of the CAP plan Regulation that have been taken into account in the CAP plans' needs assessment for this specific objective	130
2.1.SO6.4 Intervention logic.....	135
2.1.SO6.5 Where relevant, a justification for the use of InvestEU, including the amount and its expected contribution to the Specific Objective/Cross-Cutting Objective.....	142
2.1.SO6.7 Are you planning CAP contribution towards the LIFE programme (only for SO4, SO5, SO6).....	142
2.1.SO6.8 Selection of the result indicator(s).....	142
2.1.SO6.9 Justification of the financial allocation.....	147
2.1.SO7 Attract and sustain young farmers and other new farmers and facilitate sustainable business development in rural areas.....	148
2.1.SO7.1 Summary of the SWOT Analysis	148
2.1.SO7.1.1 Strengths	148
2.1.SO7.1.2 Weaknesses.....	148

2.1.SO7.1.3 Opportunities	149
2.1.SO7.1.4 Threats	149
2.1.SO7.1.5 Other comments.....	149
2.1.SO7.2 Identification of needs	149
2.1.SO7.4 Intervention logic.....	150
2.1.SO7.5 Where relevant, a justification for the use of InvestEU, including the amount and its expected contribution to the Specific Objective/Cross-Cutting Objective.....	153
2.1.SO7.6 Are you planning CAP contribution towards the Erasmus programme	153
2.1.SO7.8 Selection of the result indicator(s).....	153
2.1.SO7.9 Justification of the financial allocation.....	154
2.1.SO8 Promote employment, growth, gender equality, including the participation of women in farming, social inclusion and local development in rural areas, including the circular bio-economy and sustainable forestry	156
2.1.SO8.1 Summary of the SWOT Analysis	156
2.1.SO8.1.1 Strengths	156
2.1.SO8.1.2 Weaknesses.....	156
2.1.SO8.1.3 Opportunities	157
2.1.SO8.1.4 Threats	157
2.1.SO8.1.5 Other comments.....	157
2.1.SO8.2 Identification of needs	158
2.1.SO8.4 Intervention logic.....	158
2.1.SO8.5 Where relevant, a justification for the use of InvestEU, including the amount and its expected contribution to the Specific Objective/Cross-Cutting Objective.....	165
2.1.SO8.8 Selection of the result indicator(s).....	165
2.1.SO8.9 Justification of the financial allocation.....	168
2.1.SO9 Improve the response of Union agriculture to societal demands on food and health, including high quality, safe, and nutritious food produced in a sustainable way, the reduction of food waste, as well as improving animal welfare and combatting antimicrobial resistances	169
2.1.SO9.1 Summary of the SWOT Analysis	169
2.1.SO9.1.1 Strengths	169
2.1.SO9.1.2 Weaknesses.....	169
2.1.SO9.1.3 Opportunities	169
2.1.SO9.1.4 Threats	170
2.1.SO9.1.5 Other comments.....	170
2.1.SO9.2 Identification of needs	170
2.1.SO9.4 Intervention logic.....	170
2.1.SO9.5 Where relevant, a justification for the use of InvestEU, including the amount and its expected contribution to the Specific Objective/Cross-Cutting Objective.....	176
2.1.SO9.8 Selection of the result indicator(s).....	177
2.1.SO9.9 Justification of the financial allocation.....	178
2.1.XCO Cross-cutting objective of modernising the sector by fostering and sharing of knowledge, innovation and digitalisation in agriculture and rural areas, and encouraging their uptake	179
2.1.XCO.1 Summary of the SWOT Analysis.....	179
2.1.XCO.1.1 Strengths.....	179
2.1.XCO.1.2 Weaknesses	179
2.1.XCO.1.3 Opportunities	180
2.1.XCO.1.4 Threats.....	180
2.1.XCO.1.5 Other comments	181
2.1.XCO.2 Identification of needs.....	181
2.1.XCO.4 Intervention logic	182
2.1.XCO.5 Where relevant, a justification for the use of InvestEU, including the amount and its expected contribution to the Specific Objective/Cross-Cutting Objective.....	186
2.1.XCO.8 Selection of the result indicator(s)	186
2.1.XCO.9 Justification of the financial allocation	188
2.2 Context Indicators and other values used for the calculation of the targets	190

2.3 Targets Plan	190
2.3.1 Recapitulative table	190
2.3.2 Planned interventions and outputs with a direct and significant link to result indicators	203
2.3.3 Consistency with and contribution to the Union targets for 2030 set out in the Farm to Fork Strategy and the EU Biodiversity for 2030	203
3 Consistency of the Strategy and complementarities.....	208
3.1 Overview of the environmental and climate architecture.....	208
3.1.1 A description of the overall contribution of conditionality to the specific environmental- and climate-related objectives set out in points (d), (e) and (f) of Article 6(1).....	208
3.1.2 Overview of the complementarity between the relevant baseline conditions, as referred to in Article 31(5) and Article 70(3), conditionality and the different interventions addressing environment and climate-related objectives	209
3.1.3 Explanation on how to achieve the greater overall contribution set out in Article 105	218
3.1.4 Explanation of how the environmental and climate architecture of the CAP Strategic Plan is meant to contribute to already established long-term national targets set out in or deriving from the legislative instruments referred to in Annex XI	233
3.1.5 Where relevant, CAP contribution towards LIFE projects.....	249
3.2 Overview of the generational renewal strategy	249
3.2.1 Where relevant, CAP contribution towards Erasmus projects	253
3.3 Explanation on how the interventions under coupled income support as referred to in Subsection 1 of Section 3 of Chapter II of Title III are consistent with the Water Framework Directive - 2000/60/EC	253
3.4 Overview as regards the aim of fairer distribution and more effective and efficient targeting of income support	264
3.5 Overview of the sector-related interventions.....	273
3.5.1 Fruit and Vegetables.....	273
3.5.2 Apiculture products	276
3.5.3 Wine.....	281
3.5.4 Hops.....	285
3.5.5 Olive oil and tables olive	285
3.5.6 Beef and veal	285
3.5.7 Milk and milk products.....	286
3.5.8 Sheep and goat.....	287
3.5.9 Protein crops	287
3.5.10 Sugar beet	287
3.5.11 Other sectors	287
3.6 Overview of the interventions that contribute to ensure a coherent and integrated approach to risk management, where relevant	288
3.7 Interplay between national and regional interventions.....	295
3.7.1 Where relevant, a description of the interplay between national and regional interventions, including the distribution of financial allocations per intervention and per fund	295
3.7.2 Where relevant, where elements of the CAP Strategic Plan are established at regional level, how does the interventions strategy ensure the coherence and the consistency of these elements with the elements of the CAP Strategic Plan established at national level	295
3.8 Overview of how the CAP Strategic Plan contributes to the objective of improving animal welfare and reducing antimicrobial resistance set out in point (i) of Article 6(1), including the baseline conditions and the complementarity.....	295
3.9 Simplification and reducing the administrative burden.....	297
3.10 Conditionality	299
3.10.1 Main issue: Climate change (mitigation of and adaptation to).....	299
3.10.1.1 GAEC 1: Maintenance of permanent grassland based on a ratio of permanent grassland in relation to agricultural area.....	299
3.10.1.1.1 Summary of the farm obligation (e.g. prior authorisation system and reconversion obligation).....	299
3.10.1.1.2 Territorial scope (national, regional, farm-level, group-of-holdings)	299

3.10.1.1.3 Value of the reference ratio (including calculation method).....	299
3.10.1.1.4.Type of farmers concerned (all farmers that have permanent grasslands)	300
3.10.1.1.5 Explanation of the contribution to achieve the main objective of the GAEC standard	300
3.10.1.2 GAEC 2: Protection of wetland and peatland	300
3.10.1.2.1 Summary of the on-farm practice.....	300
3.10.1.2.2 Year of application of the GAEC	301
3.10.1.2.3 Territorial scope and area designated	301
3.10.1.2.4 Type of farmers concerned.....	301
3.10.1.2.5 Explanation of the contribution to achieve the main objective of the GAEC standard	301
3.10.1.3 GAEC 3: Ban on burning arable stubble, except for plant health reasons	302
3.10.1.3.1 Summary of the on-farm practice.....	302
3.10.1.3.2 Territorial scope.....	302
3.10.1.3.3 Type of farmers concerned.....	302
3.10.1.3.4 Explanation of the contribution to achieve the main objective of the GAEC standard	302
3.10.2 Main issue: Water.....	302
3.10.2.1 GAEC 4: Establishment of buffer strips along water courses	302
3.10.2.1.1 Summary of the on-farm practice.....	302
3.10.2.1.2 Minimal width of buffer strips (in m).....	302
3.10.2.1.3 Territorial scope, including water courses definition	302
3.10.2.1.4 Type of farmers concerned.....	302
3.10.2.1.5 Explanation of the contribution to achieve the main objective of the GAEC standard	302
3.10.3 Main issue: soil(protection and quality)	303
3.10.3.1 GAEC 5: Tillage management, reducing the risk of soil degradation and erosion, including consideration of the slope gradient.....	303
3.10.3.1.1 Summary of the on-farm practice.....	303
3.10.3.1.2 Territorial scope (including erosion risks areas and the slope gradient)	303
3.10.3.1.3 Type of farmers concerned.....	303
3.10.3.1.4 Explanation of the contribution to achieve the main objective of the GAEC standard	303
3.10.3.2 GAEC 6: Minimum soil cover to avoid bare soils in period(s) that are most sensitive	303
3.10.3.2.1 Summary of the on-farm practice (including the period concerned).....	303
3.10.3.2.2 Territorial scope.....	303
3.10.3.2.3 Type of farmers concerned.....	303
3.10.3.2.4 Explanation of the contribution to achieve the main objective of the GAEC standard	304
3.10.3.3 GAEC 7: Crop rotation in arable land except for crops grown under water	304
3.10.3.3.1 Summary of the on-farm practice for crop rotation.....	304
3.10.3.3.2 Summary of the farm practice for crop diversification	305
3.10.3.3.3 Territorial scope.....	305
3.10.3.3.4 Type of farmers concerned.....	306
3.10.3.3.5 Explanation of the contribution to achieve the main objective of the GAEC standard (notably if MS has chosen crop diversification).....	306
3.10.4 Main issue: Biodiversity and landscape (protection and quality).....	306
3.10.4.1 GAEC 8: Retention of landscape features.Ban on cutting hedges and trees during the bird breeding and rearing season.As an option, measures for avoiding invasive plant species.....	306
3.10.4.1.1 Summary of the in-farm practice.....	306
3.10.4.1.2 Territorial scope (applicable for the “minimum share” standard).....	311
3.10.4.1.3 Type of farmers concerned.....	311
3.10.4.1.4 Explanation of the contribution to the main objective of the practice/standard	311
3.10.4.2 GAEC 9: Ban on converting or ploughing permanent grassland designated as environmentally-sensitive permanent grasslands in Natura 2000 sites	312

3.10.4.2.1 Summary of the on-farm practice.....	312
3.10.4.2.2 Territorial scope.....	312
3.10.4.2.3 Type of farmers concerned.....	312
3.10.4.2.4 Explanation of the contribution to achieve the main objective of the GAEC standard	312
3.10.5 Additional GAEC (if applicable).....	312
4 Elements common to several interventions.....	313
4.1 Definition and minimum requirements.....	313
4.1.1 Agricultural activity.....	313
4.1.1.1 Definition of production.....	313
4.1.1.2 Definition of maintenance of agricultural area.....	313
4.1.1.2.1 Maintenance criteria in arable land	313
4.1.1.2.2 Maintenance criteria in permanent crops.....	313
4.1.1.2.3 Maintenance criteria in permanent grassland	314
4.1.2 Agricultural area.....	315
4.1.2.1 Elements of agroforestry systems when it is established and/or maintained on the agricultural area	315
4.1.2.1.1 Elements of agroforestry systems in arable land.....	315
4.1.2.1.2 Elements of agroforestry systems in permanent crops	315
4.1.2.1.3 Elements of agroforestry systems in permanent grassland.....	315
4.1.2.2 Arable land	315
4.1.2.2.1 Other comments relating to the definition of arable land.....	315
4.1.2.3 Permanent crops	316
4.1.2.3.1 Definition of nurseries.....	316
4.1.2.3.2 Definition of Short Rotation Coppice.....	316
4.1.2.3.3 Other comments relating to the definition of permanent crops	316
4.1.2.4 Permanent grassland.....	316
4.1.2.4.1 Definition of grasses and other herbaceous forage.....	316
4.1.2.4.2 Decision to use ‘ploughing’ criterion in relation to permanent grassland classification	317
4.1.2.4.3 Decision to use ‘tilling’ criterion in relation to permanent grassland classification ...	317
4.1.2.4.4 Decision to use ‘reseeding with different types of grasses’ criterion in relation to permanent grassland classification	317
4.1.2.4.5 Decision regarding the inclusion of other species such as trees and/or shrubs which produce animal feed, provided that grasses and other herbaceous forage remain predominant	317
4.1.2.4.6 Decision regarding the inclusion of other species, such as shrubs and/or trees, which could be grazed and/or which produce animal feed, where grasses and other herbaceous forage are traditionally not predominant or are absent in grazing areas.....	317
4.1.2.4.7 Other comments relating to the definition of permanent grassland.....	317
4.1.2.5 Other comments relating to the definition of agricultural area in general.....	317
4.1.3 Eligible hectare	318
4.1.3.1 Criteria how to establish the predominance of agricultural activity in case the land is also used for non-agricultural activities	318
4.1.3.2 Criteria to ensure that the land is at the disposal of the farmer	318
4.1.3.3 Period during which an area has to comply with the definition of ‘eligible hectare’	320
4.1.3.4 Decision to include areas used for agricultural activity only every second year	320
4.1.3.5 Decision regarding the inclusion of other landscape features (those not protected under GAEC), provided that they are not predominant and do not significantly hamper the performance of an agricultural activity due to the area they occupy.....	320
4.1.3.6 Decision as regards permanent grassland with scattered ineligible features, to apply fixed reduction coefficients to determine the area considered eligible	322
4.1.3.7 Decision to maintain the eligibility of previously eligible areas when they no longer meet the definition of ‘eligible hectare’ pursuant to paragraphs a) and b) of Article 4(4) of the SPR regulation as a result of using national schemes the conditions of which comply with the interventions covered by integrated system referred to in Art 63(2) of Regulation (EU) HzR	

allowing for the production of non-annex 1 products by way of paludiculture and which contribute to envi-clima related objectives of the SPR regulation	322
4.1.4 Active farmer	322
4.1.4.1 Criteria to identify those who have minimum level of agricultural activity	322
4.1.4.2 Decision to use a negative list of non-agricultural activities as a complementary tool.....	325
4.1.4.3 Decision to set an amount of direct payments not higher than EUR 5 000 under which farmers shall in any event be considered as ‘active farmers’	325
4.1.5 Young farmer.....	325
4.1.5.1 Maximum age limit	325
4.1.5.2 Conditions for being ‘head of the holding’	325
4.1.5.3 Appropriate training and/or skills required	325
4.1.5.4 Other comments relating to Young farmer definition	326
4.1.6 New farmer	327
4.1.6.1 Conditions for being ‘head of the holding’ for the first time	327
4.1.6.2 Appropriate training and skills required.....	327
4.1.7 Minimum requirements for receiving direct payments	327
4.1.7.1 Threshold.....	327
4.1.7.2 Explanation.....	327
4.1.8 Other definitions used in the CAP Plan.....	329
4.2 Element related to Direct Payments	333
4.2.2 Reduction of direct payments.....	333
4.2.2.1 Description of the reduction and/or capping of direct payments.....	333
4.2.2.2 Subtraction of labour costs	333
4.2.2.3 Estimated product of the reduction of direct payments and capping for each year.....	333
4.2.3 Application at the level of members of legal persons or groups/ at the level of group of affiliated legal entities (Article 110).....	333
4.2.4 Contribution to risk management tools	334
4.3 Technical Assistance	334
4.3.1 Objectives	334
4.3.2 Scope and indicative planning of activities	334
4.3.3 Beneficiaries	336
4.3.4 Rate.....	336
4.4 CAP Network	336
4.4.1 Summary overview and objectives of the National CAP Network, including activities to support EIP and knowledge flows within the AKIS.....	336
4.4.2 Structure, governance and operation of the National CAP Network	337
4.5 Overview of the coordination, demarcation and complementarities between the EAFRD and other Union funds active in rural areas.....	349
4.6 Financial instruments.....	356
4.6.1 Description of the financial instrument	356
4.7 Common elements for Rural Development types of interventions	357
4.7.1 List of non eligible investments.....	357
4.7.2 Definition of rural area and applicability	357
4.7.3 Additional elements common for Sectoral interventions, for rural development interventions, or common for both Sectoral and Rural Development interventions	358
4.7.4 Contribution rate(s) applicable to Rural Development interventions.....	358
5 Direct payments, sectoral and rural development interventions specified in the strategy	361
5.1 Direct Payments Interventions.....	370
BISS(21) - Basic income support for sustainability	370
DP01_E01_BISS_16 - The basic income support for sustainability.....	370
1 Territorial scope and, if relevant, regional dimension.....	370
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives	370
3 Need(s) addressed by the intervention.....	370
4 Result indicator(s).....	370
5 Specific design, requirements and eligibility conditions of the intervention	370

6 Identification of relevant baseline elements	371
7 Range and amounts of support	371
8 Additional questions/information specific to the Type of Intervention	371
9 WTO compliance.....	371
11 Planned Unit Amounts - Definition.....	372
12 Planned Unit Amounts - Financial table with outputs.....	376
CRISS(29) - Complementary redistributive income support for sustainability	377
DP02_E02_CRIS_16 - Complementary redistributive income support for sustainability.....	377
1 Territorial scope and, if relevant, regional dimension.....	377
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives	377
3 Need(s) addressed by the intervention.....	377
4 Result indicator(s).....	377
5 Specific design, requirements and eligibility conditions of the intervention	377
6 Identification of relevant baseline elements	378
7 Range and amounts of support	378
8 Additional questions/information specific to the Type of Intervention	378
9 WTO compliance.....	379
11 Planned Unit Amounts - Definition.....	380
12 Planned Unit Amounts - Financial table with outputs.....	383
CIS-YF(30) - Complementary income support for young farmers	385
DP03_B01_YFS_16 - Complementary income support for young farmers	385
1 Territorial scope and, if relevant, regional dimension.....	385
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives	385
3 Need(s) addressed by the intervention.....	385
4 Result indicator(s).....	385
5 Specific design, requirements and eligibility conditions of the intervention	386
6 Identification of relevant baseline elements	386
7 Range and amounts of support	387
8 Additional questions/information specific to the Type of Intervention	387
9 WTO compliance.....	389
11 Planned Unit Amounts - Definition.....	390

6 Form and rate of support/amounts/calculation methods.....	535
7 Additional information specific to the Type of Intervention.....	536
8 WTO compliance.....	536
ADV11(47(1)(b)) - - advisory services and technical assistance, in particular concerning sustainable pest and disease control techniques, sustainable use of plant protection and animal	

health products, climate change adaptation and mitigation, the conditions of employment, employer obligations and occupational health and safety	537
SC11_A03_FVA_47 - Advisory services and technical assistance — fruit and vegetables.....	537
1 Territorial scope and, if relevant, regional dimension.....	537
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives...	537
3 Need(s) addressed by the intervention.....	537
4 Result indicator(s).....	538
5 Specific design, requirements and eligibility conditions of the intervention	538
6 Form and rate of support/amounts/calculation methods.....	539
7 Additional information specific to the Type of Intervention.....	540
8 WTO compliance.....	540
TRAINCO(47(1)(c)) - - training including coaching and exchange of best practices, in particular concerning sustainable pest and disease control techniques, sustainable use of plant protection and animal health products, and climate change adaptation and mitigation, as well as the use of organised trading platforms and commodity exchanges on the spot and futures market.....	542
SC12_A04_FVT_47 - training, including coaching and exchange of best practices — fruit and vegetables	542
1 Territorial scope and, if relevant, regional dimension.....	542
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives...	542
3 Need(s) addressed by the intervention.....	542
4 Result indicator(s).....	543
5 Specific design, requirements and eligibility conditions of the intervention	543
6 Form and rate of support/amounts/calculation methods.....	544
7 Additional information specific to the Type of Intervention.....	546
8 WTO compliance.....	546
ORGAN(47(1)(d)) - - organic or integrated production.....	547
SC13_G01_FVO_47 - organic or integrated production — Vegetable fruit	547
1 Territorial scope and, if relevant, regional dimension.....	547
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives...	547
3 Need(s) addressed by the intervention.....	547
4 Result indicator(s).....	548
5 Specific design, requirements and eligibility conditions of the intervention	548
6 Form and rate of support/amounts/calculation methods.....	549
7 Additional information specific to the Type of Intervention.....	550
8 WTO compliance.....	550
TRANS(47(1)(e)) - - actions to increase the sustainability and efficiency of transport and of storage of products.....	551
SC14_B01_FVE_47 - increasing the sustainability and efficiency of transport and storage of products — fruit and vegetables.....	551
1 Territorial scope and, if relevant, regional dimension.....	551
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives...	551
3 Need(s) addressed by the intervention.....	551
4 Result indicator(s).....	552
5 Specific design, requirements and eligibility conditions of the intervention	552
6 Form and rate of support/amounts/calculation methods.....	553
7 Additional information specific to the Type of Intervention.....	554
8 WTO compliance.....	554
PROMO(47(1)(f)) - - promotion, communication and marketing including actions and activities aimed in particular at raising consumer awareness about the Union quality schemes and the importance of healthy diets, and at diversification and consolidation of markets	555
SC15_E10_FVP_47 - promotion, communication and marketing — fruit and vegetables	555
1 Territorial scope and, if relevant, regional dimension.....	555
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives...	555
3 Need(s) addressed by the intervention.....	555
4 Result indicator(s).....	556

5 Specific design, requirements and eligibility conditions of the intervention	556
6 Form and rate of support/amounts/calculation methods.....	557
7 Additional information specific to the Type of Intervention.....	558
8 WTO compliance.....	558
QUAL(47(1)(g)) - - implementation of Union and national quality schemes.....	559
SC16_E11_FVQ_47 - use of EU and national quality schemes	559
1 Territorial scope and, if relevant, regional dimension.....	559
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives...	559
3 Need(s) addressed by the intervention.....	559
4 Result indicator(s).....	560
5 Specific design, requirements and eligibility conditions of the intervention	560
6 Form and rate of support/amounts/calculation methods.....	561
7 Additional information specific to the Type of Intervention.....	562
8 WTO compliance.....	562
TRACE(47(1)(h)) - - implementation of traceability and certification systems, in particular the monitoring of the quality of products sold to final consumers.....	563
SC17_E12_FVC_47 - application of traceability and certification schemes — fruit and vegetables	563
1 Territorial scope and, if relevant, regional dimension.....	563
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives...	563
3 Need(s) addressed by the intervention.....	563
4 Result indicator(s).....	564
5 Specific design, requirements and eligibility conditions of the intervention	564
6 Form and rate of support/amounts/calculation methods.....	565
7 Additional information specific to the Type of Intervention.....	566
8 WTO compliance.....	566
CLIMA(47(1)(i)) - - actions to mitigate and to adapt to climate change	567
SC18_G02_FVL_47 - climate change mitigation and adaptation measures — fruit and vegetables	567
1 Territorial scope and, if relevant, regional dimension.....	567
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives...	567
3 Need(s) addressed by the intervention.....	567
4 Result indicator(s).....	568
5 Specific design, requirements and eligibility conditions of the intervention	568
6 Form and rate of support/amounts/calculation methods.....	569
7 Additional information specific to the Type of Intervention.....	570
8 WTO compliance.....	570
SETUP(47(2)(a)) - - setting up, filling and refilling of mutual funds by producer organisations and by associations of producer organisations recognised under Regulation (EU) No 1308/2013, or under Article 67(7) of this Regulation.....	571
SC19_I01_FVF_47 - mutual funds — fruit and vegetables.....	571
1 Territorial scope and, if relevant, regional dimension.....	571
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives...	571
3 Need(s) addressed by the intervention.....	571
4 Result indicator(s).....	571
5 Specific design, requirements and eligibility conditions of the intervention	571
6 Form and rate of support/amounts/calculation methods.....	573
7 Additional information specific to the Type of Intervention.....	574
8 WTO compliance.....	575
INVVO(47(2)(b)) - - investments in tangible and intangible assets making the management of the volumes placed on the market more efficient including for collective storage.....	576
SC20_I02_FVV_47 - investments to improve the management and joint storage of quantities placed on the market — fruit and vegetables	576
1 Territorial scope and, if relevant, regional dimension.....	576
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives...	576

3 Need(s) addressed by the intervention.....	576
4 Result indicator(s).....	577
5 Specific design, requirements and eligibility conditions of the intervention	577
6 Form and rate of support/amounts/calculation methods.....	577
7 Additional information specific to the Type of Intervention.....	579
8 WTO compliance.....	579
STORE(47(2)(c)) - - collective storage of products produced by the producer organisation or by its members, including where necessary collective processing to facilitate such storage.....	580
SC21_I03_FVS_47 - joint storage of products, including, where necessary, the collective processing of products — fruit and vegetables	580
1 Territorial scope and, if relevant, regional dimension.....	580
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives	580
3 Need(s) addressed by the intervention.....	580
4 Result indicator(s).....	580
5 Specific design, requirements and eligibility conditions of the intervention	581
6 Form and rate of support/amounts/calculation methods.....	581
7 Additional information specific to the Type of Intervention.....	582
8 WTO compliance.....	583
ORCHA(47(2)(d)) - - replanting of orchards or olive groves where that is necessary following mandatory grubbing up for health or phytosanitary reasons on the instruction of the Member State competent authority or to adapt to climate change.....	584
SC22_I04_FVR_47 - replanting of orchards — fruit and vegetables	584
1 Territorial scope and, if relevant, regional dimension.....	584
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives	584
3 Need(s) addressed by the intervention.....	584
4 Result indicator(s).....	584
5 Specific design, requirements and eligibility conditions of the intervention	585
6 Form and rate of support/amounts/calculation methods.....	585
7 Additional information specific to the Type of Intervention.....	586
8 WTO compliance.....	587
WITHD(47(2)(f)) - - market withdrawal for free-distribution or other destinations, including where necessary processing to facilitate such withdrawal	588
SC23_I05_FVW_47 - withdrawals for free distribution or other destinations — fruit and vegetables	588
1 Territorial scope and, if relevant, regional dimension.....	588
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives	588
3 Need(s) addressed by the intervention.....	588
4 Result indicator(s).....	588
5 Specific design, requirements and eligibility conditions of the intervention	588
6 Form and rate of support/amounts/calculation methods.....	589
7 Additional information specific to the Type of Intervention.....	591
8 WTO compliance.....	591
GREEN(47(2)(g)) - - green harvesting consisting of the total harvesting on a given area of unripe non-marketable products which have not been damaged prior to the green harvesting, whether due to climatic reasons, disease or otherwise.....	592
SC24_I06_FVG_47 - green harvesting — fruit and vegetables.....	592
1 Territorial scope and, if relevant, regional dimension.....	592
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives	592
3 Need(s) addressed by the intervention.....	592
4 Result indicator(s).....	592
5 Specific design, requirements and eligibility conditions of the intervention	592
6 Form and rate of support/amounts/calculation methods.....	595
7 Additional information specific to the Type of Intervention.....	596
8 WTO compliance.....	596

NOHAR(47(2)(h)) - - non-harvesting consisting of the termination of the current production cycle on the area concerned where the product is well developed and is of sound, fair and marketable quality, excluding destruction of products due to a climatic event or disease	598
SC25_I07_FVN_47 - non-harvesting — fruit and vegetables	598
1 Territorial scope and, if relevant, regional dimension.....	598
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives...	598
3 Need(s) addressed by the intervention.....	598
4 Result indicator(s).....	598
5 Specific design, requirements and eligibility conditions of the intervention	598
6 Form and rate of support/amounts/calculation methods.....	601
7 Additional information specific to the Type of Intervention.....	602
8 WTO compliance.....	602
HARIN(47(2)(i)) - - harvest and production insurance that contributes to safeguarding producers' incomes where there are losses as a consequence of natural disasters, adverse climatic events, diseases or pest infestations while ensuring that beneficiaries take necessary risk prevention measures	603
SC26_I08_FVH_47 - harvest and production insurance — fruit and vegetables	603
1 Territorial scope and, if relevant, regional dimension.....	603
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives...	603
3 Need(s) addressed by the intervention.....	603
4 Result indicator(s).....	603
5 Specific design, requirements and eligibility conditions of the intervention	604
6 Form and rate of support/amounts/calculation methods.....	604
7 Additional information specific to the Type of Intervention.....	605
8 WTO compliance.....	605
COACH(47(2)(j)) - - coaching to other producer organisations and associations of producer organisations recognised under Regulation (EU) No 1308/2013 or under Article 67(7) of this Regulation, or to individual producers	607
SC29_I10_FVC_47 - personalised advice – fruit and vegetables	607
1 Territorial scope and, if relevant, regional dimension.....	607
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives...	607
3 Need(s) addressed by the intervention.....	607
4 Result indicator(s).....	607
5 Specific design, requirements and eligibility conditions of the intervention	607
6 Form and rate of support/amounts/calculation methods.....	608
7 Additional information specific to the Type of Intervention.....	609
8 WTO compliance.....	609
COMM(47(2)(l)) - - communication actions aiming at raising awareness and informing consumers	610
SC27_I09_FVM_47 - communication activities to raise awareness and inform consumers — fruit and vegetables.....	610
1 Territorial scope and, if relevant, regional dimension.....	610
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives...	610
3 Need(s) addressed by the intervention.....	610
4 Result indicator(s).....	610
5 Specific design, requirements and eligibility conditions of the intervention	610
6 Form and rate of support/amounts/calculation methods.....	612
7 Additional information specific to the Type of Intervention.....	613
8 WTO compliance.....	613
Apiculture products	614
ADVIBES(55(1)(a)) - - advisory services, technical assistance, training, information and exchange of best practices, including through networking, for beekeepers and beekeepers' organisations	614
SC02_A01_BEA_55 - Apiculture knowledge transfer and technical assistance	614
1 Territorial scope and, if relevant, regional dimension.....	614

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives...	614
3 Need(s) addressed by the intervention.....	614
4 Result indicator(s).....	614
5 Specific design, requirements and eligibility conditions of the intervention	614
6 Form and rate of support/amounts/calculation methods.....	616
7 Additional information specific to the Type of Intervention.....	616
8 WTO compliance.....	616
9 Planned Unit Amounts - Definition.....	618
10 Planned Unit Amounts - Financial table with output	618
INVAPI(55(1)(b)) - - investments in tangible and intangible assets, as well as other actions.....	621
SC03_E02_BEI_55 - Improving the competitiveness of the apiculture sector.....	621
1 Territorial scope and, if relevant, regional dimension.....	621
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives...	621
3 Need(s) addressed by the intervention.....	621
4 Result indicator(s).....	621
5 Specific design, requirements and eligibility conditions of the intervention	621
6 Form and rate of support/amounts/calculation methods.....	624
7 Additional information specific to the Type of Intervention.....	624
8 WTO compliance.....	625
9 Planned Unit Amounts - Definition.....	626
10 Planned Unit Amounts - Financial table with output	630
PROMOBEES(55(1)(f)) - - promotion, communication and marketing including market monitoring actions and activities aimed in particular at raising consumer awareness about the quality of the apiculture products	634
SC01_A02_BEM_55 - Beekeeping marketing	634
1 Territorial scope and, if relevant, regional dimension.....	634
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives...	634

8 WTO compliance.....	647
9 Planned Unit Amounts - Definition.....	648
10 Planned Unit Amounts - Financial table with output	648
GREENWINE(58(1)(c)) - - green harvesting, which means the total destruction or removal of grape bunches while still in their immature stage, thereby reducing the yield of the relevant area to zero and excluding non-harvesting comprising of leaving commercial grapes on the plants at the end of the normal production cycle	650
SC07_E06_WIG_58 - Support for green harvesting in the wine sector	650
1 Territorial scope and, if relevant, regional dimension.....	650
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives	650
3 Need(s) addressed by the intervention.....	650
4 Result indicator(s).....	650
5 Specific design, requirements and eligibility conditions of the intervention	650
6 Form and rate of support/amounts/calculation methods.....	651
7 Additional information specific to the Type of Intervention.....	651
8 WTO compliance.....	651
9 Planned Unit Amounts - Definition.....	652
10 Planned Unit Amounts - Financial table with output	652
INOVWINE(58(1)(e)) - - tangible and intangible investments in innovation consisting of development of innovative products, including products from, and by-products of, wine making, innovative processes and technologies for the production of wine products and the digitalisation of those processes and technologies, as well as other investments adding value at any stage of the supply chain, including for knowledge exchange and contribution to adaptation to the climate change.....	654
SC04_A01_WIIN_58 - INOVWINE – Innovative investments in the wine sector.....	654
1 Territorial scope and, if relevant, regional dimension.....	654
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives	654
3 Need(s) addressed by the intervention.....	654
4 Result indicator(s).....	654
5 Specific design, requirements and eligibility conditions of the intervention	654
6 Form and rate of support/amounts/calculation methods.....	655
7 Additional information specific to the Type of Intervention.....	655
8 WTO compliance.....	655
9 Planned Unit Amounts - Definition.....	656
10 Planned Unit Amounts - Financial table with output	656
ADVWINE(58(1)(f)) - - advisory services, in particular concerning the conditions of employment, employer obligations and occupational health and safety	658
SC30a_A02_WIA_58 - Advisory services in the wine sector	658
1 Territorial scope and, if relevant, regional dimension.....	658
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives	658
3 Need(s) addressed by the intervention.....	658
4 Result indicator(s).....	658
5 Specific design, requirements and eligibility conditions of the intervention	658
6 Form and rate of support/amounts/calculation methods.....	659
7 Additional information specific to the Type of Intervention.....	659
8 WTO compliance.....	659
9 Planned Unit Amounts - Definition.....	660
10 Planned Unit Amounts - Financial table with output	660
DISTIL(58(1)(g)) - - distillation of by-products of wine making carried out in accordance with the restrictions laid down in Part II, Section D, of Annex VIII to Regulation (EU) No 1308/2013	662
SC08_E07_WID_58 - Distillation of wine by-products	662

1 Territorial scope and, if relevant, regional dimension.....	662
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives...	662
3 Need(s) addressed by the intervention.....	662
4 Result indicator(s).....	662
5 Specific design, requirements and eligibility conditions of the intervention	662
6 Form and rate of support/amounts/calculation methods.....	663
7 Additional information specific to the Type of Intervention.....	663
8 WTO compliance.....	663
9 Planned Unit Amounts - Definition.....	664
10 Planned Unit Amounts - Financial table with output	664
INFOR(58(1)(h)) - - information actions concerning Union wines carried out in Member States encouraging responsible consumption of wine or promoting Union quality schemes covering designations of origin and geographical indications	666
SC09_E08_WIN_58 - Promotion in the internal market in the wine sector	666
1 Territorial scope and, if relevant, regional dimension.....	666
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives...	666
3 Need(s) addressed by the intervention.....	666
4 Result indicator(s).....	666
5 Specific design, requirements and eligibility conditions of the intervention	666
6 Form and rate of support/amounts/calculation methods.....	667
7 Additional information specific to the Type of Intervention.....	667
8 WTO compliance.....	667
9 Planned Unit Amounts - Definition.....	668
10 Planned Unit Amounts - Financial table with output	668
ACTREPUT(58(1)(i)) - - actions undertaken by interbranch organisations recognised by Member States in the wine sector in accordance to Regulation (EU) No 1308/2013 aiming at enhancing the reputation of Union vineyards by promoting wine tourism in production regions	670
SC30b_E10_WIT_58 - Enhancing the reputation of EU vineyards by promoting wine tourism by recognised interbranch organisations	670
1 Territorial scope and, if relevant, regional dimension.....	670
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives...	670
3 Need(s) addressed by the intervention.....	670
4 Result indicator(s).....	670
5 Specific design, requirements and eligibility conditions of the intervention	670
6 Form and rate of support/amounts/calculation methods.....	671
7 Additional information specific to the Type of Intervention.....	671
8 WTO compliance.....	671
9 Planned Unit Amounts - Definition.....	672
10 Planned Unit Amounts - Financial table with output	672
ACTMKTKNOW(58(1)(j)) - - actions undertaken by interbranch organisations recognised by Member States in the wine sector in accordance to Regulation (EU) No 1308/2013 aiming at improving market knowledge.....	674
SC30c_E11_WIM_58 - Improving market knowledge by recognised interbranch organisations in the wine sector.....	674
1 Territorial scope and, if relevant, regional dimension.....	674
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives...	674
3 Need(s) addressed by the intervention.....	674
4 Result indicator(s).....	674
5 Specific design, requirements and eligibility conditions of the intervention	674
6 Form and rate of support/amounts/calculation methods.....	675
7 Additional information specific to the Type of Intervention.....	675
8 WTO compliance.....	675
9 Planned Unit Amounts - Definition.....	676
10 Planned Unit Amounts - Financial table with output	676
PROMOWINE(58(1)(k)) - - promotion carried out in third countries.....	678

SC10_E09_WIP_58 - Promotion in the wine sector in third countries.....	678
1 Territorial scope and, if relevant, regional dimension.....	678
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives...	678
3 Need(s) addressed by the intervention.....	678
4 Result indicator(s).....	678
5 Specific design, requirements and eligibility conditions of the intervention	678
6 Form and rate of support/amounts/calculation methods.....	679
7 Additional information specific to the Type of Intervention.....	679
8 WTO compliance.....	679
9 Planned Unit Amounts - Definition.....	680
10 Planned Unit Amounts - Financial table with output	680
5.3 Rural Development Interventions.....	681
ENVCLIM(70) - Environmental, climate-related and other management commitments	681
RD19_G01_AEC_70 - Agricultural environmental management payments (AKG).....	681
1 Territorial scope and, if relevant, regional dimension.....	681
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives	681
3 Need(s) addressed by the intervention.....	681
4 Result indicator(s).....	682
5 Specific design, requirements and eligibility conditions of the intervention	682
6 Identification of relevant baseline elements	722
7 Form and rate of support/amounts/calculation methods.....	727
8 Information regarding State aid assessment	729
9 Additional questions/information specific to the Type of Intervention	730
10 WTO compliance.....	731
11 Contribution rate(s) applicable to this intervention.....	731
12 Planned Unit Amounts - Definition.....	732
13 Planned Unit Amounts - Financial table with outputs.....	742
RD19a_G01_AEC_70 - AGRI-environmental management payments (AKG)	747
1 Territorial scope and, if relevant, regional dimension.....	747
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives	747
3 Need(s) addressed by the intervention.....	747
4 Result indicator(s).....	748
5 Specific design, requirements and eligibility conditions of the intervention	748
6 Identification of relevant baseline elements	761
7 Form and rate of support/amounts/calculation methods.....	763
8 Information regarding State aid assessment	765
9 Additional questions/information specific to the Type of Intervention	765
10 WTO compliance.....	766
11 Contribution rate(s) applicable to this intervention.....	766
12 Planned Unit Amounts - Definition.....	767
13 Planned Unit Amounts - Financial table with outputs.....	773
RD20_G02_ORT_70 - Support to organic farming	778
1 Territorial scope and, if relevant, regional dimension.....	778
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives	778
3 Need(s) addressed by the intervention.....	778
4 Result indicator(s).....	779
5 Specific design, requirements and eligibility conditions of the intervention	779
6 Identification of relevant baseline elements	780
7 Form and rate of support/amounts/calculation methods.....	781
8 Information regarding State aid assessment	783
9 Additional questions/information specific to the Type of Intervention	783
10 WTO compliance.....	783
11 Contribution rate(s) applicable to this intervention.....	784
12 Planned Unit Amounts - Definition.....	785
13 Planned Unit Amounts - Financial table with outputs.....	787

RD20a_G02_ORT_70 - Support for organic farming.....	791
1 Territorial scope and, if relevant, regional dimension.....	791
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives.....	791
3 Need(s) addressed by the intervention.....	791
4 Result indicator(s).....	792
5 Specific design, requirements and eligibility conditions of the intervention	792
6 Identification of relevant baseline elements	793
7 Form and rate of support/amounts/calculation methods.....	794
8 Information regarding State aid assessment	796
9 Additional questions/information specific to the Type of Intervention	796
10 WTO compliance.....	796

3 Need(s) addressed by the intervention.....	1053
4 Result indicator(s).....	1053
5 Specific design, requirements and eligibility conditions of the intervention	1053
6 Identification of relevant baseline elements	1055
7 Form and rate of support/amounts/calculation methods.....	1055
8 Information regarding State aid assessment	1056
9 Additional questions/information specific to the Type of Intervention	1056
10 WTO compliance.....	1057
11 Contribution rate(s) applicable to this intervention.....	1057
12 Planned Unit Amounts - Definition.....	1058
13 Planned Unit Amounts - Financial table with outputs.....	1058
RD01e_E01_FRM_73 - Support for investments in animal holdings for disease control, by reducing tail docking in the pig sector.....	1060
1 Territorial scope and, if relevant, regional dimension.....	1060
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives	1060
3 Need(s) addressed by the intervention.....	1060
4 Result indicator(s).....	1060
5 Specific design, requirements and eligibility conditions of the intervention	1060
6 Identification of relevant baseline elements	1063
7 Form and rate of support/amounts/calculation methods.....	1063
8 Information regarding State aid assessment	1064
9 Additional questions/information specific to the Type of Intervention	1064
10 WTO compliance.....	1064
11 Contribution rate(s) applicable to this intervention.....	1065
12 Planned Unit Amounts - Definition.....	1066
13 Planned Unit Amounts - Financial table with outputs.....	1066
RD02_D01_FRM_73 - Supporting the digital transition of agricultural holdings	1068
1 Territorial scope and, if relevant, regional dimension.....	1068
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives	1068
3 Need(s) addressed by the intervention.....	1068

4 Result indicator(s).....	1068
5 Specific design, requirements and eligibility conditions of the intervention	1068
6 Identification of relevant baseline elements	1072
7 Form and rate of support/amounts/calculation methods.....	1072
8 Information regarding State aid assessment	1073
9 Additional questions/information specific to the Type of Intervention	1073
10 WTO compliance.....	1074
11 Contribution rate(s) applicable to this intervention	1074
12 Planned Unit Amounts - Definition.....	1075
13 Planned Unit Amounts - Financial table with outputs.....	1075
RD04a_E02_FON_73 - Adding value to agricultural products	1077
1 Territorial scope and, if relevant, regional dimension.....	1077
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives	1077
3 Need(s) addressed by the intervention.....	1077
4 Result indicator(s).....	1078
5 Specific design, requirements and eligibility conditions of the intervention	1078
6 Identification of relevant baseline elements	1079
7 Form and rate of support/amounts/calculation methods.....	1079
8 Information regarding State aid assessment	1080
9 Additional questions/information specific to the Type of Intervention	1080
10 WTO compliance.....	1081
11 Contribution rate(s) applicable to this intervention	1081
12 Planned Unit Amounts - Definition.....	1082
13 Planned Unit Amounts - Financial table with outputs.....	1082
RD04b_E03_FOF_73 - Support for green investments linked to adding value to agricultural products	1084
1 Territorial scope and, if relevant, regional dimension.....	1084
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives	1084
3 Need(s) addressed by the intervention.....	1084
4 Result indicator(s).....	1084
5 Specific design, requirements and eligibility conditions of the intervention	1084
6 Identification of relevant baseline elements	1086
7 Form and rate of support/amounts/calculation methods.....	1086
8 Information regarding State aid assessment	1087
9 Additional questions/information specific to the Type of Intervention	1087
10 WTO compliance.....	1088
11 Contribution rate(s) applicable to this intervention	1088
12 Planned Unit Amounts - Definition.....	1089
13 Planned Unit Amounts - Financial table with outputs.....	1089
RD09a_B05_SML_73 - Sustainable development of small farms	1091
1 Territorial scope and, if relevant, regional dimension.....	1091
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives	1091
3 Need(s) addressed by the intervention.....	1091
4 Result indicator(s).....	1091
5 Specific design, requirements and eligibility conditions of the intervention	1091
6 Identification of relevant baseline elements	1092
7 Form and rate of support/amounts/calculation methods.....	1092
8 Information regarding State aid assessment	1093
9 Additional questions/information specific to the Type of Intervention	1093
10 WTO compliance.....	1094
11 Contribution rate(s) applicable to this intervention	1094
12 Planned Unit Amounts - Definition.....	1095
13 Planned Unit Amounts - Financial table with outputs.....	1095
RD09b_R14_OGR_73 - Support for small enterprises in the ornamental horticulture sector.....	1097
1 Territorial scope and, if relevant, regional dimension.....	1097

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives	1097
3 Need(s) addressed by the intervention.....	1097
4 Result indicator(s).....	1097
5 Specific design, requirements and eligibility conditions of the intervention	1097
6 Identification of relevant baseline elements	1099
7 Form and rate of support/amounts/calculation methods.....	1099
8 Information regarding State aid assessment	1099
9 Additional questions/information specific to the Type of Intervention	1100
10 WTO compliance.....	1101
11 Contribution rate(s) applicable to this intervention.....	1101
12 Planned Unit Amounts - Definition.....	1102
13 Planned Unit Amounts - Financial table with outputs.....	1102
RD11_B07_DVF_73 - Diversification of activities of farmers	1104
1 Territorial scope and, if relevant, regional dimension.....	1104
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives	1104
3 Need(s) addressed by the intervention.....	1104
4 Result indicator(s).....	1104
5 Specific design, requirements and eligibility conditions of the intervention	1104
6 Identification of relevant baseline elements	1106
7 Form and rate of support/amounts/calculation methods.....	1106
8 Information regarding State aid assessment	1106
9 Additional questions/information specific to the Type of Intervention	1107
10 WTO compliance.....	1107
11 Contribution rate(s) applicable to this intervention.....	1108
12 Planned Unit Amounts - Definition.....	1109
13 Planned Unit Amounts - Financial table with outputs.....	1109
RD12_W01_WTO_73 - On-farm investment to improve irrigation and water efficiency	1111
1 Territorial scope and, if relevant, regional dimension.....	1111
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives	1111
3 Need(s) addressed by the intervention.....	1111
4 Result indicator(s).....	1111
5 Specific design, requirements and eligibility conditions of the intervention	1111
6 Identification of relevant baseline elements	1116
7 Form and rate of support/amounts/calculation methods.....	1116
8 Information regarding State aid assessment	1117
9 Additional questions/information specific to the Type of Intervention	1117
10 WTO compliance.....	1118
11 Contribution rate(s) applicable to this intervention.....	1118
12 Planned Unit Amounts - Definition.....	1119
13 Planned Unit Amounts - Financial table with outputs.....	1119
RD18_I03_JGR_73 - Agricultural Risk Management System (Pillar III) Digitalisation of the National Agricultural Hail Mitigation System	1121
1 Territorial scope and, if relevant, regional dimension.....	1121
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives	1121
3 Need(s) addressed by the intervention.....	1121
4 Result indicator(s).....	1121
5 Specific design, requirements and eligibility conditions of the intervention	1121
6 Identification of relevant baseline elements	1123
7 Form and rate of support/amounts/calculation methods.....	1123
8 Information regarding State aid assessment	1123
9 Additional questions/information specific to the Type of Intervention	1124
10 WTO compliance.....	1124
11 Contribution rate(s) applicable to this intervention.....	1125
12 Planned Unit Amounts - Definition.....	1126
13 Planned Unit Amounts - Financial table with outputs.....	1126

RD21_G04_LCI_73 - Non-productive investments in Agro-ecological	1128
1 Territorial scope and, if relevant, regional dimension.....	1128
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives	1128
3 Need(s) addressed by the intervention.....	1128
4 Result indicator(s).....	1129
5 Specific design, requirements and eligibility conditions of the intervention	1129
6 Identification of relevant baseline elements	1139
7 Form and rate of support/amounts/calculation methods.....	1139
8 Information regarding State aid assessment	1141
9 Additional questions/information specific to the Type of Intervention	1141
10 WTO compliance.....	1142
11 Contribution rate(s) applicable to this intervention.....	1142
12 Planned Unit Amounts - Definition.....	1143
13 Planned Unit Amounts - Financial table with outputs.....	1145
RD38_F05_AFI_73 - Support for investments in afforestation and creation of woodland	1150
1 Territorial scope and, if relevant, regional dimension.....	1150
2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives	1150
3 Need(s) addressed by the intervention.....	1150
4 Result indicator(s).....	1150
5 Specific design, requirements and eligibility conditions of the intervention	1151
6 Identification of relevant baseline elements	1153
7 Form and rate of support/amounts/calculation methods.....	1153
8 Information regarding State aid assessment	1154
9 Additional questions/information specific to the Type of Intervention	1154
10 WTO compliance.....	1155

1 Strategic Statement

Vision and mission of the CAP Strategic Plan

The Hungarian Government is an ally of the countryside. We are convinced that the success of our rural areas, cities and villages, together with the people living there, is one of the most important foundations for Hungary's future success. Renewable rural areas, our renewable agriculture programme are their future.

Shaping the future of the Hungarian countryside is therefore essential for the Hungarian Government from a social, economic and environmental point of view. Our aim is to renew the economy of Hungary's rural areas and put it on the highest possible development path, taking advantage of the opportunities offered by modern technologies; ensure attractive living conditions and employment opportunities for our fellow people living there; making agricultural production, which provides security of food supply in Europe and Hungary, the production of high-quality food, a profitable and socially recognised activity, while at the same time significantly improving Hungary's environmental status and the renewal of its natural resources. Therefore, the Hungarian Strategic Plan contributes substantially to the achievement of the objectives of the European Green Deal in the field of agriculture.

For rural Hungary, the economically and environmentally sustainable development of agriculture, forestry, food processing and related economic sectors is an opportunity to create value and provide livelihoods, building on its own resources. A significant part of the Hungarian rural areas has comparative advantages and accumulated knowledge of the economic activities linked to agriculture, which is worth and should be built on.

Policy objectives for economic development

Analysing global and European developments in the agricultural economy, Hungary has decided that the main development priority under CAP rural development support will be the food industry, while in the agricultural sector we aim to increase the value added per hectare and to plan an investment support structure aimed at increasing the cost-effectiveness of production.

As a result of the implementation of the Hungarian Strategic Plan, we intend to create a competitive, resource-efficient, high-value-added and innovative agriculture and food industry, measured against international standards, making it more resilient to external economic shocks and natural factors directly affecting production.

To this end, we want to use predictable and effective tools to support the knowledge and technology competitiveness of small and medium-sized farms and the food industry. We consider small farms as a value, for whom our support policy instruments are intended to give them a broad opportunity to strengthen their own economy, to participate more actively in local marketing or to create conditions for participation in production value chains. In order to strengthen the position of smaller farms, particular attention will be paid to encouraging joint development and investment in producer cooperation, in particular in the context of food processing activities, thus contributing to a fairer distribution of income generated on the product path.

In order to further increase agricultural production intensity, we prioritise several product pathways, such as the main animal product tracks (poultry, milk, pigs) and related feed production, industrial vegetable production, horticultural crops, seed production and the processing thereof.

In the case of livestock farming, in addition to coupled aid and investment aid, we intend to introduce more extensive forms of support linked to additional animal welfare commitments.

We will increase the importance of the financial soundness of investment projects and sustainability aspects in the framework of the call for proposals under the Strategic Plan for more complex investments.

Policy goals for a green future

As a result of the implementation of the Strategic Plan, we expect the resource efficiency of agricultural production to be improved, the use of environmentally friendly production technology and processes by a

wide range of farmers, resulting in agriculture managing natural resources in a more sustainable way, reducing its contribution to climate change and increasing biodiversity. We take a complex approach to our system of standards for the improvement of the environment and the sustainable management of natural resources linked to the support scheme, so that we can reasonably encourage our producers to renew their farming practices. Our interventions will strengthen the protection of soil and organic matter than ever before, and encourage water retention in soils, landscapes and our waters more than ever.

The green architecture of the Hungarian CAP Strategic Plan planned on the basis of situational and needs analysis can be outlined as follows:

Level 1: Extension of the definition of eligible area (PA) (Pillar I-II)

Level 2: Mandatory baseline environmental conditions (conditionality) (Pillars I-II)

Level 3: Basic voluntary programme for agro-ecology (AÖP, eco-scheme): (Pillar I)

Level 4: Voluntary advanced agro-ecological transition interventions (Pillar II)

Level 5: Other interventions with environmental, climate and adaptation impact (Pillar II)

The green architecture naturally includes some green elements of sectoral support, as well as investments in particular in energy and resource efficiency and the use of renewable energy, forestry measures from afforestation to the Forest Environmental Programme, as well as support for the conservation of genetic resources and animal welfare. We also prioritise horizontal AKIS interventions supporting all levels, as well as the green support unit of the CAP Network.

Policy targets for renewable rural areas

In the Strategic Plan, we put a lot of emphasis on encouraging generational renewal and provide support to ensure that older farmers who do not move their own farms can reassure the fate of their farms by transferring it to a member of the younger generation at the same time. To this end, we support the young generation (under the age of 40) as well as the older people, if they take over the entire economy, in the implementation of a five-year business plan. In particular, we support the cooperation between the transferor and the receiving farmer, whereby the transferor, the farmer who has reached retirement age, receives support for carrying out the transfer.

The CAP Strategic Plan focuses on a number of possible development goals that can be achieved in rural municipalities, which are linked to agriculture, food, environmental protection and landscape maintenance. In particular, we support the diversification of farming activities outside agriculture (e.g. tourism services), the creation of markets for the sale of local producers' goods, the development of public kitchens to promote the exploitation of local products, the development of a farm guard service, the creation of local producers' and consumers' marketing communities, etc. These activities develop basic services that determine the standard of living in rural areas and improve local employment.

During the programme period, a priority is to increase the adaptability of the farming community, one of the pillars of which is the creation of a knowledge network that efficiently conveys information. This will be facilitated by the strengthening of the network of village farmers and the expertise of sectoral professional organisations, the development of educational farms in secondary and higher agricultural educational establishments as a modern demonstration plant, and the involvement of farmers in adult training programmes. To increase innovation, we will provide more professional support to emerging innovation groups, who will mobilise new producers.

We support the development of a self-standing local strategy for the five years of the Strategic Plan (LEADER programme) for cooperating municipalities. We also support the development of smart village strategies, where a single municipality will be able to define its own development strategy, focusing on digital solutions, with the objectives pursued and the resources needed for them. An important requirement for local strategies is not only to focus on infrastructure development, but also to include economic development and environmental goals.

Agricultural knowledge and innovation systems at the service of policy objectives

The overall objective of the programme period is to contribute effectively to each policy objective by promoting and sharing knowledge, innovation and digitalisation (AKIS).

2 Assessments of needs and intervention strategy, including target plan and context indicators

2.1 Assessments of needs and intervention strategy

Code	Title	Prioritisation at the level of the CAP Strategic Plan	Need is addressed in Cap Strategic Plan	SO1	SO2	SO3	SO4	SO5	SO6	SO7	SO8	SO9	XCO
1.1.1	Predictable basic income for farmers	2	Yes	X									
1.1.2	Provision of available loan financing	2	Partially	X									
1.1.3.	Improving the profitability of small farms	2	Yes	X									
1.2.1	Tackling adverse climatic events and damage caused by climate change in agriculture	1	Yes	X									
1.2.3	Offsetting and mitigating the impact of market risks	2	Yes	X									
1.2.4	Promotion of agricultural insurance (self-care)	2	Yes	X									
2.1.1	Increasing operational and business efficiency of production	1	Yes		X								
2.1.11	Creation of new plantations, refurbishment and modernisation of plantations	2	Yes		X								
2.1.2	Creation of modern generation capacities	2	Yes		X								
2.1.3	Increasing the level of processing of agricultural raw materials	1	Yes		X								
2.1.4	Management of water scarcity in arable crops	1	Yes		X			X					
2.1.7	Technological transition taking into account stricter phytosanitary requirements	1	Yes		X								
2.1.8	Improvement of cultivation technology	1	Yes		X								
2.1.9	Adaptation and development of husbandry technology	1	Yes		X								
2.2.1	Development of post harvest technology	2	Yes		X								
2.2.2	Construction/refurbishment of crop storages, cold stores	2	Yes		X								
2.2.4	Inland waterway freight transport infrastructure, development of rail crop loading capacity	3	No		X								
2.3.1	Uptake of innovative technologies and sustainable approaches in agriculture	2	Yes		X								X
2.3.2	Diversification of business activities	2	Yes		X								
2.3.3	Increasing the market share of high added value products	1	Yes		X								
2.3.5	Increasing companies' innovativeness, responsiveness to changing market needs	2	Yes		X								
2.4.1	Market research	3	Yes		X								

Code	Title	Prioritisation at the level of the CAP Strategic Plan	Need is addressed in Cap Strategic Plan	SO1	SO2	SO3	SO4	SO5	SO6	SO7	SO8	SO9	XCO
2.4.2	Promotion of agri-food products	2	Yes		X								
2.4.3	Raising awareness of healthy eating	1	Yes		X								
3.1.1	Promoting horizontal and vertical integration, coordination and cooperation	1	Yes			X							
3.1.2	Increase the number and market efficiency of sectoral cooperation (including PO, PG)	1	Yes			X							
3.1.3	Development of short supply chains (database, tool, infrastructure and competence development)	1	Yes			X							
3.1.4	Development of local cooperation in product production, distribution and marketing	1	Yes			X							
3.2.1	Ending information asymmetry between producers and traders	3	No			X							
3.2.2	Strengthening contractual discipline, strengthening long-term contractual relations	2	No			X							
4.1.1	Improving the carbon sequestration capacity of soils and ecosystems	1	Yes				X						
4.1.2	Reduction of GHG and ammonia emissions through technological development of livestock farming	2	Yes				X						
4.2.1	Maintaining the carbon balance of forest stands and promoting climate adaptive renewal	2	Yes				X						
4.2.2	Reduction of GHG and atmospheric load gases emissions using forestry tools	2	Yes				X						
4.3.1	Increasing the use of renewable energy, taking into account potential environmental conflicts	3	Yes				X						
4.3.3	Increasing efficiency of energy use at operational and technological level	1	Yes				X						
4.4.1	Development of solutions and tools to protect against adverse weather effects	1	Yes				X						
4.4.2	Review of the use of arable land at the boundary of economics	2	Yes				X		X				
4.4.3	Improving the water retention capacity of soils and ecosystems by encouraging land-use change	1	Yes				X						
4.5.1	Knowledge transfer and its development on climate change production conditions	1	Yes				X						X
4.6.1	Development of regional databases for climate change adaptation assessment.	1	Partially				X						

Code	Title	Prioritisation at the level of the CAP Strategic Plan	Need is addressed in Cap Strategic Plan	SO1	SO2	SO3	SO4	SO5	SO6	SO7	SO8	SO9	XCO
4.7.1	Development and use of climate-additive and climate-adaptive plant and animal breeds	1	Yes				X						
5.1.1	Developing soil and nutrient management at farm level	1	Yes					X					
5.1.2	Reducing nutrient losses, preventing nutrient leaching	1	Yes					X					
5.1.3	Restoring degraded soils and improving their water management	1	Yes					X					
5.1.4	Protection of arable land by agroforestry systems	2	Yes					X					
5.1.5	Wastewater/sludge, food waste and biomass recycling in nutrient supply	1	No					X					
5.2.1	Sustainable use of surface and groundwater	1.	Yes					X					
5.2.2	Appropriate vegetation (invasive species, background pollution)	2	Yes					X					
5.2.3	Rehabilitation of type-dependent zoning in the coastal zone of waters, establishment of a buffer zone	2	Yes					X					
5.3.1	Promoting water retention in soil and landscape	1	Yes					X	X				
5.3.2	Planting drought-tolerant crop varieties	1	No					X					
5.4.1	Reducing emissions of air pollutants and particulate matter of agricultural origin	3	Yes					X					
5.4.2	Reducing ammonia emissions from agriculture	2	Yes				X	X					
5.5.2	Integrated environmentally friendly pest management	1	Yes					X					
6.1.1	Conservation or improvement of the natural condition of Natura 2000 farmland habitats	1	Yes	X					X				
6.1.2	Maintenance or improvement of the natural condition of high nature value sites	1	Yes				X		X				
6.1.3	Maintenance and development of grasslands in good ecological status and species richness	2	Yes						X				
6.2.3	Ensuring ecological interoperability and biodiversity between cultivated areas by means of intermediate zones	1	Yes						X				
6.3.1	Conservation or improvement of the natural condition of Natura 2000 and protected forest habitats	1	Yes	X					X				
6.3.2	Increasing the share of forest land under forest management with continuous cover	1	Yes					X	X				
6.3.3	Improve forest structure, age composition, encourage reforestation	1	Yes						X				
6.3.4	Reducing the risk of forest fires and vegetation fires through complex prevention	2	Yes						X				

Code	Title	Prioritisation at the level of the CAP Strategic Plan	Need is addressed in Cap Strategic Plan	SO1	SO2	SO3	SO4	SO5	SO6	SO7	SO8	SO9	XCO
6.4.1	Developing up-to-date data collection and monitoring systems for measuring biodiversity	1	Partially						X				
6.5.1	Support for cooperation between agriculture, forestry, hunting and nature conservation	1	Partially						X				
6.5.2	Providing information to the public on the importance of ecosystem services and biodiversity	2	Yes						X				X
6.5.3	Ensuring stability of Pollination systems	1	Yes						X				
6.6.1	Genetic conservation and land use in climate adaptive agriculture and forestry	2	Yes						X				
6.7.1	Increasing the area under organic cultivation	2	Yes						X				
7.1.1	Encouraging business start-ups in agriculture and forestry among young people	1	Yes							X			
7.1.2	Support intergenerational cooperation	2	Yes							X			
7.1.3	Easing access to land for young farmers	2	Partially							X			
7.1.4	Easing access to credit for young farmers	2	Partially							X			
7.1.5	Reducing the administrative burden of intergenerational transfer of agricultural enterprises	2	Partially							X			
7.2.1	Providing complex entrepreneurial skills for setting up a farm	1	Yes							X			X
7.2.2	Attracting young generations to farming	1	Yes							X			
7.3.1	Business start-up support for people outside the young farmer category	1	Yes							X			
7.3.2	On-farm/off-farm diversification, with the aim of creating multi-start rural businesses	2	Yes							X			
8.1.1	Increasing the employment rate of women in rural areas	1	Partially								X		
8.1.2	Improving the profitability of rural micro-enterprises	1	Partially								X		
8.1.5	Improving the profitability of small farms	2	Yes							X	X		
8.1.6	Biomass feedstocks, intermediate products, waste processing, renewable energy use	1	Partially				X				X		
8.1.7	Replacement of fossil industrial feedstocks with green substitutes	1	Yes				X				X		
8.2.1	Human resources for the implementation of development policy programmes	2	Partially								X		
8.2.2	Developments that can be adapted to local/regional needs and have a measurable impact on them	1	Partially								X		

Code	Title	Prioritisation at the level of the CAP Strategic Plan	Need is addressed in Cap Strategic Plan	SO1	SO2	SO3	SO4	SO5	SO6	SO7	SO8	SO9	XCO
8.2.3	Coherence of local development programmes, regional cooperation	1	Partially								X		
8.3.1	Reducing regional disparities in rural transport infrastructure	3	Partially								X		
8.3.2	Development of infrastructural background for local public services raising quality of life	3	Partially								X		
8.4.1	Provision of small villages with child protection, health and education services	3	Partially								X		
8.4.2	Encouraging Roma inclusion programmes, reducing segregation	3	Partially								X		
8.6.1	Increase the scope and added value of forest benefits, improve profitability	3	Yes								X		
8.6.2	Production of forest reproductive material to increase forest stands and to adapt them to climate change	2	Yes								X		
9.1.1	Meeting animal welfare requirements and meeting the natural needs of farm animals	1	Yes									X	
9.1.2	Improving general hygiene and biosecurity conditions, increasing food safety	1	Yes									X	
9.1.3	Prevention of animal health problems, development/development of forecasting systems	1	Partially									X	
9.2.1	Promote the use of a rational, predictive targeted pesticide	1	Yes									X	
9.2.2	Rational use of antibiotics in livestock farming	1	Yes									X	
9.3.1	Product development and packaging development that meet consumers' expectations	3	Yes									X	
9.3.2	Use of innovative technological solutions in food production – packaging	2	Partially									X	
9.3.3	Promoting compliance with the Packaging and Waste Framework Directive	2	Yes									X	
9.3.4	Quality schemes, quality assurance and certification schemes, consumer information	1	Yes									X	
9.4.1	Increase the share of organic products in the internal market and related processing capacities	2	Yes									X	
9.5.1	Increasing the effectiveness of information transmission and data collection in the field of official controls	1	No									X	
9.7.1	Development of market information systems	2	No									X	
9.8.1	Meeting dietary needs due to specific health or social reasons	2	Yes									X	

Code	Title	Prioritisation at the level of the CAP Strategic Plan	Need is addressed in Cap Strategic Plan	SO1	SO2	SO3	SO4	SO5	SO6	SO7	SO8	SO9	XCO

1.1.1 - Predictable basic income for farmers

Continuation of the current basic payment: single area payment + green component to preserve or improve the environment + support for young farmers;

Coupled support is also complemented by coupled support in the following sectors:

- Crop production: sugar beet, rice, industrial vegetables and vegetables, fruit production, industrial oil crops, grain and fibre protein crops.
- Livestock production: ewe rearing, fattening bulls, suckler cows, dairy cows.

1.1.2 - Provision of available loan financing

Enhancing income stability for farmers through guarantees, loan guarantees, etc.

1.1.3. - Improving the profitability of small farms

Improving the fairness, effectiveness and efficiency of direct payments is key. In order to better target support, special attention should be paid to small and medium-sized farms, supported by the SWOT analysis and the needs assessment.

1.2.1 - Tackling adverse climatic events and damage caused by climate change in agriculture

Tackling adverse climatic events and farmers' damage caused by climate change in agriculture (crop, livestock, horticulture)

1.2.3 - Offsetting and mitigating the impact of market risks

Mitigating the impact of market risks to farmers' incomes (e.g. large price decreases).

1.2.4 - Promotion of agricultural insurance (self-care)

Helping farmers to be able and willing to reduce their risks themselves by insuring their crops and real estate.

2.1.1 - Increasing operational and business efficiency of production

Increasing efficiency in agricultural production and sales increases competitiveness and profitability.

2.1.11 - Creation of new plantations, refurbishment and modernisation of plantations

The creation of new fruit plantations will significantly increase competitiveness through more modern technology.

2.1.2 - Creation of modern generation capacities

Investments in the development and modernisation of production capacities strengthen the position of the farmer on the market by increasing efficiency.

2.1.3 - Increasing the level of processing of agricultural raw materials

Technological development, increasing the share of processed products, increasing added value, strengthening the market position of agricultural products.

2.1.4 - Management of water scarcity in arable crops

If the farmer is not exposed to fluctuations in quantity/quality due to water scarcity, it also strengthens its efficiency and market position.

2.1.7 - Technological transition taking into account stricter phytosanitary requirements

Compliance with plant health standards sometimes leads to significant costs for farmers, thus reducing competitiveness, and the CAP can help bridge the lack of resources.

2.1.8 - Improvement of cultivation technology

Investments in cultivation directly improve competitiveness by improving the quality and quantity of products.

2.1.9 - Adaptation and development of husbandry technology

As with cultivation technology, the improvement of rearing technology leads to more and more marketable products.

2.2.1 - Development of post harvest technology

In the case of fruit and vegetables, post-harvest technology has received less attention in recent years and needs to be improved to maintain competitiveness.

2.2.2 - Construction/refurbishment of crop storages, cold stores

The marketing of agricultural products depends on the quality of storage and thus directly affects competitiveness.

2.2.4 - Inland waterway freight transport infrastructure, development of rail crop loading capacity

Efficient and large transporting of produced goods is a condition for competitiveness.

2.3.1 - Uptake of innovative technologies and sustainable approaches in agriculture

Innovative and sustainable technologies and farming methods such as precision farming or circular farming are determinants of competitiveness and predictable economic outcomes.

2.3.2 - Diversification of business activities

More footholds help farmers to reduce their production risk.

2.3.3 - Increasing the market share of high added value products

Increasing the market share of high value-added products in the basic food market or specialty and niche markets leads to an increase in demand and revenue.

2.3.5 - Increasing companies' innovativeness, responsiveness to changing market needs

Innovativeness and ability to react quickly are an important component of competitiveness.

2.4.1 - Market research

Market research is an essential tool for companies' market presence.

2.4.2 - Promotion of agri-food products

Promotion is a decisive tool for market presence.

2.4.3 - Raising awareness of healthy eating

The need for healthy eating needs to be developed across a wide range of populations, thus not only improving the overall health status, but also expanding the market for healthy agricultural products.

3.1.1 - Promoting horizontal and vertical integration, coordination and cooperation

Within the value chain, integration and cooperation determine the opportunities for participants.

3.1.2 - Increase the number and market efficiency of sectoral cooperation (including PO, PG)

The effective functioning of the cooperation will increase market opportunities for participants.

3.1.3 - Development of short supply chains (database, tool, infrastructure and competence development)

The development of short supply chains is important in terms of market access for local products, reducing transport costs.

3.1.4 - Development of local cooperation in product production, distribution and marketing

Local cooperation also increases efficiency in the production, distribution and marketing of products.

3.2.1 - Ending information asymmetry between producers and traders

Producers' knowledge and knowledge of the market situation is typically lower than that of traders, making them vulnerable.

3.2.2 - Strengthening contractual discipline, strengthening long-term contractual relations

Contractual discipline is a guarantee of trust between farmers and purchasers.

4.1.1 - Improving the carbon sequestration capacity of soils and ecosystems

The carbon sequestration capacity of soils and ecosystems can be improved by developing and maintaining grasslands, non-productive areas, wetlands, selved habitats, conservation trees, developing agrotechnological practices, changing manure application.

4.1.2 - Reduction of GHG and ammonia emissions through technological development of livestock farming

Livestock farming, in particular feeding and husbandry technology, and manure storage should be developed in a way that reduces GHG and ammonia emissions.

4.2.1 - Maintaining the carbon balance of forest stands and promoting climate adaptive renewal

Maintaining forests is an important tool for adapting to climate change.

4.2.2 - Reduction of GHG and atmospheric load gases emissions using forestry tools

Forests also play a role in reducing GHG emissions.

4.3.1 - Increasing the use of renewable energy, taking into account potential environmental conflicts

Increasing the use of renewable energy is an important tool for climate adaptation, but should only be done taking into account ecological aspects and potential environmental conflicts (e.g. energy plantations, invasive species, thermal water use, etc.).

4.3.3 - Increasing efficiency of energy use at operational and technological level

Efficient use of energy reduces, among other things, GHG emissions, thus also acting against climate change.

4.4.1 - Development of solutions and tools to protect against adverse weather effects

In order to prevent damage, including to mitigate the effects of climate change, it is essential to develop solutions and tools to prevent adverse weather effects (e.g. drought, burner, fire damage, biotic damage, frost damage).

4.4.2 - Review of the use of arable land at the boundary of economics

Reviewing the use of arable land at the limits of economy and optimising alternative use will make it possible to exploit the climate protection effect of extensive farming.

4.4.3 - Improving the water retention capacity of soils and ecosystems by encouraging land-use change

We aim to improve the water retention capacity of soils and ecosystems by encouraging land use change (forest, grassland, wetland), mosaicing land cover (bearing areas, non-productive areas) and using water conservation agro-technologies, including the development of land-based water retention facilities.

4.5.1 - Knowledge transfer and its development on climate change production conditions

The provision of information to operators on production conditions and adaptation opportunities that change climate change is essential for climate adaptation.

4.6.1 - Development of regional databases for climate change adaptation assessment.

The development of databases, monitoring and forecasting systems will help to assess adaptation to climate change and thus contribute to mitigating its effects.

4.7.1 - Development and use of climate-additive and climate-adaptive plant and animal breeds

Increasing the resilience of animal and plant varieties is an important tool for climate adaptation.

5.1.1 - Developing soil and nutrient management at farm level

The development of precision, farm-level soil and nutrient management, based on the real nutrient supply potential of soils (soil testing) and the real need of crops, facilitates efficient thalal force management.

5.1.2 - Reducing nutrient losses, preventing nutrient leaching

Reducing nutrient losses can be achieved by promoting the use of inhibiting technologies (e.g. increasing leguminous ratios in crop rotation) or formulations (e.g. N-inhibitors, microbiological preparations). This will contribute to reducing fertiliser use and pesticide use.

5.1.3 - Restoring degraded soils and improving their water management

The restoration of degraded soils, including the restoration of organic matter in soils, the improvement of soil water management properties and the replacement of trace elements, and the protection of soils against erosion and deflation are the most important means of soil protection.

5.1.4 - Protection of arable land by agroforestry systems

Dissemination of agroforestry systems for land protection (e.g. planting of woody crops for soil protection, water protection or air quality protection, creation of buffer strips).

5.1.5 - Wastewater/sludge, food waste and biomass recycling in nutrient supply

Create and encourage recycling opportunities for nutrient supply of treated waste water and – sludge, and bed sludge and compost, as well as food waste and/or biomass, as part of a circular approach.

5.2.1 - Sustainable use of surface and groundwater

Sustainable use of our surface and groundwater, water bases, protection from pollution and pressures from agricultural sources.

5.2.2 - Appropriate vegetation (invasive species, background pollution)

Developing suitable vegetation in the waves of major watercourses (increasing mosaicism, displacement of invasive species), reducing background pollution.

5.2.3 - Rehabilitation of type-dependent zoning in the coastal zone of waters, establishment of a buffer zone

Rehabilitation of type-specific zoning in the coastal zone of small watercourses and stagnant waters, establishment of a buffer zone.

5.3.1 - Promoting water retention in soil and landscape

Promote water retention in the soil by various agrotechnical tools in order to reduce water scarcity and by changing land use to create a more diverse landscape structure in the landscape.

5.3.2 - Planting drought-tolerant crop varieties

As part of adaptation to water stress management conditions, it is necessary to develop and use new varieties of crops (mainly cereals) in cultivation that are better suited to drought.

5.4.1 - Reducing emissions of air pollutants and particulate matter of agricultural origin

Reduce air pollution through agricultural pollutants.

5.4.2 - Reducing ammonia emissions from agriculture

Reduction of ammonia emissions from agricultural sources with manure management and land application standards, full nitrogen cycle management, incentives for the use of livestock manure, replacement of urea-type fertilisers, introduction of low protein feed systems, coverage of slurry storages and improvement of housery techniques (National Air Pollution Reduction Programme)

5.5.2 - Integrated environmentally friendly pest management

Encourage the use of integrated pest management solutions, with a particular focus on restoring soil biological life, and other environmentally friendly solutions in plant protection that help protect pollinators

6.1.1 - Conservation or improvement of the natural condition of Natura 2000 farmland habitats

Maintenance of Natura 2000 habitats is an important tool for biodiversity conservation

6.1.2 - Maintenance or improvement of the natural condition of high nature value sites

The conservation and improvement of high nature value areas (agriculture, forest, wetland) contributes to the conservation of biodiversity.

6.1.3 - Maintenance and development of grasslands in good ecological status and species richness

Maintaining and improving the good ecological status and species richness of grasslands and preventing scrubbing enables biodiversity to be maintained, e.g. by grazing livestock.

6.2.3 - Ensuring ecological interoperability and biodiversity between cultivated areas by means of intermediate zones

Ensuring ecological interoperability will eliminate the isolation of habitat patches between cultivated areas, thereby improving the situation of biodiversity, in particular pollinators.

6.3.1 - Conservation or improvement of the natural condition of Natura 2000 and protected forest habitats

Natura 2000 and the maintenance of protected and specially protected forest areas are important tools for maintaining biodiversity.

6.3.2 - Increasing the share of forest land under forest management with continuous cover

In addition to climate protection, increasing forest areas also increases biodiversity.

6.3.3 - Improve forest structure, age composition, encourage reforestation

Improving the structure and age composition of forests and encouraging reforestation allows forests to survive, taking full account of ecological aspects.

6.3.4 - Reducing the risk of forest fires and vegetation fires through complex prevention

Forest fires and vegetation fires cause major damage to both wildlife and owners, so prevention is the best strategy.

6.4.1 - Developing up-to-date data collection and monitoring systems for measuring biodiversity

IT development is a prerequisite for the rational management of natural resources. The development of modern data collection and monitoring systems (biodiversity, ecosystem services, real estate registry, land use/land use) and the provision of information to industry stakeholders are crucial.

6.5.1 - Support for cooperation between agriculture, forestry, hunting and nature conservation

Without cooperation between agriculture, water management, grassland management, forestry, wildlife management and nature conservation, the objectives of nature conservation cannot be met.

6.5.2 - Providing information to the public on the importance of ecosystem services and biodiversity

Public information and thus support is essential for increasing biodiversity.

6.5.3 - Ensuring stability of Pollination systems

The ecological status of pollinators, their species richness, number of individuals and the composition of their communities are highly dependent on environmental parameters: the availability, quantity and distribution of suitable feeding and resting areas. The more pollinators are present in an area, the more the system is resistant to external pest effects, but intensive agricultural management negatively affects the diversity of plants and pollinators.

6.6.1 - Genetic conservation and land use in climate adaptive agriculture and forestry

Genetic conservation, landscape varieties, long-established animal breeds and landscape management can be a good starting point for the development of climate adaptive breeds.

6.7.1 - Increasing the area under organic cultivation

The expansion of organic land is not only a green deal requirement, but also a tool for biologic diversity and close-to-environment farming.

7.1.1 - Encouraging business start-ups in agriculture and forestry among young people

Encouraging business start-ups in agriculture and forestry among young people helps to reduce the average age of farmers.

7.1.2 - Support intergenerational cooperation

Young farmers' start-up is made easier if they can work with the farm transferor.

7.1.3 - Easing access to land for young farmers

The most important condition for young farmers to set up is that they have access to land on which they can start farming.

7.1.4 - Easing access to credit for young farmers

The most important condition for young farmers to start up is the availability of sufficient capital, typically through loans.

7.1.5 - Reducing the administrative burden of intergenerational transfer of agricultural enterprises

In most cases, the transfer of agricultural undertakings can be carried out with significant administrative burdens and costs. Simplifying this is a central task.

7.2.1 - Providing complex entrepreneurial skills for setting up a farm

Business start-up requires the provision of complex entrepreneurial skills, which can be transferred through training, information, advice and mentoring.

7.2.2 - Attracting young generations to farming

Agricultural careers are becoming less attractive to young people and it is therefore necessary to promote the benefits of this profession and lifestyle in particular in educational establishments.

7.3.1 - Business start-up support for people outside the young farmer category

While supporting the establishment of young farmers, the start-up of those outside this category should also be supported.

7.3.2 - On-farm/off-farm diversification, with the aim of creating multi-start rural businesses

More footholds improve the ability to earn income, thus helping to stay in rural areas.

8.1.1 - Increasing the employment rate of women in rural areas

Women's employment in rural areas is particularly important for the quality of life and the reduction of emigration.

8.1.2 - Improving the profitability of rural micro-enterprises

The start-up of micro-enterprises leads to increased local employment opportunities, which in turn reduces outflows.

8.1.5 - Improving the profitability of small farms

The profitability of small farms is crucial to the number of rural populations living in agriculture.

8.1.6 - Biomass feedstocks, intermediate products, waste processing, renewable energy use

Solutions to promote the management and use (e.g. nutrient supply) of intermediate agricultural and processing intermediate products, by-products, waste and waste and sewage, bed sludge, in line with circular farming objectives, through regional organisation and community-based solutions, will enable the sustainable management of rural areas.

8.1.7 - Replacement of fossil industrial feedstocks with green substitutes

Promote the replacement of fossil-based industrial input (fibres, solvents, monomers, colouring agents, etc.) by green substitutes.

8.2.1 - Human resources for the implementation of development policy programmes

The availability of human resources active at local/regional level, with local knowledge, links, experience in implementation of development policy and programme, and stable operational resources, determines the success of local cooperation and development programmes (e.g. LEADER, smart village).

8.2.2 - Developments that can be adapted to local/regional needs and have a measurable impact on them

Development adapted to local needs is an important tool for keeping the population locally.

8.2.3 - Coherence of local development programmes, regional cooperation

The development of municipalities is served by coordinating concepts for their development and by coordinating their experiences among themselves.

8.3.1 - Reducing regional disparities in rural transport infrastructure

The quality of transport infrastructure determines the standard of living and thus the chances of staying there.

8.3.2 - Development of infrastructural background for local public services raising quality of life

The quality of local public services is an important determinant of quality of life

8.4.1 - Provision of small villages with child protection, health and education services

In the case of small villages, the quality of local services tends to be the worst.

8.4.2 - Encouraging Roma inclusion programmes, reducing segregation

Improving the situation of the Roma is one of the most important tools for improving the situation of lagging settlements.

8.6.1 - Increase the scope and added value of forest benefits, improve profitability

Increasing the added value of forest products ensures that the sector gets better off.

8.6.2 - Production of forest reproductive material to increase forest stands and to adapt them to climate change

The production of reproductive material is an important tool for adapting the climate of forests.

9.1.1 - Meeting animal welfare requirements and meeting the natural needs of farm animals

Meeting society's animal welfare requirements and meeting the natural needs of farm animals and improving their husbandry conditions are fundamental objectives.

9.1.2 - Improving general hygiene and biosecurity conditions, increasing food safety

Meeting food safety requirements is an essential objective.

9.1.3 - Prevention of animal health problems, development/development of forecasting systems

The prevention of animal health problems (mainly avian influenza, salmonella, campylobacter, ASP, PRRS, mastitis) and the development/development of predictive systems are essential conditions for animal husbandry.

9.2.1 - Promote the use of a rational, predictive targeted pesticide

Promote the use of a rational, predictive targeted pesticide use, reduce losses by using precision technologies, technical development of digital tools that contribute to reduced use by excluding unjustified treatments. Reducing the use of chemicals helps pollinating insects.

9.2.2 - Rational use of antibiotics in livestock farming

Rational use of antibiotics in animal husbandry, traceability of antibiotics, development of digital solutions for sales of antibiotics and recording of use.

9.3.1 - Product development and packaging development that meet consumers' expectations

Product developments that respond to global trends and consumer expectations, and the development of product packaging, thus contributing to the use of environmentally friendly packaging materials and circular farming.

9.3.2 - Use of innovative technological solutions in food production – packaging

Research and deployment of sustainable, innovative technological solutions in food production and food packaging; development of one-way packaging and environmentally sound packaging solutions

9.3.3 - Promoting compliance with the Packaging and Waste Framework Directive

Regulating packaging and waste management in agriculture and the food industry

9.3.4 - Quality schemes, quality assurance and certification schemes, consumer information

Support farmers and food processors in the production of quality, healthy products, the introduction and application of EU and national quality schemes, quality assurance and certification schemes, and the provision of consumer/user information.

9.4.1 - Increase the share of organic products in the internal market and related processing capacities

Increasing the share of organic products in the internal market and the related processing capacities will help to increase organic production.

9.5.1 - Increasing the effectiveness of information transmission and data collection in the field of official controls

Increasing the efficiency and digitalisation of information transfer and data collection; increase the efficiency and risk-based organisation of official controls, improve methods of laboratory testing

9.7.1 - Development of market information systems

Market information systems are essential when selling products.

9.8.1 - Meeting dietary needs due to specific health or social reasons

Meeting dietary needs due to specific health or social reasons, preferably with local products

CCO.1.1 - Support for practice-oriented knowledge transfer in support of sectoral objectives

Practice-oriented knowledge transfer is a guarantee of profitable and sustainable management.

CCO.1.10 - Consumer education and awareness raising

Consumer education, awareness raising of national and EU quality schemes and food safety, promotion of sustainable technologies and food, awareness raising to reduce food waste

CCO.1.2 - Raising farmers' knowledge

Improving farmers' knowledge: strengthening state-of-the-art management knowledge, practice-oriented transfer of knowledge on, inter alia, social and environmental challenges, changing production conditions with climate change, adaptation options, and the environmental impact of the agricultural economy; integrating innovation practices into day-to-day work processes and motivating to pursue close-to-nature farming.

CCO.1.3 - Strengthening cooperation between producers and processors of researchers

Strengthening collaborations between producers and processors of researchers to increase innovation potential

CCO.1.6 - Knowledge transfer to accelerate generational renewal in agriculture and forestry

Knowledge transfer is also essential for generational renewal in agriculture and forestry.

CCO.1.7 - Training of special advisers

Training of consultants, adaptation of the advisory system to the specific objectives of the CAP, in particular the integrated approach to low-impact agricultural practices (pesticide application, GHG, atmospheric and particulate matter abatement processes, good nutrient management and composting) and the expansion of sector-specific advisory services.

CCO.1.9 - Encourage the participation of agricultural entrepreneurs in dual training as recipients

Dual training is the most effective way for prospective farmers to acquire practical knowledge.

CCO.2.1 - Development of the skills and tools of secondary and higher agricultural education institutions

The effective development of educational institutions can be achieved by expanding the pool of tools.

CCO.2.2 - Design of demonstration plants

Development, organisation and subsequent interconnection of demonstration plants, development of knowledge transfer programmes, including demonstration of modern and emission abatement technologies

CCO.3.1 - Increasing the level of skills of the workforce to make use of innovative technologies

The level of skills of the agricultural workforce needs to be raised in order to be competitive.

CCO.3.2 - Hosting qualified researchers, support to the RDI sector

Keeping qualified researchers in situ is essential in order to maintain the quality of research.

CCO.3.3 - Increasing the innovativeness of agricultural and food business operators

Increasing the innovativeness of agricultural and food business operators is needed to accelerate the response to changing market needs

CCO.4.1 - Providing personal access to broadband internet services

Ensuring personal access to broadband internet services and strengthening basic digital skills.

CCO.4.2 - Development and integration of digital sector registers

The digitalisation of sector registers leads to administrative cuts.

CCO.4.3 - Electronic administration, transparency

The development of e-administration will reduce red tape.

CCO.4.4 - Development of digital infrastructure for agri-food and forest businesses

Without digital infrastructure and IT back-up, businesses will not be able to develop properly.

CCO.4.5 - Development of digital solutions for quality assurance, certification, traceability, marking

The development of digital solutions will reduce the administrative burden and increase efficiency for quality assurance, certification, traceability, marking of goods and classification.

Need assessment to specific geographical areas, such as the outermost regions, mountainous and island areas.

Such areas are not included in the Hungarian CAP Strategic Plan, so the issue is not relevant.

Methodology and criteria used for prioritisation

Since autumn 2019, the Ministry of Agriculture organised expert working groups in line with the main chapters of the CAP plan (CAP I, CAP II, risk management, AKIS, monitoring, sectoral measures, green architecture). For operators (arable crops, milk, cattle, pigs, poultry, small ruminants, fruit and vegetables, etc.), the Ministry organised workshops involving the Chamber of Agriculture to analyse the situation and gather needs. In the first half of 2020, the Institute of Agricultural Economics (AKI) prepared situation analyses by SO and by sector, taking into account the work of the working groups and workshops. They are closed by the SWOT plate.

We gathered needs from the SWOT findings. The needs were further refined at working group meetings and on the basis of e-mail feedback, “classified” (sub-needs sub-dependencies) and in some cases reclassified sub-needs by SO.

Needs are listed by SO in an excel table with a breakdown of main needs sub-needs. The needs were grouped by general objective (Economic-Environment-Society) following an ex post regrouping. Some needs have already been merged and further redeployed here (e.g. in SO 2, several needs are also included in the CCO, so we only place them in one place, avoiding duplication). All transfers (consolidation) are indicated in the auxiliary boards. The needs prioritisation questionnaire was prepared by AKI and introduced into an on-line interface. The questionnaire was sent to all members of the working group.

A total of 71 questionnaire replies were received. Some members appear in several working groups and in some working groups there are several members representing an organisation. One member only responded to one questionnaire, but was able to nominate each member of the working group.

In the replies to the questionnaire, evaluations were published at working group level, covering two aspects: one is that an individual’s assessment was reported as many times as he was a member of a working group, mainly because of those who represented an organisation in one person in several working groups. Another aspect was that where an organisation was present in a working group with more than one representative, the average of the assessments of the members of the same working group from the same organisation should be taken into account.

The summary table showed averages of organisations per working group (if there was one representative (member) of the organisation, the average was the same as his/her assessment). At the bottom of the columns of the questions there were two types of total average calculations, one based on all answers and the other average calculated from the averages within the working groups. The Min-Max rows showed what was the lowest and highest given priority in all responses to the question.

For the 10 SOs, there is no overall ranking of needs, but only at separate socio-economic-AKIS level.

The ranking was scored as terciles, followed by 3 priorities (important to medium to less important), marked in colours (red-yellow-green) and assigned numbers (1, 2. 3.).

Justification for the decision to not address the identified needs in the CAP Strategic Plan or address them partially

1.1.2 – Access to credit can be facilitated by administrative means or depends on the financial markets, not the competence of the CAP ST

2.2.4 – Developing inland transport infrastructure is the task of the Integrated Transport Operational Programme Plus (IKOP Plus)

3.2.1 – Development of databases and IT support is primarily a public task, to a lesser extent the Digital Renewal Operational Programme (DIMOP Plus), CAP ST's minimal contribution

3.2.2 – The contractual discipline cannot be strengthened by a support measure, and the legislative environment needs to be properly designed

4.6.1 – Database development is primarily a public task, to a lesser extent the Digital Renewal Operational Programme (DIMOP Plus), CAP ST's minimal contribution

5.1.5 – Recycling sewage sludge, food waste and biomass in nutrient supply is not yet part of cultivation practices, so the CAP ST does not support their use

5.3.2 – The introduction of drought-tolerant varieties into cultivation is part of research projects, CAP ST does not include targeted intervention

6.4.1 – Development of data collection is primarily a public task, to a lesser extent the Digital Renewal Operational Programme (DIMOP Plus), CAP ST's minimal contribution

6.5.1 – Stakeholders' cooperation does not depend primarily on the existence of aid.

7.1.3 – Access to land can be facilitated by administrative means or depends on the land market, not the competence of the CAP ST

7.1.4 – Access to credit can be facilitated by administrative means or depends on the financial markets, not the competence of the CAP ST

7.1.5 – The reduction of administrative burdens is primarily the responsibility of public bodies, and the Strategic Plan can only contribute to this.

8.1.1 – Rural employment, including female employment, depends on many factors, and from the support side, most OPs encourage employment growth.

8.1.2 – Rural employment depends on many factors, in addition to the CAP, most OPs encourage employment growth.

8.1.6 – The development of circular farming in rural areas is supported by a number of OPs outside the CAP.

8.2.1 – Human Resources development is also a task for many OPs.

8.2.2 – In addition to the CAP, local developments are supported by other OPs.

8.2.3 – As local development programmes are not only financed by the CAP, their coordination is a shared responsibility.

8.3.1 – Transport infrastructure development is primarily the responsibility of the IKOP plus.

8.3.2 – Local services are not primarily supported by the CAP.

8.4.1 – The development of the small village fund infrastructure is not primarily supported by the CAP.

8.4.2 – Reduction of segregation is not primarily the responsibility of the CAP.

8.5.1 – Rural renewable energy deployment is also tasked with several other OPs (TOP, KEHOP+).

9.1.3 – Development of animal health warning systems is a public task

9.2.2 – The development of databases is primarily a public task, to a lesser extent the Digital Renewal Operational Programme (DIMOP Plus) and the CAP ST's contribution is minimal

9.3.2 – The CAP supports ST research only through EIPs, while research can be funded from a number of other programmes

9.5.1 – The development of databases is primarily a task of the State and, to a lesser extent, the Digital Renewal Operational Programme (DIMOP Plus)

9.7.1 – Development of information systems is primarily a public task, to a lesser extent the Digital Renewal Operational Programme (DIMOP Plus)

CCO.2.1 – Development of the training and further training infrastructure is a public task and responsibility of DIMOP Plus and other OPs

CCO.4.1 – Broadband network development is primarily the task of the TOP

CCO.4.2 – Development of databases and IT support is primarily a public task, to a lesser extent the Digital Renewal Operational Programme (DIMOP Plus)

CCO.4.3 – Extension of electronic administration is the responsibility not only of the CAP, but also of the other OPs and the State budget.

2.1.SO1 Support viable farm income and resilience of the agricultural sector across the Union in order to enhance long-term food security and agricultural diversity as well as to ensure the economic sustainability of agricultural production in the Union

2.1.SO1.1 Summary of the SWOT Analysis

2.1.SO1.1.1 Strengths

- E.1. Net value added per AWU for Hungary has improved above the EU average
- E.2. High overall efficiency of medium-sized farms (90 thousand and 250 thousand SS)
- E.3. A well-functioning agricultural risk management system and its continuous improvement
- E.4. Spread of delivery contracts adjusted to benchmark prices (milk production, rearing of poultry and pigs)
- E.5. AVHGA for access to credit for micro, small and medium-sized enterprises
- E.6. Level of food security

2.1.SO1.1.2 Weaknesses

- Gy.1. Lower than the national average level of agricultural income [SO1/1.1]
- Gy.2. Strong income fluctuations in several agricultural sectors (e.g. certain fruit and vegetables, pig fattening, bull fattening, etc.) [SO1/1.1] [SO1/1.2] [SO1/2.3]
- Gy.3. Strong dependence of the profitability of agricultural enterprises, especially small farms and certain sectors, on direct aids
- Gy.4. High production costs and inefficiencies in EU comparison
- Gy.5. Capitalisation of direct grants in land rents
- Gy.6. Lack of management of risks other than weather risks, low share of animal insurance, under-utilisation of derivative market risk management tools [SO1/2.4.]
- Gy.7. Decrease in the number of holdings with non-agricultural activities
- Gy.8. Import dependency for certain inputs (e.g. protein feed, livestock equipment and materials, certain germinal products, fertilisers, etc.) [SO1/3.2.]

2.1.SO1.1.3 Opportunities

- L.1. Contribution of direct aids to agricultural incomes and to facilitating bank financing
- L.2. Positive impact of investment aid on investment intensity
- L.3. Introduction of an income stabilisation tool
- L.4. Faster and more flexible implementation of development applications and simplification of related administration

2.1.SO1.1.4 Threats

- F.1. Climate change, increasing occurrence of weather extremes, emergence of new pathogens, pests, spread of zoonoses and resulting increase in costs and loss of income [SO1/2.1] [SO1/2.2] [SO1/3.1.]
- F.2. Increased exposure to market crises due to a decrease in EU agricultural subsidies and a shrinking range of market measures [SO1/2.3]
- F.3. Further reduction in the number of small farms resulting in the loss of jobs in rural areas [SO1/1.1] [SO1/1.2].
- F.4. Reduction in food self-sufficiency due to increased food imports (e.g. free trade agreements) and cost burden (non-productive investments, imported inputs) [SO1/1.2] [SO1/3.1]

		insurance scheme	tools

Overview

The focus of the situation and SWOT analysis is agricultural income, income replacement and other support, risk management, resilience and food security. With regard to the specific objective, the main conclusion is that income in agriculture in Hungary is lower than in other sectors of the national economy and that income in certain sectors (e.g. fruit and livestock production) fluctuates strongly, so the main task/need is to create income stability for those engaged in agriculture. We aim to achieve this by providing a predictable basic income, facilitating additional financing (borrowing) and various risk-mitigating measures (incentivising the take-up of insurance through grants). The related interventions are basic agricultural income (BISS) and complementary forms of direct support (young farmers, coupled to production, etc.), various sectoral support (SC) and risk management tools in the Rural Development Toolbox (RD 16, 17). Borrowing can be facilitated by a guarantee fee subsidy (almost all DP and RD measures allow it), by easing the administration of borrowing, by reducing collateral, by lowering loan fees, etc. Borrowing is mainly regulated by means outside the CAP, through national legislation or banks' own business rules.

The analyses show that a large proportion of the holdings in each sector would operate at a loss without direct aid. Among the targeted forms of direct aids, coupled support (CIS) should therefore be granted to the following sectors, thereby helping to stabilise their profitability and improve their resilience in the medium and long term:

Crop production: sugar beet production, rice production, industrial vegetables and vegetables production, fruit production, industrial oil crop production, grain and fibrous protein crops.

Livestock farming: ewe rearing, bull rearing, suckler cow rearing, dairy cow rearing.

Low farm incomes and income volatility also pose significant threats, such as the reduction in the number of small farms, resulting in job losses and a reduction in food sovereignty levels and, at the same time, food security.

Among the threats to agricultural production, the increasing incidence of weather extremes, the rapid spread of pests and pathogens and the increase in their damage, which we aim to mitigate by supporting risk management tools, are particularly important.

In addition to direct and sectoral support and risk reduction, the security of production can be achieved by laying the foundations for quality production, such as the purchase and renovation of propagating material, machinery, buildings. Thus, all types of aid under the CAP ST contribute indirectly to the objectives of SO1.

2.1.SO1.5 Where relevant, a justification for the use of InvestEU, including the amount and its expected contribution to the Specific Objective/Cross-Cutting Objective

Not relevant.

2.1.SO1.8 Selection of the result indicator(s)

Selection of the result indicator(s) for this specific objective

Result indicators [recommended Result indicators for this specific objective are fully displayed in bold]	Target value
R.4 - Linking income support to standards and good practices Share of utilised agricultural area (UAA) covered by income support and subject to conditionality	94.17 %
R.5 - Risk management Share of farms with supported CAP risk management tools	30.29 %
R.6^{PR} - Redistribution to smaller farms Percentage of additional direct payments per hectare	112.25 %

for eligible farms below average farm size (compared to average)	
R.7 PR - Enhancing support for farms in areas with specific needs Percentage of additional support per hectare in areas with higher needs (compared to average)	111.57 %
R.8 - Targeting farms in specific sectors Share of farms benefitting from coupled income support for improving competitiveness, sustainability or quality	18.32 %
R.36 CU PR - Generational renewal Number of young farmers benefitting from setting up with support from the CAP, including a gender breakdown	10,700.00

Justification of the targets and related milestones

SO1 – Support viable farm income and resilience of the agricultural sector across the Union to enhance long-term food security and agricultural diversity and ensure the economic sustainability of Union agricultural production

The milestone value of each R indicator and the value of the contribution of the related interventions (by year) are set out in the attached table, so they are not described in detail in the text.

R.4 – making income support conditional on compliance with standards and the application of best practices: Share of utilised agricultural area (UAA) covered by income support and subject to conditionality

Target value for indicator R.04: 94.17 %, representing income support of 5 000 000 ha of agricultural area (UAA) per year compared to 5 309 520 ha. The indicator target is set at 100 % by the area covered by the basic income support for sustainability (DP01_E01_BISS_16), the areas covered by the other interventions relevant for quantifying the indicator value are subsets and are thus fully overlapping. They are not added to the overall target due to the elimination of duplications. In other words: territorial units supported by interventions relevant to the value of indicator R.04 also benefit from the ‘Basic Income Support for Sustainability’ (DP01_E01_BISS_16).

All interventions relevant to R.04 (direct payments and one rural development intervention for Natura 2000 agricultural areas) respond to at least one of the following five needs of the SO1 specific objective:

- In Hungary, the average annual labour income in agriculture was EUR 9.4 thousand per FTE, or 88 per cent of the national average (EUR 10.7 thousand/TME^[1]). In the period 2014-2019, the backlog of agricultural labour income remained unchanged from the national average.^[2] Experience shows that in Hungary, from EU accession until 2013, EU direct support has contributed to increasing agricultural incomes, facilitating bank financing, improving liquidity and improving developments^[3]. It is therefore still necessary to provide farmers with **a predictable basic income**(requirement 1.1.1).
- Income stability can be enhanced through guarantees and loan guarantees for farmers. It is necessary to provide **available credit funding** (need 1.1.2). Access to credit can be facilitated by administrative means and depends on the financial markets, not directly the CAP’s ST competence, and interventions that also respond to sub-needs 1.1.1 respond indirectly and partially.
- In order to improve the fairness, effectiveness and efficiency of direct payments and to better target support, particular attention should be paid to **improving the profitability of small and medium-sized farms** (need 1.1.3).
- **Addressing adverse climatic events and climate change damage in agriculture** (1.2.1 need)
- Due to strong producer price fluctuations in recent years (due to trade-restrictive measures by third countries, animal health outbreaks, etc.) and weather extremes (e.g. spring frost damage, hail), it is necessary to **mitigate the impact of market risks to farmers’ incomes (e.g. large price decreases)** (need 1.2.3)

R.5 – Risk management: Share of farms with supported CAP risk management tools

Target R.5 indicator: 30.29 %, representing 73.000 beneficiary holdings, compared to a total of 241.000. A major contribution to the indicator target is RD14_I03_DMMF_76 Agricultural Risk Management System (MKR Pillar I): Agricultural Damage Mitigation Risk Management Fund intervention. In the

Communication "Agricultural Risk Management System (MCS Pillar II): Subsidised agricultural insurance' (RD16_I01_INS_76) responds to the SO1 specific objective 1.2 'Reduction of income fluctuations due to natural (weather) and market risks'. On the basis of the number of producers receiving premium payments in the previous programming period (20 790 in 2021) and its increase (17 % on average over 2017-2021), the target of 73.000 producers can be considered justified, following the opinion of the Hungarian Insurance Association (MABISZ).

To a lesser extent, the 'Agricultural Risk Management System' (Pillar IV) contributes to the target: Agricultural Crisis Insurance Scheme" (RD17_I02_IST_76) which also responds to Main Needs 1.2. The crisis insurance scheme introduced in 2021 is a pioneering aid scheme covering not only crop production but also the livestock sector, and the risks it manages go beyond the damage caused by weather and climatic events. On the basis of the above, it can be concluded that the Hungarian risk management system is complete with crisis insurance. A moderate increase in appetite is expected in the 2023-2027 planning period, as it is a measure starting in 2021. Considering objectively, for the years 2026-2027 (years covered by financing from ST), the number of farmers who joined is estimated at 1050, of which 20 % will also benefit from subsidised agricultural insurance.

In addition, further interventions responding to SO1 specific needs may contribute to the indicator value, but there is no pre-defined target. Such interventions include:

- Mutual funds – fruit and vegetables (SC19_I01_FVF_47)
- Harvesting and production insurance – fruit and vegetables (SC26_I08_FVH_47)
- Green harvesting – fruit and vegetables (SC24_I06_FVG_47)
- Support for green harvesting in winery (SC07_E06_WIG_58)

R.6^{PR} – Redistribution to smaller farms: Percentage of additional direct payments per hectare for eligible farms below average farm size (compared to average)

The target value for indicator R.6 is 112.25 %, which shows how the average payment per hectare (EUR 299,15/ha) for beneficiaries below average farm size is compared to the average payment per hectare to all beneficiaries (EUR 266,51/ha).

The indicator target value has been established taking into account the following factors:

- The average area of CAP beneficiaries is 30.40 ha,
- Amount of direct payments (DP) to beneficiaries with below-average size: EUR 287872956,99,
- Total number of hectares of beneficiaries with a size below average: 962 296.25 ha,
- Amount of direct payments (DP) to all CAP beneficiaries: EUR 1323088879,01
- Total number of CAP beneficiaries' hectares of aid (calculated with the last closed year (2020) for a more precise estimate): 4 964 458.61 ha.

In calculating the indicator target, all direct payments interventions were taken into account, which respond to each of the 5 needs already listed for indicator R.4.

R.7^{PR} – Increasing support for farms in areas with special needs: Percentage additional support per hectare in areas with higher needs (compared to average)

The overall target for the indicator is 111.57 %, which shows how the amount of income support per hectare for beneficiaries in areas with special needs (EUR 303,67/ha) relates to the amount of income support per hectare paid to all beneficiaries (EUR 272,18/ha).

In the calculation of the indicator target, in addition to all direct payments interventions, compensation payments for Natura 2000 (agricultural and forest) areas have also been taken into account, which respond to the 5 needs already listed for indicator R.4.

R.8 – Aid to farms in specific sectors: Share of farms benefitting from coupled income support for improving competitiveness, sustainability or quality

Indicator target: 18.32 %, showing the proportion of beneficiaries receiving CIS aid (44148) and total holdings (241000 farms).

In the calculation of the indicator target, all coupled direct payments interventions were taken into

account, which respond to each of the 5 needs already listed for indicator R.4.

The target setting has been supported by experience gained in 2015-2022 and relative stability among the supported sectors. This provided adequate basic data on the role of coupled aid in the revenue of the supported sectors and what its absence would have in terms of operational efficiency. The findings of the SWOT analysis showed that coupled support is a key element for the supported sectors.

The number of holdings concerned and the amount typically sufficient to minimise the loss or, where appropriate, increase profitability of the activity to an expected level, so as to prevent cessation of activity or transition to other crops, has been determined on the basis of the multi-annual statistical series included in the sectoral situational analyses.

R.36^{CU PR} – Generational renewal: Number of young farmers benefitting from setting up with support from the CAP, including a gender breakdown

The overall target for the indicator is 6800 young farmers setting up businesses. The vast majority of the indicator target, i.e. 5500 enterprises, is provided by the intervention “Complementary income support for young farmers” (DP03_B01_YFS_16), which responds to each of the 5 needs already listed for indicator R.4 that underpin the SO1 specific objective.

It is expected that potential new entrants can be moderately dynamised for producers using the opportunity used at the beginning of the period starting in 2015. As a result, in view of the five-year eligibility limit, the ‘demographic reserve’ appears to be exhausted. Following a substantial drop in 2020, this process is expected to continue in later years. This is mitigated by an increase in the specific aid amount and the maximum number of eligible hectares. Planning is therefore subject to uncertainty both in terms of expected outputs and number of new entrants. Therefore cautious planning after realities was warranted.

Detailed background analyses underpinning the indicator value are provided in the chapter justifying the planned unit amounts for intervention DP03_B01_YFS_16.

[3] *Situation analysis for specific objective 1 (30.6.2021), Chapter 2*

2.1.SO1.9 Justification of the financial allocation

To support viable farm income and resilience and maintain food security, we provide significant resources for SO. Direct aids (area and coupled payments, complementary income support for young farmers and additional direct payments for eligible holdings below average farm size) fully serve this objective. In addition, sectoral interventions as well as Pillar II funds such as risk management interventions contribute to SO objectives.

The relevant Commission Recommendation “Improve farm viability by better addressing income gaps between (professional) farms of different farm sizes, sectors and territories”. The allocated resources can achieve the goal.

2.1.SO2 Enhance market orientation and increase farm competitiveness, both in the short and long term, including greater focus on research, technology and digitalisation

2.1.SO2.1 Summary of the SWOT Analysis

2.1.SO2.1.1 Strengths

- E.1. Total factor productivity in Hungary increased more than the EU28 average. (2.)
- E.2. Domestic production of agricultural and food products and foodstuffs which satisfy the majority of domestic supplies (1)
- E.3. Existence of production potential in terms of both quantity and quality (1)
- E.4. Positive external trade balance in the agricultural and food economy (8)
- E.5. Significant market positions in the European market for certain products (8)

2.1.SO2.1.2 Weaknesses

- Gy.1. Lack of development of domestic genetic resources in agriculture, underdeveloped infrastructure (3 and 11), [SO2/1.2] [SO2/1.8]
- Gy.2. Low labour productivity (less than half of the EU average) (2), [SO2/1.1] [SO2/1.2.] [SO2/1.8]
- Gy.3. Low share of processed food products in exports (below the EU average) (8), [SO2/1.3] [SO2/4.2].
- Gy.4. Narrow export radio (shipping distance) (8), [SO2/4.2]
- Gy.5. Domestic food consumption below the EU average (7), [SO2/4.3]
- Gy.6. Strong dependence of agricultural incomes on direct aids (4)
- Gy.7 Fragmented production structure and therefore heterogeneous production standard (1), [SO2/1.8.]
- Gy.8. Obsolete infrastructure, low technological standard of post harvest (9), [SO2/2.1] [SO2/2.2] [SO2/2.3]
- Gy.9 Demographic processes hampering the spread of digitalisation, high investment needs and knowledge gaps (10 and SO7, 5), [SO2/5.1]
- Gy.10. The level of skills of the workforce is not suitable for the proper use of innovative technologies (10, SO7, 4 and SO10, 3) [SO2/5.1] [SO2/5.4]
- Gy.11. Weaknesses in strategic planning, commercial and marketing knowledge (SO7, 3). And ÉLIP Sector Situation Analysis), [SO2/3.5] [SO2/4.1] [SO2/5.1.]
- Gy.12 Low innovation of businesses, slow reaction to changing consumer demand (SO10, 2nd & ÉLIP sector situation analysis),[SO2/3.1.]
- Gy.13. Incomplete, outdated infrastructure for training and further training (SO10, 3), [SO2/3.1] [SO2/5.5.]
- Gy.14. Weak collaboration between researchers and producers and processors, low innovation potential (SO10, 1), [SO2/3.1] [SO2/3.6.]
- Gy.15. Underdeveloped research (SO10, 2), [SO2/3.1] [SO2/3.1] [SO2/3.1] [SO2/3.6] to create new, more modern, higher-value products, processes and technologies that become marketable.
- Gy.16. Technological backlog in the food sector (ÉLIP sector situation analysis),[SO2/3.1]
- Gy. 17. Low irrigated area (1), [SO2/1.4.]
- Gy. 18. The production area of the main fruits is declining or stagnating, most of the plantations are ageing and need to be renovated (1, Vegetable and fruit sector analysis), [SO2/1.11]

2.1.SO2.1.3 Opportunities

- L.1. Existence of digital technologies, Digital Agriculture Strategy, Digital Food Strategy (10)
- L.2. Increase in European demand for higher value-added or specific products (SO9, 4), [SO2/3.3] [SO2/4.1] [SO2/5.3]

L.3. Emergence of diversified new consumer needs (SO9, 4), [SO2/3.2] [SO2/3.3] [SO2/4.1].
 L.4. Increase of domestic resources for R & D & I in agriculture (including food) (11)
 L.5. Increased consumer awareness (SO9, 4), [SO2/4.3]
 L.6. Market clearance and forced technological developments due to labour shortages can improve the efficiency and profitability of food businesses (ÉLIP sector situation analysis)
 L.7 Speeding up and simplifying administrative processes through digitalisation

2.1.SO2.1.4 Threats

F.1 Increased competition due to free trade agreements and the development of agricultural and food economies in other countries (8)
 F.2 Strong dependency of agricultural investment on subsidies (5)
 F.3 Due to its size, Hungary is not price-determining. (6.)
 F.4. Land ownership and land use are decoupled, so conflicts of interest can arise, hindering and uncertain investment and development
 F.5. Brain drain, further withdrawal of funds from RDI sector (11), [SO2/5.6.]
 F.6. Lack of skilled and seasonal workers may drive up labour costs (SO7, 3)
 F.7 Shortcomings and constraints on rail and river navigation can cause a significant competitive disadvantage (9), [SO2/2.4]
 F.8. The disadvantage of logistics resulting from the country's isolation from maritime ports is further accentuated by the declining share of rail freight transport (9), [SO2/2.4]
 F.9 Reduced navigability of the lower part of the Danube (9), [SO2/2.4]

2.1.SO2.1.5 Other comments

Not relevant.

Overview

2.1.Main demand: Improving the efficiency of production by modernising plants

The analysis of the situation underlying the second specific objective shows that agricultural enterprises in Hungary have low production efficiency, which greatly reduces their competitiveness on the agricultural product market. Modernisation of plants could significantly improve their competitive position, but this is hampered by a number of factors. They are characterised by weak innovation potential, technological lags, outdated production infrastructure and a lack of applied research into new products, technologies and processes. The development of human capital is a sine qua non for meeting the main needs, because the low level of skills of the workforce and the lack of knowledge to use modern means of production also hinder agricultural enterprises in Hungary from implementing farm development.

2.1.1.Requirement: Increasing the operational and business efficiency of production

We aim to increase labour productivity by improving the operational and business efficiency of production, which we support at every stage of the value creation process. As climate conditions and market needs have changed significantly over the past decades, restructuring of plantations (SC05, SC22) is an important part of the measures. Successful adaptation to changed natural conditions is supported by a more efficient water use measure (RD12). In addition, the modernisation of plant production is an important element of development plans through the modernisation of technical investments and business models (SC06, SC17, SC18, SC20, SC28). The acquisition of knowledge for the management of advanced technologies and modern business strategies would be supported by training the workforce and various advisory services (SC11, SC12).

2.1.2.Requirement: Creation of modern production capacities

The creation of modern production capacities is a fundamental need for the competitiveness of Hungarian businesses. On the one hand, the ability of undertakings to generate profits depends to a large extent on the amount of added value of the product produced and, on the other hand, the way in which the products chosen are produced is also decisive in this regard, so undertakings would also be encouraged by supporting investments in production processes by means of SC03, SC06, RD01a, RD01b, RD01e. In addition to the production capacity, the increase in stockholding capacity is crucial and therefore we support logistics and storage activities (SC14, SC28). Beneficiary companies will also be helped to develop the knowledge needed to design business models and strategies, as well as for new technology, by supporting the use of professional training and advisory services (SC11, SC12).

2.1.3.Requirement: Increasing the level of processing of agricultural raw materials, improving technology, increasing the proportion of processed products, increasing added value

The share of processed products in the export of agricultural raw materials and food products from Hungary is below the average of the European Union, therefore the intervention is necessary to increase the value added of the products, which we also intend to improve by supporting investment in infrastructure at all stages of the production process. Support for achieving a high level of processing (RD04a) is most appropriate in sectors where the country's climate and sector characteristics are such that businesses can expect the highest profit growth. Investments in the wine (SC06) and apiculture (SC03) sectors are of particular importance for Hungary. A high quality of products and a favourable market perception can be ensured by continuous training of quality assurance systems and human resources for production processes (SC12, SC16).

2.1.4.Requirement: Addressing water scarcity in arable crops

Increasing the production efficiency of Hungarian businesses can be greatly improved by increasing the proportion of irrigated areas and by upgrading irrigation infrastructure already built. In Hungary, annual rainfall is expected to decrease over the coming decades due to climate change and the importance of efficient water use is therefore appreciated (RD12).

2.1.7.Required: Technological transition taking into account stricter plant health standards

The increase in production costs and the need to invest in the investments needed to maintain their competitiveness are an increasing challenge for agricultural businesses in Hungary. The reasons for this are due to a number of factors, all of which need to be addressed in business plans. Among others, persistently unfavourable international economic and political macro-environments, tightening environmental, plant and animal health requirements and increasing consumer quality expectations are decisive. The technological transition, adapted to changing circumstances, affects all stages of operational production and therefore the interventions cover several areas (SC17, SC28, RD01a, RD01b). We pay particular attention to the digitalisation of production processes and are therefore supported by an autonomous intervention measure (RD02). The acquisition of the professional knowledge needed for the transition is encouraged by supporting the use of training and advisory services (SC11, SC12).

2.1.8.Requirement: Improvement of cultivation technology

Agricultural holdings in Hungary are characterised by fragmented land tenure, underdeveloped infrastructure and lack of development of genetic resources. All these factors lead to low labour productivity and weak competitiveness. Improving cultivation technology could strengthen the market position of Hungarian businesses. On the one hand, efficiency indicators can be improved by climate mitigation measures (SC18). On the other hand, sustainability improvements (RD01a, RD01b) and targeted support to producer organisations (SC28) contribute to optimising the production process as a whole. Furthermore, the use of modern quality assurance and certification systems increases transparency, qualitative and quantitative stability of production capacities, providing adequate guarantees for partners on products (SC16, SC17). The knowledge needed to carry out the developments is not available to most agricultural enterprises in Hungary, therefore support for training and professional advisory services is essential for successful cultivation technology developments (SC11, SC12).

2.1.9.Requirement: Adaptation and development of housing technology

The transformation and development of maintenance technology is a crucial need in several respects. While housing infrastructure in part of domestic livestock farms is lagging behind, the tightening of animal welfare requirements and the appreciation of sustainability aspects are increasingly demanding

large-scale livestock farming. There is a need to modernise farms so that businesses can meet expectations (RD01a, RD01b, RD01e). This cannot be done in their own right.

2.1.11.Requirement: Creation, renewal and modernisation of new plantations

In Hungary, the production area of orchards shows a steady downward trend and the existing population tends to be aged and needs major renovation. This hinders the improvement of production efficiency on farms and it is therefore necessary to support the restructuring of vineyards and orchards (SC05, SC22). Several plant species are highly sensitive to climate change in plantations in Hungary, so adaptation to changed natural conditions is a priority area for support (SC18). The coordination of producers with weak bargaining power and the production of a marketable homogeneous commodity fund can be achieved through producer organisations (SC28). Sustainable farm development (RD01a, RD01b) modernisation of plantations contributes to the stable and flexible functioning of agricultural enterprises. Encouraging the use of training and advisory services in order to acquire the professional knowledge required for implementation helps the beneficiary enterprises (SC11, SC12).

2.2.Main demand: Development of infrastructure and technology

The Hungarian Vegetable and Fruit Sectoral Strategy, as part of the National Rural Strategy (2012-2020), states, in connection with the technological quality of the sector, that the weaknesses of agricultural holdings in the sector include, inter alia, volatile crop averages caused by heterogeneous, sometimes low technical and technological standards; underdeveloped post harvest technology and little irrigated land. It also notes that the investment of smaller fruit and vegetable farms in the introduction of modern technologies and the replacement and development of tangible assets is currently insufficient. In addition, a basic condition for the competitiveness of the Hungarian fruit and vegetables sector is to achieve crop security, to have a stable and predictable product base, and to use appropriate cultivation technology as one of the pillars of modern, competitive vegetable production.

As noted in the assessment of the situation in the fruit and vegetables sector, domestic horticultural production tends to fall short of foreign competitors. A high proportion of fragmented enterprises are not suitable for the introduction of high-level technologies, which is further hampered by the low number of well-trained professionals and the low use of specialist advice. The development of underdeveloped infrastructure and low-quality post harvest technology is planned in a complex manner, as follows:

2.2.1. Need: Development of post harvest technology, including the need for feed, protein feed and seed, using appropriate sorting and packaging technology

Hungarian agriculture, especially in the fruit and vegetables sector, is characterised by outdated infrastructure and low-quality post harvest technology. The production of higher value-added products for retail sale is based on efficiency gains and technological improvements. However, the Hungarian fruit and vegetable processing sector is lagging behind in terms of efficiency and state-of-the-art (e.g. production of value added per business, labour productivity) compared to the European countries with the predominant fruit and vegetable processing. This can only be developed in a complex manner, taking into account all stages of the entire production process and integrating interventions. Information, training and advice to farm managers and producer organisations (SC11, SC12, SC28) are the basis for infrastructure interventions, helping to plan and optimise them. Account should be taken, inter alia, of the seasonality of the sector, which is reflected in harvesting, processing, employment and consumption. Without efficiency gains and capacity building (SC14, SC20), it is not possible to build a stable commodity base and increase productivity. In addition, producers have to meet rising consumer expectations, which can be ensured, inter alia, by supporting the use of traceability and certification schemes (SC17).

2.2.2. Need: Construction/renovation of crop storage and cold stores

According to a 2017 study by the European Commission, Hungary has capacity to store around 20 million tonnes of cereals, oilseeds and protein crops. A significant part of them is hall storage, which is multifunctional, i.e. suitable for the storage of other bulk products in addition to grain. The more advantageous silos (metal silos and reinforced concrete silos) in terms of storing grains cover only 20 % of the storage capacity.

The competitiveness and market access of horticultural products for fresh consumption is strongly influenced by existing storage and cooling capacities. Previous agricultural development programmes were mainly production-oriented, the targeted development of logistics systems for agricultural production was not included as a priority, without which the fruit and vegetables sector was placed at a

serious competitive disadvantage. One of the biggest problems in the domestic F & V market is that the existing cooling storage capacity is limited and largely outdated. The professional transport and storage of products increases their lifetime and marketability, so these developments (SC14, SC20, SC21) are also decisive for increasing the competitiveness of the sector. The development and management of joint capacities requires cooperation between producers and coordination of production, which we plan to support through SC20, SC21 and SC28 interventions.

2.2.4. Need: Inland waterway freight infrastructure, development of rail crop handling capacities

The domestic cereal and oilseed sector is export-oriented, with both rail, water and road transport. Rail transport is also a bottleneck in transit countries like Hungary, such as Germany, Austria, Poland, Czechia and Slovakia. We typically transport grain from Hungary to Italy by rail. Waterborne transport is difficult due to the limited navigability of the Rhine-Main-Danube Canal and the lower Danube, with a relatively short navigability period of 150-200 days instead of 250-300 days. The disadvantage of logistics resulting from the country's isolation from maritime ports is further exacerbated by the declining share of rail freight transport.

Planned actions:

Its solution does not fall within the scope of the CAP.

2.3. Main Needs: Promoting innovation, encouraging the use of innovative methods

The overarching objective of the CAP is to modernise the sector by helping to increase and share knowledge, and to promote innovation and digitalisation in agriculture and rural areas. Based on the Hungarian impact studies and analyses, support for innovation will play a key role in the development of Hungarian agriculture in the coming period for a number of reasons. On the one hand, it can be concluded that underdeveloped infrastructure and the level of skills of the workforce are currently not suitable for the proper use of innovative technologies. On the other hand, business innovation is low, slowly responsive to changing consumer needs, and cooperation between researchers, producers and processors, including innovation potential, is weak. Responding to rapidly changing new consumer trends requires innovative food solutions throughout the food supply chain. In addition to mass products, processors in Hungary should also increase exports of higher-processed items, but this is hampered by the weak innovation capacity of Hungarian companies. From a knowledge transfer perspective, training and upskilling are incomplete, outdated infrastructure and, along the digitalisation aspect, demographic processes, high investment needs and knowledge gaps hamper the spread of digitalisation. Together, they make technological developments and support for new innovative solutions inevitable.

2.3.1. Need: Uptake of innovative technologies and sustainable approaches in agriculture: precision farming, circular farming

Based on the above, one of the key objectives of domestic development is to spread and further develop innovative technologies and sustainable approaches (e.g. precision farming, circular farming) in agriculture, forestry and the food industry. Their uptake is currently hampered partly by a lack of resources and partly due to a lack of awareness and awareness on the part of businesses. As a consequence, the majority of farmers are unable to adapt to the changing production conditions due to climate change due to a lack of knowledge and technological gaps. In addition, in the fruit and vegetables sector, due to the lack of predictable marketing opportunities, producers do not implement technological developments (e.g. plantation upgrading, irrigation development) nor start adding new species to production, resulting in the processing industry not having access to sufficient quantities of a homogeneous commodity base of sufficient quality, without which it will not be able to create new, innovative products that are not based on basic industrial fruits and vegetables. The technical competence and cooperation of producers and processors is to be strengthened through SC11, SC12, SC28, and technological developments by SC17, RD02.

2.3.2. Need: Diversification of business activities

According to the 2020 EIT Country Report, Hungary also has a significantly higher share of people with allergies among the population compared to the EU, with 7 % of the population being gluten-sensitive. The turnover of healthy, so-called 'free' products increased by more than 20 % annually between 2017 and 2020, making the production of healthy food a dynamic sector on the Hungarian food market.

Consumers increasingly want to choose fresh, less processed and sustainably sourced fully-fledged food containing natural and nutrient-rich ingredients, thereby increasing the demand for organic products. At the same time, according to trend scientists, the most important factor for the future and future consumption trends is unpredictability, i.e. it is impossible to predict precisely what new consumer tastes are spreading and which remain stratified. Most importantly, food producers must remain flexible and always be prepared for change. In this changing economic and market environment, diversification of business activities (e.g. expanding the range of plant species or animal species produced, product developments) can help create stable business operations. We plan to support the personal and knowledge conditions of this by means of SC11 and SC12 interventions.

2.3.3. Need: Increasing the market share of high value-added products (basic food, special and niche markets)

The coronavirus pandemic has shown that consumer preferences can change rapidly. Research shows that, as a result of the pandemic, many consumers have made a positive change in their lives that they wish to maintain. European demand for higher value-added and specific products is also increasing. The risk of loss of consumer confidence caused by copying or imitation of quality products is a serious problem in Hungary, which hinders the return on investment in the production of innovative high value-added products. The use of trade marks to certify the quality of products can help to gain consumer confidence, which is supported by SC16, while the creation and development of technological conditions to increase the market share of processed products is supported by SC20.

2.3.5. Need: Increasing the innovability of companies, rapid responsiveness to changing market needs

Continuous innovation, mostly product-related, is one of the means to attract consumers. Due to the lack of knowledge and knowledge in the Hungarian food production and processing sectors (lack of strategic planning, trade and marketing knowledge, lack of knowledge on innovation issues, insufficient market knowledge), there is rarely and little innovation among food producers and processors in Hungary, which is partly justified by low profitability, and the limited size of the internal market is also an obstacle. Supporting the digital transformation of farms (RD02) helps the organisations concerned to develop the technical conditions for business development and responsiveness.

2.4. Main demand: Development of distribution channels

Nowadays very few businesses can afford to rely only on a small number of distribution channels to obtain their revenues. The markets of most firms have undergone fundamental changes in recent years. Consumer habits are constantly changing and distribution channels themselves have evolved. In the agricultural and food sector, FMCG (*Fast-Moving Consumer Goods*) products, these changes are particularly fast, but not all operators are able to adapt quickly. We have set up a comprehensive support package for the sector, consisting of elements such as market research, marketing and awareness-raising, as follows.

2.4.1. Need: Market research

Global trends show that, in addition to the traditional food expectations of consumers (flavour, price, comfort), there is a growing need to know the extent of health, food safety, social and environmental impacts. It is important for food producers, processors and traders to position their own products well in a fast-changing food market. In this, we strongly support the actors in the apiculture and the fruit and vegetables sector through the SC01, SC11 and SC28 interventions.

2.4.2. Need: Promotion of agri-food products

The proportion of processed food products in Hungary's exports is low (below the EU average). At the same time, European demand for higher value-added and specific products is constantly increasing. In addition, specific consumer needs require the promotion of agri-food products on both domestic and export markets. In this, we strongly support the apiculture, wine and fruit sectors through the SC01, SC09, SC10, SC15 and SC27 interventions. According to the Eurobarometer survey, the origin, price, safety and taste of goods are the most important factors when buying food in the EU. Access to internal and external markets and the strengthening of market positions are aimed at supporting the use of EU and national quality schemes (SC16).

2.4.3. Need: Raising public awareness of healthy eating

A comparison of annual expenditure on food and non-alcoholic beverages per capita shows that consumption in Hungary is below the EU average. In 2017, the Hungarian population spent only EUR 1161 per person per year on these products, compared to the EU average of almost EUR 2000 per capita per year. Healthy diets include the consumption of fresh fruit and vegetables. Based on the food balance, this is around 100 kg/person per year in Hungary. On this basis, the Hungarian consumer consumes around 270 grams of fresh fruit and vegetables per day, which is significantly below the WHO consumption recommendation, which proposes 400 grams per day for a healthy diet, i.e. 146 kilograms of fresh fruit and vegetables per year.

Hungarian consumers believe in food safety and nutrition matters slightly higher than the EU average for researchers, but less for consumer organisations and farmers. However, trust in the national authority (Nébih – National Food Chain Safety Office), EU institutions, food industry and supermarkets is much higher than the EU average, but trust in the press is significantly lower. As consumers in Hungary have a high degree of confidence in the authority, it is important to maintain trust and to consider it a primary source of information for consumers. By taking advantage of this favourable situation, legal and science-based communication can be made in plain language, reducing the risk of consumers making their decisions relying on inadequate information. We plan to support public awareness through the SC15 intervention.

2.1.SO2.5 Where relevant, a justification for the use of InvestEU, including the amount and its expected contribution to the Specific Objective/Cross-Cutting Objective

Not relevant.

2.1.SO2.8 Selection of the result indicator(s)

Selection of the result indicator(s) for this specific objective

Result indicators [recommended Result indicators for this specific objective are fully displayed in bold]	Target value
R.3^{CU} - Digitalising agriculture Share of farms benefitting from support for digital farming technology through CAP	7.32 %
R.8 - Targeting farms in specific sectors Share of farms benefitting from coupled income support for improving competitiveness, sustainability or quality	18.32 %
R.9^{CU PR} - Farm modernisation Share of farmers receiving investment support to restructure and modernise, including to improve resource efficiency	2.86 %
R.10^{CU PR} - Better supply chain organisation Share of farms participating in producer groups, producer organisations, local markets, short supply chain circuits and quality schemes supported by the CAP	2.59 %
R.39^{CU} - Developing the rural economy Number of rural businesses including bio-economy businesses developed with CAP support	7,900.00

Justification of the targets and related milestones

SO2 – Enhancing market orientation and increasing the competitiveness of economies both in the short and long term, including through a stronger focus on research, technology and digitalisation

The milestone value of each R indicator and the value of the contribution of the related interventions (by year) are set out in the attached table, so they are not described in detail in the text.

CU03 - Digitalisation of agriculture: Share of farms benefitting from support for digital farming technology through CAP

See xCO to substantiate the total value of the indicator.

R.8 – Aid to farms in specific sectors: Share of farms benefitting from coupled income support for improving competitiveness, sustainability or quality

To support the total value of the indicator, see SO1.

R.09^{CU PR} - Modernisation of farms: Share of farmers receiving investment support to restructure and modernise, including to improve resource efficiency

Overall cumulated target for indicator R.09: 3.2 %, corresponding to 7700 beneficiary farmers without duplication, compared to a total of 241.000. The beneficiaries of the interventions contributing to the indicator target are expected to overlap, so a smaller proportion of beneficiaries receiving aid in each year will be taken into account for the overall target (in 2029, only 80 % of the beneficiaries contribute to the target as the first-time farmer). Each intervention of the indicator target is linked to the achievement of the SO2 specific objective.

Farm development (RD01a_E01_FRM_73) is responsible for almost a third of the indicator target, which will improve the operational and business efficiency of production in almost 2500 farms, in particular in the last 3 years of the period, build up modern production capacities, switch to sustainable grassland management and improve cultivation and husbandry technology (main need 2.1). The same needs are addressed by the intervention to support investments in agriculture by young farmers (RD01b_E01_FRM_73), which reaches more than 700 farmers during the period, and that support for disease control investments in livestock farms (RD01e_E01_FRM_73) with 500 farmers contributes to most of the needs.

The sustainable development of small farms (RD09a_B05_SML_73) is also an important contribution to the target, as it reaches nearly 1800 farms, specifically increasing the operational and business efficiency of production (need 2.1.1).

Support for the digital transition of farms (RD02_D01_FRM_73) will provide real support for 530-540 farms per year over the three years 2025-2027 to achieve a technological transition adapted to changing circumstances (2.1.7), the deployment of innovative technologies and sustainable approaches that have not been implemented so far due to a lack of resources (need 2.3.1) and the development of technical conditions for business innovation and rapid responsiveness, rarely and to a small extent among food producers and processors in Hungary, which is an important means of attracting consumers (2.3.5).

By supporting in-farm investments to improve water efficiency (RD12_W01_WTO_74), in particular in 2026 and 2027, a total of more than 500 farms will be able to successfully adapt to changed natural conditions, in particular the expected reduction in annual domestic rainfall over the coming decades (needs 2.1.1 and 2.1.4).

Through the aid for restructuring and conversion of vineyards (SC05_E04_WIR_58), 1500 farms will be able to adapt to the climate and market needs that have changed considerably in recent decades (need 2.1.1) or to renew old plantations (requirement 2.1.11.) in the first half of the period.

Investments in tangible and intangible assets in the wine sector (SC06_E05_Wii_58) will build up modern production capacities in 400 farms (need 2.1.2) and increase the level of processing of agricultural raw materials (need 2.1.3) through the modernisation of operational production (need 2.1.1).

Aid to fruit and vegetable producer organisations (SC28_E01_FVI_47), which have an impact on most of the needs underlying the SO2 specific objective, allows farms to receive additional funds for restructuring and modernisation, but no plan value is set in this respect.

A detailed justification for each need and its link with the interventions providing the value of the R indicator is provided in chapter 2.1.SO2.4.

R.10^{CU PR} – Improving supply chain organisation: Share of farms participating in Producer Groups, Producer Organisations, local markets, short supply chain circuits and quality schemes supported by the CAP

The overall target for R.10 is 2.55 %, representing 6145 beneficiary farms, compared to a total of 241.000. Of the interventions providing the total design value of the R.10 indicator, the technical programmes implemented through the Operational Funds support (SC11-28_1-18_FV_47) respond to one or more of

the needs underlying the SO2 specific objective.

A total of 3300 holdings active in the fruit and vegetables sector may be supported through the Operational Funds in order to carry out the following activities:

Acquiring the knowledge necessary to improve efficiency of production (2.1), the development of infrastructure and technology (major need 2.2), the use of innovative methods (main need 2.3) and the development of distribution channels (main need 2.4) by means of staff **training and various advisory services**(SC11_A03_FVA_47; SC12_A04_FVT_47);

In addition to the production capacity, the **sustainability and efficiency of the transport and storage of products (SC14_B01_FVE_47) is increased through increased stockholding capacity (need 2.1.2), development of post harvest technology (requirement 2.2.1) and construction/renovation of crop storage** and cold stores (requirement 2.2.2).

Specific consumer needs require the **promotion of agri-food products** (SC15_E10_FVP_47) on both domestic and export markets (need 2.4.2), which also contributes to public awareness of healthy eating, which falls short of the WHO consumption recommendation (need 2.4.3). Support for information and promotion of quality schemes (RD48_R07_QSP_77) which ensures the promotion of agri-food products (need 2.4.2) is closely linked to this.

· **Use of EU and national quality schemes** (SC16_E11_FVQ_47) to ensure high quality and favourable market perception of processed products (need 2.1.3), to increase transparency, qualitative and quantitative stability of production capacities, to provide adequate guarantees to partners in relation to products (2.1.8) and to help increase the market share of high value-added products (need 2.3.3), to strengthen access and market positions in internal and external markets;

During technological developments (2.1.1, 2.1.7, 2.1.8, 2.2.1, 2.3.1), producers must also meet increasing consumer expectations, which can be ensured by the use of **traceability and certification systems** (SC17_E12_FVC_47);

As part of **adaptation to climate change** (SC18_G02_FVL_47), new plantations will be created, existing plantations will be renovated and upgraded (requirement 2.1.11.), improvements in cultivation technology will strengthen the market position of Hungarian businesses (2.1.8).

Additional interventions (SC20_I02_FVV_47, SC21_I03_FVS_47, SC22_I04_Fvr_47, SC27_I09_FVM_47, SC28_E01_FVI_47) may also contribute to the target of indicator R.10 (SC20_I02_FVV_47, SC21_I03_FVS_47, SC27_I09_FVM_47, SC28_E01_FVI_47) but no plan value is required.

A detailed justification for each need and its link with the interventions providing the value of the R indicator is provided in chapter 2.1.SO2.4.

The R.39 indicator target is also supported by the RD04a_E02_FON_73 Agricultural product enhancement intervention, which is linked to the SO2 objective with a need to increase the level of processing of agricultural raw materials in order to increase market orientation and the competitiveness of farms.

2.1.SO2.9 Justification of the financial allocation

Increasing market orientation and increasing competitiveness, prioritising the development of research, technology and digitalisation are our strategic priorities. The planned interventions will focus on increasing productivity, the efficiency of agricultural production, improving the market position of agricultural products, improving post-harvest and logistics and the uptake of digitalisation technologies. Our priority is to develop farms, including rural economies. Pillar II interventions, in particular investments (farm development, improvement of water management efficiency) and other interventions related to AKIS (development of digitalisation, knowledge transfer) contribute to the objectives. In addition, Pillar I interventions, such as support for grain and coarse protein fodder crops, as well as sectoral interventions, serve the above objectives. The resources allocated for the specific purpose are sufficient.

The related Commission Recommendation “Promoting market orientation and competitiveness of the

agricultural and agri-food sector by continuing to support investments in logistics and processing.” Investments in processing/added value of agricultural products receive much higher resources than in previous periods, so we can comply with the recommendation.

2.1.SO3 Improve the farmer' position in the value chain

2.1.SO3.1 Summary of the SWOT Analysis

2.1.SO3.1.1 Strengths

E.1. Significant commodity funds for certain products (e.g. cereals, oilseeds, poultry meat) and processing capacities (e.g. cereals, oilseeds, poultry meat, pigmeat, milk) (SO2)
E.2. Well-functioning integrations on certain product tracks (poultry meat, canning industry) (5)
E.3. Operation of producer markets under lighter conditions (6)
E.4. A strong consumer-recognised authority in the food chain (S9)
E.5. Presentation and adaptation of domestic and international good practices in the field of vertical and horizontal coordination

2.1.SO3.1.2 Weaknesses

Gy.1. Critically low commodity base sizes in specific sectors (e.g. onions, cucumbers) (5)
Gy.2. Basically fragmented production structure, fragmented farm sizes and large differences in size (forest and agriculture) (3 and SO1)
Gy.3. Lack of willingness of producers to cooperate (in the fields of agriculture, processing, forestry) (4th and forest professional position papers), [SO3/1.1]
Gy.4. Weak bargaining power of farmers in the value chain, mainly due to significant information asymmetry and lack of trust (3), [SO3/1.1], [SO3/2.1]
Gy.5. Low degree of horizontal and vertical coordination in most product pathways, which is not conducive to effective cooperation (4, 5), [SO3/1.2]
Gy.6. Weak contractual discipline (5), [SO3/2.2]
Gy.7 The lack of long-term contractual relations and sectoral framework agreements often results in uncoordinated production of raw materials and processing needs (5)
Gy.8. Due to the lack of clarity and conflicting interests, certain parts of the chain may be affected by transparency (especially in fruit and vegetable production) (4, 5), [SO3/2.1]
Gy.9 Prioritising individual decisions over Community decisions (4)
Gy.10. Lack of tool, infrastructure and competence for REL development (6), [SO3/1.4] [SO3/1.5]
Gy.11. The value-added of the sectors producing and distributing processed products is lower than that of agriculture and below the EU average (1)
Gy.12 Low share of producer ownership/interest in manufacturing (3, 5)
Gy.13. Strong reliance on subsidies for investment (SO1)

2.1.SO3.1.3 Opportunities

Digitalisation can contribute to improving coordination, transparency and traceability (SO10)
L.2. The existence and further strengthening of the legislative framework in the area of small farmers' access can improve the position of producers (REL) (6)
L.3. The development of ICT tools enables the development of innovative food supply chains (6, SO10)
L.4. Increasing consumer awareness of COVID-19 on local products, secure products (SMARTCHAIN H2020 research, 6)

2.1.SO3.1.4 Threats

F.1 In the absence of producer cooperation, bargaining power in the supply chain remains weak (3)
F.2 Internal market demand constraint, increase in import pressure (SO2)
F.3 Slow generational renewal, slow changes in producer competences and interests may hinder consolidation (SO7)

F.4. Retail chains take advantage of the difference in market power (3)

F5. Extreme price volatility (5)

2.1.SO3.1.5 Other comments

Not relevant.

2.1.SO3.2 Identification of needs

Code	Title	Prioritisation at the level of the CAP Strategic Plan	Need is addressed in Cap Strategic Plan
3.1.1	Promoting horizontal and vertical integration, coordination and cooperation	1	Yes
3.1.2	Increase the number and market efficiency of sectoral cooperation (including PO, PG)	1	Yes
3.1.3	Development of short supply chains (database, tool, infrastructure and competence development)	1	Yes
3.1.4	Development of local cooperation in product production, distribution and marketing	1	Yes
3.2.1	Ending information asymmetry between producers and traders	3	No
3.2.2	Strengthening contractual discipline, strengthening long-term contractual relations	2	No

Other comments related to needs assessment.

Number of supported operational programmes
Sectoral - Fruit and Vegetables	QUAL(47(1)(g)) - implementation of Union and national quality schemes	SC16_E11_FVQ_47 - use of EU and national quality schemes	O.35. Number of supported operational programmes
Sectoral - Fruit and Vegetables	TRACE(47(1)(h)) - implementation of traceability and certification systems, in particular the monitoring of the quality of products sold to final consumers	SC17_E12_FVC_47 - application of traceability and certification schemes — fruit and vegetables	O.35. Number of supported operational programmes
Sectoral - Fruit and Vegetables	CLIMA(47(1)(i)) - actions to mitigate and to adapt to climate change	SC18_G02_FVL_47 - climate change mitigation and adaptation measures — fruit and vegetables	O.35. Number of supported operational programmes
Sectoral - Fruit and Vegetables	SETUP(47(2)(a)) - setting up, filling and refilling of mutual funds by producer organisations and by associations of producer organisations recognised under Regulation (EU) No 1308/2013, or under Article 67(7) of this Regulation	SC19_I01_FVF_47 - mutual funds — fruit and vegetables	O.35. Number of supported operational programmes
Sectoral - Fruit and Vegetables	INVVO(47(2)(b)) - investments in tangible and intangible assets making the management of the volumes placed on the market more efficient including for collective storage	SC20_I02_FVV_47 - investments to improve the management and joint storage of quantities placed on the market — fruit and vegetables	O.35. Number of supported operational programmes
Sectoral - Fruit and Vegetables	STORE(47(2)(c)) - collective storage of products produced by the producer organisation or by its members, including where necessary collective processing to facilitate such storage	SC21_I03_FVS_47 - joint storage of products, including, where necessary, the collective processing of products — fruit and vegetables	O.35. Number of supported operational programmes
Sectoral - Fruit and Vegetables	ORCHA(47(2)(d)) - replanting of orchards or olive groves where that is necessary following mandatory grubbing up for health or phytosanitary reasons on the instruction of the Member State competent authority or to adapt to climate change	SC22_I04_FVR_47 - replanting of orchards — fruit and vegetables	O.35. Number of supported operational programmes
Sectoral - Fruit and Vegetables	WITHD(47(2)(f)) - market withdrawal for free-distribution or other destinations, including where necessary processing to facilitate such withdrawal	SC23_I05_FVW_47 - withdrawals for free distribution or other destinations — fruit and vegetables	O.35. Number of supported operational programmes
Sectoral - Fruit and Vegetables	GREEN(47(2)(g)) - green harvesting consisting of the total harvesting on a given area of unripe non-marketable products which have not been damaged prior to the green harvesting, whether due to climatic reasons, disease or otherwise	SC24_I06_FVG_47 - green harvesting — fruit and vegetables	O.35. Number of supported operational programmes
Sectoral - Fruit and Vegetables	NOHAR(47(2)(h)) - non-harvesting consisting of the termination of the current production cycle on the area concerned where the product is well developed and is of sound, fair and marketable quality, excluding destruction of products due to a climatic event or disease	SC25_I07_FVN_47 - non-harvesting — fruit and vegetables	O.35. Number of supported operational programmes
Sectoral - Fruit and Vegetables	HARIN(47(2)(i)) - harvest and production insurance that contributes to safeguarding producers' incomes where there are losses as a consequence of natural disasters, adverse climatic events, diseases or pest infestations while ensuring that beneficiaries take necessary risk prevention measures	SC26_I08_FVH_47 - harvest and production insurance — fruit and vegetables	O.35. Number of supported operational programmes
Sectoral - Fruit and Vegetables	COACH(47(2)(j)) - coaching to other producer organisations and associations of producer	SC29_I10_FVC_47 - personalised advice – fruit and vegetables	O.35. Number of supported

Vegetables	organisations recognised under Regulation (EU) No 1308/2013 or under Article 67(7) of this Regulation, or to individual producers		operational programmes
Sectoral - Fruit and Vegetables	COMM(47(2)(1)) - communication actions aiming at raising awareness and informing consumers	SC27_I09_FVM_47 - communication activities to raise awareness and inform consumers — fruit and vegetables	O.35. Number of supported operational programmes
RD	COOP(77) - Cooperation	RD44_R03_POG_77 - Support to producer groups, producer organisations	O.28. Number of supported producer groups and producer organisations
RD	COOP(77) - Cooperation	RD45_R04_GIS_77 - Support for cooperation to establish a new PDO/PGI/GJ/TSG and to carry out a new activity related to the operation of the quality scheme in the framework of EU quality schemes	O.29. Number of beneficiaries receiving support to participate in official quality schemes
RD	COOP(77) - Cooperation	RD46_R05_GIJ_77 - Cooperation in the case of an existing national quality scheme or a PDO/PGI/GI/TSG or organic product registered in an EU quality scheme	O.29. Number of beneficiaries receiving support to participate in official quality schemes
RD	COOP(77) - Cooperation	RD48_R07_QSP_77 - Support for information and promotion activities for quality schemes	O.32. Number of supported other cooperation operations or units (excluding EIP reported under O.1)
RD	COOP(77) - Cooperation	RD49_R09_SCC_77 - Rural Development Cooperation for the Development of Short Supply Lances	O.32. Number of supported other cooperation operations or units (excluding EIP reported under O.1)
RD	COOP(77) - Cooperation	RD57_R15_LDR_77 - Preparation and implementation of LEADER strategies	O.31. Number of supported local development strategies (LEADER) or preparatory actions

Overview

3.1.Main Needs: Increase organisation, increase the efficiency of cooperation and encourage concentration of supply

The assessment of the situation shows that farmers' willingness to cooperate in Hungary is weak, with fragmented production structures and farm sizes, especially in certain sectors. Insufficient concentration of supply justifies strengthening both horizontal and vertical cooperation, which can improve the efficiency of product pathways, value chains and producers' bargaining power.

3.1.1.Requirement: Promoting horizontal and vertical integration, coordination and cooperation

3.1.2.Requirement: Increasing the number and market efficiency of sectoral cooperation (including POs, PGs)

Encouraging horizontal and vertical cooperation between producers can contribute to concentration of supply and to improving the efficiency of product pathways and value chains. In order to achieve this goal, cooperation will help to acquire the right state-of-the-art knowledge (SC11, SC12 measures) and improve their chances of access to the market by promoting better compliance with the expectations and

requirements of consumers and retail (actions SC14, SC15, SC16, SC17, SC27). In order to reach marketable commodity funds, we promote joint storage and processing of products in cooperation between producers (SC20, SC21 measures) and, last but not least, encourage and facilitate the implementation and operation of producer groups (measures SC28, RD44).

3.1.3.Requirement: Development of short supply chains (database, tool, infrastructure and competence development)

Short supply chains (REL) offer alternative sales to producers and a new type of purchasing option based on personal trust for consumers (measure RD49). The REL can also contribute to social and environmental sustainability, but it is only economically viable if it is brought together by several producers, and we therefore support producer groupings (measures SC28 and RD44).

3.1.4.Requirement: Development of local cooperation (unitions) in the production, distribution and marketing of products

Close cooperation between producers can improve their access to the market by developing, implementing, or setting up joint joint producer, marketing and tourism associations, linked to the geographical area.

3.2.Main demand: Increasing transparency and transparency

One of the negative consequences of the low degree of cooperation is the weak bargaining power of producers in product pathways and value chains, and contributes to the development of unclear, conflicting interests, and discourages transparent operation.

3.2.1.Removal of information asymmetry between producers and traders

The imbalance of power along the food chain is exacerbated by differences in access to information, and it is therefore important to collect, process and provide relevant data and information to producers in an appropriate and comprehensible form. The need is not addressed within the framework of the CAP.

3.2.2 Strengthen contractual discipline, strengthening long-term contractual relations

The lack of compliance with contracts remains a problem in supply chains, which increases risks, makes long-term planning difficult and makes it difficult to make the right market decisions. The development of long-term contractual relationships will lead to a more predictable market environment for both suppliers and buyers. We cannot strengthen contractual discipline with a support measure, and the legislative environment needs to be properly designed.

2.1.SO3.5 Where relevant, a justification for the use of InvestEU, including the amount and its expected contribution to the Specific Objective/Cross-Cutting Objective

Not relevant.

2.1.SO3.8 Selection of the result indicator(s)

Selection of the result indicator(s) for this specific objective

Result indicators [recommended Result indicators for this specific objective are fully displayed in bold]	Target value
R.10^{CU PR} - Better supply chain organisation Share of farms participating in producer groups, producer organisations, local markets, short supply chain circuits and quality schemes supported by the CAP	2.59 %
R.11/Fruit and Vegetables - Concentration of supply Share of value of marketed production by producer organisations or producer groups with operational programmes in certain sectors	20.92 %
R.39^{CU} - Developing the rural economy Number of rural businesses including bio-economy businesses developed with CAP support	7,900.00

Justification of the targets and related milestones

SO3 – Improving farmers' position in the value chain

The milestone value of each R indicator and the value of the contribution of the related interventions (by

year) are set out in the attached table, so they are not described in detail in the text.

R.10^{CU PR} – Improving supply chain organisation: Share of farms participating in Producer Groups, Producer Organisations, local markets, short supply chain circuits and quality schemes supported by the CAP

The overall target for R.10 is 2.55 %, representing 6145 beneficiary farms, compared to a total of 241.000. All interventions ensuring the total design value of the R.10 indicator respond to one or more of the needs underlying the SO3 specific objective.

It is responsible for almost two thirds of the target, making it a priority intervention to support the operational funds (SC11-28_1-18_FV_47), through which as early as 2023, 3300 farms will receive real help to acquire adequate, up-to-date knowledge and improve their chances of market access by helping consumers and retail to better meet their expectations and requirements. A further increase in the order of magnitude of the indicator value is expected from 2025, when a further 1905 farms can benefit from cooperation by supporting the realisation and operation of producer groupings (RD44_R03_POG_77). Support for cooperation under new (RD45_R04_GIS_77) or existing quality schemes (RD46_R05_GIJ_77) will involve an additional 730 economies in improving supply chain organisation, and intervention aimed specifically at developing short supply chains (RD49_R09_SCC_77) supports an additional 210 economies – these interventions involve farms continuously over four years from 2024 onwards, thus reaching the target by 2027.

The effectiveness of the R.10 target interventions becomes tangible through an overview of the needs underpinning the SO3 objective.

In the EU, the POs and other producer groups are responsible for ensuring co-operation between fruit and vegetable producers and thus ensuring the representation of producers and the development of their bargaining power. In 2007, the European Commission set a target of 60 % of fruit and vegetables marketed through POs by 2013, but according to the 2010 figures published by the organisation in 2014, this target was not met. Hungary's market share was close to 20 %^[1]. In the domestic environment, PGs play a crucial role in strengthening farms of smaller economic size through coordination of production, advice and innovation brokering for the production of raw materials. At the same time, the vast majority of PGs operating in the domestic environment are currently partially integrated and their activity is limited to the joint purchase of inputs and the joint sale of the commodity fund produced by the membership. Value-added co-operations covering several stages of the product chain still have significant development potential in the domestic food economy^[2]. In April 2018, 61 POPs and 6 fruit and vegetables PGs were recognised in Hungary. There has been a downward trend in the number of organisations since 2014.^[3] It is therefore necessary to increase the **number of sectoral cooperation (including POs, PGs) and their market efficiency**. (3.1.2) Due to the low co-ordination of production, there is a continuous challenge for the processing industry to procure sufficient quantities of uniform quality raw materials^[4]. The processing of fruit and vegetables in Hungary has a relatively narrow range of products, and it is not possible to expand the product scope without strengthening cooperation between producers and processors^[5] The low degree of **horizontal and vertical coordination** is true for most product pathways, which needs to be strengthened in order to ensure effective cooperation (3.1.1). Interventions to support the operational funds (SC11-28_1-18_FV_47) and to Producer Groups and Producer Organisations (RD44_R03_POG_77) are active in addressing these two needs.

Over the past 10-15 years, there has been a growing consumer demand in the EU countries for food sold directly by producers or only by an intermediary. The participation of producers and consumers in the Short Supply Chain (REL) is not only a source of greater bargaining power for producers compared to global supply systems, but also generates social and environmental benefits^[6]. Without the development of cooperation and further social and economic development, both the spread of modern RELs and the sustainable functioning of traditional forms are rather uncertain. After the re-opening of the economy following the COVID outbreak, many newly created direct sales channels are struggling to survive. In order to survive, the **development of short supply chains** (need 3.1.3) should include, inter alia, the development of innovative food supply chains, support for the development of information and

communication (ICT) tools for producers, the development of applied software, and education in the use of ICT tools. It should also include support for the development of logistics capacity, the promotion of innovative solutions for delivery (cooling or fragile goods) and help create the legal conditions for producers' own-house delivery systems, temporarily easing the administrative burden[7]. A total of 2115 farms will receive support to address this need through the RD44_R03_POG_77 and RD49_R09_SCC_77 interventions.

The producers currently involved in the REL are typically the smallest (primary producers, individual or micro-enterprises), farmers do not have sufficient transport, storage, commercial infrastructure and equipment in sufficient quantities and quality, and the supply is insufficient, particularly in terms of resource efficiency.[8] Therefore, it is necessary to **further develop local cooperation (grouping) in the production, marketing and marketing** of products. (3.1.4) In addition to the 1905 farms affected by the support of producer groups and producer organisations, in addition to RD44_R03_POG_77, a further 940 farms could improve their chances of access to the market through the development of common geographical-related quality schemes and trade marks through interventions RD45_R04_GIS_77, RD46_R05_GIJ_77, RD49_R09_SCC_77; furthermore, intervention RD48_R07_QSP_77 will also contribute in real value without a plan value.

Large processors are characterised by integration in providing themselves with sufficient quantity of quality raw materials (e.g.: sweet corn, green peas). Smaller producers and suppliers struggle to commit themselves to a distribution channel and therefore it is difficult to establish long-term cooperation with them. In the absence of secure, predictable and accountable sales opportunities, producers do not implement technological developments (e.g.: plantation modernisation, irrigation development) and will not start – to a greater extent – into the production of new species, which means that the processing industry does not have sufficient access to a homogeneous commodity base of sufficient quality, without which it will not be able to produce new, innovative products, not based on basic industrial fruit and vegetables.[9] Consequently, **it is necessary to strengthen contractual discipline and strengthen long-term contractual relations**. (Requirement 3.2.2). Support for green harvesting and non-harvesting interventions in the fruit and vegetable sector (SC24_I06_FVG_47, SC25_I07_FVN_47) could improve the possibility of establishing long-term contractual relations.

R.11 – Concentration of supply side: Share of value of marketed production by producer organisations or producer groups with operational programmes in certain sectors

The overall target for indicator R.11 is 19.52 %. Method of calculation: Planned total value of marketed production of producer organisations participating in operational programmes: EUR 243434744. Total value of production in the sectors concerned (actual data available for the last year): EUR 1247231821. The intervention responsible for the overall target for indicator R.11 is the support to the operational funds (SC11-28_1-18_FV_47), which addresses the following needs, which are already surrounded by indicator R.10, as already presented at R.10:

- Encouraging horizontal and vertical integration, coordination and cooperation (3.1.1);
- Increasing the number and market efficiency of sectoral cooperation (including POs, PGs) (3.1.2);
- Development of short supply chains (database, tool, infrastructure and competence development) (3.1.3).

R.39^{CU} – Development of the rural economy: Number of rural businesses including bio-economy businesses developed with CAP support

The overall cumulated target for R.39 is 4600 rural economies. To reach the target, there is a complex intervention package: We expect added value from 11 interventions. We expect strong progress in the indicator's target in 2027, with steady increases before and after.

The SO3 specific objective R.39 is linked to an intervention with no design value (SC28_E01_FVI_47). Interventions supporting the achievement of the SO3 specific objective will contribute to the target of indicator R.39 by addressing the following needs, already described in detail in indicator R.10: In order to strengthen horizontal and vertical integration (3.1.1) and to increase the number and market efficiency of

sectoral cooperation (including POs, PGs) (3.1.2) and to develop short supply chains (3.1.3), support for fruit and vegetable producer organisations (SC28_E01_FVI_47) is available for rural farms; there is no plan value for the farms concerned.

2.1.SO3.9 Justification of the financial allocation

Farmers' position in the value chain can be improved by encouraging horizontal and vertical integration, coordination and cooperation. Our aim is to increase the number and market efficiency of sectoral cooperation (e.g. POs, PGs), to develop short supply chains and local cooperation in product production, distribution and marketing. Sectoral measures and collaborative measures under Pillar II contribute to achieving our goals. We consider that the allocated resources are sufficient to achieve the objectives.

Commission recommendations for SO

- Strengthen the position of farmers by supporting: farmer cooperation – in particular through producer organisations which integrate their economic activities; farmers' engagement in more downstream activities; innovation; and the development of new markets.
- Improving the resilience of the agricultural sector by supporting the sector in adding value to products, e.g. through EU quality schemes (including organic farming), processing or specialisation in products for which Hungary has a competitive advantage.

The significant increase in the processing/added value of the agricultural product is a significant increase in the objectives of this SO and makes it much easier to meet the recommendations, just as in the case of SO2.

2.1.SO4 Contribute to climate change mitigation and adaptation, including by reducing greenhouse gas emission and enhancing carbon sequestration, as well as promote sustainable energy

2.1.SO4.1 Summary of the SWOT Analysis

2.1.SO4.1.1 Strengths

- E.1. Agricultural risk management system. The contribution of the national ice mitigation system, which is part of the domestic agricultural risk management system, to the reduction of ice damage caused on agricultural land. The mitigation scheme contributes to managing the risks of weather and other natural events affecting agricultural production [SO4/4.1]
- E.2. Technologies to improve energy efficiency are applied to agriculture, forestry and the food industry [SO4/3.3]
- E.3. Widespread use of agro-technologies (use of cover crops, soil relaxation, etc.) to improve organic matter sequestration and water management of soils [SO4/4.3]
- E.4. Exploring and promoting afforestation opportunities for non-agricultural land [SO4/2.2]

2.1.SO4.1.2 Weaknesses

- Gy.1. GHG emissions from agriculture are increasing from 2013 [SO4/1.2]
- Gy.2. Relatively low share of renewable energy in the energy use of the agricultural economy [SO4/3.1]
- Gy.3. Most farmers are unable to adapt to the changing production conditions due to climate change due to knowledge gaps, scale efficiency and technological gaps [SO4/5.1]
- Gy.4. Tillage techniques that retain water are not used, and most farmers do not have the necessary machinery and knowledge to do so. They are not taught [SO4/4.3]
- Gy.5. Limited data available to assess adaptation to climate change, difficulties in accessing databases available in different locations and a lack of preparation of the monitoring system to assess the fulfilment of climate and energy targets [SO4/6.1]
- Gy.6. Lack of a mosaic landscape structure for adaptation, under-utilisation of existing elements. Non-inclusion of adaptation to landscape conditions
- Gy.7 The health status of several groups of tree species in the domestic forest stand is deteriorating and its age and species composition is unfavourable; reforestation is prolonged, carbon sequestration capacity is reduced [SO4/2.1]
- Gy.8. Forest cover is lagging behind and its improvement is hampered by insufficient institutional capacity in afforestation. [SO4/2.2]
- Gy.9 Low levels of producer cooperation hamper larger-scale agricultural investments in climate protection

2.1.SO4.1.3 Opportunities

- L.1.Intensification and further development of innovative technologies and sustainable approaches in agriculture, forestry and food (e.g. precision farming, circular farming)
- L.2.Increase renewable energy production and use in agriculture and forestry [SO4/3.1], [SO4/3.2]
- L.3.Building on the available research infrastructure, R & D & I, ITC new technologies, processes, products will be developed, new technologies will be deployed in education [SO4/5.1]
- L.4.The horizontal and vertical cooperation of farmers will enable better climate change preparedness and adaptation
- L.5.The landscape role will be used as a climate regulator, increasing forest and grassland, wetlands, border habitats [SO4/2.1] [SO4/4.2]
- L.6.In situ water retention also has a positive impact on climate regulation [SO4/4.3]
- L.7.The use of agro-technologies to improve carbon dioxide and other GHG sequestration of soils (non-

disturbed cultivation) is widely spread [SO4/1.1]

L.8.Increasing adaptation possibilities as a result of research to preserve the health and potential of forests

L.9.The pressure on consumer demand in short supply chains can improve producers' climate awareness and thus their resilience

L.10.There is a large number of alternative domestic climate protection tools and products development that require research into their mode of action

L.11.Improvement of forest fire management

L.12.Physical protection against hail and frost (nelons, nets)

L.13.Improvement of soil quality, which contributes to increasing its water retention and nutrient retention capacity

L.14.Crop, grassland and forestry play an important role in adapting to climate change and have the potential to mitigate the adverse effects of climate change

L.15.Filter and inland water mapping help increase adaptability [SO4/4.1]

L.16. Research institutes have great experience in producing varieties adapted to domestic climatic conditions [SO4/7.1]

2.1.SO4.1.4 Threats

F.1.Increased agricultural damage due to changes in the nature of plant and animal diseases or changing cultivation conditions due to climate change [SO4/7.1]

F.2.Increase in food prices due to climate change mitigation and adaptation obligations may lead to carbon leakage to countries with less stringent environmental requirements

F.3.Increase in financial risks due to climate change

F.4.The share of natural and semi-natural habitats mitigating the effects of climate change is decreasing due to the rise of greenfield investments (line facilities, industrial investments)

F.5.Take land use (e.g. extensive agricultural production, woodland) contributing to climate change mitigation due to a lack of long-term return from low profitability

F.6.The grassland area is decreasing

F.7.Decrease of agricultural area suitable for crop production or forested or wooded cover due to accelerating climate change

F.8.The market treats weather anomalies inflexible, resulting in a lack of responsiveness of the prices of producer products to the supply of demand

F.9.The holistic modelling of climate change currently contains too many uncertainties (e.g.: lack of forecasting and modelling of animal husbandry systems at EU level)

F.10.Emissions from agriculture will increase in the 'existing measures' (WEM) scenario and stagnate in the 'supplementary measures' (WAM) scenario

F.11. Carbon removals from LULUCF will decrease in both WEM and WAM scenarios

F.12 We do not have a national database and monitoring system for monitoring domestic climate change (due to the fragmented institutional structure) [SO4/6.1]

2.1.SO4.1.5 Other comments

Not relevant.

2.1.SO4.2 Identification of needs

Code	Title	Prioritisation at the level of the CAP Strategic Plan	Need is addressed in Cap Strategic Plan
4.1.1	Improving the carbon sequestration capacity of soils and ecosystems	1	Yes

4.1.2	Reduction of GHG and ammonia emissions through technological development of livestock farming	2	Yes
4.2.1	Maintaining the carbon balance of forest stands and promoting climate adaptive renewal	2	Yes
4.2.2	Reduction of GHG and atmospheric load gases emissions using forestry tools	2	Yes
4.3.1	Increasing the use of renewable energy, taking into account potential environmental conflicts	3	Yes
4.3.3	Increasing efficiency of energy use at operational and technological level	1	Yes
4.4.1	Development of solutions and tools to protect against adverse weather effects	1	Yes
4.4.2	Review of the use of arable land at the boundary of economics	2	Yes
4.4.3	Improving the water retention capacity of soils and ecosystems by encouraging land-use change	1	Yes
4.5.1	Knowledge transfer and its development on climate change production conditions	1	Yes
4.6.1	Development of regional databases for climate change adaptation assessment.	1	Partially
4.7.1	Development and use of climate-additive and climate-adaptive plant and animal breeds	1	Yes
5.4.2	Reducing ammonia emissions from agriculture	2	Yes
6.1.2	Maintenance or improvement of the natural condition of high nature value sites	1	Yes
8.1.6	Biomass feedstocks, intermediate products, waste processing, renewable energy use	1	Partially
8.1.7	Replacement of fossil industrial feedstocks with green substitutes	1	Yes

Other comments related to needs assessment.

Not relevant

2.1.SO4.3 Identification of the relevant (elements of) national plans emanating from the legislative instruments referred to in Annex XI of the CAP plan Regulation that have been taken into account in the CAP plans' needs assessment for this specific objective

Needs

4.1.Reduction of GHG and atmospheric gas emissions by means of agriculture

4.1.1.Improving the carbon sequestration capacity of soils and ecosystems: establishment and maintenance of grasslands, non-productive areas, wetlands, selvedges, conservation trees, development of agro-technological practices, changes in manure application

4.1.2.Development of livestock farming, in particular feeding and husbandry technology, and manure storage in a way that reduces GHG emissions

4.2.Reduction of GHG and atmospheric gas emissions by forestry equipment

4.2.1.Preserving the carbon balance of forest stands and promoting climate adaptive renewal

4.2.2.Reduction of GHG and atmospheric load gases by forestry equipment

Annex XIII EU legislation

Regulation (EU) 2018/841 of the European Parliament and of the Council of 30 May 2018 on the inclusion of greenhouse gas emissions and removals from land use, land use change and forestry in the 2030 climate and energy framework, and amending Regulation (EU) No 525/2013 and Decision No

Regulation (EU) 2018/842 of the European Parliament and of the Council of 30 May 2018 on binding annual greenhouse gas emission reductions by Member States from 2021 to 2030 contributing to climate action to meet commitments under the Paris Agreement and amending Regulation (EU) No 525/2013

Related objectives of national environmental and climate plans

Second National Climate Change Strategy 2018-2030 with a 2050 perspective

1.

- *Domestic Decarbonisation Tool: sectoral priority lines and tasks for reducing domestic greenhouse gas emissions*
- *Agriculture; Opportunities to mitigate climate-related damage in agriculture*

National Energy and Climate Plan

1.

- *Greenhouse gas emissions should be reduced by at least 40 % by 2030 compared to 1990, i.e. gross emissions should not exceed 56.19 million tCO₂e in 2030, or 7.6 million tCO₂e in 2017.*
- *The primary objective of reducing agricultural emissions is the requirement of good agricultural practices and various support instruments.*
- *In order to enhance CO₂ sink capacities, in line with the National Forest Strategy, we will significantly increase the share of forest and other woodland cover.*

National Clean Development Strategy 2021 (draft)

1.

- *Hungary strives for net-zero GHG emissions, i.e. climate neutrality by 2050*
- *Full integration of climate change as an edge condition into agricultural policies and practices by 2050, taking into account decarbonisation requirements and actual climate changes*
- *Reducing GHG emissions in agriculture by means that also promote yields;*
- *Reducing ammonia emissions from agriculture by 32 % by 2030;*
- *Enhancing carbon sequestration (carbon storage in soil by increasing the organic carbon stock of soils and in biomass);*
- *Improving the gross nutrient balance of agricultural land, reducing extortion and replenishment of organic matter;*
- *Circular use of plant by-products in soil management and biomass-based agriculture;*
- *Launching pilot plants to showcase innovations in the biomass economy;*
- *Increasing the area and proportion of the total agricultural area covered by agri-environmental programmes;*
- *The production of renewable energy of agricultural origin through the rational use of by-products;*
- *Encourage climate investments and agro-technical solutions through producer cooperation.*
- *Fully integrate climate change as an edge condition into forest policies, taking into account decarbonisation requirements and actual climate changes.*
- *Increased protection of forests, forest degradation, prevention of forest fires, negative impacts and reduction of carbon emissions.*
- *The development of the wood industry capable of processing wood to the greatest extent possible, which provides a high-quality wood raw material, greater use of wood as a renewable raw material, greater energy investment and the replacement of raw materials and products produced with high GHG emissions.*

National Forest Strategy 2016-2030

1.

- *The role of forests in carbon sequestration, promoting the adaptation of forests to the effects of climate change*

4.3. Increase the share of renewable energy use and deployment in the agricultural sector and increase energy efficiency

4.3.1. Increase the use of renewable energy taking into account ecological aspects and possible environmental conflicts (e.g. energy plantations, invasive species, use of thermal water, etc.)

4.3.2. Increase the production of RES based on siomas, taking into account ecological aspects and possible environmental and food production conflicts (e.g. energy plantations, invasive species, straw utilisation, etc.).

4.3.3. Increasing efficiency in energy use at operational and technological level

Annex XIII EU legislation

Directive 2009/28/EC on the promotion of the use of energy from renewable sources;

Regulation (EU) 2018/1999 OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 11 December 2018 on the Governance of the Energy Union and Climate Action, amending Regulations (EC) No 663/2009 and (EC) No 715/2009 of the European Parliament and of the Council, Directives 94/22/EC, 98/70/EC, 2009/31/EC, 2009/73/EC, 2010/31/EU, 2012/27/EU and 2013/30/EU of the European Parliament and of the Council, Council Directives 2009/119/EC and (EU) 2015/652 and repealing Regulation (EU) No 525/2013 of the European Parliament and of the Council

RD	COOP(77) - Cooperation	RD37_F04_FRC_77 - Co-operative support for forest fire prevention and risk reduction	O.32. Number of supported other cooperation operations or units (excluding EIP reported under O.1)
RD	COOP(77) - Cooperation	RD52_R12_BIC_77 - Rural development cooperation for the development of a biomass-based economy	O.32. Number of supported other cooperation operations or units (excluding EIP reported under O.1)
RD	COOP(77) - Cooperation	RD57_R15_LDR_77 - Preparation and implementation of LEADER strategies	O.31. Number of supported local development strategies (LEADER) or preparatory actions

Overview

4.1. Main Needs: Reduction of GHG and atmospheric gas emissions through agricultural instruments

The situation reveals that global climate change is most affected by the presence of greenhouse gases and pollutants in the atmosphere. Agriculture is the sector most vulnerable to climate change, with effects differentiated over time and space and causing different damage. In Hungary, most economic sectors contribute to high levels of GHG emissions, accounting for 72 per cent of energy production and consumption, 11-11 per cent for industry and agriculture and 5 per cent for waste management. At the same time, in addition to GHG emissions, the agricultural economy also has significant carbon sequestration potential as a result of farmland farming, which can be influenced in both positive and

negative directions, depending on the farming practices used. Prioritising livestock and crop farming practices focused on GHG emission reduction can reduce the net emissions footprint of agriculture.

Need 4.1.1: Improving the carbon sequestration capacity of soils and ecosystems: establishment and maintenance of grasslands, non-productive areas, wetlands, selvedges, conservation trees, development of agro-technological practices, changes in manure application

The carbon sequestration capacity of soils and ecosystems can be improved by developing and maintaining grasslands, non-productive areas, wetlands, selvedges, conservation trees, developing agrotechnological practices and altering manure application. Among the optional requirements of the basic agro-ecological programme (DP17), winter soil cover, tillage without rotation, cover between plantations and the maintenance of higher non-productive areas contribute to the carbon sequestration of agricultural land, and the use of soil conditioners and microbial products contributes to reducing fertiliser application and reducing ammonia emissions. Several of the general requirements for agri-environmental management payments (AKG, RD19) cover sustainable nutrient management, contributing to reducing fertiliser application and thus reducing ammonia emissions. It contributes directly to the reduction of ammonia emissions from agriculture as a result of the principles and rules laid down in EU legislation on organic production (RD20, SC13). Agro-ecological non-productive (RD21) and land-use change (RD22) interventions aim to curb the current decline of grasslands and wetlands and promote their growth.

Need 4.1.2: Improving livestock farming practices, in particular feed and husbandry technology, and manure storage in a way that reduces GHG emissions

The significant extension of the animal welfare measures envisaged in the CAP aims at the sustainable development of animal husbandry in terms of both animal species and expectations, helping keepers to apply stricter animal welfare, hygiene, husbandry and feeding standards than the mandatory requirements. Enhancing farm competitiveness and value-added production by supporting the uptake and development of new, innovative and environmentally friendly cultivation, breeding and production technologies (RD30, RD31, RD01d) contributes to the reduction of carbon emissions and energy consumption on farms.

4.2. Main Needs: Effective transfer of knowledge to take up an economic activity

Estimates show that the land use, land use change and forestry sector (LULUCF) in Hungary has been a net carbon sink over the last decade. In general, forest land (FL) is the largest contributor to this net carbon sink, with WL and built-up areas (SE) being a net source of emissions, while grassland (GL) and arable crop production (CL) are net emitters in some years and net sinks in others. Increasing forest areas and increasing woody cover, which can also be used as an ecological solution to reduce the risk of damage to agriculture, are desirable.

Need 4.2.1: Preserving the carbon balance of forest stands and promoting climate adaptive renewal

Forest growth plays an important role in domestic climate regulation, which is ensured by afforestation activity in addition to current agricultural subsidies. The health status of several groups of tree species in the domestic forest stand is deteriorating and its age and species composition is unfavourable; reforestation is protracted, carbon sequestration capacity is being reduced, it is of utmost importance to increase investments in competitive forest management and investments for the environmental sustainability of forest management (RD40, RD41).

Need 4.2.2: Reduction of GHG and atmospheric gas emissions by forestry equipment

One of the key objectives of intervention to support the development and maintenance of afforestation and creation of woodland is to reduce the effects of climate change through land-use change and to significantly sequester carbon dioxide. The situation revealed that forest cover in Hungary is lagging behind, and this improvement is hampered by insufficient institutional capacity in the State for afforestation. The planned measures are intended to explore and encourage afforestation opportunities for non-agricultural land (RD38) and to maintain them (RD35, RD41).

4.3. Main Needs: Increasing the share of renewable energy use and deployment in the agricultural sector, increasing energy efficiency

Rural development policy measures that lead to an increase in energy efficiency and the use of renewable energy produced have the effect of reducing fossil dependency at macro-economic level, increasing

energy security, reducing vulnerability to external energy imports, improving the external trade balance and improving the country's competitiveness.

Need 4.3.1: Increase the use of renewable energy taking into account ecological aspects and possible environmental conflicts (e.g. energy plantations, invasive species, use of thermal water, etc.)

Increasing the use of renewable energy is an important tool for climate adaptation, but this should only be done taking into account ecological aspects and possible environmental conflicts (e.g. energy plantations, invasive species, use of thermal water, etc.). Investments in farm development and the enhancement of the value of agricultural products should be supported by interventions aimed, inter alia, at improving energy efficiency and the use of renewable energy, thereby improving farm sustainability (RD01c, RD04b, SC06, SC18). Increasing the deployment of renewable energy is part of rural infrastructure development (RD42, RD43, RD52).

Need 4.3.3: Increasing efficiency in energy use at operational and technological level

Efficient energy use also reduces GHG emissions, including climate change, which is best achieved at operational level and through technological interventions (RD01c, RD04b).

4.4. Main Needs: To mitigate and adapt to the negative impacts of climate change by reviewing technologies and land use

Climate change mitigation and adaptation options are environmentally friendly water retention and irrigation development, for which the sustainable use of water (water regulation, waste water treatment) is not yet exploited, and the rationalisation of land use and the use of site-specific technologies for dry farming in most agricultural areas should also be prioritised.

Need 4.4.1: Development of technologies and tools to help protect against negative weather effects to prevent damage (e.g. drought, burns, fire damage, biotic damage, frost damage)

The development of technologies and tools to help prevent damage, including mitigating the effects of climate change (e.g. drought, burns, fire, biotic damage, frost damage) is an important tool and investments in their application and development (SC18, SC28, RD18, RD37, RD41).

Need 4.4.2: Review the use of arable land cultivated at the limits of economy and optimise alternative use

The review of the use of arable production sites cultivated at the limits of economy and the optimisation of alternative uses will make it possible to take advantage of the climate protection effect of extensive farming (DP17, RD21, RD22, RD38, RD39).

Need 4.4.3: Improving the water retention capacity of soils and ecosystems by encouraging land use change (forest, grassland, wetland), making land cover mosaic (shelf habitats, non-productive areas) and using agro-water conservation techniques, including the development of lined water retention facilities that can be cultivated

Improving the water retention capacity of soils and ecosystems can be achieved by encouraging land use change (forest, grassland, wetlands), making land cover mosaic (marine habitats, non-productive areas) and using water conservation agronomic techniques (DP17, RD19, RD21, RD22, RD38, RD39).

4.5. Main Needs: Knowledge transfer and development of climate change production conditions and adaptation options

The climate mitigation and adaptability of the agricultural economy to climate change is crucially influenced by the use of new knowledge and innovation in production, the success of which is ensured by the presence of well-trained and state-of-the-art professionals and precision farming in production. The use and wider take-up of precision technology to help adapt to climate change and increase the technical efficiency of agricultural production entails a realistic market competitiveness reserve.

Requirement 4.5.1: Knowledge transfer and development of climate change production conditions and adaptation options

The provision of information to operators on climate change production conditions and adaptation options is essential for climate change (SC11, SC12, RD58, RD60).

4.6. Main Needs: Development of climate change adaptation assessment databases and monitoring system

Requirement 4.6.1: Development of regional climate adaptation assessment databases, monitoring and forecasting systems

The development of databases, monitoring and forecasting systems will help assess adaptation to climate change, thereby also contributing to mitigating its impacts. They are supported by planned interventions (SC18). Activity outside the CAP.

4.7. Main Needs: Development and use of climate-adaptive and climate-adaptive plant and animal breeds

Need 4.7.1: Development and use of climate-adaptive and climate-adaptive plant and animal breeds

Need 4.7.1: Development and use of climate-adaptive and climate-adaptive plant and animal breeds

Increasing the resilience of animal and plant varieties is an important tool for climate adaptation. They are supported by planned interventions (SC03, SC18, RD27, RD28).

2.1.SO4.5 Where relevant, a justification for the use of InvestEU, including the amount and its expected contribution to the Specific Objective/Cross-Cutting Objective

Not relevant.

2.1.SO4.7 Are you planning CAP contribution towards the LIFE programme (only for SO4, SO5, SO6)

: No

2.1.SO4.8 Selection of the result indicator(s)

Selection of the result indicator(s) for this specific objective

Result indicators [recommended Result indicators for this specific objective are fully displayed in bold]	Target value
R.12 - Adaptation to climate change Share of utilised agricultural area (UAA) under supported commitments to improve climate adaptation	21.51 %
R.13^{PR} - Reducing emissions in the livestock sector Share of livestock units (LU) under supported commitments to reduce emissions of greenhouse gases and/or ammonia, including manure management	20.74 %
R.14^{PR} - Carbon storage in soils and biomass Share of utilised agricultural area (UAA) under supported commitments to reduce emissions or to maintain or enhance carbon storage (including permanent grassland, permanent crops with permanent green cover, agricultural land in wetland and peatland)	21.14 %
R.15^{CU} - Renewable energy from agriculture and forestry and from other renewable sources Supported investments in renewable energy production capacity, including bio-based (in MW)	131.29 MW
R.16^{CU} - Investments related to climate Share of farms benefitting from CAP investment support contributing to climate change mitigation and adaptation, and to the production of renewable energy or biomaterials	2.29 %
R.17^{CU PR} - Afforested land Area supported for afforestation, agroforestry restoration, including breakdowns	16,174.00 ha
R.18^{CU} - Investment support for the forest sector Total investment to improve the performance of the forestry sector	399,567,252.00 EUR
R.22^{PR} - Sustainable nutrient management Share of utilised agricultural area (UAA) under supported commitments related to improved nutrient management	21.89 %
R.26^{CU} - Investment related to natural resources Share of farms benefitting from CAP productive and non-productive investment support related to care for the natural resource	1.20 %

R.27^{CU} - Environmental or climate-related performance through investment in rural areas Number of operations contributing to environmental sustainability and the achievement of climate mitigation and adaptation goals in rural areas	1,811.00
R.29^{PR} - Development of organic agriculture Share of utilised agricultural area (UAA) supported by the CAP for organic farming with a split between maintenance and conversion	5.26 %
R.30^{PR} - Supporting sustainable forest management Share of forest land under commitments to support forest protection and management of ecosystem services	6.54 %

Justification of the targets and related milestones

SO4 – Contribution to climate change mitigation and adaptation and to the diffusion of sustainable energy

The value of the R indicators related to the SO4 specific objective is heavily influenced by the AKG, ÖKO and AÖP interventions. In the case of these payments, farmers choose from a set of commitments that change their farming practices in an environmentally sound manner. Each commitment contributes to a number of R indicators, as they modify farming practices to an extent that they address a number of natural factors (e.g.: water, soil, biodiversity). Examples include organic grassland management (ÖKO) or retention of unsown land (AKG). These pledges both save nature from chemical use, earthworks and provide habitats for wildlife. ÖKO support is in itself a complex set of commitments, but in the case of AKG and ÖP, farmers have to choose more commitments, so that a given area contributes to most environmental R indicators. The contribution of the requirements to a given R indicator has sometimes been taken into account with different territories, as they also affect natural factors (such as R indicators) at different territorial scales. In the case of biodiversity, the impact on the area concerned may be significantly exceeded (e.g.: 10 % unmown land).

R.12 – Adaptation to climate change: Share of utilised agricultural area (UAA) under supported commitments to improve adaptation to climate change

Overall target for indicator R.12: 21.51 %, representing the 1 141 836 ha supported in 2027 compared to the total area of 5 309 520 ha. The indicator measures only the achievement of SO4 objectives, and 4 out of 6 interventions are used at the planning stage to reach the current target.

One of the most significant interventions contributing to the indicator's target in itself is the *basic programme for agro-ecology* (DP17_G01_ECOS_16), with an equal annual contribution (860 521 ha) in the financial years 2024-2028. Among the optional requirements, winter soil cover, non-rotational tillage, covering between plantations and maintaining a higher proportion of non-productive areas contribute to the carbon sequestration of agricultural land and, on the other hand, the use of soil conditioners and microbial products contributes to reducing fertiliser application, thereby reducing ammonia emissions. The intervention addresses the following three needs of SO4:

- 4.1.1. Improving the carbon sequestration capacity of soils and ecosystems: establishment and maintenance of grasslands, non-productive areas, wetlands, selvedges, conservation trees, development of agro-technological practices, changes in manure application,
- 4.4.2. Reviewing the use of arable land cultivated at the limits of economy and optimising alternative use,
- 4.4.3 Improving the water retention capacity of soils and ecosystems by encouraging land use change (forests, grasslands, wetlands), making land cover mosaic (shelf habitats, non-production areas) and using water conservation agro-technical techniques, including the development of lined water retention facilities that can be cultivated.

The number of hectares supported by *agri-environmental management (AKG) payments* (RD19_G01_AEC_70) is only slightly below and significantly overlaps with the area supported by the basic agro-ecological scheme. Several of the general requirements of the AKG cover sustainable nutrient management (preparation of a nutrient management plan based on soil and leaf analysis, restriction of nitrogen application, application of organic fertilisers) thus contributing to reducing fertiliser application

and thus reducing ammonia emissions. The intervention responds to two needs of SO4:

4.1.1. Improving the carbon sequestration capacity of soils and ecosystems: establishment and maintenance of grasslands, non-productive areas, wetlands, selvedges, conservation trees, development of agro-technological practices, changes in manure application.

The *agro-ecological land use change incentive payment* (RD22_G05_LCP_70) contributes only modestly to the target value of indicator R.12: between 1 and 2 000 ha per year are eligible for aid. The aim of the intervention is to promote the change in land use of arable land currently cultivated at the expense of economy, including through the planting of grasslands and the creation of wetlands, thus promoting a change in land use in favour of carbon sequestration, the storage of carbon in soil and biomass, and an increase in the organic carbon stock of soils. The intervention addresses the following three needs of SO4:

·4.1.1 Improving the carbon sequestration capacity of soils and ecosystems: establishment and maintenance of grasslands, non-productive areas, wetlands, selvedges, conservation trees, development of agro-technological practices, changes in manure application,

·4.4.2. Reviewing the use of arable land cultivated at the limits of economy and optimising alternative use,

·4.4.3 Improving the water retention capacity of soils and ecosystems by encouraging land use change (forests, grasslands, wetlands), making land cover mosaic (shelf habitats, non-production areas) and using water conservation agro-technical techniques, including the development of lined water retention facilities that can be cultivated.

Through the in situ conservation of plant genetic resources (RD28_G 11_GPI_70), 30 260 hectares of assisted area per year can be counted between FY2024 and FY 2027, so the contribution of this intervention to indicator target R.12 is much more modest than other interventions. However, that does not mean that the intervention is not justified in itself. In addition to habitat and racial diversity, the preservation of genetic diversity is a key element of biodiversity, which is of particular importance both in terms of land and forestry, especially in the light of adaptation to the effects of climate change. Gene conservation, landscape varieties, long-range animal breeds and landscape management can be a good starting point for the development of climate-adaptive breeds. The intervention shall be the specific objective SO4 4.7.1 To address the need for “Development and use of climate-adaptive and climate-adaptive varieties of plants and animals”.

Climate change mitigation and adaptation measures – fruit and vegetables (SC18_G02_FVL_47) and sectoral interventions – fruit and vegetables: Support to Producer Organisations (SC28_E01_FVI_47) interventions do not have a planned value, but will subsequently contribute to indicator R.12 in real terms.

R.13^{PR} – Reduction of emissions in the livestock sector: Share of livestock units (LU) under supported commitments to reduce greenhouse gas and/or ammonia emissions, including manure management

Two interventions contribute to the target value of indicator R.13. Among these, the value of the *indicator is more significant in the cattle sector* (RD30_G13_AWC_70), where 327 thousand livestock units are supported in the financial years 2026 and 2027. RD31_G14_AWC_70 – *Animal welfare premiums in the beef cattle sector* will contribute almost half of this (in the same years) to the indicator at 180000 LU. The target setting for both interventions is based on a background calculation by independent experts.

The general welfare and more liveable conditions of domestic dairy and meat cattle herds are determined by husbandry technology and feed, therefore, in these two areas, it is particularly justified to apply animal welfare obligations and commitments that substantially improve the animals’ husbandry and feed and overall living conditions. However, the implementation of such a commitment entails a significant loss of income which needs to be compensated.

Interventions shall be covered by the SO4 specific objective 4.1.2. To address the need for “GHG and ammonia emission reduction through technological improvements in livestock farming”.

R.14^{PR} – Carbon storage in soil and biomass: Share of utilised agricultural area (UAA) under supported commitments to reduce emissions or maintain or increase carbon storage (including: permanent grassland, permanent crops with permanent green cover, agricultural land in wetlands and peatlands)

Overall target for indicator R.14: 21.14 %, corresponding to 894 285 ha in 2024 and 1 122 174 ha in 2027 compared to the total area of 5 309 520 ha. The indicator measures only the achievement of the SO4 objectives, which 4 interventions serve to achieve in terms of plan values.

The achievement of indicator target R.14 is *mainly used for agri-environmental management payments (AKG – RD19_G01_AEC_70)*, where support will be granted uniformly to almost 786 thousand ha per year in 2023-2027. In addition, the size of the areas covered by the *Agro-Ecological Basic Programme (DP17_G01_ECOS_16)*, with a uniform allocation of almost 645 thousand ha per year in 2024-2028, is also to be highlighted. However, the area covered by the AÖP overlaps significantly with the area covered by the AKG, so the indicator target is not significantly increased, nor the *Agro-ecological land-use change payment (RD22_G05_LCP_70)* with a modest contribution (some thousand ha from 2026). The 3 interventions listed have already been described in detail for indicator R.12 (see here).

Support for organic farming (RD20_G02_ORT_70) is also making a significant contribution to the target, with more than 108 thousand hectares of land being supported per year in 2024-2027. The target setting is based on a background calculation carried out by independent experts. In order to achieve the territorial increase set out in the Hungarian eco-management action plan, the aim is to involve all beneficiaries applying for the intervention in the programme. Agro-environmental management payments and support for organic farming have been designed together with and in line with the basic programme for agro-ecology. In the course of the various provisions, Hungary has taken particular care to strengthen the environmental impact of each aid scheme. Each commitment is defined in such a way that it fully covers the cultivated areas and where one aid can no longer be present, the other can connect and farmers can manage accordingly. The aim of the intervention is to encourage the organicisation of conventional areas and to maintain farming methods in organic areas. Organic farming, among other things, protects and improves the biological status of soil. The intervention in relation to SO4 is set out in Section 4.1.1. Improving the carbon sequestration capacity of soils and ecosystems: the development and maintenance of grasslands, non-productive areas, wetlands, selvedges, conservation trees, the development of agrotechnological practices, and the need to change manure application.

R.15 – Renewable energy from agriculture, forestry and other renewable sources: Supported investments in renewable energy production capacity, including bio-based (in MW)

The cumulative target value of indicator R.15 is 131.29 MW, which is planned to be reached in 2029, with a stronger pick-up in the second half of the period. Almost 50 % of the target is expected to be met by 2027. Of the 5 interventions contributing to the indicator target, *support for green investments in agricultural holdings (RD01c_E01_FRM_73)* and *rural infrastructure development (RD42_R01_RAN_73)* account for the vast majority of the indicator value. In addition, three interventions (overall less than 10 % of the target) contribute even more modestly to the target: *support for green investments linked to the enhancement of agricultural products (RD04b_E03_FOF_73)*, *rural development cooperation for the development of the biomass economy (RD52_R12_BIC_77)* and *Investments in tangible and intangible assets in the wine sector (SC06_E05_Wii_58)*. *Support to Producer Organisations in the F & V sector (SC28_E01_FVI_47)* and the *preparation and implementation of LEADER strategies (RD57_R15_LDR_77)* contribute to the indicator, without a fixed target value. The interventions of the R.15 indicator respond to the following needs underpinning the SO4 specific objective:

- 4.3.1. Increasing the use of renewable energy, taking into account ecological aspects and possible environmental conflicts (e.g. energy plantations, invasive species, use of thermal water, etc.),
- 4.3.3. Increasing the efficiency of energy use at operational and technological levels,
- 4.4.1 Development of technologies and tools to help protect against negative weather effects to prevent damage (e.g., drought, burns, fire damage, biotic damage, frost damage).

R.16 – Climate-related investments: Share of farms benefitting from CAP investment support contributing to climate change mitigation and adaptation, and to renewable energy or biomaterials production

The cumulated target value of indicator R.16 is 29.1 %, representing 7.540 beneficiary holdings with no duplication compared to the total of 241.000. . Minimum overlaps are expected between beneficiaries of

interventions contributing to the indicator target (10 % in total). The indicator is expected to rise by the end of the period: In 2027-2029, there will be almost three times more beneficiaries per year than in 2025-2026.

Of the 9 interventions contributing to the indicator target, in addition to *supporting green investments in agricultural holdings* that account for more than half of the target (RD01c_E01_FRM_73), *rural infrastructure development* (RD42_R01_RAN_73) and *support for investments in afforestation and woodland* (RD38_F05_AFI_73) can be highlighted with a contribution of approximately 20 %. In addition, three interventions (amounting to ~11 % of the target) contribute even more modestly to the target: *Support for green investments linked to the enhancement of agricultural products* (RD04b_E03_FOF_73), *Rural infrastructure development in small municipalities* (RD43_R02_LOC_73). *Climate change mitigation and adaptation measures in the fruit and vegetables sector* (SC18_G02_FVL_47), *aid to producer organisations in the fruit and vegetables sector* (SC28_E01_FVI_47) will contribute to the indicator, without a fixed target value and in plan value. The interventions of the indicator respond to the needs underlying the following SO4 specific objective:

- 4.2.2. Reduction of GHG and atmospheric gas emissions by forestry equipment
- 4.3.1. Increasing the use of renewable energy, taking into account ecological aspects and possible environmental conflicts (e.g. energy plantations, invasive species, use of thermal water, etc.),
- 4.3.3. Increasing the efficiency of energy use at operational and technological levels,
- 4.4.1 Development of technologies and tools to help protect against negative weather effects to prevent damage (e.g., drought, burns, fire damage, biotic damage, frost damage).
- 4.4.2. Review the use of arable land cultivated at the limits of economy and optimise alternative use
- 4.4.3. Improving the water retention capacity of soils and ecosystems by encouraging land use change
- 4.6.1. Development of regional climate adaptation assessment databases, monitoring and forecasting systems
- 4.7.1. Development and use of climate-adaptive and climate-adaptive plant and animal breeds

R.17^{PR} – Afforested area: Area supported for afforestation, agroforestry and restoration, including breakdowns

The overall target value of the indicator is 16 174 ha, which is planned to be evenly distributed over the 4 financial years 2025-2028.

Support for *investments in afforestation and woodland* (RD38_F05_AFI_73) represents 94 % (15000 ha) of the target, which responds to the following needs underpinning the SO4 specific objective:

- 4.2.2. Reduction of emissions of GHG and atmospheric load gases by forestry equipment;
- 4.4.2. Reviewing the use of arable land cultivated at the limits of economy and optimising alternative use,
- 4.4.3 Improving the water retention capacity of soils and ecosystems by encouraging land use change (forests, grasslands, wetlands), making land cover mosaic (shelf habitats, non-production areas) and using water conservation agro-technical techniques, including the development of lined water retention facilities that can be cultivated.

Agro-ecological non-productive investments (RD21_G04_LCI_73) complementing the target respond to the needs underlying the following SO4 specific objective:

- 4.1.1 Improving the carbon sequestration capacity of soils and ecosystems: establishment and maintenance of grasslands, non-productive areas, wetlands, selvedges, conservation trees, development of agro-technological practices, changes in manure application,
- 4.4.2. Reviewing the use of arable land cultivated at the limits of economy and optimising alternative use,
- 4.4.3 Improving the water retention capacity of soils and ecosystems by encouraging land use change (forests, grasslands, wetlands), making land cover mosaic (shelf habitats, non-production areas) and using water conservation agro-technical techniques, including the development of lined water retention facilities that can be cultivated.

R.18 – Investment support for the forestry sector: Total investment to improve the performance of the forestry sector

The value of the indicator is discussed in SO6 and SO8, as far as the interventions that are also relevant for SO4 are concerned.

R.22^{PR} – Sustainable nutrient management: Share of Utilised Agricultural Area (UAA) under supported commitments to improve nutrient management

Overall target for indicator R.22: 21.89 %, accounting for almost 1.2 million hectares per year by 2026 after a gradual ramp-up (compared to a total area of 5 309 520 ha). Two interventions support the achievement of the target. *Agro-environmental management payments* (RD19_G01_AEC_70) have a higher added value to the target, and the basic *agri-ecological programme* (DP17_G01_ECOS_16) is equally important in achieving the target. In the course of the various provisions, Hungary has taken particular care to strengthen the environmental impact of each aid scheme. The commitments are defined in such a way that they fully cover the cultivated areas and where one aid can no longer be present, the other can connect and farmers can manage accordingly.

The interventions respond to the needs underpinning the following SO4 specific objective:

- 4.1.1 Improving the carbon sequestration capacity of soils and ecosystems: establishment and maintenance of grasslands, non-productive areas, wetlands, selvedges, conservation trees, development of agro-technological practices, changes in manure application,
- 4.4.2. Reviewing the use of arable land cultivated at the limits of economy and optimising alternative use,
- 4.4.3 Improving the water retention capacity of soils and ecosystems by encouraging land use change (forests, grasslands, wetlands), making land cover mosaic (shelf habitats, non-production areas) and using water conservation agro-technical techniques, including the development of lined water retention facilities that can be cultivated.

R.26: Investments related to natural resources: Share of farms receiving support for productive and non-productive investments linked to the protection of natural resources under the CAP

The numerator of indicator R.26 will increase to 3300 between FY 2025-2028, the number of farms affected will grow more dynamically in the first two years, followed by more modest growth, and finally 1.37 % of all farms will be affected by investments in natural resources. The achievement of the target is mainly due to two interventions: *Agro-ecological non-productive investments* (RD21) and *support for investments in afforestation and woodland* (RD38) account for more than 90 % of the farms concerned. Other interventions contributing to R.26 are in *-farm investment to improve water efficiency* (RD12) and *farm development to reduce ammonia emissions* (RD01d). Intervention SC28 does not increase the value of the indicator at design value and then increases the value of the indicator in real value.

Interventions under R.26 concern nearly all main SO4 needs:

- 4.1.1. Improving the carbon sequestration capacity of soils and ecosystems
- 4.1.2. Reducing GHG and ammonia emissions through technological improvements in livestock farming
- 4.2.2. Reduction of GHG and atmospheric gas emissions by forestry equipment
- 4.3.1. Increasing the use of renewable energy, taking into account potential environmental conflicts
- 4.4.1. Development of technologies and tools to help protect against negative weather effects
- 4.4.2. Review of the use of arable production sites cultivated at the limits of economy
- 4.4.3. Improving the water retention capacity of soils and ecosystems by encouraging land use change
- 4.6.1. Development of regional climate adaptation assessment databases
- 4.7.2. Development and use of climate-adaptive and climate-adaptive plant and animal breeds

R.27 – Environmental or climate-related performance through investments in rural areas: Number of operations contributing to environmental sustainability and the achievement of climate mitigation and adaptation goals in rural areas

Cumulated target value of indicator R.27: 1675 supported operations expected to be reached by 2028 with bell curves (to reach the maximum in 2025 with 529 operations).

One out of 7 interventions supporting the achievement of the target is highlighted: *investments for the environmental sustainability of forestry (non-profit)* (RD41_F08_INN_73), accounting for almost 90 % of the target.

The 7 interventions concerned respond to the needs underlying the following SO4 specific objective:

- 4.2.1. Preserving the carbon balance of forest stands and promoting climate adaptive renewal;
- 4.2.2. Reduction of emissions of GHG and atmospheric load gases by forestry equipment;
- 4.4.1 Developing technologies and tools to protect against negative weather effects to prevent damage (e.g. drought, burns, fire damage, biotic damage, frost damage);
- 4.4.2. Reviewing the use of arable land cultivated at the limits of economy and optimising alternative use,
- 4.4.3 Improving the water retention capacity of soils and ecosystems by encouraging land use change (forests, grasslands, wetlands), making land cover mosaic (shelf habitats, non-production areas) and using water conservation agro-technical techniques, including the development of lined water retention facilities that can be cultivated;
- 4.7.1. Development and use of climate-adaptive and climate-adaptive plant and animal varieties.

R.29^{PR} – Development of organic farming: Share of utilised agricultural area (UAA) supported by the CAP for organic farming, with a split between maintenance and conversion

The annual target value of the indicator shall be: 5.26 %, representing 280 thousand hectares per year in 4 years 2024-2027 compared to the total area of 5 309 520 ha. The indicator's target is provided by the *support for organic farming* (RD20_G02_ORT_70) alone, which may be complemented by the intervention of *organic or integrated production in the fruit and vegetables sector* (SC13_G01_FVO_47) without a fixed target.

The two interventions concerned are among the needs underlying the SO4 specific objective 4.1.1. Improving the carbon sequestration capacity of soils and ecosystems: the development and maintenance of grasslands, non-productive areas, wetlands, selvedges, conservation trees, development of agro-technological practices, changes in manure application responds to the need.

R.30^{PR} – Promoting sustainable forest management: Share of forest land under commitments to support forest protection and management of ecosystem services

The indicator's target is 6.54 %, representing 127 thousand hectares of forest land. Each year, the share of hectares covered by the target increases, and the target will be reached in 2029. One intervention of R.30 is linked to the needs of the SO4 specific objective: RD39_F06_AFM_70 -Retention of investments in afforestation and income replacement support is an intervention affecting a third of the target. The intervention responds specifically to the SO4 Main Needs 4: In addition to optimising alternative use (4.4.2), improving the water retention capacity of soils and ecosystems by encouraging land use change (forest, grassland, wetlands), making land cover mosaic (shelf habitats, non-productive areas) or using agro-technical water conservation techniques, including the development of lined water retention facilities that can be cultivated (4.4.3), will be able to make a meaningful contribution to the needs of arable land.

2.1.SO4.9 Justification of the financial allocation

Specific objectives 4, 5 and 6 cannot be separated from the point of view of meeting the recommendations and ensuring an adequate financial allocation. Overall, the measures relating to the three SOs fulfil our obligation under Article 93. Some of the measures of all other SOs also contribute to the objectives of the three SOs, with the result that environmental resources constitute one of the most significant parts of the plan's framework.

Relevant recommendations:

- Halting and reversing biodiversity loss, contributing to the EU Green Deal targets on high-diversity landscape features.
- Preparing agriculture for the challenges of water management.
- Increase the efficiency of nutrient management to reduce losses and soil, air and water pollution through reduction measures, thereby helping to achieve the Green Deal objective of reducing nutrient losses.
- Contribution to the organic farming objective of the EU Green Deal.
- Support mitigation practices and adaptation tools.

The financial envelope provided for in the plan is sufficient to address the recommendations, supported by

the relevant parts of Headings 3 and 5.

2.1.SO5 Foster sustainable development and efficient management of natural resources such as water, soil and air, including by reducing chemical dependency

2.1.SO5.1 Summary of the SWOT Analysis

2.1.SO5.1.1 Strengths

- E.1. There are significant surface and coastal filtration water resources linked to large rivers as well as usable groundwater resources
- E.2. Existence of topographical and micro-domestic conditions allowing for retention of water in the landscape, sometimes mosaic landscape structure [SO/3.1]
- E.3. Lower phosphorus balance compared to the EU average
- E.4. A nutrient management plan based on soil sampling is mandatory for 87 % of the agricultural area supported
- E.5. Soil experts with a university degree carry out soil protection planning and authorisation
- E.6. The Agricultural Sub-programme of the National Airload Reduction Programme has been adopted
- E.7 Plant protection activities carried out under the supervision of plant doctors with a university degree
- E.8. A high-quality plant protection forecast is in place, enabling preventive, environmental protection
- E.9 Adoption and extension of a national air load reduction programme to the agricultural sector (Commission Implementing Decision (EU) 2018/1522)

2.1.SO5.1.2 Weaknesses

- Gy.1. Existing, although neglected and efficient, built irrigation systems [SO5/2.1]
- Gy.2. Most of their surface waters and almost half of shallow groundwater do not meet the status required by the Water Framework Directive, and the proportion of waters with high nitrate concentrations has increased [SO5/2.1]
- Gy.3. Lack of area-specific planning knowledge
- Gy.4. High proportion of areas exposed to drought, inland water and floods [SO5/2.1]
- Gy.5. Lack of conversion of protective forest strips, water buffer-oriented forest strips, improvement processes and inland water drainage channels to water retention, low share of agricultural land with efficient water management [SO5/1.2], [SO5/2.2], [SO5/2.3], [SO5/3.1]
- Gy. 6. Strong decrease in protective forest strips, water buffer-oriented forest strips over the last 15 years [SO5/1.2], [SO5/2.2]
- Gy.7 Degradation of soil life, soil structure and soil quality due to current management practices [SO5/1.1]
- Gy.8. Agricultural soils' nutrient balance vulnerability and high nutrient deficit [SO5/1.1]
- Gy.9 Knowledge transfer interventions on application of new and state-of-the-art pesticides, emission reduction procedures for GHG, air pollutants and particulate matter, good nutrient management and composting are not available to producers and consultants [SO5/7.1]
- Gy.10. Hungary is not yet fully implementing its commitment to reduce emissions of ammonia and other air pollutants. [SO5/4.1], [SO5/4.2]
- Gy.11. There are currently no agricultural consultants who could provide integrated advice on GHG and air pollutant reduction [SO5/7.2]
- Gy.12 There is no single monitoring system and register on the subject yet; the data received from producers is always available according to the specific aid conditions
- Gy.13. Domestic fertiliser application is primarily based on cheaper nitrogen fertilisers, e.g. urea, which has a high ammonia emission value
- Gy.14. Integrated and environmentally-friendly pest management technologies and a system of advice based on them are not yet available at either European or Member State level to mitigate the food safety and economic impact of drastic pesticide withdrawals, in particular in the case of grain cultivation in

continental climate and small crops [SO5/5.1], [SO5/5.2]
 Gy.15: Low awareness among farmers of resource conservation benefits from agroforestry systems
 Gy. 16. The National Strand Strategy established under the OVGT was not adopted by Parliament, and no action plan to reduce drought damage
 Gy. 17. Relative high percentage of illegal water abstraction for irrigation [SO5/2.1]

2.1.SO5.1.3 Opportunities

L.1. Review of the RBMPs required by the WFD and the proposals for measures contained therein
 L.2. Uptake of sustainable rainfall and inland water management (Agricultural techniques to support water retention, retention of water within the plate, collection and infiltration of inland and rainwater in suitable areas)
 L.3. Increasing water retention in the water management sector
 L.4. Reducing the administrative burden of territorial retention of water, reviewing regulation, simplifying permitting procedures
 L.5. The development of main water facilities and distribution systems will be further strengthened in irrigation development
 L.6. Improved resource efficiency, differentiated, efficient and smart input application and use, reduction of GHG, air pollutants and particulate matter emissions in crop and livestock production (e.g. development of feeding and husbandry technology, manure storage and management, with a particular focus on digitalisation) [SO5/4.2], [SO5/7.3]
 L.7 Humane agro-technologies (e.g. non-rotational and soil cover-based processes) for soil sequestration of organic matter are spread (expert finding)
 L.8. Integration of existing databases (e.g. DAS, Risk Management Database, Cizek, Drought Monitoring, Inland Water Maps, Talajweb, National Laboratory Network [SO5/6.1], [SO5/7.3]
 L.9 Establishment of an EU and national system for research, innovation and knowledge transfer for the widespread uptake of agro-ecological practices, i.e. agricultural practices with low environmental pressures [SO5/7.3]
 L.10. In particular, launch a flagship research, innovation and knowledge transfer programme for the development of environmentally friendly plant protection practices against mycotoxins and small cultures [SO5/7.3]
 L.11 Woody crops have a positive impact on agricultural land in terms of water protection, soil protection and microclimatic
 L.12. R & D activities for agricultural use of sewage sludge, sewage sludge composers, declared products, dredging sludges and treated waste water [SO5/1.3]
 L.13. The specific environmental pressures of intensive livestock farming focused on modern emission reductions (e.g. water demand and area fixation) can be reduced
 L.14. Acceptance by farmers and policy of agro-technological methods and natural water retention solutions that help to make better use of soil water storage capacity and contribute to soil organic matter fixation
 L.15 Improving forest health and age composition
 L.16. Farmers are open to modern but economical manure management methods, which helps to favour organic fertilisers over fertilisers [SO5/1.1]
 L.17. Research on alternative domestically developed products suitable for ammonia and GHG reduction is needed to propose cost-effective solutions to producers
 L.18.High-quality nutrient management advice and domestically developed digital tools are available
 L.19. Woodlands between Hungarian forests and agricultural land have a clear positive impact, both in terms of soil protection, water protection and air protection

2.1.SO5.1.4 Threats

F.1 F.1.Decrease of renewable (or available) water resources

F.2.Lessment of available water resources due to the reduction of groundwater resources and inadequate ecological status of surface waters

F.3.water abstraction (agriculture + drinking water) threatens most water bodies

F.4.A high pressure from agriculture on surface waters by changing water bodies

F.5.Degradation of water quality due to inland discharges and nutrient pollution

F.6.Water soil erosion increased

F.7.Intensification of intensive farming in higher-lying watercourse catchment areas, loss of grassland and forest areas, increased soil degradation processes

F.8.Delay in the implementation of territorial water retention due to proprietary disincentives and shortcomings in cooperation, coordination and tools

F.9.The negative effects of climate change on the qualitative and quantitative state of natural resources

F.10.The difficulty for small farms to meet environmental requirements

F.11.Increased satisfaction of the need for renewable energy production with agricultural by-products could accelerate the degradation of soil organic matter and increase the level of air pollution

F.12.In the absence of specific measuring instruments to monitor certain air pollutants and GHG emissions, we use international estimation methods that do not take into account individual Member State alternative methods

F.13. Organic fertilisation of agricultural land is not solved by the separation of crop and livestock production because the crop grower is not interested in applying organic fertilisers with higher unit costs and stricter standards

F.14.Plant protection, nutrient management, emission commitments (including animal husbandry, e.g. animal feed) are only willing to pay if the aid condition

F.15.Pesticide withdrawals represent an increase in the cost of domestic production, creating a competitive disadvantage vis-à-vis third countries

F.16.The Water Framework Directive (WFD) 2027 and the 2030 targets of the NDS and F2F strategies are not met

F.17. Agricultural diffuse pollution affects 36 % of surface water, 39 % of groundwater and 8 % chemical pollution

2.1.SO5.1.5 Other comments

Not relevant.

2.1.SO5.2 Identification of needs

Code	Title	Prioritisation at the level of the CAP Strategic Plan	Need is addressed in Cap Strategic Plan
2.1.4	Management of water scarcity in arable crops	1	Yes
5.1.1	Developing soil and nutrient management at farm level	1	Yes
5.1.2	Reducing nutrient losses, preventing nutrient leaching	1	Yes
5.1.3	Restoring degraded soils and improving their water management	1	Yes
5.1.4	Protection of arable land by agroforestry systems	2	Yes
5.1.5	Wastewater/sludge, food waste and biomass recycling in nutrient supply	1	No
5.2.1	Sustainable use of surface and groundwater	1.	Yes
5.2.2	Appropriate vegetation (invasive species, background pollution)	2	Yes

5.2.3	Rehabilitation of type-dependent zoning in the coastal zone of waters, establishment of a buffer zone	2	Yes
5.3.1	Promoting water retention in soil and landscape	1	Yes
5.3.2	Planting drought-tolerant crop varieties	1	No
5.4.1	Reducing emissions of air pollutants and particulate matter of agricultural origin	3	Yes
5.4.2	Reducing ammonia emissions from agriculture	2	Yes
5.5.2	Integrated environmentally friendly pest management	1	Yes
6.3.2	Increasing the share of forest land under forest management with continuous cover	1	Yes

Other comments related to needs assessment.

Not relevant

2.1.SO5.3 Identification of the relevant (elements of) national plans emanating from the legislative instruments referred to in Annex XI of the CAP plan Regulation that have been taken into account in the CAP plans' needs assessment for this specific objective

Needs

5.1. Improvement, protection and sustainable use of soils

5.1.1. Development of precision, plant-level soil and nutrient management based on the real potential of soils to provide nutrients (soil analysis) and the real demand of plants.

Annex XIII EU legislation

· Directive 2000/60/EC of the European Parliament and of the Council of 23 October 2000 establishing a framework for Community action in the field of water policy (Water Framework Directive, WFD)
· Council Directive 91/676/EEC of 12 December 1991 concerning the protection of waters against pollution caused by nitrates from agricultural sources (Nitrate Directive);

Related objectives of national environmental and climate plans

Hungary's 3 rd River Basin Management Plan 2022-2027 2021 Discussion Paper

1.
 - *Reducing nutrient pollution from agriculture*

National Airload Reduction Programme Agriculture Sub-programme

1.
 - *Facilitating the practical application of nutrient management*

National Strategy for the Conservation of Biological Diversity 2021-2030 (draft to be approved 2021)*

1.
 - *Significantly reduce the environmental impact caused by crops and performance-enhancing agents used in agriculture.*

Soil Action Plan

1.
 - *The conscious and environmentally sound use of soils by farmers, among other things,*

increases the organic matter content of soils, improves the supply capacity of nutrients, reduces the amount of fertilisers used and strengthens erosion control, which also prevents agricultural phosphate loads in surface waters.

5.1.2.Reducing nutrient losses, preventing nutrient leaching by promoting technologies that prevent this (e.g. increasing legumes in crop rotation) and the use of preparations (e.g. N-inhibitors, microbiological preparations) thereby contributing to the reduction of fertiliser use and pesticide use.

Annex XIII EU legislation

Directive 2000/60/EC of the European Parliament and of the Council of 23 October 2000 establishing a framework for Community action in the field of water policy (Water Framework Directive, WFD)

1.
 - Measures to promote natural water retention

Long-term goals included in the National Water Strategy (Kvassay Jenő Plan):

1.
 - *Water retention for better use of our waters*

Second National Climate Change Strategy 2018-2030 with a 2050 perspective

1.
 - *Opportunities to mitigate climate-related damage in agriculture*

National Strategy for the Conservation of Biological Diversity 2021-2030 (draft to be approved 2021)

1.
 - *Sustainable water management, water retention and rational, saving water use to conserve biodiversity and maintain ecosystem services.*

5.4.Air protection, reduction of emissions of air pollutants and particulate matter

5.4.1.Reduction of emissions of air pollutants and particulate matter of agricultural origin

5.4.2.Reduction of ammonia emissions from agriculture through manure management and land application standards, full nitrogen cycle management, encouraging the use of organic manure, replacing urea-type fertilisers, introducing low protein feeding systems, covering slurry stores and developing stable techniques (National Airload Reduction Programme)

Annex XIII EU legislation

Directive 2008/50/EC of the European Parliament and of the Council of 21 May 2008 on ambient air

quality and cleaner air for Europe;

Directive (EU) 2016/2284 of the European Parliament and of the Council of 14 December 2016 on the reduction of national emissions of certain atmospheric pollutants, amending Directive 2003/35/EC and repealing Directive 2001/81/EC;

Related objectives of national environmental and climate plans

Air Quality Action Plan

1.

- *The combined aim of the air quality plans and the LCsT is to ensure compliance with air quality limit values throughout the country. They do not include only objectives and targets directly or indirectly linked to agriculture or the Common Agricultural Policy, but agriculture, in particular, makes a significant contribution to the emission of ammonia, which contributes to the development of secondary particulate matter (PM), and the reduction of their emissions is essential to meet the air quality limit values for PM10 and PM2.5.*

National Airload Reduction Programme Agriculture Sub-programme

1.

- *Promoting the use of organic fertilisers,*
- *Organic manure – setting conditions for land application,*
- *Promoting the practical application of nutrient management;*
- *Covering slurry stores,*
- *Technological development standards for ammonia sequestration in livestock farms,*
- *Ban on outdoor burning of crop residues and waste from agricultural harvests and forest biomass residues*

5.5.Reduction of the risk of use of plant protection products

5.5.2.Incentivising integrated plant protection solutions, with a particular focus on restoring soil biological life, and other environmentally friendly solutions in plant protection that help protect pollinators

Annex XIII EU legislation

Directive 2009/128/EC of the European Parliament and of the Council of 21 October 2009 establishing a framework for Community action to achieve the sustainable use of pesticides;

Related objectives of national environmental and climate plans

National Plant Protection Action Plan

1.

- *Compliant pesticide use, reasonable, timely and appropriate (chemical, biological, agrotechnical) plant protection,*
- *Introduction of integrated crop management technology to mitigate risks from pesticide use;*
- *Reducing risks from pesticide use*

National Strategy for the Conservation of Biological Diversity 2021-2030 (draft to be approved 2021)

1.

- *Significantly reduce the environmental impact caused by crops and performance-enhancing agents used in agriculture.*

The following need has been classified under the SO9 objective but is directly related to Directive

2009/128/EC of the European Parliament and of the Council of 21 October 2009 establishing a framework for Community action to achieve the sustainable use of pesticides and the objectives of the National Plant Action Plan and the National Strategy for the Conservation of Biodiversity 2021-2030 as indicated above, as set out in Annex XIII:

9.2.1. Promoting the use of a reasonable, predictive, targeted plant protection product, reducing losses by using precision technologies, and technical development of digital tools, which contributes to a reduction in substance use by excluding unjustified treatments. Reducing chemical use helps pollinating insects.

5.6. Interconnection and integration of existing databases

5.6.1. Interconnection of existing databases, integration, development of monitoring and forecasting systems

Annex XIII EU legislation

No directly related EU legislation

Related objectives of national environmental and climate plans

Second National Climate Change Strategy 2018-2030 with a 2050 perspective

1.
 - *Geospatial basis for territorial climate vulnerability assessment, need for a complex monitoring system*

National air load reduction programme – sub-programme for agriculture,

1.
 - *Development of a coordinated agricultural data collection system for the elaboration of an inventory reflecting the real results of using emission reduction technologies*

National Plant Protection Action Plan

1.
 - *Gathering information on plant protection practices,*
 - *The establishment of a cooperation agreement between the state and administrative bodies involved in the collection of data, using the information available from the database.*

Hungary's 3 rd River Basin Management Plan 2022-2027 2021 Discussion Paper

1.
 - *Development and operation of monitoring systems and information systems*

Awareness-raising and integrated advice for good resource management, information for industry stakeholders

5.7.1. Development of a system of expert advice approaching modern agroecological practices, i.e. low-impact agricultural practices in an integrated approach (application of plant protection products, GHG, air pollutants and particulate matter abatement procedures, correct nutrient management and composting)

5.7.2. Involvement of farmers in soil, water and air protection monitoring, awareness-raising for good resource management, information to industry stakeholders

5.7.3. Development of priority knowledge transfer and demonstration programmes to showcase state-of-the-art and emission-reduction technologies

Annex XIII EU legislation

No directly related EU legislation

Related objectives of national environmental and climate plans

Second National Climate Change Strategy 2018-2030 with a 2050 perspective

1.
 - *Opportunities to mitigate climate-related damage in agriculture, support farmers by providing the necessary knowledge and advice*

National air load reduction programme – sub-programme for agriculture,

1.
 - *Promoting the practical application of nutrients – farming, advisory tools and educational materials*

National Plant Protection Action Plan

1.
 - Raising awareness among plant protection product users, farmers, garden owners and the general public;
 - Operation of a plant protection management network

Hungary's 3rd River Basin Management Plan 2022-2027 2021 Discussion Paper

1.
 - *Agricultural consultancy system supplemented with water protection aspects*

*For the National Strategy for the Conservation of Biodiversity 2021-2030, the inter-ministerial consultation and a national conference on the draft strategy with broad stakeholder participation were completed in 2021, but the Strategy has not yet been adopted by Parliament.

2.1.SO5.4 Intervention logic

Form of Intervention	Type of Intervention	Intervention Code (MS) - Name	Common Output Indicator
DPdecoupled	Eco-scheme(31) - Schemes for the climate, the environment and animal welfare	DP17_G01_ECOS_16 - Agro-ecological programme	O.8. Number of hectares or of livestock units benefitting from eco-schemes
Sectoral - Fruit and Vegetables	INVRE(47(1)(a)) - investments in tangible and intangible assets, research and experimental and innovative production methods and other actions	SC28_E01_FVI_47 - Investments, research and experimental and innovative production methods and other activities – fruit and vegetables	O.35. Number of supported operational programmes
RD	ENVCLIM(70) - Environmental, climate-related and other management commitments	RD19_G01_AEC_70 - Agricultural environmental management payments (AKG)	O.14. Number of hectares (excluding forestry) or number of other units covered by environmental or climate-related commitments going beyond mandatory requirements
RD	ENVCLIM(70) - Environmental, climate-related and other management commitments	RD19a_G01_AEC_70 - AGRI-environmental management payments (AKG)	O.14. Number of hectares (excluding forestry) or number of other units covered by environmental or climate-related commitments going beyond mandatory requirements
RD	ENVCLIM(70) - Environmental, climate-related and other management commitments	RD20_G02_ORT_70 - Support to organic farming	O.17. Number of hectares or number of other units benefitting from support for organic farming
RD	ENVCLIM(70) - Environmental, climate-related and other management commitments	RD20a_G02_ORT_70 - Support for organic farming	O.17. Number of hectares or number of other units benefitting from support for organic farming
RD	ENVCLIM(70) - Environmental, climate-related and other management commitments	RD22_G05_LCP_70 - Payment to	O.14. Number of hectares

	climate-related and other management commitments	encourage agro-ecological land use change	(excluding forestry) or number of other units covered by environmental or climate-related commitments going beyond mandatory requirements
RD	INVEST(73-74) - Investments, including investments in irrigation	RD01d_E01_FRM_73 - Farm development to reduce ammonia emissions	O.20. Number of supported on-farm productive investment operations or units
RD	INVEST(73-74) - Investments, including investments in irrigation	RD12_W01_WTO_73 - On-farm investment to improve irrigation and water efficiency	O.20. Number of supported on-farm productive investment operations or units
RD	INVEST(73-74) - Investments, including investments in irrigation	RD21_G04_LCI_73 - Non-productive investments in Agro-ecological	O.21. Number of supported on-farm non-productive investment operations or units
RD	INVEST(73-74) - Investments, including investments in irrigation	RD38_F05_AFI_73 - Support for investments in afforestation and creation of woodland	O.24. Number of supported off-farm productive investment operations or units
RD	COOP(77) - Cooperation	RD51_R11_TUC_77 - Rural development cooperation for active and eco-tourism development in the region	O.32. Number of supported other cooperation operations or units (excluding EIP reported under O.1)
RD	COOP(77) - Cooperation	RD57_R15_LDR_77 - Preparation and implementation of LEADER strategies	O.31. Number of supported local development strategies (LEADER) or preparatory actions

Overview

5.1. Main Needs: Improvement, protection and sustainable use of soils

SO 5. According to the assessment of the situation ‘Supporting sustainable development and efficient management of natural resources such as water, soil and air, including by reducing chemical dependency’, most of Hungary’s soils have natural handicaps. The capacity of our soils to store water varies widely from one area to another, is affected by erosion and the compaction of the soils contributes to the development of inland waters and also reduces the interoperability of the soil.

Requirement 5.1.1: Establishment of plant-level soil and nutrient management

The Nitrate Regulation requires protection against eutrophication of surface waters and deterioration of groundwater quality in more than two thirds of the country. This is demonstrated by the fact that, according to the indicator of gross nutrient balance of agricultural soils in Hungary, annual fluctuations of nitrogen in the soil and a phosphorus deficit can be observed over the period 2000-2016. In addition to natural factors (soil composition and precipitation), the soil condition is mainly influenced by poor cultivation and nutrient supply methods, mechanisation and irrigation.

Planned interventions:

Agri-environmental management payments (AKG) RD19_G01_AEC_70

Support for organic farming RD20_G02_ORT_70

Requirement 5.1.2: Reduce nutrient losses and prevent nutrient leaching

The Nitrate Regulation requires protection against eutrophication of surface waters and deterioration of groundwater quality in more than two thirds of the country. This is demonstrated by the fact that, according to the indicator of gross nutrient balance of agricultural soils in Hungary, annual fluctuations of nitrogen in the soil and a phosphorus deficit can be observed over the period 2000-2016. In addition to natural factors (soil composition and precipitation), the soil condition is mainly influenced by poor cultivation and nutrient supply methods, mechanisation and irrigation.

Planned interventions:

Agro-ecological programme DP17_G01_ECOS_16

· Replanting of orchards – Vegetables SC22_I04_Fvr_47

· In-farm investment to improve water efficiency RD12_W01_WTO_74

·Agricultural Management Payments (AKG) RD19_G01_AEC_70

·Support for organic farming RD20_G02_ORT_70

·Sectoral interventions for fruit and vegetables: Support to producer organisations SC28_E01_FVI_47

Requirement 5.1.3: Restoring degraded soils and improving their water management

The organic matter content of arable land is estimated at 280 megatonnes of total organic carbon. The soils of the Southern Transdanubia region and the Northern Central Mountains have the lowest organic carbon content in the country. The region of South Great Plain has the highest stock of organic carbon, but it does not exceed the required limit of 5 %. Soil erosion by water is particularly vulnerable to soils in the Northern Central Mountains and the South Transdanubia region. The picture is nuanced by the fact that the percentage of land at risk of moderate and severe soil erosion represented almost 1 % of agricultural land in 2007 and almost 3 % in 2012.

Planned interventions:

·Agro-ecological programme DP17_G01_ECOS_16

·Replanting of orchards – Vegetables SC22_I04_Fvr_47

·Agricultural Management Payments (AKG) RD19_G01_AEC_70

·Support for organic farming RD20_G02_ORT_70

·Agro-ecological NPI RD21_G04_LCI_73

·Agro-ecological land use change incentive payment RD22_G05_LCP_70

Requirement 5.1.4: Protection of land with agroforestry systems

The results of the National Rural Development Plan (2005-2007) show the multifunctional contribution of forests to the sustainable management of natural resources, without the use of additional external resources. The nutrient load of streams from forest cover is lower, the total inorganic nitrogen content is closely linked to the afforestation of the river basins, its value decreases as forest cover increases, and woody vegetation limits evaporation from the soil.

Planned interventions:

Agro-ecological non-productive investments RD21_G04_LCI_73

Agro-ecological land use change incentive payment RD22_G05_LCP_70

Support for afforestation and woodland investments RD38_F05_AFI_73

Rural development cooperation for regional active and ecotourism development RD51_R11_TUC_77

Requirement 5.1.5: Waste water/sludge, food waste and biomass recycling in nutrient supply

Regional organisation and community-based solutions, in line with the objectives of circular farming, enable the sustainable operation of rural areas by-products, by-products, waste and solutions to promote the treatment and use of waste water, sewage sludge (e.g. nutrient supply). Activity outside the CAP.

5.2. Main Needs: Effective transfer of knowledge to take up an economic activity

In recent years there has been a strong expansion in crop production, but its future evolution is difficult to predict. The expected water demand for irrigation is uncertain and depends heavily on the weather in the year in question, but thanks to growing crop production, energy crops, land change and landscape management, there is a significant increase in water demand in Hungary. Water retention efforts can create opportunities for adaptation.

Requirement 5.2.1: Sustainable use of surface and groundwater

In Hungary, drinking water is predominantly extracted from groundwater and its water quality status deserves particular attention in terms of both nitrate and pesticide content. The Nitrate Regulation requires protection against eutrophication of surface waters and deterioration of groundwater quality in more than two thirds of the country. Nitrates, sulphates and ammonium pollution from urban or agricultural sources are typical of polluted water bases, but there are also exceedances of conductivity, and in some cases the degradation product of pesticide active substance is the state cause of poor quality of water bases.

Planned interventions:

·Agro-ecological programme DP17_G01_ECOS_16

·In-farm investment to improve water efficiency RD12_W01_WTO_74

·Agricultural Management Payments (AKG) RD19_G01_AEC_70

·Support for organic farming RD20_G02_ORT_70

·Agro-ecological NPI RD21_G04_LCI_73

·Agro-ecological land use change incentive payment RD22_G05_LCP_70

·Sectoral interventions for fruit and vegetables: Support to producer organisations SC28_E01_FVI_47

Requirement 5.2.2: Appropriate vegetation (invasive species, background contamination)

The development of appropriate vegetation (increasing mosaicity, displacement of invasive species) in the wave spaces of larger watercourses will help reduce pollution from the background.

Planned interventions:

·Agro-ecological NPI RD21_G04_LCI_73

·Agro-ecological land use change incentive payment RD22_G05_LCP_70

Requirement 5.2.3: Rehabilitation of type-specific zonation in coastal zones of waters, establishment of a buffer zone

The situation revealed that the absence of conversion of forest strips, water buffer-oriented forest strips, land management processes and inland water drainage channels into water retention, a small proportion of agricultural land with efficient water management, is characterised by a small proportion of agricultural land with efficient water management, which could be increased by the following measures.

Planned interventions:

·Agro-ecological NPI RD21_G04_LCI_73

·Agro-ecological land use change incentive payment RD22_G05_LCP_70

5.3. Main Needs: Creating the conditions for territorial retention of water

On the basis of the findings made during the preparation of the third RBMP, the water resources of our smaller watercourses and our shallow lakes are already subject to quantitative reductions due to climate change, as they depend mainly on local rainfall conditions, drought and stock changes in groundwater. For groundwater bodies, studies show persistent descent water levels over the past period.

Requirement 5.3.1: Promoting water retention in soil and landscape

Measures to promote natural water retention include inland water retention, rainfall management (land level retention in order to increase infiltration and reduce run-off) and hillland reservoirs (in small watercourses, possibly in permanent reservoirs) and plain storage (in inland water reservoirs and plain storage). The OVG (2016) states that the territorial retention of storm water is mostly unresolved in Hungary, and good practices in storm water management and inland water management have not been sufficiently spread.

Planned interventions:

·Agro-ecological programme DP17_G01_ECOS_16

·Agricultural Management Payments (AKG) RD19_G01_AEC_70

·Agro-ecological NPI RD21_G04_LCI_73

·Agro-ecological land use change incentive payment RD22_G05_LCP_70

5.3.2 Needs: Production of drought-tolerant plant varieties

Activities outside the CAP

5.4. Main Needs: Air protection, reduction of emissions of air pollutants and particulate matter

Ammonia emissions decreased by 41 % in 2019 compared to 1 990 in Hungary due to a sharp drop in cattle and pig numbers. Compared to 2005, emissions decreased in 2019, which can be explained by a further decrease in the number of animals. At the same time, there has been a slight increase compared to 2018, mainly due to the increasing use of fertilisers and an increase in emissions from dairy cattle rearing. Agricultural production is responsible for more than 90 % of ammonia emissions and emission reduction measures should therefore be prioritised in this sector. Significant emission reductions can be achieved through the modernisation of livestock husbandry technology, emission reduction technologies for livestock manure storage and application, as well as the application of fertilisers based on a nutrient management plan and the immediate incorporation of urea-based fertilisers after application.

Requirement 5.4.1: Reducing emissions of air pollutants and particulate matter of agricultural origin

The 1979 Convention on Long-Range Transboundary Air Pollution for 2020 and subsequent years sets

new emission reduction commitments for all Parties for sulphur dioxide, nitrogen oxides, non-methane volatile organic compounds, ammonia and fine particulate matter, based on 2005 as a basis. As a Party, Directive (EU) 2016/2284 of the European Parliament and of the Council (NEC Directive) imposes emission reduction commitments on Member States, including Hungary, to reduce national emissions of certain atmospheric pollutants.

Planned interventions:

Agro-ecological programme DP17_G01_ECOS_16

·Agricultural Management Payments (AKG) RD19_G01_AEC_70

·Support for organic farming RD20_G02_ORT_70

Requirement 5.4.2: Reduction of ammonia emissions from agriculture

The primary source of ammonia is livestock farming and, more specifically, nitrogen from manure, which can also leave the house, manure storage, faeces hunted on pastures or manure spreading sites. In addition, fertilisers used in crop production may also be responsible for emissions, which mainly affect urea type fertilisers, as urea is the fertiliser type with the most significant ammonia emission factor. The low rate of grazing is the main reason for the relatively high emissions of dairy cows. 35 per cent of emissions are generated during manure application. For sows, 39 per cent of NH₃emissions occur in the house (application 33 per cent, storage 25 per cent).

Planned interventions:

Agro-ecological programme DP17_G01_ECOS_16

·Farm development to reduce ammonia emissions RD01d_E01_FRM_73

·Agricultural Management Payments (AKG) RD19_G01_AEC_70

·Support for organic farming RD20_G02_ORT_70

5.5. Main Needs: Reduction of risks of pesticide use

Requirement 5.5.2: Integrated green pest management

In Hungary, we grow arable, vegetable and fruit crops above the European average, which can have a wide variety of weeds, pathogens and pests. Thus, because of the withdrawals of the active substance in recent years in small crops, there is little or no plant protection solution. The narrow range of active substances, on the other hand, has a serious risk of resistance development, food safety (mycotoxin) and competitiveness. It is therefore of utmost importance to support integrated green pest management solutions covering the widest possible range of crops, targeted research, innovation and knowledge transfer activities at European and national level (e.g. through an agro-ecological partnership).

Planned interventions:

Agro-ecological programme DP17_G01_ECOS_16

Agri-environmental management payments (AKG) RD19_G01_AEC_70

Support for organic farming RD20_G02_ORT_70

2.1.SO5.5 Where relevant, a justification for the use of InvestEU, including the amount and its expected contribution to the Specific Objective/Cross-Cutting Objective

Not relevant.

2.1.SO5.7 Are you planning CAP contribution towards the LIFE programme (only for SO4, SO5, SO6)

: No

2.1.SO5.8 Selection of the result indicator(s)

Selection of the result indicator(s) for this specific objective

Result indicators [recommended Result indicators for this specific objective are fully displayed in bold]	Target value
R.17^{CU PR} - Afforested land Area supported for afforestation, agroforestry restoration,	16,174.00 ha

including breakdowns	
R.18^{CU} - Investment support for the forest sector Total investment to improve the performance of the forestry sector	399,567,252.00 EUR
R.19^{PR} - Improving and protecting soils Share of utilised agricultural area (UAA) under supported commitments beneficial for soil management to improve soil quality and biota (such as reducing tillage, soil cover with crops, crop rotation included with leguminous crops)	30.48 %
R.20^{PR} - Improving air quality Share of utilised agricultural area (UAA) under supported commitments to reduce ammonia emission	13.48 %
R.21^{PR} - Protecting water quality Share of utilised agricultural area (UAA) under supported commitments for the quality of water bodies	25.24 %
R.22^{PR} - Sustainable nutrient management Share of utilised agricultural area (UAA) under supported commitments related to improved nutrient management	21.89 %
R.23^{PR} - Sustainable water use Share of utilised agricultural area (UAA) under supported commitments to improve water balance	18.94 %
R.24^{PR} - Sustainable and reduced use of pesticides Share of Utilised Agricultural Area (UAA) under supported specific commitments which lead to a sustainable use of pesticides in order to reduce risks and impacts of pesticides, such as pesticides leakage	23.94 %
R.26^{CU} - Investment related to natural resources Share of farms benefitting from CAP productive and non-productive investment support related to care for the natural resource	1.20 %
R.27^{CU} - Environmental or climate-related performance through investment in rural areas Number of operations contributing to environmental sustainability and the achievement of climate mitigation and adaptation goals in rural areas	1,811.00
R.29^{PR} - Development of organic agriculture Share of utilised agricultural area (UAA) supported by the CAP for organic farming with a split between maintenance and conversion	5.26 %

Justification of the targets and related milestones

SO5 – Supporting sustainable development and efficient management of natural resources such as water, soil and air, including by reducing chemical dependency

The milestone value of each R indicator and the value of the contribution of the related interventions (by year) are set out in the attached table, so they are not described in detail in the text.

The value of the R indicators related to the SO5 specific objective is heavily influenced by the AKG, ÖKO and AÖP interventions. In the case of these payments, farmers choose from a set of commitments that change their farming practices in an environmentally sound manner. Each commitment contributes to a number of R indicators, as they modify farming practices to an extent that they address a number of natural factors (e.g.: water, soil, biodiversity). Examples include organic grassland management (ÖKO) or retention of unsown land (AKG). These pledges both save nature from chemical use, earthworks and provide habitats for wildlife. ÖKO support is in itself a complex set of commitments, but in the case of AKG and ÖP, farmers have to choose more commitments, so that a given area contributes to most environmental R indicators. The contribution of the requirements to a given R indicator has sometimes been taken into account with different territories, as they also affect natural factors (such as R indicators) at different territorial scales. In the case of biodiversity, the impact on the area concerned may be significantly exceeded (e.g.: 10 % unmown land).

R.17^{PR}: Afforested land: Area supported for afforestation, agroforestry and restoration, including breakdowns

For the support of the total value of the indicator, see SO4.

R.18: Investment support for the forest sector: Total investment to improve the performance of the forestry sector

The interventions ensuring the value of the indicator are presented under the SO4, SO6 and SO8 specific objectives.

R.19^{PR}: Improving and protecting soils: Share of utilised agricultural area (UAA) under supported commitments beneficial for soil management to improve soil quality and biota (such as reducing tillage, soil cover with crops, crop rotation included with leguminous crops)

The indicator's overall target is 30.48 %, which is the share of Utilised Agricultural Area (UAA) that benefits soil management and is affected by supported commitments to improve soil quality (such as reducing tillage, soil cover with crops and crop rotation, including leguminous crops). The related interventions cover the full range of needs underlying the SO5 specific objective, so the effectiveness of R.19 is specifically closely linked to SO5, showing the progress made in the SO5. The interventions support the improvement, protection and sustainable use of soils (principal need 1), contribute to the effective transfer of the knowledge needed to start farming activities (priority 2), help create the conditions for territorial water retention (priority 3), air protection, reduce emissions of air pollutants and particulate matter (priority 4) and reduce risks of pesticide use (main need 5). The R.19 target is mostly influenced by the DP17_G01_ECOS_16 – Basic Agro-ecological programme. While the rate of duplication with other R.19-related interventions is very high, the ÖP alone provides more than 90 % of the target. Another significant intervention in achieving the objectives of R.19 is RD19_G01_AEC_70 – Agri-environmental management payments (AKG) and substantial but significantly less contribution to the intervention RD20_G02_ORT_70 – Support for organic farming.

R.20^{PR}: Improving air quality: Share of utilised agricultural area (UAA) under supported commitments to reduce ammonia emissions

The indicator's target is 13.48 %, which is the share of utilised agricultural area (UAA) under supported commitments to reduce ammonia emissions. Interventions contributing to the target:

DP17_G01_ECOS_16 – Basic Agro-Ecological Programme (AÖP, Ecoscheme), RD19_G01_AEC_70 – Agri-environmental management payments (AKG) and RD20_G02_ORT_70 – Support for organic farming. The number of hectares allocated to the interventions is balanced and adapted to the resumption of multi-annual interventions to improve air quality. The achievement of the target depends primarily on the AAP intervention, which in itself can deliver results; the other two interventions fully overlap with AAAs in terms of improving air quality. As R.19, R.20 responds to challenges in a complex manner, covering five different main needs of SO5.

R.21^{PR}: Protecting water quality: Share of utilised agricultural area (UAA) under supported commitments for the quality of water bodies

Indicator target: 25.24 %, which is the share of Utilised Agricultural Area (UAA) under supported water quality commitments. The following interventions shall contribute to the target: DP17_G01_ECOS_16 – Basic Agro-Ecological Programme (AÖP, Ecoscheme), RD19_G01_AEC_70 – Agri-environmental management payments (AKG), RD22_G05_LCP_70 – Agro-ecological land-use change payment, RD20_G02_ORT_70 – Support for organic farming. With the highest territorial value, the AÖP contributes to the protection of water quality, but the positive impact of other interventions with a smaller territorial share, but with stricter farmer obligations, is not negligible. The areas covered by each intervention overlap significantly, but the overlap is not complete, so the success of several interventions will be necessary to achieve the R.21 indicator target. As R.19, R.21 responds to challenges in a complex manner, covering almost all major needs of SO5.

R.22^{PR}: Sustainable nutrient management: Share of Utilised Agricultural Area (UAA) under supported commitments to improve nutrient management

For the support of the total value of the indicator, see SO4.

R.23^{PR}: Sustainable water use: Share of utilised agricultural area (UAA) under supported commitments to improve water balance

The indicator's target is 18.94 %, which is the share of Utilised Agricultural Area (UAA) under supported commitments to improve water balance. Interventions that contribute substantially to the target with approximately the same proportion: DP17_G01_ECOS_16 – Basic Agro-Ecological Programme (AÖP, Ecoscheme) and RD19_G01_AEC_70 – Agri-environmental management payments (AKG). As R.19, R.23 responds to challenges in a complex manner, covering five different main needs of SO5.

R.24^{PR}: Sustainable and reduced use of pesticides: Utilised Agricultural Area (UAA) concerned by supported specific commitments which lead to a sustainable use of pesticides in order to reduce risks and impacts of pesticides, such as pesticides leakage

The indicator target is 23.94 %, which is the share of Utilised Agricultural Area (UAA) under supported specific commitments in relation to the total utilised agricultural area aimed at reducing the risks posed by plant protection products and the adverse effects of plant protection products, such as leakages of plant protection products. All interventions targeting the needs of SO5 contribute to the indicator value: DP17_G01_ECOS_16 – Basic Agro-Ecological Programme (AÖP, Ecoscheme), RD19_G01_AEC_70 – Agri-environmental management payments (AKG) and RD20_G02_ORT_70 – Support for organic farming and SC05_E04_WIR_58 – Aid for restructuring and conversion of vineyards. Of the interventions concerned, the AÖP represents the largest territorial contribution, with around 50 % of the AKG and around 10 % of organic farming as of 2024. Territorial overlaps are significant, but all interventions are needed to meet the target. As R.19, R.24 responds to challenges in a complex manner, covering five different main needs of SO5.

R.26: Investments related to natural resources: Share of farms receiving support for productive and non-productive investments linked to the protection of natural resources under the CAP

The overall target for R.26 is 1.37 %, which is the share of farms receiving support for productive and non-productive investments linked to the protection of natural resources under the CAP. Result indicator R.26 is fully linked to the SO5 objective. An overlap of 15 % was calculated between interventions, but it can still be seen that the key interventions to reach the target are RD38_F05_AFI_73 – Support for investments in afforestation and woodland, which is more than 1800, and RD21_G04_LCI_73 – Agro-ecological non-productive investments ensuring that 1420 farms are reached within the total number of holdings of 3300. A third of these contributions are covered by RD12_W01_WTO_74 Investment in a farm to improve water efficiency. These investments are an important and valuable part of the long-term conservation of resources, and the conversion of land that may be forced into natural semi-natural areas also contributes significantly and directly to the stated objectives. The improvement, protection, sustainable use of soils (priority 1) and the effective transfer of knowledge to start farming activities (main need 2) will also be supported by these two interventions in order to achieve the intended results and indicator of results.

R.27: Environmental or climate-related performance through investment in rural areas: Number of operations contributing to environmental sustainability and achievement of climate change mitigation and adaptation targets in rural areas

See SO4 and SO6 for a description of the indicator value.

R.29^{PR}: Development of organic agriculture: Share of utilised agricultural area (UAA) supported by the CAP for organic farming, with a split between maintenance and conversion

For the support of the total value of the indicator, see SO4.

2.1.SO5.9 Justification of the financial allocation

Specific objectives 4, 5 and 6 cannot be separated from the point of view of meeting the recommendations and ensuring an adequate financial allocation. Overall, the measures relating to the three SOs fulfil our

obligation under Article 93. Some of the measures of all other SOs also contribute to the objectives of the three SOs, with the result that environmental resources constitute one of the most significant parts of the plan's framework.

Relevant recommendations:

- Halting and reversing biodiversity loss, contributing to the EU Green Deal targets on high-diversity landscape features.
- Preparing agriculture for the challenges of water management.
- Increase the efficiency of nutrient management to reduce losses and soil, air and water pollution through reduction measures, thereby helping to achieve the Green Deal objective of reducing nutrient losses.
- Contribution to the organic farming objective of the EU Green Deal.
- Support mitigation practices and adaptation tools.

The financial envelope provided for in the plan is sufficient to address the recommendations, supported by the relevant parts of Headings 3 and 5.

2.1.SO6 Contribute to halting and reversing biodiversity loss, enhance ecosystem services and preserve habitats and landscapes

2.1.SO6.1 Summary of the SWOT Analysis

2.1.SO6.1.1 Strengths

- E.1.Significant extent of EU or domestic protected areas for nature protection (Chapter 1)
- E.2.Hungary is part of the Pannon biogeographical region (representing 17 % of the species listed in the annexes to the Habitats Directive, 36 % of the species covered by the Birds Directive) (Chapter 1)
- E.3.Natura 2000 sites are also protected sites of national importance (Chapter 1)
- E.4.The share of forest areas in the Natura 2000 network is more than twice the EU average (Chapter 1)
- E.5.European gene banking outstanding
- E.6.The long-term agricultural production is based on high biodiversity and balanced ecosystems – these are better than average in the EU
- E.7.EU important wetlands, Ramsar areas
- E.8.Ecological network of significant national dimensions (solutions to connect isolated habitats) (Chapter 1)
- E.9.Our agriculture GMO-free (Chapter 9)
- E.10.Significant sectoral expertise in nature conservation, forestry and wildlife management
- E.11.For forestry and hunting, there is a legal obligation to employ a qualified professional
- E.12.The continuous modernisation of the legislative framework for forest management clearly points to increasing the continuous forest cover and mixing. [SO6/3.2.]
- E.13.Legal provision is made for cultivation appropriate to the cultivation of the area in question
- E.14.Basic map of Hungary's Ecosystem has been prepared (Chapter 10)
- E.15.The rate of expansion of built-up areas is slowing down (chapter 2)
- E.16.Mapping of permanent grasslands since 2013
- E.17 Existence of areas providing high-level ecosystem services
- E.18. Existence of a national landscape strategy (2017-2026), existing detailed conservation management and maintenance plans (Chapter 9)
- E.19. Territorial presence of nature conservation interests in farming through the National Park Directorates
- E.20.Compensation of land use standards slows down the loss of agro-biodiversity in Natura 2000 sites.

2.1.SO6.1.2 Weaknesses

- Gy.1.Deficiency on the exact state of biodiversity, incomplete, uncoordinated monitoring networks (SO6/4.1)
- Gy.2.Conservation status, poor or unsatisfactory status of habitats and species of Community interest^[1], including those associated with agriculture (Chapter 3), (SO6/1.2)
- Gy.3.Biodiversity large plot sizes (lower parcel size to maintain biodiversity), high share of intensively farmed agricultural land (Chapter 7)
- Gy.4.A continuous decline in the mosaicity of the areas, periphery habitats, landways, submersibles and forest strips (chapter 7)
- Gy.5.Reduction in the population of small wild game and bird species associated with agricultural habitats (Chapter 5, Chapter 9), [SO6/2.4]
- Gy.6.Deterioration of habitats linked to agriculture (Chapter 5)
- Gy.7.Agriculture, water management, forestry, hunting, nature conservation and low share of landscape management areas (chapter 7), [SO6/5.1]
- Gy.8.Minformed farmer knowledge of the environmental impacts of farming, low motivation to continue closer-to-nature farming, consultancy services are missing, [SO6/5.3]

Gy.9.The low level of recognition by society of ecosystem services provided by the natural environment (pollination, value of forest ecosystem services) and biodiversity conservation due to a lack of information [SO6/5.2.]

Gy.10. Decline in the population of bird species associated with agricultural habitats (Chapter 5), [SO6/2.4]

Gy.11. The impact of ecosystem commitments in forests is slow to develop

Gy.12 Low landscape management area (chapter 7)

Gy.13. Weaknesses in the inventory of organic farming areas

Gy.14. The rise of invasive alien species is significant (Chapter 9)

Gy.15. Inadequate implementation of existing detailed conservation management and maintenance plans

Gy.16. An obstacle to the uptake of agro-forestry systems is the uncertainty and disinterest in the direct aid conditions for agricultural land.

Gy.17. Use of the environmental, social and economic potential of organic farming and low consumer demand (Chapter 6), [SO6/7.1]

2.1.SO6.1.3 Opportunities

L.1.Ecologically cultivated area increase (chapter 6)

Amendment of L.2.Natura 2000 legislation on rational, differentiated grassland management that meets the needs of the habitat concerned.

L.3.Resource efficiency is improved, differentiated, efficient and rational input application and use is prioritised

L.4.Increase knowledge of farmers, consultants and social awareness of climate change, biodiversity and ecosystem services

L.5.The complexity and targeting of forest-environment interventions is evolving, [SO6/3.3].

L.6.Procedures for forest mixing and multi-ageing are developed and applied

L.7 Sustainable hunting management according to the ecological requirements of the areas (Chapter 9)

L.8.Consideration of the biodiversity potential of inland waters in order to preserve the long-term water balance of the area (conversion of extreme inland waters into wetlands)

L.9.Habitat management (e.g. ‘below farm threshold’ forests, ecological corridors, green architecture elements)

L.10.The potential of gene conservation can contribute to climate adaptation (both in agriculture and forestry) (Chapter 9), [SO6/6.1]

L.11.Economic recognition of the added value of biodiversity and ecosystem services

L.12.The uptake of agro-forestry systems as cultivation methods that have a positive impact on the local microclimate and function as ecological corridors, and other cultivation technologies leading to higher crop cover, is increasing, [SO6/3.2.]

L.13.The water retention power of management in line with landscape conditions is significant (Chapter 7)

L.14.Education of a natural resource-friendly and climate-conscious approach to farming at all levels of vocational education, starting from secondary education

L.15.Knowledge on the importance and conservation of biodiversity is integrated into the agricultural vocational training system as a basic competence

L.16.Installation of a long-term single spatial data system and data reporting platform (on the model of the GIS or integrated into the GIS) needed to achieve the target, prioritising brownfield installations rather than greenfield developments

L.17.Increase in cross-sectoral cooperation and exchange of information

L.18.Good scope of remote sensing data and methods and number of spatial data needed to achieve the purpose

L.19.Precision farming is more concentrated and involved in promoting nature-friendly farming

L.20.The take-up of integrated development and the development actually implemented in an integrated

way in cooperation between different sectors will contribute to improved biodiversity and landscape management improvements

L.21.Prepared for National Biodiversity Strategy 2021-2030

L.22.The most popular mode of secular tourism remains forest pedestrian excursion

2.1.SO6.1.4 Threats

F.1 Land-use change, hacking of former grassland for agricultural purposes, [SO6/1.3]; [SO6/1.5]

F.2.Flood protection and inland water management which do not take into account biodiversity considerations threaten the conservation of biodiversity in these areas and make it difficult to maintain forest and wildlife management (Chapter 5)

F.3 Negative impact of shifts in climate zones on different habitats and production potential

F.4. Invasive alien species due to climate change, appearance and spread of pests, pathogens

F.5. The status of natural assets in protected natural areas and Natura 2000 sites is seriously compromised by effects directly and indirectly linked to mismanagement [SO6/1.1]; [SO6/3.1.],

F.6. Further intensification of habitat degradation, in particular for ecosystem transitions (e.g. forest margins, tree groups, small water surfaces), [SO6/2.1]

F.7 Negative impacts of significant large wild game stocks on habitats (Chapter 9), [SO6/1.4]

F.8. Compliance with context indicators C.41 (Increasing the production of renewable energy from agriculture and forestry) and C.42 (Energy use in agriculture, forestry and food) raises conservation concerns

F.9 Further increase in integration (mainly industry, residential areas) to the detriment of agricultural and natural areas (chapter 2)

F.10.Greenfield investments are still significant

F.11 Decline in the population of Pollinators (wild and bee bees) (Chapter 9)

F.12 The intensification of agricultural production continues to increase, the proportion of large-scale monoculture is increasing (Chapter 7), [SO6/2.3]

F.13. Biodiversity-friendly land use change, conversion of grassland into cropland (Chapter 5), [SO6/2.2]

F.14. Further drastic decline in the population of bird species linked to agricultural habitats (chapter 5)

F.15. The negative effects on habitats of further large wild game growth are increasing (Chapter 9), [SO6/1.4]; [SO6/1.6]

F.16. Poor habitats (monocultures, trees of the same age, artificially propagated trees) increase exposure to pests, diseases and forest fires, [SO6/3.4.]

2.1.SO6.1.5 Other comments

Not relevant.

2.1.SO6.2 Identification of needs

Code	Title	Prioritisation at the level of the CAP Strategic Plan	Need is addressed in Cap Strategic Plan
4.4.2	Review of the use of arable land at the boundary of economics	2	Yes
5.3.1	Promoting water retention in soil and landscape	1	Yes
6.1.1	Conservation or improvement of the natural condition of Natura 2000 farmland habitats	1	Yes
6.1.2	Maintenance or improvement of the natural condition of high nature value sites	1	Yes
6.1.3	Maintenance and development of grasslands in good ecological status and species richness	2	Yes

6.2.3	Ensuring ecological interoperability and biodiversity between cultivated areas by means of intermediate zones	1	Yes
6.3.1	Conservation or improvement of the natural condition of Natura 2000 and protected forest habitats	1	Yes
6.3.2	Increasing the share of forest land under forest management with continuous cover	1	Yes
6.3.3	Improve forest structure, age composition, encourage reforestation	1	Yes
6.3.4	Reducing the risk of forest fires and vegetation fires through complex prevention	2	Yes
6.4.1	Developing up-to-date data collection and monitoring systems for measuring biodiversity	1	Partially
6.5.1	Support for cooperation between agriculture, forestry, hunting and nature conservation	1	Partially
6.5.2	Providing information to the public on the importance of ecosystem services and biodiversity	2	Yes
6.5.3	Ensuring stability of Pollination systems	1	Yes
6.6.1	Genetic conservation and land use in climate adaptive agriculture and forestry	2	Yes
6.7.1	Increasing the area under organic cultivation	2	Yes

Other comments related to needs assessment.

Not relevant

2.1.SO6.3 Identification of the relevant (elements of) national plans emanating from the legislative instruments referred to in Annex XI of the CAP plan Regulation that have been taken into account in the CAP plans' needs assessment for this specific objective

Needs

6.1. Improving the status of agriculture-related habitats and species

6.1.1.Natura 2000 conservation or improvement of the natural condition of agricultural habitats

6.1.2.Preservation or improvement of areas of high natural value (agriculture, forest, wet)

6.1.3. Maintain and improve the good ecological status and species richness of the grasslands, prevent scrubbing, e.g. by grazing livestock

6.1.4.Regulating large wild game, taking full account of ecological considerations, reducing negative impacts on habitats

Harmonisation of environmental constraints and management rules with requirements for professional grassland management

6.1.6.Prevention of damage caused by protected animals

Annex XIII EU legislation

Directive 2009/147/EC of the European Parliament and of the Council of 30 November 2009 on the conservation of wild birds and

Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora.

Related objectives of national environmental and climate plans

V. National Nature Conservation Basic Plan (The 5th National Plan for Nature Conservation)

Annex 1 of the National Environment Programme)

1.

- *Improving the status of species in unfavourable conservation status, in particular those listed in the annexes to the Habitats and Birds Directives, and specially protected species.*
- *Maintenance and development of agricultural subsidies to support the conservation of grasslands in order to protect protected species in non-protected areas.*
- *Support initiatives to conserve our native species (e.g. bird-friendly garden, butterfly-friendly garden, butterfly-friendly vineyards).*
- *Continue and strengthen measures to resolve conflict situations related to protected species (building bat and bird species, sowing cows, etc.).*
- *Improving the status of key stocks of specially protected species.*
- *Conservation of non-forest wood stands, rows, groups of trees, tree arborets, parks, with a special focus on older odour trees (for species and bats consuming dead wood).*

National Natura 2000 Priorised Action Plan for the Multiannual Financial Framework 2021-2027

1.

- *Support for grazing and mowing management in private areas.*
- *Zonal programmes for the conservation of species of Community interest linked to cultivated grassland and arable land in High Natural Value Areas (LPAs) – species-specific agri-environmental management payments.*
- *Compensation for additional costs and income foregone resulting from specific land use standards for utilised agricultural areas in the Natura 2000 network*

National Strategy for the Conservation of Biodiversity 2021-2030 (draft to be approved 2021)*

1.

- *Promote sustainable and mosaic agriculture that takes into account biodiversity conservation and environmental and landscape conservation aspects, as well as mainstreaming biodiversity conservation into the Common Agricultural Policy.*
- *Ensure sustainable wildlife and fisheries management that does not endanger biodiversity renewal*

6.2. Restoring acronymity of agricultural land, land use change

6.2.3. Ensuring ecological interoperability and biodiversity between operational areas by intermediate zones

Annex XIII EU legislation

No related EU legislation

Related objectives of national environmental and climate plans

V. National Nature Conservation Basic Plan (The 5th National Plan for Nature Conservation) Annex 1 of the National Environment Programme)

1.

- *Continuation of habitat rehabilitation and reconstruction works (e.g. re-grazing, restoration of wetlands);*
- *Improving existing and potential green infrastructure components, mitigating the negative effects of climate change and promoting adaptation, improving interoperability between natural and semi-natural areas*

National Strategy for the Conservation of Biodiversity 2021-2030 (draft to be approved 2021)

1.

- *Promote sustainable and mosaic agriculture that takes into account biodiversity*

conservation and environmental and landscape conservation aspects, as well as mainstreaming biodiversity conservation into the Common Agricultural Policy.

- *Sustainable water management, water retention and rational, saving water use to conserve biodiversity and maintain ecosystem services.*
- *The coordinated development, maintenance and improvement of green infrastructure components.*

6.3. Improving the status of forest habitats and species

6.3.1. Natura 2000 conservation or improvement of the natural condition of forest habitats

6.3.2. Increase the share of forest land under forest management providing continuous cover

6.3.3. Improve forest structure, age composition and encourage reforestation, taking full account of ecological considerations

6.3.4. Reduction of forest and vegetation fires through complex prevention

Annex XIII EU legislation

Directive 2009/147/EC of the European Parliament and of the Council of 30 November 2009 on the conservation of wild birds and

Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora.

Related objectives of national environmental and climate plans

National Forest Strategy 2016-2030

1.

- *Ensuring the survival of forest ecosystems and organisms, preserving and, where possible, improving forest biodiversity*
- *Ensuring the possibility to adapt to changing production conditions*
- *Conservation or, where possible, improvement of the natural nature offorests*
- *Protecting natural processes inforests (forest dynamics) and promoting sustainable forest management*
- *Prevention of forest damage through forest management methods that improve forest resilience and take into account the effects of climate change*

National Natura 2000 Priorised Action Plan for the Multiannual Financial Framework 2021-2027

1.

- *Forest-environment payments for nature conservation in private forest areas.*
- *Compliance with forest management obligations for forest-used areas of the Natura 2000 network.*

V. National Nature Conservation Basic Plan (The 5th National Plan for Nature Conservation) Annex 1 of the National Environment Programme)

1.

- *Ensuring forest management for nature conservation purposes in protected natural areas and Natura 2000 sites.*
- *Aligning forest management and conservation objectives with the widest possible national and EU support schemes*

National Strategy for the Conservation of Biodiversity 2021-2030 (draft to be approved 2021)

1.

- *Conservation of existing primary and old-growth forests, expansion of forest stands of high biodiversity value, and creation of a forest structure favourable to biodiversity conservation and development*

The primary objective of RD38_F05_AFI_73 – Support for investments in afforestation and woodland is to promote land use change and increase natural carbon sequestration. At the same time, an important objective for new forests is to promote the objective set out in **Section 16(3) of Act LIII of 1996 on the protection of nature**: ‘Forest is planted primarily with native tree species, in natural proportions and in a nature-friendly manner, if the conditions of the production area permit.’ Therefore, the conditions for support are defined more narrowly than the option provided for in the current Hungarian Forest Law. Ineligible: forest, woodland or plantation of woody plants established in accordance with separate legislation with intensively spread tree species, within a radius of 100 metres of natural forest or nature-like forest, and within and within 100 metres of any protected or Natura 2000 natural area.

6.4. Developing state-of-the-art data collection and monitoring systems (biodiversity, land registry, land use/land use) by maintaining existing systems, informing industry stakeholders

6.4.1. Develop advanced data collection and monitoring systems (biodiversity, ecosystem services, land registry, land use) by maintaining existing systems, informing industry stakeholders

Annex XIII EU legislation

No related EU legislation

Related objectives of national environmental and climate plans

National Strategy for the Conservation of Biodiversity 2021-2030 (draft to be approved 2021)

1.

- *Assess and map the extent, condition and services of ecosystems to maintain and restore ecosystems in the long term, monitor change*
- *Maintain and further develop monitoring for nature conservation purposes to ensure the continuity of long-term biodiversity data series.*

6.5. Fostering cross-sectoral cooperation, enhancing knowledge transfer on ecosystem services and the environmental impacts of agriculture and the benefits of closer-to-nature farming

Support for cooperation between agriculture, water management, grassland management, forestry, hunting, nature conservation

6.5.2. Information to the general public on the importance of ecosystem services and biodiversity
Ensuring the stability of policy systems

Annex XIII EU legislation

No related EU legislation

Related objectives of national environmental and climate plans

National Strategy for the Conservation of Biodiversity 2021-2030 (draft to be approved 2021)

1.

- *The assessment of ecosystem services and the integration of aspects for their conservation and restoration into the decision-making processes of relevant sectoral policies to better preserve and restore the service-providing capacity of ecosystems.*
- *Shaping an understanding of the importance of biodiversity, the preservation of domestic natural assets, awareness-raising and dissemination.*

National Forest Strategy 2016-2030

1.

- *Effective communication to promote public acceptance of measures taken in the interest of nature conservation*

6.6. Exploiting the potential of gene conservation, the use of landscape varieties, long-established animal breeds and landscape management in both agriculture and forestry

6.6.1. Use the potential of conservation and landscape management in climate adaptive agriculture and forestry

Annex XIII EU legislation

No related EU legislation

Related objectives of national environmental and climate plans

National Strategy for the Conservation of Biodiversity 2021-2030 (draft to be approved 2021)

1.

- *The conservation of genetic resources and ensuring the fair and equitable sharing of genetic resources and the benefits arising from their use.*

6.7. Increasing the area under organic farming

6.7.1. Increase of organically cultivated areas

Annex XIII EU legislation

No related EU legislation

Related objectives of national environmental and climate plans

National Action Plan for the Development of Organic Farming 2021-2027 (draft)

1.

- *Balanced development of the supply and demand side of the domestic organic sector by doubling the proportion of areas under organic farming and promoting organic products and creating an environment conducive to and supporting market growth.*

National Plant Protection Action Plan

1.

- *Increase the number of farmers subject to the organic control and certification system, including the area checked and the quantity of certified products.*

Second National Climate Change Strategy 2018-2030 with a 2050 perspective

1.

- *Accelerate the uptake of production systems with lower energy and more efficient use of fertilisers (e.g. organic farming that does not use fertilisers), promote the uptake of cultivation methods with less disturbance of the soil*

National Strategy for the Conservation of Biodiversity 2021-2030 (draft to be approved 2021)

1.

- *National Strategy for the Conservation of Biological Diversity 2021-2030 (draft 2021) – Improving sustainable and mosaic farming for biodiversity conservation, environment and landscape conservation, and mainstreaming biodiversity conservation into the Common Agricultural Policy.*

*For the National Strategy for the Conservation of Biodiversity 2021-2030, the inter-ministerial consultation and a national conference on the draft strategy with broad stakeholder participation were completed in 2021, but the Strategy has not yet been adopted by Parliament.

2.1.S06.4 Intervention logic

Form of Intervention	Type of Intervention	Intervention Code (MS) - Name	Common Output Indicator
DPdecoupled	Eco-scheme(31) - Schemes for the climate, the environment and animal welfare	DP17_G01_ECOS_16 - Agro-ecological programme	O.8. Number of hectares or of livestock units benefitting from eco-schemes
Sectoral - Fruit and Vegetables	INVRE(47(1)(a)) - investments in tangible and intangible assets, research and experimental and innovative production methods and other actions	SC28_E01_FVI_47 - Investments, research and experimental and innovative production methods and other activities – fruit and vegetables	O.35. Number of supported operational programmes
Sectoral - Fruit and Vegetables	ORGAN(47(1)(d)) - organic or integrated production	SC13_G01_FVO_47 - organic or integrated production — Vegetable fruit	O.35. Number of supported operational programmes
Sectoral - Apiculture products	ADVICEES(55(1)(a)) - advisory services, technical assistance, training, information and exchange of best practices, including through networking, for beekeepers and beekeepers' organisations	SC02_A01_BEA_55 - Apiculture knowledge transfer and technical assistance	O.37. Number of actions or units for beekeeping preservation or improvement
Sectoral - Apiculture products	INVAPI(55(1)(b)) - investments in tangible and intangible assets, as well as other actions	SC03_E02_BEI_55 - Improving the competitiveness of the apiculture sector	O.37. Number of actions or units for beekeeping preservation or improvement
Sectoral - Apiculture products	PROMOBEES(55(1)(f)) - promotion, communication and marketing including market monitoring actions and activities aimed in particular at raising consumer awareness about the quality of the apiculture products	SC01_A02_BEM_55 - Beekeeping marketing	O.37. Number of actions or units for beekeeping preservation or improvement
RD	ENVCLIM(70) - Environmental, climate-related and other management commitments	RD19_G01_AEC_70 - Agricultural environmental management payments (AKG)	O.14. Number of hectares (excluding forestry) or number of other units covered by environmental or climate-related commitments going beyond mandatory requirements
RD	ENVCLIM(70) - Environmental, climate-related and other management commitments	RD19a_G01_AEC_70 - AGRI-environmental management payments (AKG)	O.14. Number of hectares (excluding forestry) or number of other units covered by environmental or climate-related commitments going beyond mandatory requirements
RD	ENVCLIM(70) - Environmental, climate-related and other management commitments	RD20_G02_ORT_70 - Support to organic farming	O.17. Number of hectares or number of other units benefitting from support for organic farming

RD	ENVCLIM(70) - Environmental, climate-related and other management commitments	RD22_G05_LCP_70 - Payment to encourage agro-ecological land use change	O.14. Number of hectares (excluding forestry) or number of other units covered by environmental or climate-related commitments going

			beyond mandatory requirements
RD	ENVCLIM(70) - Environmental, climate-related and other management commitments	RD24_G07_GAX_70 - Ex situ conservation and technical support of animal genetic resources	O.19. Number of operations or units supporting genetic resources
RD	ENVCLIM(70) - Environmental, climate-related and other management commitments	RD25_G08_GAI_70 - Conservation in situ of animal genetic resources	O.19. Number of operations or units supporting genetic resources
RD	ENVCLIM(70) - Environmental, climate-related and other management commitments	RD26_G09_GAV_70 - In vitro conservation of animal genetic resources	O.19. Number of operations or units supporting genetic resources
RD	ENVCLIM(70) - Environmental, climate-related and other management commitments	RD27_G10_GPX_70 - Ex situ conservation of plant genetic resources and micro-organisms	O.19. Number of operations or units supporting genetic resources
RD	ENVCLIM(70) - Environmental, climate-related and other management commitments	RD28_G11_GPI_70 - Conservation in situ of plant genetic resources	O.19. Number of operations or units supporting genetic resources
RD	ENVCLIM(70) - Environmental, climate-related and other management commitments	RD33_G16_ANB_70 - Animal welfare aid in the apiculture sector	O.18. Number of livestock units (LU) benefitting from support for animal welfare, health or increased biosecurity measures
RD	ENVCLIM(70) - Environmental, climate-related and other management commitments	RD35_F02_FEC_70 - Forest multi-annual commitments (Multiannual Commitments)	O.15. Number of hectares (forestry) or number of other units covered by environmental or climate-related commitments going beyond mandatory requirements
RD	ENVCLIM(70) - Environmental, climate-related and other management commitments	RD36_F03_GEN_70 - Multi-annual commitments for forest genetics	O.19. Number of operations or units supporting genetic resources
RD	ASD(72) - Area-specific disadvantages resulting from certain mandatory requirements	RD23_G06_NAG_72 - Natura 2000 agricultural land compensation payments	O.13. Number of hectares benefitting from support under Natura 2000 or Directive 2000/60/EC
RD	ASD(72) - Area-specific disadvantages resulting from certain mandatory requirements	RD34_F01_NAF_72 - Natura 2000 compensation payments for forest areas	O.13. Number of hectares benefitting from support under Natura 2000 or Directive 2000/60/EC
RD	INVEST(73-74) - Investments, including investments in irrigation	RD21_G04_LCI_73 - Non-productive investments in Agro-ecological	O.21. Number of supported on-farm non-productive investment operations or units
RD	INVEST(73-74) - Investments, including investments in irrigation	RD38_F05_AFI_73 - Support for investments in afforestation and creation of woodland	O.24. Number of supported off-farm productive investment operations or units
RD	COOP(77) - Cooperation	RD37_F04_FRC_77 - Co-operative support for forest fire prevention and risk reduction	O.32. Number of supported other cooperation operations or units (excluding EIP reported under O.1)
RD	COOP(77) - Cooperation	RD51_R11_TUC_77 - Rural development cooperation for active and eco-tourism development in the region	O.32. Number of supported other cooperation operations or units (excluding EIP reported under O.1)
RD	COOP(77) - Cooperation	RD52_R12_BIC_77 - Rural development cooperation for the development of a biomass-based economy	O.32. Number of supported other cooperation operations or units (excluding EIP reported under O.1)

6.1. Main needs: Improving the status of agriculture-related habitats and species

The situation revealed that in Hungary there are valuable habitats for biodiversity in the cultivated areas and that the presence of different species is also directly linked to the agricultural or forestry farm. For habitat types specifically linked to agriculture (grasslands and other agro-ecosystems), the conservation status in each habitat type is bad or unsatisfactory, and the trend towards change is markedly deteriorating. It is therefore necessary to implement farming practices that help to improve the status of habitats linked to agriculture and the status of species.

Need 6.1.1: Natura 2000 maintenance or improvement of the natural condition of agricultural habitats

In 2016, the proportion of Natura 2000 sites designated under two European Union Nature Directives – the Birds Directive and the Habitats Directive – was 21.44 % (1.99 million hectares) in Hungary. Its share of agricultural land is 14.73 % (787 171 hectares). The vast majority (90 %) of our protected natural areas or the national Natura 2000 network are cultivated, affected by agriculture or forestry (25 % of agricultural land, grapes or orchards, 27 % grassland and 38 % forest). Maintaining Natura 2000 habitats is an important tool to conserve biodiversity.

Planned interventions:

- Agro-ecological NPI RD21_G04_LCI_73
- Agro-ecological land use change incentive payment RD22_G05_LCP_70
- Natura 2000 compensatory payments for agricultural land RD23_G06_NAG_72

Need 6.1.2: Conservation or improvement of high nature value areas (agriculture, forest, wetlands)

According to 2019 data, almost 87 % of habitat types covered by the Habitats Directive are not in a satisfactory (38 %) or bad (49 %) conservation status, while the proportion of habitats with favourable conservation status is only 13 %. Agricultural habitats and wetlands most vulnerable to environmental impacts are in the worst position. Preserving or improving the natural state of high nature value areas (agriculture, forest and wetlands) contributes to the conservation of biodiversity.

Planned interventions:

- Agricultural management payments RD19_G01_AEC_70
- Agro-ecological NPI RD21_G04_LCI_73
- Agro-ecological land use change incentive payment RD22_G05_LCP_70 70
- Natura 2000 compensatory payments for agricultural land RD23_G06_NAG_72

Need 6.1.3: Maintaining and improving the good ecological status and species richness of grasslands, preventing scrub, e.g. by grazing livestock

The population of bird species linked to agricultural habitats has been declining in Hungary since 1999. The decrease can be linked to intensification of agriculture, land use change, hacking of former grasslands, reduction of submersibles, fallows, tree and bush groups. The decline in the biodiversity of farmland areas is illustrated by the continuous decline in populations of farmland bird species since 2005, with most grasslands in poor ecological status. Maintaining and improving the good ecological status and species richness of grasslands, preventing scrub, e.g. through pastoralism, makes it possible to maintain biodiversity.

Planned interventions:

- Agro-ecological programme DP17_G01_ECOS_16 (Meeting: SO4; SO5)
- Agricultural management payments RD19_G01_AEC_70
- Agro-ecological NPI RD21_G04_LCI_73
- Agro-ecological land use change incentive payment RD22_G05_LCP_70

·Natura 2000 compensatory payments for agricultural land RD23_G06_NAG_72

6.2. Main Needs: Restoring acronymity of agricultural land, land use change

The assessment highlights that large plot sizes are not favourable in terms of maintaining biodiversity (the smaller parcel size is favourable to maintaining biodiversity) and that the share of intensively farmed agricultural land is high. There is a continuous decline in the mosaicity of areas, periphery habitats, landways, submersibles and forest strips. The main need is to solve this problem by restoring the mosaicity of the edges.

6.2.3. Ensuring ecological interoperability and biodiversity between cultivated areas through intermediate zones

The significant decline in the mosaicity of areas, the elimination of periphery habitats (such as ecological corridors), the abandonment of landscape management and the abandonment of cultivation (spreading invasive species) also have negative consequences for biodiversity [Gy.4.]. It would therefore be important to apply competitive farming and landscape management at an appropriate rate. While maintaining the natural habitats in the landscape, landscape management enables agricultural production to make a significant contribution to the conservation of biodiversity and improves the environmental conditions of the countryside. Ensuring ecological interoperability eliminates the isolation of cultivated areas.

Planned interventions:

- Agro-ecological programme DP17_G01_ECOS_16
- Agro-ecological NPI RD21_G04_LCI_73
- Agro-ecological land use change incentive payment RD22_G05_LCP_70

6.3.Main needs: Improving the status of forest habitats and species

According to 2019 data, almost 87 % of habitat types covered by the Habitats Directive are not in a satisfactory (38 %) or bad (49 %) conservation status, while the proportion of habitats with favourable conservation status is only 13 %. 6.5 % of habitat types of Community interest (3 out of 46 habitat types) (e.g. Euro-Siberian forest styp oak forests) show an actual deterioration in the conservation status. Just over 61 % of species of Community interest linked to forest ecosystems in Hungary, while 77 % of habitat types are not in a satisfactory or bad conservation status.

Need 6.3.1: Conservation or improvement of the natural condition of Natura 2000 forest habitats

The richness of Hungary's natural assets is illustrated by the fact that 22.2 % of Hungary's territory, about 2 067 876 hectares, is protected by EU or national nature protection [E.1.]. The proportion of Natura 2000 sites designated under two European Union Nature Directives [fn1^{\[1\]}](#) and the Habitats Directive [2] was 21.44 % (1.99 million hectares) in Hungary in 2016. Its share of agricultural land is 14.73 % (787 171 hectares). Nearly half of Natura 2000 sites (848 140 ha, 9.108 %) are also protected sites of national importance. The Natura 2000 network in Hungary consists of a total of 479 Special Areas of Conservation (SACs) and 56 Special Protection Areas (SPAs). The maintenance of Natura 2000 and protected and highly protected forest areas is an important tool for maintaining biodiversity.

Planned interventions:

- Natura 2000 conservation or improvement of the natural condition of forest habitats RD34_F01_NAF_72

Need 6.3.2: Increasing the share of forest land under forest management providing continuous cover

Forest management, which provides continuous forest cover, builds more on natural processes than

cutting-edge management, allows them to be better implemented and makes better use of their benefits. This type of forest management is in line with nature, helps to increase biodiversity and provides forests with greater protection against the challenges of climate change. In addition to climate protection, increasing forest areas also increases biodiversity.

Planned interventions:

- Forest multiannual commitments RD35_F02_FEC_70

- Support for investments in afforestation and woodland – RD38_F05_AFI_73

Need 6.3.3: Improving forest structure, age composition and encouraging forest renovations, taking full account of ecological considerations

Over the last half a century, the volume of damage to Hungarian forests has shown an increasing trend in terms of the size of the forest area in question. This is true for abiotic and biotic forms of damage. The impact of weather extremities (late frosts, storms, droughts, tin rain) is directly reflected in the trend of abiotic damage (drought, fire damage, storm castings, fractures). However, for many forms of biotic damage, there is clear evidence that the evolution of weather conditions plays a decisive role in increasing trends. It is also important that abiotic damage in many cases creates appropriate conditions for the development of certain biotic damage events and increases their volume and severity. The mass destruction of trees and stands (droughts) caused each year by native species (both insects, pathogens) that have not previously been attributed importance to forest protection on trees and stands that have been weakened as a result of adverse weather conditions. As a result of the displacement of certain climate zones in the production area beyond the adaptability of the trees, the future survival of certain tree species is already being called into question in large areas (e.g. beech) and some of the 60-80-year-old stands are already disappearing (spruce). Improving the structure and age composition of forests and encouraging forest renovations make it possible to maintain forests, taking full account of ecological considerations.

Planned interventions:

- Forest multiannual commitments RD35_F02_FEC_70

6.3.4 Risk reduction of forest and vegetation fires through complex prevention

In Hungary, the relative frequency of forest fires has increased in recent decades. This is due to climate extremes, less precipitation, higher average annual temperatures and a series of winters without snow cover. Typically, as a result of climate change, more hot summers have not only increased the number of forest fires, but sometimes also the speed and intensity of fire propagation. More intense forest fires may affect a larger area than before and are more difficult to vacate.

In domestic forests, the so-called surface fires are typical when the litter on the forest soil, other dead plant parts and smaller shrubs are given flame. These may evolve into crown fires in the event of high intensity combustion. All forest areas in the country are classified in forest fire risk categories. The National Forest Stock Data Repository operated by the NFCSO contains the classification per forest section and per farmer. For these reasons, it is of utmost importance to reduce the risk of forest and vegetation fires through complex prevention. Forest and vegetation fires cause great damage to both wildlife and owners, so prevention is the best strategy.

Planned interventions:

Collaborative support for forest fire prevention and risk reduction – RD37_F04_FRC_77

6.4. Development of state-of-the-art data collection and monitoring systems (biodiversity, land registry, land use/land use) by maintaining and developing existing systems, informing industry stakeholders

Although Hungary has a number of data collection and monitoring systems, in particular in the field of land registration, land use/land use, and data collections on biodiversity, they are isolated, databases are not harmonised, their use and consultation are difficult and therefore they cannot be described as up-to-date in terms of data collection and monitoring. In particular, there is a lack of data on the exact state of biodiversity, incomplete and uncoordinated monitoring networks. The implementation of the measure seeks to address this problem, which contributes to the accurate assessment of biodiversity and thus to the application of measures that help to increase it.

6.4.1. Development of state-of-the-art data collection and monitoring systems (biodiversity, land registry, land use/land use) by maintaining and developing existing systems, informing industry stakeholders

Although Hungary has different data collection and monitoring systems, in particular in the field of land registration, land use/land use, there are still data collections on biodiversity, which are isolated, databases are not harmonised, their use and consultation are difficult to use and therefore cannot be described as up-to-date in terms of data collection and monitoring. In particular, there is a lack of data on the exact state of biodiversity, incomplete and uncoordinated monitoring networks. The implementation of the measure seeks to address this problem, which contributes to the accurate assessment of biodiversity and thus to the application of measures that help to increase it. Its development is a prerequisite for rational management of natural resources. The development of modern data collection and monitoring systems (biodiversity, ecosystem services, land registry, land use/land use) and the provision of information to industry actors are key tasks.

- Agro-ecological programme – DP17_G01_ECOS_16
- Agro-ecological NPI – RD21_G04_LCI_73
- Agricultural Management Payments – RD19_G01_AEC_70
- Support for organic farming – RD20_G02_ORT_70
- Agro-ecological non-productive investments – RD21_G04_LCI_73
- Agro-ecological land use change incentive payment – RD22_G05_LCP_70
- Sectoral interventions for fruit and vegetables: Aid to producer organisations – SC28_E01_FVI_47
- Organic or integrated production – Vegetable fruit – SC13_G01_FVO_47
- Preservation of plant genetic resources in situ – RD28_G11_GPI_70
- Support for investments in afforestation and woodland – RD38_F05_AFI_73
- Activities other than caps

6.5. Fostering cross-sectoral cooperation, enhancing knowledge transfer on ecosystem services and the impact of agriculture on the environment and the benefits of closer-to-nature farming

The stocktaking exercise showed that there is a lack of knowledge on the environmental impacts of farming and low motivation to continue close-to-nature farming. There is little social recognition of the ecosystem services provided by the natural environment and the conservation of biodiversity, and there is a lack of advisory services in this regard. The level of cooperation between sectors is very low, but rather some form of competition has developed, so it is important to facilitate cooperation between sectors and to support their establishment.

6.5.1. Support for cooperation between agriculture, water management, grassland management, forestry, hunting, nature conservation

The situation has clearly shown the weakness that the level of cooperation between agriculture, water management, grassland management, forestry, wildlife management and nature conservation is very low. There is a very low degree of cooperation and coordination between professionals and areas, while these areas interact strongly and action in one area often has a serious impact on other areas. It is therefore very justified to support cooperation between different areas. Without cooperation between agriculture, water management, grassland management, forestry, hunting and nature conservation, the objectives of nature protection cannot be achieved.

Planned interventions:

- Rural development cooperation for the development of the biomass economy RD52_R12_BIC_77
- Sectoral interventions for fruit and vegetables: Aid to producer organisations – SC28_E01_FVI_47
- Activities other than caps

6.5.2. Communicating the importance of ecosystem services and biodiversity to the general public

Society is increasingly confronted with the consequences of negative developments in the natural environment, but at the same time is very little aware of causal relationships. Members of society have very little knowledge of ecosystem services, biodiversity, its role, the relationship between individual and social well-being and the functioning of healthy ecosystems. Public information on this issue should therefore be a priority. Informing the public and thus supporting it is essential to increase biodiversity.

Planned interventions:

- Apiculture marketing SC01_A02_BEM_55
- Rural development cooperation for regional active and ecotourism development RD51_R11_TUC_77

6.5.3. Improving farmers' knowledge of the environmental impact of agriculture, motivating closer-to-nature farming

The stocktaking exercise showed that there is a lack of knowledge on the environmental impacts of farming and low motivation to continue close-to-nature farming. Farmers make their decisions primarily on the basis of cost-benefit considerations, and taking into account the impact of farming on the environment is only a multitude of considerations. It is therefore essential to raise awareness in this area. In particular, healthy food can only be produced in a healthy, diversified environment and a healthy ecosystem is more resilient to the challenges of climate change. The clarification of these contexts is particularly important for farmers. Improving farmers' knowledge of the environmental impact of agriculture and motivating them to continue closer-to-nature farming are important for farmers to recognise the importance of the topic.

Planned interventions:

- Beekeeping knowledge transfer and technical assistance SC02_A01_BEA_55
- Animal welfare aid in the apiculture sector RD33_G16_ANB_70
- Improving the competitiveness of the beekeeping sector SC03_E02_BEI_55

6.6. Exploiting the potential of gene conservation, the use of landscape varieties, long-established animal breeds and landscape management in both agriculture and forestry

In addition to habitat and racial diversity, the preservation of genetic diversity is a key element of biodiversity, which is of particular importance both in terms of land and forestry, especially in the light of adaptation to the effects of climate change. The conservation and development of forest genetic resources can ensure future viable material and biological diversity of afforestation. Gene conservation, landscape breeds, long-range animal breeds and landscape management can be a good starting point for the development of climate adaptive breeds.

6.6.1. Harnessing the potential of gene conservation and landscape management in adaptive agriculture and forestry

In addition to habitat and racial diversity, the preservation of genetic diversity is a key element of biodiversity, which is of particular importance both in terms of land and forestry, especially in the light of adaptation to the effects of climate change. The conservation and development of forest genetic resources can ensure future viable material and biological diversity of afforestation. Gene conservation, landscape varieties, long-range animal breeds and landscape management can be a good starting point for the development of climate-adaptive breeds.

Planned interventions:

- Increasing the competitiveness of the beekeeping sector SC03_E02_BEI_55
- Ex situ conservation of animal genetic resources RD24_G07_GAX_70
- Preservation of animal genetic resources in situ RD25_G08_GAI_70

- In vitro conservation of animal genetic resources RD26_G09_GAV_70
- Ex situ conservation of plant genetic resources and micro-organisms RD27_G10_GPX_70
- Preservation of plant genetic resources in situ RD28_G11_GPI_70
- Forest genetic multiannual commitments RD36_F03_GEN_70

6.7. Increasing the area under organic farming

In Hungary, the production volume of organic farming remained stable between 2005 and 2014. The number of organic farmers ranged from 1429 to 1672, with organic farmland ranging from 116 to 141 thousand hectares. The area covered by organic farming in Hungary in 2019 was 303 190 thousand hectares, of which the organic area was 185.227 ha and the area under conversion 117 963 ha. This area falls significantly short of the EU's strategic objective, therefore increasing this is an important objective.

6.7.1. Increasing the area under organic farming

The expansion of organically cultivated areas is not only a green deal requirement, but also a tool for biologic diversity and close-to-environment farming.

Planned interventions:

- Organic or integrated production – Vegetables SC13_G01_FVO_47
- Support for organic farming RD20_G02_ORT_70

2.1.SO6.5 Where relevant, a justification for the use of InvestEU, including the amount and its expected contribution to the Specific Objective/Cross-Cutting Objective

Not relevant.

2.1.SO6.7 Are you planning CAP contribution towards the LIFE programme (only for SO4, SO5, SO6)

: No

2.1.SO6.8 Selection of the result indicator(s)

Selection of the result indicator(s) for this specific objective

Result indicators [recommended Result indicators for this specific objective are fully displayed in bold]	Target value
R.7^{PR} - Enhancing support for farms in areas with specific needs Percentage of additional support per hectare in areas with higher needs (compared to average)	111.57 %
R.17^{CU PR} - Afforested land Area supported for afforestation, agroforestry restoration, including breakdowns	16,174.00 ha
R.18^{CU} - Investment support for the forest sector Total investment to improve the performance of the forestry sector	399,567,252.00 EUR
R.22^{PR} - Sustainable nutrient management Share of utilised agricultural area (UAA) under supported commitments related to improved nutrient management	21.89 %
R.24^{PR} - Sustainable and reduced use of pesticides Share of Utilised Agricultural Area (UAA) under supported specific commitments which lead to a sustainable use of pesticides in order to reduce risks and impacts of pesticides, such as pesticides leakage	23.94 %
R.25 - Environmental performance in the livestock sector Share of livestock units (LU) under supported commitments to improve environmental sustainability	1.45 %
R.27^{CU} - Environmental or climate-related performance through investment in rural	1,811.00

areas Number of operations contributing to environmental sustainability and the achievement of climate mitigation and adaptation goals in rural areas	
R.29^{PR} - Development of organic agriculture Share of utilised agricultural area (UAA) supported by the CAP for organic farming with a split between maintenance and conversion	5.26 %
R.30^{PR} - Supporting sustainable forest management Share of forest land under commitments to support forest protection and management of ecosystem services	6.54 %
R.31^{PR} - Preserving habitats and species Share of utilised agricultural area (UAA) under supported commitments for supporting biodiversity conservation or restoration including high-nature-value farming practices	29.95 %
R.32^{CU} - Investments related to biodiversity Share of farms benefitting from CAP investment support contributing to biodiversity	1.02 %
R.33 - Improving Natura 2000 management Share of total Natura 2000 area under supported commitments	11.35 %
R.34^{PR} - Preserving landscape features Share of utilised agricultural area (UAA) under supported commitments for managing landscape features, including hedgerows and trees	0.49 %
R.35^{CU} - Preserving beehives Share of beehives supported by the CAP	62.71 %

Justification of the targets and related milestones

SO6 – Contributing to halting and reversing biodiversity loss, enhancing ecosystem services and preserving habitats and landscapes

The milestone value of each R indicator and the value of the contribution of the related interventions (by year) are set out in the attached table, so they are not described in detail in the text.

The value of the R indicators related to the SO6 specific objective is heavily influenced by the AKG, ÖKO and AÖP interventions. In the case of these payments, farmers choose from a set of commitments that change their farming practices in an environmentally sound manner. Each commitment contributes to a number of R indicators, as they modify farming practices to an extent that they address a number of natural factors (e.g.: water, soil, biodiversity). Examples include organic grassland management (ÖKO) or retention of unsown land (AKG). These pledges both save nature from chemical use, earthworks and provide habitats for wildlife. ÖKO support is in itself a complex set of commitments, but in the case of AKG and ÖP, farmers have to choose more commitments, so that a given area contributes to most environmental R indicators. The contribution of the requirements to a given R indicator has sometimes been taken into account with different territories, as they also affect natural factors (such as R indicators) at different territorial scales. In the case of biodiversity, the impact on the area concerned may be significantly exceeded (e.g.: 10 % unmown land).

R.07^{PR}: Enhancing support for farms in areas with specific needs: Percentage additional support per hectare in areas with higher needs (compared to average)

All interventions (and their value) of the R.07^{PR} indicator that relate to SO6 have already been analysed for SO1.

R.17^{PR}: Afforested land: Area supported for afforestation, agroforestry and restoration, including breakdowns

For the support of the total value of the indicator, see SO4.

R.18: Investment support for the forest sector: Total investment to improve the performance of the forestry sector

The indicator's target is investment support for the forestry sector – the value of the total investment to

improve the performance of the forestry sector, which is EUR 399567252. Two of the interventions contributing to the target relate to the needs underlying the SO6 specific objective, which together account for almost half of the target of R.18. The more significant of these (also crucial for all interventions in the indicator) is RD38_F05_AFI_73 – Support for investments in afforestation and woodland, with an aid intensity of 100 %, which will provide a balanced investment support between 2026 and 2028 on nearly 5 thousand hectares per year, in total almost 15 thousand hectares. The area was calculated on the basis of increased planting areas in 2020, with territorial values consolidated over the medium term, with the corresponding aid amount planned on the basis of the previous planning period, taking into account the expected target stock, with the support of the basic aid and the additional aid. Support for afforestation and woodland investments in relation to the SO6 specific objective will support an increase in the share of forest land under forest management that provides continuous cover (6.3.2). RD52_R12_BIC_77 – Rural development cooperation for the development of the biomass economy and RD51_R11_TUC_77 – Rural development cooperation for active and eco-tourism development in the region, supported by a total of 21 projects for both interventions between 2024 and 2027, represent a much lower contribution to the target of indicator R.18, which also builds SO6.

R.22^{PR}: Sustainable nutrient management: Share of Utilised Agricultural Area (UAA) under supported commitments to improve nutrient management

For the support of the total value of the indicator, see SO4.

R.24^{PR}: Sustainable and reduced use of pesticides: Utilised Agricultural Area (UAA) concerned by supported specific commitments which lead to a sustainable use of pesticides in order to reduce risks and impacts of pesticides, such as pesticides leakage

For the support of the total value of the indicator, see SO5.

R.25: Environmental performance of the livestock sector: Share of livestock units under supported commitments to improve environmental sustainability

Indicator target: 1.45 %, which is the share of livestock units covered by supported commitments to improve environmental sustainability; the numerator of the indicator shall be equal to 35573 LU, which shall remain at full value in 2026 and 2027. Both interventions responsible for the value of the indicator R.25 are linked to the needs underlying the SO6 specific objective, so the indicator is presented at full value. More than 88 % of the indicator target is provided by the intervention RD25_G08_GAI_70 – Conservation of animal genetic resources in situ, the remaining less modest rate is due to the ex situ conservation of animal genetic resources intervention RD24_G07_GAX_70. The results of each intervention, calculated in LSU, were calculated on the basis of the number of animals in the applications submitted in the previous planning period, using the coefficients. Accordingly, the interventions contributing to the target of indicator R.25 specifically support the exploitation of the potential of gene conservation, the use of landscape varieties, long-established animal breeds and landscape management in climate-adaptive agriculture. (6.6.1).

R.27: Environmental or climate-related performance through investment in rural areas: Number of operations contributing to environmental sustainability and achievement of climate change mitigation and adaptation targets in rural areas

See SO4 for supporting the indicator value; there is one intervention to support the achievement of indicator R.27 with a modest contribution (10 projects) exclusively through SO6: RD26_G09_GAV_70 – In vitro conservation of animal genetic resources, namely 6.6.1 Gene conservation, use of landscape varieties, use of long-established animal breeds and use of landscape management in climate adaptation by addressing the need for both agriculture and forestry.

R.29^{PR}: Development of organic agriculture: Share of utilised agricultural area (UAA) supported by the CAP for organic farming, with a split between maintenance and conversion

For the support of the total value of the indicator, see SO4.

R.30^{PR}: Supporting sustainable forest management: Share of forest land under commitments to support forest protection and management of ecosystem services

The indicator's target is 6.54 %, representing 127 thousand hectares of forest land. Each year, the share of hectares covered by the target increases, and the target will be reached in 2029. There is no overlap between the areas covered by the two interventions related to the indicator. The most important intervention for the indicator target is RD35_F02_FEC_70 – Forest Multi-Annual Commitments for the Environment (JU) with nearly two thirds of the indicator target. This intervention responds specifically to the SO6 Main Needs 3: in addition to increasing the share of forest land under forest management that provides continuous cover (6.3.2), improving forest structure and age composition and encouraging forest renovations, taking full account of ecological considerations (6.3.3), the two needs addressed.

A more modest contribution to the value of the indicator is provided by RD36_F03_GEN_70 – Forest Genetic Multi-Annual Commitments, which supports the exploitation of the potential of gene conservation, the use of landscape varieties, long-established animal breeds, landscape management, both in climate adaptation and in agriculture and forestry (6.6.1).

R.31^{PR}: Preserving habitats and species: Share of utilised agricultural area (UAA) under supported commitments for supporting biodiversity conservation or restoration including high-nature-value farming practices

The indicator target is 29.95 %, which is the share of utilised agricultural area (UAA) under supported commitments to support biodiversity conservation or restoration, including high nature value farming practices. The calculation underlying the indicator target value used territorial data from the previous planning period and takes into account possible duplications. The numerator of the target calculated after duplication screening shall be 1 590 450 hectares, resulting from the contribution of five interventions. The largest areas will be provided by the DP17_G01_ECOS_16 – Basic Agro-ecological Programme and the second most important result unit RD19_G01_AEC_70 – Agri-environmental management payments (AKG). The contribution of RD20_G02_ORT_70 – Support for organic farming and payment for agro-ecological land-use change measures RD20_G02_ORT_70 – Support for organic farming and payment to encourage agro-ecological land-use change in the areas of R.31 is further but much less modest, but the latter is of great importance in practice by helping to maintain new habitats. The territorial coverage resulting from the specificities of these interventions is described in detail in chapter 2.1.8 of the SO4 specific objective.

The interventions of the indicator R.31 respond in a complex manner to the needs underlying the SO6 specific objective. Intermediate zones ensure ecological interoperability and biodiversity between cultivated areas (6.2.3). They also serve to improve the status of habitats linked to agriculture and the status of species: NATURA 2000 agricultural habitats (6.1.1) and high nature value areas (6.1.2) are also included in their commitments to preserve and improve their natural condition, maintain and improve the good ecological status and species richness of grasslands and prevent scrub (6.1.3). As other elements of complexity, they support cooperation between agriculture, water management, grassland management, forestry, hunting, nature conservation (6.5.1), gum conservation, the use of landscape varieties, long-established animal breeds, landscape management (6.6.1), and increasing the area under organic farming (6.7.1).

R.32: Investments related to biodiversity: Share of farms benefitting from CAP investment support contributing to biodiversity

The indicator target is 1.18 % of farms receiving CAP investment support contributing to biodiversity. Achievement of the indicator target by RD21_G04_LCI_73 – Agro-ecological non-productive investments intervention involving a total of 1278 farms, RD38_F05_AFI_73 – Support for investments in afforestation and creation of woodland with a total of 1560 farms. The indicator value will develop between 2025 and 2029, calculated with a higher number of more intensive engagements over the first two years.

The interventions of the indicator R.32 play a key role in addressing two main needs in a wide range of areas: in addition to improving the condition of agriculture-related habitats and the status of species

(principal need 1) it is also involved in the restoration of acronymity of agricultural land and land use change (main need 2), both in terms of territorial diversification and ecological interoperability between cultivated areas. It also concerns an increase in the share of forest land managed with permanent cover (6.3.2) and support for cooperation between farming, water management, grassland management, forestry, hunting and nature conservation (6.5.1).

R.33: Improving Natura 2000 management: Share of total Natura 2000 area under supported commitments

The indicator's target is 22.55 %, which is the share of the total Natura 2000 areas covered by supported commitments compared to Hungary's total utilised agricultural area. The indicator's target is mainly provided by the RD19_G01_AEC_70 – Agri-environmental management payments (AKG) intervention, in particular through specific payments for nature conservation in High Natural Value Areas to support Natura 2000 management tasks between 2024 and 2027 with a steady annual commitment value. The intervention contributes to addressing the main need 1 underlying the SO6 specific objective: supports the preservation or improvement of the natural condition of high nature value areas (agriculture, forest, wet) (6.1.2) and the maintenance and improvement of the good ecological status and species richness of grasslands (6.1.3). Compared to AKG, the contribution of RD35_F02_FEC_70 – Forest Multi-Annual Commitments (EAC) to the target is much lower (0.7 % in total), while reflecting a very different need for SO6 in 15 % of the total areas covered by the intervention: it also supports increasing the share of forest areas under forest management that provide continuous cover (6.3.2) and improving the structure and age composition of forests and encouraging forest renovation, taking full account of ecological considerations (6.3.3).

R.34^{PR}: Preserving landscape features: Share of utilised agricultural area (UAA) under supported commitments for managing landscape features, including hedgerows and trees

The indicator target is 0.491 %, which is the share of utilised agricultural area (UAA) under supported commitments to manage landscape features, including hedges and trees, in Hungary's total utilised agricultural area. Three interventions contribute to the indicator target; in the calculation of the target value for indicator R.34, we also ensured adequate duplication screening. DP17_G01_ECOS_16 – Basic Agro-ecological programme and RD19_G01_AEC_70 – Agri-environmental management payments (AKG) are the two most significant interventions, which provide the indicator's target. All three interventions related to the indicator reflect the main needs 1 and 2 of the SO6 specific objective, as recorded in indicator R.31.

The second subparagraph of Article 4(4)(b) states that 'If Member States so decide, 'assisted hectares' may include other landscape features, provided that they do not dominate and do not significantly impede the exercise of agricultural activity because of the area they occupy. Such landscape features are complementary to landscape features protected under GAEC 8. Hungary has decided to designate a variety of such landscape features and to make them eligible in the BISS. This is a major step that all environmental and nature protection groups see as a "historical step". This is certainly a significant step forward, as the traditional EU definition of eligible hectares previously covered only agricultural land used for production or at least kept in a form suitable for continuing agricultural production at any time.

In chapter 4.1.3.5, we list the "other landscape features" that will be eligible for BISS, thus giving farmers a direct incentive to maintain them in their full ecological functionality. These are:

- Woody-sectoral grasslands
- Ecological buffer strip
- Erosion control facility established on arable land as part of a non-productive investment
- Stitch edge
- Erosion control band

Eligibility for BISS is a sufficient incentive for farmers to:

(I) these landscape features are maintained (regardless of whether they are protected or accounted for under GAEC 8; GAEC protected landscape features are another large set of landscape features eligible for BISS listed in Chapter 3.10.4.1);

(II) create landscape features on their currently eligible agricultural areas without losing their entitlement to BISS

Although ‘other landscape features’ eligible for BISS are not methodologically eligible for R34, we estimate that an additional 80 000 hectares could be reflected through R.34 if the facts described above are taken into account. This is, of course, additional to the 26 064 hectares already calculated for the three other interventions.

R.35: Preserving beehives: Share of beehives supported by the CAP

The indicator target is 62.71 %, which is the share of beehives supported by interventions providing R.35 (760000 bee colonies). It is expected that there will be a full overlap between the two interventions concerned. SC03_E02_BEI_55 – Developing the competitiveness of the apiculture sector plans to support 700000 bee colonies already in 2023 and then calculates with 15000 new bee colonies per year until 2027. RD33_G16_ANB_70 Animal welfare aid in the apiculture sector is planned to reach bee colonies in 2026 and 2027, while remaining within the scope supported by the above mentioned intervention. The interventions of the R.35 indicator are key to ensuring the need for SO6, the stability of pollination systems (6.5.3) and the potential of gene conservation, the use of landscape varieties, long-established animal breeds and landscape management (6.6.1).

2.1.SO6.9 Justification of the financial allocation

Specific objectives 4, 5 and 6 cannot be separated from the point of view of meeting the recommendations and ensuring an adequate financial allocation. Overall, the measures relating to the three SOs fulfil our obligation under Article 93. Some of the measures of all other SOs also contribute to the objectives of the three SOs, with the result that environmental resources constitute one of the most significant parts of the plan’s framework.

Relevant recommendations:

- Halting and reversing biodiversity loss, contributing to the EU Green Deal targets on high-diversity landscape features.
- Preparing agriculture for the challenges of water management.
- Increase the efficiency of nutrient management to reduce losses and soil, air and water pollution through reduction measures, thereby helping to achieve the Green Deal objective of reducing nutrient losses.
- Contribution to the organic farming objective of the EU Green Deal.
- Support mitigation practices and adaptation tools.

The financial envelope provided for in the plan is sufficient to address the recommendations, supported by the relevant parts of Headings 3 and 5.

2.1.SO7 Attract and sustain young farmers and other new farmers and facilitate sustainable business development in rural areas

2.1.SO7.1 Summary of the SWOT Analysis

2.1.SO7.1.1 Strengths

E.1. Increase in the number and share of young farm managers with a professional qualification in agriculture
E.2. Increase in the popularity of the profession of agricultural engineer
E.3. Increase in the number of micro-enterprises operating in agriculture
E.4. Career guidance initiatives (AGRYA – Young Farmers’ Association, National Chamber of Agricultural Economy) and Successful School Open Days
E.5. Openness of young farmers to the use of digital tools and new solutions that take better account of the environment [CCO/1.4]
E.6. Farmers attach a major role in knowledge brokering to those with close personal contacts (influencer farmers, special advisers, village farmers, accountants)
E.7 Information services for young farmers and industry are well developed
E.8. There is an interest representation of young farmers
E.9 Support activities in the agricultural sector
E.10 Simple borrowing method (Agricultural Széchenyi Card) for young farmers
E.11 Policy strategy and legislation to address agricultural generational renewal from a systemic perspective

2.1.SO7.1.2 Weaknesses

Gy.1. Low agricultural skills and knowledge of young farmers compared to the EU average [SO2/5.1] [SO7/2.1] [SO9/6.1] [CCO/1.1] [CCO/1.2]
Gy.2. Lack of information and knowledge and lack of exchange/sharing on farming and farm transfer [SO7/2.1] [CCO/1.2] [CCO/1.6] [CCO/2.2]
Gy.3. Decreasing numbers of pupils in secondary agro-vocational education, high drop-outs, frequent repetition of the year [SO7/2.2]
Gy.4. Lack of training and further training and outdated infrastructure in both secondary and tertiary education [SO2/5.5] [SO3/1.2] [SO7/2.1] [CCO/2.1]
Gy.5. Almost a third of recent agricultural graduates are located in other sectors. [SO7/1.1] [SO7/2.2]
Gy.6. Low activity of agricultural enterprises in dual training [SO7/2.2] [CCO/1.9]
Gy.7 Most guidance tools are ineffective [SO7/2.2]
Gy.8. The willingness of the older generation to transfer holdings is low [SO7/1.2]
Gy.9 Low intergenerational cooperation [SO7/1.2]
Gy.10. Lack of specific elements for young farmers in the advisory system [SO7/2.1] [CCO/1.6] [CCO/1.8]
Gy.11. Low labour value in agriculture [SO7/2.2]
Gy.12 Shortage of skilled and trained labour [SO2/5.4] [CCO/3.1]
Gy.14. Access to land in general, but particularly scarce for young people [SO7/1.3]
Gy.14. Access to credit for investments by young farmers setting up a new business is more difficult, especially in livestock [SO1/1.2] [SO7/1.4]
Gy.15. The administrative and financial burden for business start-ups and farm transfer is high [SO7/1.4], [SO7/1.5] [SO7/3.1]
Gy.16. Number and share of holdings with diversified activity structure decreasing [SO7/3.2]
Gy.17. The management structure of private forest management is fragmented

2.1.SO7.1.3 Opportunities

- L.1. Improvement of the prestige of the agricultural track [SO7/2.2]
- L.2. As digitalisation rises, agricultural careers can become more attractive for young people [SO7/2.2]
- L.3. Greater involvement of agri-businesses in replacement education [SO7/2.2]
- L.4. Rise in vertical and horizontal cooperation [SO3/1.1] [SO3/1.2]
- L.5. Consumer demand for new diversified services and products in rural areas and beyond our borders [SO7/3.1] [SO7/3.2]
- L.6. Increase in income for young farmers by adding value added [SO2/1.3]
- L.7 Professional potential to expand the network of private forestry enterprises [SO7/3.3]
- L.8. Increasing crèches, pre-school accommodation and basic services in rural areas [SO8/4.1]
- L.9 Young people's more open world views and language skills underpin access to foreign markets, international perspectives and the circulation of the latest professional information
- L.10. Faster adaptability of young people to changes in farming environments
- L.11 Increasing the popularity of organic farming among young farmers.

2.1.SO7.1.4 Threats

- F.1 Reduction in the number of economically active population [SO8/1.2] [SO8/1.3]
- F.2 Young rural population exodus [SO7/1.1] [SO7/2.2] [SO8/1.2] [SO8/1.3]
- F.3 Increase in the labour-absorption effect of other sectors [SO7/1.1] [SO7/2.2]
- F.4. Further rise in land prices hinders access to land [SO7/1.3]
- F.5. Underdeveloped or poorly organised sales channels [SO3/1.1] [SO3/1.3] [SO3/1.4]
- F.6. Low labour income in agriculture compared to other sectors [SO1/1.1] [SO8/1.5]
- F.7 Underdevelopment of the services sector and infrastructure in small-scale rural areas [SO7/3.1] [SO8/3.1] [SO8/4.1]
- F.8. Unfavourable age structure of farmers (especially in the poultry sector, grape and wine production, fruit and arable crops) [SO7/1.1]
- F.9 The number of newly registered agricultural enterprises decreases from year to year [SO7/1.1] [SO7/3.1]

2.1.SO7.1.5 Other comments

Not relevant.

2.1.SO7.2 Identification of needs

Code	Title	Prioritisation at the level of the CAP Strategic Plan	Need is addressed in Cap Strategic Plan
7.1.1	Encouraging business start-ups in agriculture and forestry among young people	1	Yes
7.1.2	Support intergenerational cooperation	2	Yes
7.1.3	Easing access to land for young farmers	2	Partially
7.1.4	Easing access to credit for young farmers	2	Partially
7.1.5	Reducing the administrative burden of intergenerational transfer of agricultural enterprises	2	Partially
7.2.1	Providing complex entrepreneurial skills for setting up a farm	1	Yes
7.2.2	Attracting young generations to farming	1	Yes
7.3.1	Business start-up support for people outside the	1	Yes

	young farmer category		
7.3.2	On-farm/off-farm diversification, with the aim of creating multi-start rural businesses	2	Yes
8.1.5	Improving the profitability of small farms	2	Yes

Other comments related to needs assessment.

Not relevant

2.1.SO7.4 Intervention logic

Form of Intervention	Type of Intervention	Intervention Code (MS) - Name	Common Output Indicator
DPdecoupled	CIS-YF(30) - Complementary income support for young farmers	DP03_B01_YFS_16 - Complementary income support for young farmers	O.6. Number of hectares benefitting from complementary income support for young farmers
RD	INVEST(73-74) - Investments, including investments in irrigation	RD01b_E01_FRM_73 - Support for investments by young farmers	O.20. Number of supported on-farm productive investment operations or units
RD	INVEST(73-74) - Investments, including investments in irrigation	RD04a_E02_FON_73 - Adding value to agricultural products	O.24. Number of supported off-farm productive investment operations or units
RD	INVEST(73-74) - Investments, including investments in irrigation	RD09a_B05_SML_73 - Sustainable development of small farms	O.20. Number of supported on-farm productive investment operations or units
RD	INVEST(73-74) - Investments, including investments in irrigation	RD09b_R14_OGR_73 - Support for small enterprises in the ornamental horticulture sector	O.24. Number of supported off-farm productive investment operations or units
RD	INVEST(73-74) - Investments, including investments in irrigation	RD11_B07_DVF_73 - Diversification of activities of farmers	O.24. Number of supported off-farm productive investment operations or units
RD	INSTAL(75) - Setting up of young farmers and new farmers and rural business start-up	RD05_B01_YFS_75 - Generational renewal with start-up support for young farmers	O.25. Number of young farmers receiving setting-up support
RD	INSTAL(75) - Setting up of young farmers and new farmers and rural business start-up	RD06_B02_YFY_75 - Generational renewal with support for the economy	O.27. Number of rural businesses receiving support for start up
RD	INSTAL(75) - Setting up of young farmers and new farmers and rural business start-up	RD08_B04_BIS_75 - Generational renewal by supporting start-up rural and young forest entrepreneurs	O.27. Number of rural businesses receiving support for start up
RD	COOP(77) - Cooperation	RD07_B03_YFO_77 - Generational renewal, economic transfer cooperation	O.30. Number of supported operations or units for generational renewal (excluding setting-up support)

Overview

7.1. Main Needs: Making it easier for young people to set up farming activities

The situation reveals that young people's farming activity is hampered by a number of factors, the most important of which is the lack of capital to set up a business. It is difficult for young farmers to access preferential loans due to the lack of a proper farming record. The continued rise in land prices and rents, as well as the low supply of land, pose significant obstacles to young people's access to land. Another important obstacle to generational renewal is the lack of intergenerational cooperation, as well as the complex and lengthy administration and the high costs associated with the transition process of the economy.

Requirement 7.1.1: Encouraging start-ups in agriculture and forestry among young people

Encouraging business start-ups in agriculture and forestry among young people contributes to lowering

the average age of farmers. We can support generational renewal in agriculture by providing young farmers with complementary income support (DP03_B01_YFS_16) or by providing capital support for setting up their business (RD05_B01_YFS_75) and by supporting younger farmers to take over and continue to operate the farm from older farmers wishing to abandon farming (RD06_B02_YFY_75).

Planned interventions:

- Complementary income support for young farmers DP03_B01_YFS_16
- Generational renewal with start-up support for young farmers RD05_B01_YFS_75
- Generational renewal supported by the farmer RD06_B02_YFY_75

Need 7.1.2: Supporting intergenerational cooperation

Cooperation with the transferor of the farm makes it easier for young farmers to start up. The aim is to encourage economic growth and promote the social and economic sustainability of family farms based on successful succession stages, both by helping the conscious planning process for farming (RD07_B03_YFO_77) and by supporting younger farmers (RD06_B02_YFY_75).

Planned interventions:

- Generational renewal supported by the farmer RD06_B02_YFY_75
- Generational renewal, farm transfer cooperation RD07_B03_YFO_77

Need 7.1.3: Facilitating access to land for young farmers

The most important condition for setting up young farmers is the availability of land on which they can start farming. Access to land can be facilitated by administrative means and is dependent on the land market, not the competence of the CAP, but the initial support for young farmers (RD06_B02_YFY_75) or support for the farm takeover to take over and continue to operate the farm and land from an older farmer wishing to abandon farming (RD06_B02_YFY_75) contributes indirectly to this objective.

Planned interventions:

- Generational renewal with start-up support for young farmers RD05_B01_YFS_75
- Generational renewal supported by the farmer RD06_B02_YFY_75

Need 7.1.4: Facilitating access to credit for young farmers

The capital available in sufficient quantities is the most important condition for young farmers to start up, and they are typically able to obtain it from credit. Access to credit can be facilitated by administrative means and depends on the financial markets, not the CAP's ST competence, but the complementary income support for young farmers (DP03_B01_YFS_16) can improve the creditworthiness of young farmers.

Planned interventions:

- Complementary income support for young farmers DP03_B01_YFS_16

Need 7.1.5: Reducing the administrative burden and costs of intergenerational transfer of agri-businesses

The transfer of agri-businesses entails considerable administrative burden and costs for participants. The reduction of administrative burdens is primarily the responsibility of public bodies, and the Strategic Plan can only contribute to this by supporting the economic transferee (RD06_B02_YFY_75) and by providing advice and mentoring to the Farming Planning Process (RD07_B03_YFO_77).

Planned interventions:

- Generational renewal supported by the farmer RD06_B02_YFY_75
- Generational renewal, farm transfer cooperation RD07_B03_YFO_77

7.2. Main Needs: Effective transfer of knowledge to take up an economic activity

The stock-taking highlights that young farmers have a low level of agricultural skills and farm management knowledge compared to the EU average, as well as a lack of information and knowledge on farming and farm transfers, as well as a lack of exchange/sharing.

Need 7.2.1: Providing complex entrepreneurial knowledge for economic management

Business start-up requires complex entrepreneurial skills that young farmers can acquire through training and demonstration farm programmes (RD58_A01_TRA_78) and as part of generational renewal programmes.

Planned interventions

Generational renewal with start-up support for young farmers RD05_B01_YFS_75

Generational renewal supported by the farmer RD06_B02_YFY_75

Generational renewal with support for rural and young forest entrepreneurs RD08_B04_BIS_75

· Trainings and demonstration programmes RD58_A01_TRA_78

Need 7.2.2: Attracting young generations to farm careers

Agricultural careers are becoming increasingly unattractive among young people, even those in vocational agricultural education, and it is therefore necessary to promote and highlight the benefits of farming, agriculture-related professions and the way of life of farmers.

Planned interventions

Complementary income support for young farmers DP03_B01_YFS_16

Generational renewal with start-up support for young farmers RD05_B01_YFS_75

Generational renewal supported by the farmer RD06_B02_YFY_75

7.3. Main Needs: Encouraging business start-ups in rural areas

Need 7.3.1: Support for agricultural business start-ups for people outside the young farmer category

Given the long-term development of the sector and the survival of the rural population, it is important to support not only young farmers but also those outside the category of young farmers to set up farming. This objective is mainly supported by support for the farm takeover (RD05_B01_YFY_75), which also gives people outside the young farmer category the opportunity to transfer the holding and the corresponding payment entitlements, as well as the obligations, from the transferor intending to abandon farming, as well as the obligations. In addition, the “Sustainability Development of Small Farms” intervention (RD09a_B05_SML_73) responds to the need by helping small-scale farmers with developing potential to earn income and find more economic opportunities. The start-up and further development of the activities of farmers and forest managers in rural areas related to or not linked to agriculture (RD11_B07_DVF_73) will also contribute to the objective.

Planned intervention

· Sustainable development of small farms RD09a_B05_SML_73

Need 7.3.2: Helping on-farm/off-farm diversification, with the aim of creating more standing rural businesses

More standing businesses improve their ability to earn their income, thus helping them to stay in rural areas. On-farm diversification linked to agriculture and farm resources and off-farm diversification for non-agricultural activities independent of the farm is supported by several measures of the CAP Strategic Plan, contributing to the livelihood of the rural population on the ground, increasing rural employment and the development of the local economy.

Planned interventions:

· Adding value to agricultural products RD04a_E02_FON_73

· Diversification of farmers' activities RD11_B07_DVF_73

· Support for small enterprises in the ornamental horticulture sector RD09b_R14_OGR_73

2.1.SO7.5 Where relevant, a justification for the use of InvestEU, including the amount and its expected contribution to the Specific Objective/Cross-Cutting Objective

Not relevant.

2.1.SO7.6 Are you planning CAP contribution towards the Erasmus programme : No

2.1.SO7.8 Selection of the result indicator(s)

Selection of the result indicator(s) for this specific objective

Result indicators [recommended Result indicators for this specific objective are fully displayed in bold]	Target value
R.9^{CU PR} - Farm modernisation Share of farmers receiving investment support to restructure and modernise, including to improve resource efficiency	2.86 %
R.36^{CU PR} - Generational renewal Number of young farmers benefitting from setting up with support from the CAP, including a gender breakdown	10,700.00
R.39^{CU} - Developing the rural economy Number of rural businesses including bio-economy businesses developed with CAP support	7,900.00

Justification of the targets and related milestones

SO7 – Attracting young farmers and other new farmers and keeping them in the sector and promoting sustainable business development in rural areas

The milestone value of each R indicator and the value of the contribution of the related interventions (by year) are set out in the attached table, so they are not described in detail in the text.

R.36^{PR} – Generational renewal: Number of young farmers benefitting from setting up with support from the CAP, including a gender breakdown

Two interventions contribute to the R.36 indicator, all of which are relevant for the SO7 objective. 80 % of the indicator target is provided by the intervention “DP03 Complementary income support for young farmers” by providing 5500 new entrants to a complementary income support. The intervention “RD05 Generational renewal with start-up support for young farmers” has a smaller, but not negligible, weight: 2695 young farmers are planned to reach. There will also be duplication, with some young farmers benefiting from both interventions; by eliminating this, the indicator is planned to reach more than half of its target of 6 800 in two years, by 2025, and to reach 100 % in a further 3 years.

·According to preliminary figures from the 2020 Agrárcenzus, two thirds of farmers are above retirement age (65), while the share of farm managers under 40 is estimated to be 10 % (KSH, 2021)[1] and it is therefore necessary to encourage the start-up of agricultural and forestry businesses among young people, thereby reducing the average age of farmers (7.1.1). Both interventions aim to address this need, so by the end of the period, 6,800 young farmers (under 40) will substantially reduce the average age.

·Based on preliminary data from the 2020 Agrárcenzus, young farmers have a lower share of land ownership, renting more land than those aged 40+. According to the 2019 AKI questionnaire on generational renewal, among the obstacles to generational renewal, the farmers surveyed considered the lack of rentable or purchased land for expansion as the second most important obstacle to the administrative burden of transfer and takeover[2]. It is therefore necessary to facilitate access to land for young farmers (7.1.3); the intervention “RD05 Generational renewal with start-up support for young farmers” contributes to addressing this difficulty for 2695 young farmers.

·In the case of start-ups, most of the time, the lack of capital and collateral and the lack of an enterprise’s past hinders borrowing. In a questionnaire on generational renewal of farmers in autumn 2019, respondents considered the fourth of the top ten obstacles to generational renewal for young farmers to be

the fourth most serious problem[3]. It is therefore necessary to facilitate access to credit for young farmers (7.1.4). This need is addressed by the “DP03 Complementary Income Support for Young Farmers” intervention, thus improving the conditions of access to credit for 5500 young farmers.

R.39 – Development of the rural economy: Number of rural businesses including bio-economy businesses developed with CAP support

11 interventions contribute to indicator target R.39, of which 5 interventions, accounting for almost 60 % of the indicator target, address the two main needs for the SO7 target.

THE HEADING ‘7.1 Making it easier for young people to set up farming is also aimed at achieving progress in 4 out of 5 sub-needs of 602 farms, with a complex view of the intervention “RD06 Generative Renewal Supporting the Economic Receiver”.

·Incentivising young people to start up farming and forestry businesses among young people (7.1.1) and “facilitating access to land for young farmers” (7.1.3) which call for an average age reduction (already presented in R.36 result indicator) are also progressing.

·According to the results of the questionnaire survey on 192 generational renewals, mostly young farmers, the main difficulty for stakeholders is the administrative tasks related to farm transfers (modification of administrative authorisations, transcription of tools, transfer of tenders, transfer of aid)[4]. It is therefore necessary to reduce the administrative burden and costs of intergenerational transfer of agri-businesses (7.1.5).

·Experts and research highlight that the economic transfer process is hampered by differences in attitudes between generations and the low level of collaboration between older generations and young generations willing to take over the economy[5]. It is therefore necessary to support intergenerational cooperation.

(7.1.2.) The intervention “RD07 Generational renewal, economic transfer cooperation” will also contribute to addressing this need, so that 456 farmers can benefit from intergenerational cooperation.

THE HEADING ‘7.3 Encouraging business start-ups in rural areas’, the interventions under indicator R.39 contribute, according to the complexity of the challenge, by:

·According to farm structure surveys (FSS), the number of other non-agricultural holdings in Hungary decreased by less than half (from 44375 to 19743) over the period to be examined with statistical data (2013-2016). There was considerable interest in the RDP call for the start-up and development of non-agricultural activities, which shows that farmers are open to setting up and developing diversification activities[6]. In the 2014-2020 cycle, there is still a need to support on-farm/off-farm diversification with a view to creating more standing rural businesses. (7.3.2) This need is managed through more interventions, planned to reach more than 1000 farmers: ‘RD09b Unit cost of support for small enterprises in the skiing sector’; “RD11 Diversification of farmers’ activities”.

R.09^{PR} – Modernisation of farms: Share of farmers receiving investment support to restructure and modernise, including to improve resource efficiency

For evidence of the total value of the indicator, see SO2.

[6] Situation analysis for specific objective 7 (30.6.2021), Chapter 6

2.1.SO7.9 Justification of the financial allocation

For SO, we intend to spend around 2 % of the overall plan, thus fulfilling our obligation under Article 95. The most important of the interventions are the start-up support for young farmers, but also support for start-up farmers beyond the age limit, support for farm creation and support for non-agricultural start-ups.

As in the Strategic Plan as a whole, we mainly support objectives related to agriculture and forestry, relying on the resources of the operational programmes to support other start-ups.

One of the Commission's recommendations to Hungary states that it is important to "make the agricultural sector more attractive to newcomers", with funds for the specific purpose, we intend to respond to this recommendation.

2.1.SO8 Promote employment, growth, gender equality, including the participation of women in farming, social inclusion and local development in rural areas, including the circular bio-economy and sustainable forestry

2.1.SO8.1 Summary of the SWOT Analysis

2.1.SO8.1.1 Strengths

- E.1. Increase in employment rate in typically rural areas for both 15-64 and 20-64 age groups
- E.2. Employment growth in agriculture and food
- E.3. Leader and other good practices for local cooperation, local knowledge of local action groups, experience of implementation of development policy and programme and network of contacts
- E.4. Continuous growth of afforested or planted land, growing stock of live trees
- E.5. Wood kits are available throughout the country, albeit with significant variations, within a rational transport distance near municipalities
- E.6. Availability of small-scale LEADER funding tailored to local needs for micro-enterprises and civil society organisations with typically low capital and risk tolerance in rural areas
- E.7 Increasing the interdependence of local development and making better use of the human capacity of LEADER LAGs for the EAFRD basic services and the management of rural development funds outside the CAP
- E.8. FRM production can meet domestic climate forecasts

2.1.SO8.1.2 Weaknesses

- Gy.1. The employment rate of women is significantly below that of men [SO8/1.1]
- Gy.2. Despite rising incomes, there are still significant differences in the income distribution (between the lowest and highest income earners and between types of municipalities) [SO8/4.2].
- Gy.3. Increasing but still low labour productivity
- Gy.4. Population decline, especially in rural areas [SO8/1.3]
- Gy.5. Emigration for work purposes [SO8/1.2]
- Gy.6. Strong market exposure due to predominance of firewood among forest benefit options [SO8/6.1]
- Gy.7 Company-level inefficiencies in FRM production and forest management [SO8/6.1] SO8/6.2]
- Gy.8. Higher value selection of trees and underdevelopment of value added among forest managers [SO6/3.3] [SO8/6.1]
- Gy.9 Despite moderate convergence, significant regional disparities remain [SO8/3.1][SO8/3.2]
- Gy.10. Reduction of job capacity in rural areas
- Gy.11. Territorial differences in the development of infrastructure necessary to improve the quality of rural transport and other public services [SO8/3.1] [SO8/3.2]
- Gy.12 Low sewerage rate in municipalities
- Gy.13. General unavailability of small villages with child protection, health and education services [SO8/4.1]
- Gy.14. Restrictions on additional tourism opportunities for small farmers [SO8/1.5]
- Gy.15. The constraints of LEADER resources and the high administrative burden on the use of small-scale resources compared to the scale [SO8/2.3]
- Gy.16. Fragmented management/construction service conditions in private forest management [SO8/1.5] SO8/6.1
- Gy.17. Primary use of biomass farm feedstock production is underdeveloped [SO8/5.1]
- Gy.18. Lack of complex cross-programme solutions for the reintegration of long-term inactive people [SO8/1.4]
- Gy.19. The exposure of vulnerable social groups (Roma, unemployed, low-skilled) to poverty or social exclusion remains high

2.1.SO8.1.3 Opportunities

- L.1. Development of enterprises to improve labour productivity
- L.2. Contribution of the biomass economy to the achievement of energy efficiency and climate protection targets
- L.3. Developing the value chains of the biomass economy by complementing feedstock production with chemical and biotechnology processing
- L.4. Capacity of a biomass economy to create jobs in less-favoured areas [SO8/5.1]
- L.5. Maintenance of public amenity services in forestry
- L.6. More diverse integration of forestry in the in-situ bioeconomy, finding new functions and sources of income using BAT technologies in “energy communities”
- L.7 Increased interest in domestic tourism, including agro- and eco-tourism
- L.8. Launch of complex multi-fund rural development programmes
- L.9 Strengthening rural-urban cooperation
- L.10. Increased availability of ICT opportunities
- L.11 Increasing the efficiency of forest and forestry service companies
- L.12. Spread of rel-type cooperation
- L.13. Conscious sectoral labour supply by organising practical training for potential entrants
- L.14. Domestic and EU programmes, strategies, synergies between programmes to address complex problems (e.g. poverty) outside or complementary to CAP ST [SO8/4.2]
- L.15 Labour market integration of potential labour reserves
- L.16. Increase in fixed broadband internet coverage between households with the internet
- L.17. Improvement of some elements of transport infrastructure (e.g. increasing motorway length)
- L.18. Increased crèches and pre-school accommodation

2.1.SO8.1.4 Threats

- F.1 Further decrease in the number of economically active population [SO8/1.3]
- F.2 The ageing population puts at risk the further expansion of economic growth due to consumption [SO8/1.3].
- F.3 Exhausting reserves for further employment expansion [SO8/1.4]
- F.4. The high proportion of firewood in forestry harvesting maintains the vulnerability of the sector [SO6/3.3] [SO8/6.1] [SO8/6.2].
- F.5. Deterioration in access to local basic health services (e.g. increase in the number of unfilled GPs and nurseries) [SO8/4.1]
- F.6. Domestic and international take-up of wood replacement products [SO4/5.1.]
- F.7 Lack of a biomass-based economic strategy and action plan [SO8/5.1]
- F.8. Increased focus on emission limits for biomass-based energy production and on the calculation of the life-cycle GHG balance [SO8/5.1]
- F.9 Fragmented management conditions and persistence of labour shortages in forest management [SO8/1.2] [SO8/1.5]
- F.10. Excessive expansion of energy plantations for renewable energy use, thereby facilitating the spread of invasive species [SO8/6.1] [SO8/6.2].
- F.11 The results of Roma inclusion programmes are not sufficiently tangible [SO8/4.2].
- F.12 Further erosion of human resources available for part of LEADER LAGs [SO8/2.1] [SO8/2.2]

2.1.SO8.1.5 Other comments

Overview

1. Main needs: Reducing labour displacement by increasing the number and profitability of rural

businesses, improving income distribution and living standards for rural people, reducing territorial disparities

8.1.1 Increasing the employment rate of rural women

The SWOT analysis mentions as a weakness that the employment environment for women (Gy.1) remains significantly worse than that of men, especially in rural areas. Despite positive trends, there are still significant differences in the distribution of income (between the lowest and the highest income and between types of settlement (Gy.2). Another weakness is that rural areas are particularly affected by population decline (GY.4) and labour emigration (GY.5). Improvements to improve labour productivity in enterprises (L.1) and improvements aimed at re-integrating the labour market of long-term inactive people (L.16) are mentioned as an option.

Planned interventions:

RD11_B07_DVF_73 – Diversification of agricultural activity

RD57_R15_LDR_77 – Preparation and implementation of LEADER strategies

RD04a_E02_FON_73 – Adding value to agricultural products

RD43_R02_LOC_73 – Rural infrastructure development in small settlements

Improving the profitability of micro-enterprises in rural areas

Tourism, interventions to support generational renewal, diversification and SLAIP can be key to improving the profitability of smaller rural businesses. In the 2014-2020 period, a significant number of applications for support from LEADER Local Development Strategies (LDS) were used to develop non-agricultural and food micro-enterprises in rural areas. As LFS are based on local needs, where available resources and conditions allow, LEADER's contribution to meeting this need is still expected.

Furthermore, the call for proposals GINOP Plusz-1.2.2-22 can make a significant contribution to meeting this need by providing support to micro-entrepreneurs in municipalities with a maximum of 5000 inhabitants within or outside the free business zones. Taking this into account in the LEADER HFS, synergies between programmes should be identified at local level for interventions for economic development.

Planned interventions:

RD51_R11_TUC_77 – Rural development cooperation for regional active and eco-tourism development

RD57_R15_LDR_77 – Preparation and implementation of LEADER strategies

DP03_B01_YFS_16 Complementary income support for young farmers

RD05_B01_YFS_75 Generational renewal with young farmers start-up aid

RD08_B04_BIS_75 – Generational renewal with start-up rural and young forest entrepreneurs

RD11_B07_DVF_73 – Diversification of agricultural activity

RD04a_E02_FON_73 – Adding value to agricultural products

RD43_R02_LOC_73 – Rural infrastructure development in small municipalities (in proportion to population – total expected: 2.000.000)

RD50_R10_SEC_77 – Rural development cooperation for the development of social enterprises

8.1.5 Improving the profitability of small farms

Improving the profitability of small farms is essential for the rural population living in agriculture. In this respect, the SWOT analysis showed that obstacles remain for complementary tourism development in small farms (Gy.14). Joining the biomass-based economy would provide additional opportunities to improve the profitability of small farms (L4). In relation to the LEADER initiative, it was found in the thematic evaluation of the VP that a significant number of applications for support from the LFS envelope served the development of small-scale agricultural or food processing activities. Given that LFSs are based on local needs, where available resources and conditions allow, LEADER's contribution to meeting this need is still expected.

Planned interventions:

DP03_B01_YFS_16 – Complementary income support for young farmers

RD04a_E02_FON_73 Adding value to agricultural products
 RD07_B03_YFO_77 Generational renewal, farm transfer cooperation
 RD09a_B05_SML_73 Sustainable development of small farms
 RD09b_R14_OGR_73 Support for small enterprises in the decorative sector
 RD11_B07_DVF_73 – Support for diversification of agricultural activity
 RD51_R11_TUC_77 – Rural development cooperation for regional active and eco-tourism development
 RD52_R12_BIC_77 – Rural development cooperation for the development of a biomass-based economy

8.1.6 Biomass feedstocks, intermediate products, waste processing, renewable energy recovery
 The management of local and community-organised agricultural and manufacturing intermediate products, by-products, waste and waste water in the context of the circular economy can be an important building block for the sustainability of rural areas. The above need is based on the weakness GY.17 of the SWOT analysis, according to which the primary use of raw material production in the biomass-based economy is underdeveloped. The contribution of the biomass-based economy to the achievement of the energy efficiency and climate goals (L.2), the processing of raw material production in the biomass economy for chemical and biotechnology (L.3) and the job creation potential of the biomass-based economy in disadvantaged areas (L.4) are considered as options.

Planned interventions:

SC08_E07_WID_58 Distillation of wine by-products
 ·RD42_R01_RAN_73 – Rural infrastructure development in farms
 ·RD43_R02_LOC_73 – Rural infrastructure development in small municipalities
 ·RD52_R12_BIC_77 – Rural development cooperation for the development of a biomass-based economy
 ·RD57_R15_LDR_77 – Preparation and implementation of LEADER strategies
 RD01c_E01_FRM_73 – Support for green investments in agricultural holdings
 RD04b_E03_FOF_73 – Support for green investments linked to adding value to agricultural products

8.1.7 Replacement of industrial raw materials of Fossil origin with green substitutes
 The need reflects the use of option L3 (development of biomass economy value chains by complementing feedstock production with processing for chemical and biotechnological purposes).

Planned interventions:

RD52_R12_BIC_77 – Rural development cooperation for the development of a biomass-based economy
 RD01c_E01_FRM_73 – Support for green investments in agricultural holdings
 RD04b_E03_FOF_73 – Support for green investments linked to adding value to agricultural products

2. Main needs: Supporting local cooperation in rural areas

8.2.1 Human resources for the implementation of development policy programmes

The SWOT analysis mentions as a strength the network of LEADER Local Action Groups (LAGs) covering the country's rural areas, providing local resources for local development with local knowledge, networking, development policy and programme implementation experience (E8). However, it mentions the further erosion of this resource as a threat (F.12.). The retention of the above-mentioned human resources can be ensured primarily by the operational and animation resources of the LEADER intervention.

Planned interventions:

·RD57_R15_LDR_77 – Preparation and implementation of LEADER strategies

8.2.2 Developments that can be adapted to local/regional needs and have a measurable impact on them

The SWOT analysis found that there is still a significant lack of infrastructure and services in municipalities in rural areas (Gy.11) (Gy.13) (F.5). It is necessary to continue and expand the developments initiated under the previous programme in order to improve the quality of life in rural areas

(L.8) (L.9) (L.15). The strength of the SWOT analysis is that LEADER provides an adequate small-scale development resource tailored to local needs for micro-enterprises and civil society organisations with low capital and risk tolerance in rural areas (E11). The analysis mentions as weaknesses the limitation of LEADER funds and the high administrative burden of using small-scale funds compared to the size (GY15). In particular, LEADER and cooperation interventions can contribute to the development of local/regional needs.

Planned interventions:

- RD15_W04_COP_77 – Supporting sustainable water management communities that improve water efficiency
- RD43_R02_LOC_73 – Rural infrastructure development in small municipalities
- RD50_R10_SEC_77 – Rural Development Cooperation for Social Business Development
- RD51_R11_TUC_77 – Rural development cooperation for regional active and eco-tourism development
- RD52_R12_BIC_77 – Rural development cooperation for the development of a biomass-based economy

- RD57_R15_LDR_77 – Preparation and implementation of LEADER strategies

Coherence of local development programmes, regional cooperation

Options for SWOT analysis include strengthening the mutualisation of local development and making better use of the human capacity of LEADER LAGs for EAFRD basic services and management of rural development funds outside the CAP (L15). In order to exploit this potential, there is a need for LEADER to strengthen synergies between development programmes and regional cooperation at local level. The 2020 LEADER evaluation learned that more than half of LAGs were involved in implementing projects funded by other OPs. Providing LAGs with dedicated resources from other OPs and capacity building for their efficient use can be an effective tool to turn this activity into a common practice.

Planned interventions:

- RD57_R15_LDR_77 – Preparation and implementation of LEADER strategies

3. Main needs: Improving the quality of local infrastructure and services

8.3.1 Reduction of regional disparities in rural transport infrastructure

The SWOT analysis found that transport infrastructure and services are not of sufficient quality in rural areas (GY.11) (Gy.12). Improving this goes beyond the tools of the CAP Strategic Plan, but needs can be addressed by co-designing with other development programmes (L.14). An example could be the component of the Hungarian Village *Program Falusi* Road Fund.

Review of planned interventions:

- RD43_R02_LOC_73 – Rural infrastructure development in small settlements

8.3.2 Developing the infrastructure background for local population services that increase quality of life

The SWOT analysis has shown that the quality of local population services is an important determinant of quality of life and is therefore an important component of the retention of the rural population. The analysis shows a number of disadvantages in rural areas, especially in villages (Gy.11) (Gy.12) (Gy.13) (F5). Based on the experience of previous years, in addition to the development of the local economy, LEADER LFSs also aim to improve rural living space by developing services and the necessary small-scale infrastructure; and strengthening local attachment and community relations through community activation programmes and the development of the necessary environment. In line with the long-term vision for the European Union's rural areas, social innovation and the use of digital tools should be encouraged to achieve these goals. While the toolbox needed to address this need goes beyond the possibilities of the CAP Strategic Plan, it is proposed to create co-design with other programmes (L.15).

For example, the annual calls of the nationally funded Hungarian Village Programme for municipalities below 5000 people play an important role in meeting the needs.

Review of planned interventions:

RD43_R02_LOC_73 – Rural infrastructure development in small settlements

RD57_R15_LDR_77 – Preparation and implementation of LEADER strategies

4. Main needs: Promoting social inclusion and inclusion in rural areas

Provision of small villages with child protection, health and education services

The overall lack of care of small villages with child protection, health and education services significantly reduces the attractiveness of rural spaces (GY.13). Alleviating the need would require complex solutions across programmes for the reintegration of permanently inactive working age (GY.18). However, addressing the need goes beyond the tools of the CAP Strategic Plan, so the potential of other programmes should be highlighted as a matter of priority (L.15). Development resources are mainly included in the draft Territorial and Municipal Development Operational Programme Plus and the Recovery and Resilience Instrument (RRF). The annual calls of the nationally funded Hungarian Village Programme for municipalities below 5000 people play a significant role in meeting the needs.

Planned interventions:

RD43_R02_LOC_73 – Rural infrastructure development in small settlements

RD57_R15_LDR_77 – Preparation and implementation of LEADER strategies

8.4.2 Encouraging Roma inclusion programmes, reducing segregation

Improving the situation of the Roma population is one of the most important tools to improve the situation of lagging municipalities. However, the SWOT analysis showed that Roma inclusion programmes still lack tangible results, which maintains the cumulative disadvantage of the rural Roma population (Gy.18) (F.11). While addressing the problem goes beyond the tools of the CAP Strategic Plan, the analysis highlighted that rural development programmes together have a greater chance of achieving results in Roma inclusion (L.15). For example, the Human Resources Development Operational Programme Plus includes development resources for this need.

Planned interventions:

RD43_R02_LOC_73 – Rural infrastructure development in small settlements

·RD50_R10_SEC_77 – Rural Development Cooperation for Social Business Development

·RD57_R15_LDR_77 – Preparation and implementation of LEADER strategies

RD04a_E02_FON_73 Adding value to agricultural products

6 Main needs: Support for sustainable forest management

8.6.1 Increasing the scope and added value of existing profits and improving profitability

The inclusion of the need is justified by the weaknesses and threats identified in the forest management study and the SWOT analysis. These are the strong market exposure due to the predominance of firewood (Gy.6) (F.4) of the forest benefit options, the underdevelopment of higher-value wood ranges and the pursuit of added value among forest managers (Gy.8), fragmented management and construction operator conditions in private forest management (Gy.16), and the domestic and international penetration of wood substitute products (F.6). The SWOT analysis also found that the area afforested or cultivated with trees is constantly growing (E.9) and that these timber stocks are located within a rational transport route in the vicinity of settlements throughout the country. Increasing the added value of forest products ensures more stable employment in the sector. On this basis, the maintenance of public amenity services in forestry (L.5), a more diverse integration of forest management into the in-situ biomass economy (L.6) and an increase in the efficiency of forest management and forestry service undertakings (L.11) have been

identified as typical options in the sector.

Planned interventions:

RD39_F06_AFM_70 Rearing and income replacement support for investments in afforestation

·RD40_F07_INP_73 – Investments for competitive forestry (for-profit)

·RD57_R15_LDR_77 – Preparation and implementation of LEADER strategies

Production of forest reproductive material ensuring the enhancement and climate adaptation of forest stands

The need is justified by the fact that propagating material production is an important tool for climate adaptation of forests. There are inefficiencies in FRM production and forest management, while urgent action is needed in the sector due to rapidly deteriorating climatic conditions. Failure to do so would result in a further deterioration in the production efficiency of undertakings active in forestry.

Planned intervention:

RD36_F03_GEN_70 Multiannual forest genetic commitments

RD40_F07_INP_73 – Investments for competitive forestry (for-profit)

Summary of the intervention logic for LEADER

Leader intervention contributes to addressing many of the needs identified for SO8 through support for local development strategies. The SWOT analysis mentions as a strength the LEADER network covering the country's rural areas, providing a local resource (E8) with local knowledge, networking, development policy and programme implementer experience for local development. However, it mentions the further erosion of this resource as a threat (F.12.). These two findings are based on the need to define the need for human resources at local level for the implementation of development policy programmes (8.2.1). This need is addressed by a network of local action groups financed from the operational and animation window of LEADER intervention, which is expected to fully cover rural areas in Hungary.

The strength of the SWOT analysis is that LEADER provides an adequate small-scale development resource tailored to local needs for micro-enterprises and civil society organisations with low capital and risk tolerance in rural areas (E11). The analysis mentions as weaknesses the limitation of LEADER funds and the high administrative burden of using small-scale funds compared to the size (GY15). The above strength and weakness is based on the need to define developments that can be adapted to and have a measurable impact on local/regional needs and the need for the necessary resources to do so (8.2.2). The implementation of LEADER local development strategies contributes to this need.

Options include strengthening the mutualisation of local development and making better use of the human capacity of LEADER LAGs for EAFRD basic services and for managing rural development funds outside the CAP (L15). The need for LEADER to strengthen synergies between development programmes and regional cooperation at local level (8.2.3) has emerged in order to exploit this potential.

The **thematic focus** of LEADER intervention is defined in the CAP Strategic Plan in an orientation way. Local communities design priority areas in their local development strategies. The Managing Authority may encourage greater emphasis on certain areas (e.g. by transferring knowledge, creating additional resources) or define frameworks. In previous years, LEADER LAGs had to allocate at least 50 % of their development resources to farm development. The continuation of this practice is confirmed by point GY2 of the SWOT analysis and the following main need: *“Mitigating population decline and reducing labour displacement by increasing the number and profitability of rural businesses, improving the standard of living of rural people, reducing territorial disparities”*. By strengthening the focus on economic development, LEADER can contribute to self-employment and job creation in rural areas (in line with the level of resources available) based on previous experience. This goal is in line with the goal of a successful or prosperous rural area of the European Union's long-term vision for rural areas, creating an attractive economic space for businesses.

The territorial differences in the development of infrastructure needed to improve the quality of rural transport and other residential services are identified as weaknesses in the SWOT analysis (GY11). This is a response to the need for 8.3.2, which requires the development of the infrastructural background of local population services that enhance quality of life. Based on the experience of previous years, LEADER

LFSs have as an important objective the development of rural living space by developing services and the necessary small-scale infrastructure, as well as strengthening local connectivity and community links through community activation programmes and the development of the environment needed for it. In line with the long-term vision for the European Union's rural areas, it is necessary to promote social innovation and the use of digital tools, in particular through the transfer of knowledge and good practice, in order to achieve these goals.

2.1.SO8.5 Where relevant, a justification for the use of InvestEU, including the amount and its expected contribution to the Specific Objective/Cross-Cutting Objective

Not relevant.

2.1.SO8.8 Selection of the result indicator(s)

Selection of the result indicator(s) for this specific objective

Result indicators [recommended Result indicators for this specific objective are fully displayed in bold]	Target value
R.18^{CU} - Investment support for the forest sector Total investment to improve the performance of the forestry sector	399,567,252.00 EUR
R.30^{PR} - Supporting sustainable forest management Share of forest land under commitments to support forest protection and management of ecosystem services	6.54 %
R.37^{CU} - Growth and jobs in rural areas New jobs supported in CAP projects	10,958.00
R.38^{CU} - LEADER coverage Share of rural population covered by local development strategies	99.96 %
R.39^{CU} - Developing the rural economy Number of rural businesses including bio-economy businesses developed with CAP support	7,900.00
R.40^{CU} - Smart transition of the rural economy Number of supported smart-village strategies	52.00
R.41^{CU PR} - Connecting rural Europe Share of rural population benefitting from improved access to services and infrastructure through CAP support	28.36 %
R.42^{CU} - Promoting social inclusion Number of persons covered by supported social inclusion projects	44,181.00

Justification of the targets and related milestones

SO8 – Promoting employment, growth, gender equality, including women's participation in agricultural activities, social inclusion and local development in rural areas, including circular bio-economy and sustainable forestry

The milestone values for each R indicator and the value of the contribution of the related interventions (broken down per year) are set out in the attached table, so that they are not described in detail in the text.

R.18 – Investment support for the forestry sector: Total investment to improve the performance of the forestry sector

Interventions that respond to the needs underlying the SO8 specific objective account for 42.6 % of the total value of indicator R.18 (EUR 448423415). These three interventions are responsible for the ramp-up of indicator R.18: There is a sharp increase in the indicator value in 2025, followed by a steady high annual contribution in 2026 and 2027, reaching the target in 2028.

Of the three SO8 interventions, a key element in ensuring the indicator target is RD40_F07_INP_73 -

Investments for competitive forestry (for-profit), which alone accounts for 40 % of the R.18 pledge. This intervention is the main need 8.6: In support of sustainable forest management, both sub-necessities, 8.6.1. Increase the scope and added value of forest benefits, improve profitability and improve profitability, as well as under 8.6.2. It also reflects the need to produce forest reproductive material to increase forest stands and adapt it to the climate. A total of 800 projects are planned for the intervention, with an aid intensity of 50 % and an increase in average project size. In order to address the needs detailed in chapter 2.1.4, the scope of eligible activities, the increase in project size and the increase in the resources allocated proportionally were also justified compared to the previous period.

The rural cooperation RD51_R11_TUC_77 – Rural Development Cooperation for *active and ecotourism in the region* and RD52_R12_BIC_77 - Rural Development Cooperation for *the development of a biomass-based economy* provides 2.6 % of the R.18 indicator. These two interventions address major needs related to SO8 8.1 and 8.2 in a total of 42 projects, addressing several sub-necessities by supporting complex collaborations. This complex approach is justified on the basis of the needs described in detail in section 2.1.4: only in this way can the challenges of rural areas, which are closely interlinked, be effectively addressed. In order to reduce labour displacement, these two interventions thus aim at improving the profitability of micro-enterprises in rural areas (8.1.2), improving the profitability of small farms (8.1.5), promoting the processing of biomass feedstocks, intermediate products, waste and the use of renewable energy (8.1.6). These two interventions support local cooperation in rural areas through developments that can be adapted to local/regional needs and have a measurable impact on them (8.2.2), while also taking into account the coherence of local development programmes (8.2.3) and providing these human resources for the implementation of development policy programmes (8.2.1). Overall, an important added value will be the development of infrastructure for local population services that enhance quality of life (8.3.2).

R.30 – Support for sustainable forest management

May be assigned to R.18 or R.30 for interventions related to sustainable forestry. In the case of RD36_F03_GEN_70 – Forest Genetic Multi-annual Commitments, the R.30 indicator has been selected. We also consider it important to strengthen its genetic and sustainability link, as the need for the production of FRM ensuring the increase and climate adaptation of forest stands was also selected for the intervention.

R.37 – Growth and job creation in rural areas: New jobs supported in CAP projects

All interventions in the indicator are linked to the SO8 specific objective and thus fully support the management of related needs and the achievement of the targets set. The overall target of indicator R.37 is 6.900 FTE, which it aims to achieve over the planning period with a steady year-on-year increase in value. Of the three interventions providing a target of 6.900 FTE, the DP03_B01_YFS_16 - *Complementary Income Support for Young Farmers* intervention is of particular importance, since it alone provides a value of 5.500 FTE with the involvement of 1.100 new young farmers per year, taking into account demographic reserves. As a result of the steady increase, R.37 is planned to reach the target by 2027. In addition, the two interventions responsible for generational renewal contribute to achieving the results that the indicator makes transparent: *RD05_B01_YFS_75 for young farmers' start-up aid* and *RD08_B04_BIS_75 for start-up rural and young forest entrepreneurs*. These two interventions will mainly ensure an increase in employment for the indicator in 2024 and 2025, so that the overall target is expected to be met by 52 % in 2025, with a continuous increase. These three interventions focus on improving the profitability of micro-enterprises in rural areas (8.1.2) in order to reduce labour emigration (key needs 8.1) and also help to improve the profitability of small farms (8.1.5).

R.38 – LEADER coverage: Share of rural population covered by local development strategies

The indicator R.38 can be specifically linked to the LEADER intervention as required by the Commission. Compared to the total rural population (4.056.919 people), the proportion of the rural population expected to be affected by the local development strategy (4.056.919 people) could reach 99.96 %. Leader therefore almost fully covers the rural area for which it is intended to develop (municipalities with less than 10 thousand inhabitants and outskirts of municipalities with more than 10 thousand inhabitants). This share is ongoing from 2024 onwards, as the development starts at the start of the planning period in all

regions at the same time.

The employment provided by the LEADER programme will contribute intensively to improving the employment environment for women in rural areas, especially in smaller municipalities (8.1.1), in reducing labour migration, and will improve the profitability of micro-enterprises (8.1.2), as well as substantial progress in the processing of biomass raw materials, intermediate products, waste and the use of renewable energy (8.1.6). It supports local development in rural areas in all its aspects: it provides human resources for the implementation of development policy programmes (8.2.1). Of course, LEADER will also provide funds for the development of infrastructure for local population services that improve quality of life (8.3.2), as well as for the reduction of segregation and Roma inclusion programmes (8.4.2) for social inclusion and inclusion. To support sustainable forest management, it will contribute to increasing the range and added value of forest benefits, improving profitability (8.6.1) This complex approach and how needs are addressed are described in detail in chapter 2.1.4.

R.39 – Development of the rural economy: Number of rural businesses including bio-economy businesses developed with CAP support

The 10 interventions under the R.39 indicator reflect the needs underlying the SO8 specific objective, which together account for around 90 % of the total indicator value (4.600 farms). There is an expected overlap between the farms expected to implement the interventions, so that due to the elimination of duplications, the design values of each intervention can be primarily taken into account in the order of magnitude. The R.39 indicator is specifically one of the indicators that are constantly growing and are free from leaps: From 2024 to 2029, its value is growing dynamically every year.

Out of the 10 interventions, the added *value of agricultural products* is prominent (RD04a_E02_FON_73), which alone accounts for one third of the target value. There are another 5 interventions that each account for 7-13 % of the value of the plan, and are therefore of particular relevance to the R.39 indicator. These are *Generational Renewal, Farm Transfer Cooperation* (RD07_B03_YFO_77), *Support for Small Enterprises in the Normal Forestry sector* (RD09b_R14_OGR_73) *Generational renewal with support for rural and young forest start-ups* (RD08_B04_BIS_75), *diversification of farmers' activities* (RD11_B07_DVF_73) *and support for joining quality assurance and management systems* (RD47_R06_QSJ_77). Four additional interventions together provide an indicator value of around 6 %: *Support for sustainable water management communities that improve water efficiency* (RD15_W04_COP_77), *Rural Development Cooperation for active and ecotourism development in the region* (RD51_R11_TUC_77), *Rural Development Cooperation for the Development of a Biomass Economy* (RD52_R12_BIC_77), *Wine by-products distillation* (SC08_E07_WID_58).

The broad package of interventions contributing to the R.39 indicator responds to almost all the needs relevant to the SO8 specific objective. Several interventions contribute to reducing labour migration in rural areas, in particular by increasing the employment rate of women (8.1.1), but also by improving the profitability of micro and small farms (8.1.2; 8.1.5) is also a priority. Biomass feedstocks, intermediate products, waste processing and the use of renewable energy (8.1.6) are included in two interventions. The coordination of local and regional development programmes (8.2.3) and the promotion of development adapted to local needs (8.2.2) are also included in the related interventions, and the infrastructure development of local services enhancing quality of life will also be prioritised (8.3.2). Indicator R.39 offers a complex set of interventions according to the rural situation, needs and needs, which is planned to be used by at least 4600 farms, thus raising rural living standards, improving labour market conditions and improving the quality of services, as described in chapter 2.1.4.

R.40 Smart transition of the rural economy: Number of supported smart-village strategies

The target value of indicator R.40 is 52 strategies, the entire source of which is the preparation and implementation of RD57_R15_LDR_77 – LEADER strategies. In total, 27 strategies will be prepared between 2024 and 2027, with an increasing annual element until 2026.

The LEADER intervention also responds to 3 main needs, mainstreaming the digital transition into the intervention. Smart village strategies plan service development (8.2.2) taking into account local needs, respond to regional differences in rural transport infrastructure (8.3.1) and improve the infrastructure

background of local population services that increase quality of life, and the management of biomass feedstocks, intermediate products, waste processing and renewable energy (8.1.6) are also among the needs addressed.

R.41^{PR} Connectivity between rural areas of Europe: Share of rural population with better access to services and infrastructure thanks to CAP support

Indicator R.41 “PR” is fully linked to SO8: the 1.151.000 people affected by the two interventions account for more than 30 % of the total rural population.

Rural infrastructure development interventions play a role in reaching 1151000 people: intervention RD42_R01_RAN_73 targeting farmland areas will involve 9 thousand people and RD43_R02_LOC_73 for small settlements will affect more than 1 million people, as planned. The indicator value will start to increase in 2025, the scale of progress in interventions is expected in 2027, after which the annual contribution is constant – the target is expected to be reached by 2029.

The development of infrastructure for schoolchildren responds to the most relevant needs: it aims to increase the employment rate of rural women, improve the profitability of micro-enterprises and small businesses, and support the processing of biomass feedstocks, intermediate products, waste and the use of renewable energy through more than 3000 projects. Due to the difference in the situation of small municipalities compared to farms, the development of infrastructure for small settlements responds to a number of other main needs in addition to those listed in the case of schoolchildren by implementing 1.565 projects: to improve the quality of local infrastructure and services, it seeks to improve the conditions for rural transport (8.3.1) and focuses on local public services that increase quality of life (8.3.2); to promote social inclusion, it provides small villages with child protection, health and education services (8.4.1) and provides opportunities for Roma inclusion and desegregation programmes (8.4.2).

R.42 Promoting social inclusion: Number of persons covered by supported social inclusion projects

Indicator R.42 is fully linked to SO8: it targets the involvement of a total of 10.730 people through two interventions. We plan to reach the indicator target between 2024 and 2027, with a sharp increase in 2026. 97 % of the indicator value is achieved through the preparation and implementation of RD57_R15_LDR_77 – LEADER strategies, which we have already described under indicator R.40. The value of the indicator is supported by a more modest contribution to RD50_R10_SEC_77 - *Rural Development Cooperation for the Development of Social Enterprises*, which is very complex in terms of the needs addressed: it improves the profitability of micro-enterprises in rural areas (8.1.2), provides human resources for the implementation of development programmes (8.2.1), supports local development (8.2.2) and contributes to the development of quality of life services (8.3.2), the provision of child protection, health and education services to small villages (8.4.1) and the implementation of programmes to reduce segregation (8.4.2).

2.1.SO8.9 Justification of the financial allocation

Within the specific objective, as in the plan as a whole, measures related to agriculture and forestry will be implemented and, for other interventions linked to rural areas, resources from the operational programmes are expected. Within the objectives of the SO, we fulfil our minimum support obligation for LEADER in accordance with Article 92.

The relevant Commission Recommendation “Reversing depopulation and ageing trends in rural areas in Hungary”. The implementation of the recommendation is supported by SO7 measures as well as by the operational programmes.

2.1.SO9 Improve the response of Union agriculture to societal demands on food and health, including high quality, safe, and nutritious food produced in a sustainable way, the reduction of food waste, as well as improving animal welfare and combatting antimicrobial resistances

2.1.SO9.1 Summary of the SWOT Analysis

2.1.SO9.1.1 Strengths

E.1. Strict and extensive food chain control regulation and the existence of a veterinary action plan to reduce antimicrobial resistance in line with international guidelines for responsible antimicrobial use (1)
E.2. Existing animal welfare aid schemes (7)
E.3. Food supervisory authority enjoying consumer confidence (4)
E.4. Increase in organic land, albeit from very low levels (5.2)
E.5. Well-developed and highly professionalised Plant Protection Action Plan (2)
E.6. Integrated Pest Management System (IPM) based on plant protection forecast and operated by higher education experts (2)

2.1.SO9.1.2 Weaknesses

Gy.1. Weak domestic solvent demand for products meeting special social needs (4, SO2, 7)
Gy.2. High, often conscious, specific antibiotic use (1) [SO9/1.1]
Gy.3. Low internal market share of organic products, insufficient processing capacity (5.2) [SO9/4.1]
Gy.4. Outdated techniques and technologies hindering compliance with legal requirements and societal needs (1, 2, 3, 6) [SO9/1.1] [SO9/2.1]
Gy.5. Shortcomings in data collection (e.g. actual in-house antibiotic use, mycotoxin contamination, food loss, quality schemes), lack of interconnection of available databases (1, 2, 5.1, 6) [SO9/2.1] [SO9/2.2] [SO9/2.3] [SO9/3.1.] [SO9/7.1]
Gy.6. Complex, cumbersome waste management requirements (6) [SO9/3.3]
Gy.7 Farmers' lack of knowledge of new environmental and social challenges (1, 2, 6) [SO9/2.1] [SO9/3.5.] [SO9/6.1]
Gy.8. Lack of consumer knowledge of food production and trade marks (5.1, 5.2) [SO9/3.5] [SO9/8.1]
Gy.9 Market problems (e.g. for some by-products there is no market partly due to regulatory reasons and partly due to a lack of demand) (6) [SO9/3.3] [SO9/3.4]
GY.10. Lack of knowledge among producers of innovative alternative products and technologies to replace antibiotics and pesticides.

2.1.SO9.1.3 Opportunities

L.1. Increased demand for products meeting specific social needs – for the time being mainly in export markets (4) [SO9/8.2]
L.2. Increased segmentation of consumers, addressing specific needs (4) [SO9/5.1] [SO9/8.2].
L.3. Modernisation (e.g. precision farming, farm hygiene, vaccination, feeding systems, resistant plant varieties, biological plant protection, mechanical weed control, introduction of new food technologies) (SO10, 4)
L.4. Modern data collection and monitoring systems (e.g. antibiotics, pesticides, mycotoxins, public varietal recognition, quality schemes, food losses) (1, 2, 5.1, 6) [SO9/1.3.]
L.5. Promotion of sustainable technologies and food (4)
L.6. Existence of EU promotion programmes (4) [SO9/3.5.]
L.7 Extensive communication by public authorities and education to consumers (4) [SO9/3.5.]
L.8. Increasing consumer awareness

2.1.SO9.1.4 Threats

F.1 Increase in import pressure on the organic market (5.2)
 F.2 Emergence of new pests and diseases, animal health diseases (1) [SO9/1.2] [SO9/1.3]
 F.3 Emerging pests and diseases due to climate change and global trade, loss of feed base, heat stress (1) [SO9/1.3]
 F.4. Rapid adaptation to food consumption trends (e.g. artificial meat, insect proteins, free products) (4) [SO9/3.1.]
 F.5. Increased production costs and investment needs due to new or tightening environmental, plant and animal health, animal welfare, etc. requirements, needs (1, 2, 6, 7)

2.1.SO9.1.5 Other comments

Not relevant.

2.1.SO9.2 Identification of needs

Code	Title	Prioritisation at the level of the CAP Strategic Plan	Need is addressed in Cap Strategic Plan
9.1.1	Meeting animal welfare requirements and meeting the natural needs of farm animals	1	Yes
9.1.2	Improving general hygiene and biosecurity conditions, increasing food safety	1	Yes
9.1.3	Prevention of animal health problems, development/development of forecasting systems	1	Partially
9.2.1	Promote the use of a rational, predictive targeted pesticide	1	Yes
9.2.2	Rational use of antibiotics in livestock farming	1	Yes
9.3.1	Product development and packaging development that meet consumers' expectations	3	Yes
9.3.2	Use of innovative technological solutions in food production – packaging	2	Partially
9.3.3	Promoting compliance with the Packaging and Waste Framework Directive	2	Yes
9.3.4	Quality schemes, quality assurance and certification schemes, consumer information	1	Yes
9.4.1	Increase the share of organic products in the internal market and related processing capacities	2	Yes
9.5.1	Increasing the effectiveness of information transmission and data collection in the field of official controls	1	No
9.7.1	Development of market information systems	2	No
9.8.1	Meeting dietary needs due to specific health or social reasons	2	Yes

Overview

9.1.Main demand: SO9/1. Improving animal welfare conditions and preventing animal health problems

The analysis of the situation shows that farmers can face the challenges of agriculture in Hungary if they modernise their production systems and carry out improvements in farming, rearing and feeding technology to mitigate or avoid adverse effects. On the societal side, in addition to the production of healthy food, sustainability and animal welfare have also come to the fore. It is necessary to support livestock farmers who undertake to provide animals with stricter hygiene, feeding and husbandry conditions leading to an improvement in the overall health and hygiene status of livestock. The development of farm monitoring systems and the digitalisation of farms can help achieve these goals.

SO9/1.1 Meeting animal welfare requirements and meeting the natural needs of farm animals

In Hungary, livestock farming is characterised by outdated techniques and technologies, often with high specific antibiotic consumption. In order to meet society's animal welfare expectations, it is appropriate to meet the natural needs of farm animals and to improve the living conditions. On the basis of the above, one of the key objectives of domestic development is the modernisation of animal husbandry (e.g. farm hygiene, vaccination, development of feeding systems). Animal welfare developments in various sectors – cattle (RD30), small ruminant (RD29), poultry, (RD32) and apiculture (RD 33) – are an integral part of this.

To this end, it is proposed to introduce the following measure:

RD20 Support for organic farming

- RD29 Animal welfare aid in the small ruminant sector
 - RD30 Animal welfare premiums in the cattle sector
 - RD32 Animal welfare subsidies in the poultry sector
- RD33b Compensation payment for the fight against antimicrobial resistance

SO9/1.2. Improve general hygiene and biosecurity conditions and increase food safety

Reducing the risks of animal health epidemics, improving general hygiene and biosecurity conditions, thereby increasing food safety, can be achieved through a more sustainable development of farms (RD01). Our aim is to operate sustainable farms that improve input efficiency and reduce per unit of pollutant emissions that are relevant from the point of view of environmental pressures; re-use or recycling, continuation of organic farming, energy savings. This can be achieved by developing renewable energy, supporting green investments and implementing animal welfare improvements (RD29, RD30, RD32, RD33). Aid for adding value to agricultural products (RD04) contributes to increasing food security. The use of modern data collection and monitoring systems (e.g. antibiotics, public varietal recognition, quality schemes) contributes to addressing the problems encountered, and it is therefore proposed to support the digital transition of farms (RD02).

In order to achieve this objective, the following measures should be introduced:

RD01e Support for disease control investments in livestock holdings

- RD29 Animal welfare aid in the small ruminant sector
- RD30 Animal welfare premiums in the cattle sector
- RD32 Animal welfare subsidies in the poultry sector

RD33b Compensation payment for the fight against antimicrobial resistance

SO9/1.3. Prevention of animal health problems, development/development of forecasting systems

The emergence of new pests and diseases due to climate change and global trade, the reduction of the feed base and the increase in the frequency of animal health epidemics make it essential to develop farms in a sustainable way (RD01). This is supported by animal welfare aid for the cattle sector (RD30), the small ruminant sector (RD29) and the poultry, (RD32) and apiculture (RD 33) sectors. The development and development of modern data collection and monitoring systems, digitalisation of plants (RD02) contributes to achieving these objectives.

To this end, it is proposed to introduce the following measure:

RD01e Support for disease control investments in livestock holdings

- RD29 Animal welfare aid in the small ruminant sector
- RD30 Animal welfare premiums in the cattle sector
- RD32 Animal welfare subsidies in the poultry sector

RD33b Compensation payment for the fight against antimicrobial resistance

9.2.Main demand: SO9/2. Responsible use and reduction of plant protection products and antimicrobial veterinary medicinal products

On the basis of the analysis of the situation, it can be concluded that the practice of responsible use of plant protection products in Hungarian agriculture is deficient. It is important to reduce the risks arising from the use of plant protection products and to ensure the widest possible use of these technologies among producers. The most commonly used antibiotic groups in livestock farming, as well as pharmaceutical forms, make it likely that a significant proportion of the antibiotics used today serve to prevent and compensate for errors in husbandry technology. The promotion of more environmentally friendly cropping, rational use of pesticides and animal welfare, as well as the rational use of antibiotics, which can be approached by the sustainable and digital development of agricultural holdings, is a key support objective. Together, they make technological developments and support for new innovative solutions inevitable.

SO9/2.1. Promoting a reasonable, predictive and targeted use of pesticides

There is widespread use of outdated techniques and technologies in plant protection that hinder compliance with legal requirements and societal needs. We therefore aim to develop agricultural holdings

that meet sustainability criteria (RD01). It is important to encourage the use of alternative and integrated pest management solutions and other environmentally friendly technologies in pest management. The sustainable use of pesticides (e.g. limiting the use of pesticides that are specifically or moderately hazardous to bees and/or risky, and the use of biological agents authorised in organic farming) concerns encouraging the restriction of the use of pesticide active substances. It follows that promoting the rational use of pesticides on farms and reducing losses is the primary objective that can be achieved through the use of precision technologies and measures for the technical development of digital tools (RD02). The use of EU and national quality schemes (SC16) and traceability, certification schemes (SC17) in agriculture can help achieve the targets.

Planned actions:

RD19 Agri-environmental management payments (AKG)

·SC17 Application of traceability and certification schemes – fruit and vegetables

SO9/2.2 Rational use of antibiotics in animal husbandry

Since some of the antibiotics are used unnecessarily (preventive herd treatments) in Hungary, it is essential to spread the technology for the rational use of antibiotics in livestock farming and to make available the modernisation of animal husbandry practices. To achieve this, we support measures to improve the sustainability of small and large farms (RD01, RD09). We reduce the need for antimicrobials through the external and internal disease control of livestock farms and the development of technology. We would like to improve the gaps in data collection on actual consumption of antibiotics in situ and the lack of interconnection of available databases by supporting the digital transition of plants (RD02). In animal husbandry, the use of antibiotics and traceability of antibiotics is mainly to be achieved through compensatory payments to combat antimicrobial resistance (RD33b) and animal welfare measures for the bovine, small ruminant, poultry and apiculture sectors (RD29, RD30, RD32, RD33).

Planned actions:

RD33b Compensation payment for the fight against antimicrobial resistance

9.3. Main Needs: SO9/3. Product development, development of technology for food production and packaging

The need for rapid adaptation due to the challenges faced by food producers and the rapid change in global consumption trends requires companies to continuously develop technology and products. Food producers should remain flexible and always prepared for change. Consumer expectations are increasingly focused on environmental considerations for food production and the use of sustainable food packaging, which requires technological developments. We have drawn up a comprehensive support package for the sector, as set out below, aimed at making the agricultural and food sectors more productive, sustainable and competitive.

SO9/3.1. Development of products to meet consumer expectations and improvement of product packaging

Production costs and investment needs are increasing due to new or tightening environmental requirements. Due to rapid changes in food consumption trends (e.g. artificial meat, insect proteins, “free” products), food producers are under rapid adaptation pressure. It is essential to put in place measures to support product development and innovative technological solutions that take into account global trends and consumer expectations (RD04). Aid for improving product packaging contributes to the use of green packaging and the development of circular farming. We plan to use specialist advice, training and exchange of good practices (SC12) to learn new technologies. As farmers have insufficient knowledge of the new environmental and social challenges, this is the result of measures to support promotion, communication and marketing (SC15) and producer organisations (SC28) in the fruit and vegetables sector.

Planned actions:

·SC28 Sectoral interventions for fruit and vegetables: Support for producer organisations

·RD04 Adding value to agricultural products

SO9/3.2. Use of innovative technological solutions in food production and packaging

Climate change and environmental challenges, the need to minimise packaging materials and food waste also require new, sustainable, innovative technological solutions and product development (RD04) from

food producers. As farmers have insufficient knowledge of new environmental and social challenges, support for promotion, communication and marketing (SC15) and producer organisations (SC28) in the fruit and vegetables sector is counterbalanced. We plan to use advice and technical assistance (SC11) to learn new technologies in the sector. Our aim is to translate their existing knowledge into innovative solutions (RD61) that can be applied in practice through cooperation to develop, transfer and implement innovative practices (agriculture, forestry, food, research, consultancy). This will better adapt to current challenges such as increased competition, volatile market prices, climate change and compliance with stricter environmental rules.

Planned actions:

- SC28 Sectoral interventions for fruit and vegetables: Support for producer organisations
- RD04 Adding value to agricultural products

SO9/3.3. Facilitating compliance with the Packaging and Waste Framework Directive

It is difficult to comply with the current complex waste management requirements. Food producers and processors face a number of barriers if they look for good recovery opportunities for their food waste. Most of these are regulatory issues, but the lack of a real market for by-products, insufficient chain-based cooperation between stakeholders and currently insufficient incentives to reduce losses are also a major challenge. Aid for adding value to agricultural products (RD04) is intended to make sure that businesses need to avoid waste (including packaging waste) and make better use of losses.

Planned actions:

- SC28 Sectoral interventions for fruit and vegetables: Support for producer organisations
- RD04 Adding value to agricultural products

SO9/3.4. Quality schemes, quality assurance and certification schemes, consumer information

Farmers' lack of knowledge of new environmental and social challenges, as well as consumers' knowledge of food production and trademarks, needs to be filled. To achieve this goal, we support farmers and food processors in producing high-quality, healthy products (RD04a-b), which we also want to support through advice (SC11). The introduction and implementation of EU and national quality schemes and quality assurance and certification schemes (SC16, SC17, RD45, RD46, RD47, RD48) helps farmers and food processors to maintain and develop market positions. It is essential to continue communicating and educating consumers on high-quality, healthy products (SC27).

To this end, it is proposed to introduce the following measure:

SC14 Transport and storage of fruit

SC15 Vegetables promotion, communication and marketing

·SC16 Application of EU and national quality schemes

SC17 Vegetable and fruit traceability

SC27 Vegetable and fruit communication activities

·RD45 Support for co-operations for the creation of a new PDO/PGI/GJ/TSG and for a new activity related to the operation of the quality scheme under EU quality schemes

·RD46 Cooperation in the case of an existing national quality scheme or a PDO/PGI/GI/TSG or organic product registered in an EU quality scheme

·RD47 Support for access to quality assurance and management systems

·RD48 Support for information and promotion of quality schemes

Major Needs SO9/4. Product development and market share of organic products

A significant proportion of certified organic farming products produced in Hungary are sold abroad, mostly unprocessed, in the form of raw material; as a result, their added value is low. Although Hungarian organic products seem to be sold because of the western demand market, good marketing work and the promotion of the consumption of domestic organic products are necessary, especially as a large proportion of the products available to consumers on the Hungarian markets are imported goods.

The low degree of market share of domestic organic products, the lack of processing capacities and know-how, as well as shortcomings in the support system, both demonstrate the need for product development and market access support for organic farming and organic products.

SO9/4.1. Increase the internal market share of organic products and related processing capacity

The low internal market share of organic products, due to insufficient processing capacity, support for organic farming, the achievement of added value to organic products (RD20, SC13, RD04) is necessary. A specific target for support is fruit and vegetable growers engaged in organic farming, to be supported in the area of promotion, communication and marketing (SC15). EU and national quality schemes for organic products (SC16) also help to increase their market share.

Planned actions:

- SC13 Organic or integrated production of fruit and vegetables
- SC15 Promotion, communication and marketing – fruit and vegetables
- RD04a-b Adding value to agricultural products

Main needs SO9/5. Strengthening cooperation between public authorities and businesses

Incomplete data collection and monitoring systems justify the need to interconnect, integrate, develop and improve existing databases in addition to the development of digital infrastructure for businesses.

SO9/5.1 Increase the efficiency of information transfer and data collection in the area of official controls

Our aim is to develop modern data collection and monitoring systems (e.g. antibiotics, pesticides, mycotoxins, public varietal recognition, quality schemes, food losses) to strengthen cooperation between authorities and businesses. Support for the digital transition of farms (RD02), alongside the development of digital solutions, the development of quality assurance, certification and traceability (SC17) also aims to strengthen the efficiency of information transfer and data collection. Innovation collaborations allow actors from different professional backgrounds to connect and find solutions to a current problem and challenge (RD61) in a complementary way to meet the needs.

Activity outside the CAP.

Main needs SO9/7. Development of market information systems to inform producers

The Market Information System enables the exchange of information between the parties. Rapid and immediate access to data is an important issue for both the administration and market participants. The analysis of the situation reveals shortcomings in data collection, which justifies supporting the need below.

Need: SO9/7.1 Development of market information systems

Gaps in data collection and the interconnection of available databases justify the development of market information systems. Communication between market players is based on the collection and processing of primary data, making rapid, immediate access to data by developing digital solutions a key issue for market participants. This requires support for the provision of advisory services (SC11) in addition to the development of digital infrastructure for agri-food businesses (RD02), which meet the environmental-economic societal expectations of digital technologies.

Activity outside the CAP.

Major Needs SO9/8. Increasing the level of consumer knowledge on food production and production

Need: SO9/8.1. Meeting nutritional needs due to specific health or social reasons

Society's demand for products that meet special dietary habits is characterised by an increase in demand. In response to societal needs, we plan to address specific needs through support for the added value of agricultural products (RD04a-b) and producer organisations (SC28) in the fruit and vegetables sector.

To this end, it is proposed to introduce the following measure:

RD04 Adding value to agricultural products

2.1.SO9.5 Where relevant, a justification for the use of InvestEU, including the amount and its expected contribution to the Specific Objective/Cross-Cutting Objective

Not relevant.

2.1.SO9.8 Selection of the result indicator(s)

Selection of the result indicator(s) for this specific objective

Result indicators [recommended Result indicators for this specific objective are fully displayed in bold]	Target value
R.10^{CU PR} - Better supply chain organisation Share of farms participating in producer groups, producer organisations, local markets, short supply chain circuits and quality schemes supported by the CAP	2.59 %
R.24^{PR} - Sustainable and reduced use of pesticides Share of Utilised Agricultural Area (UAA) under supported specific commitments which lead to a sustainable use of pesticides in order to reduce risks and impacts of pesticides, such as pesticides leakage	23.94 %
R.29^{PR} - Development of organic agriculture Share of utilised agricultural area (UAA) supported by the CAP for organic farming with a split between maintenance and conversion	5.26 %
R.39^{CU} - Developing the rural economy Number of rural businesses including bio-economy businesses developed with CAP support	7,900.00
R.43^{PR} - Limiting antimicrobial use Share of livestock units (LU) concerned by supported actions to limit the use of antimicrobials (prevention/reduction)	11.55 %
R.44^{PR} - Improving animal welfare Share of livestock units (LU) covered by supported actions to improve animal welfare	57.03 %

Justification of the targets and related milestones

SO9 – Improving the response of EU agriculture to societal demands on food and health, including high-quality, safe and nutritious, sustainably produced food, reducing food waste, enhancing animal welfare and combating antimicrobial resistance

The milestone value of each R indicator and the value of the contribution of the related interventions (by year) are set out in the attached table, so they are not described in detail in the text.

R.10^{PR} – Improving supply chain organisation

See SO2 and SO3 to support the total value of the indicator.

R.24^{PR} – Sustainable and reduced use of plant protection products

For evidence of the total value of the indicator, see SO5.

R.29^{PR} – Development of organic farming

For evidence of the total value of the indicator, see SO4.

R.39^{CU} – Development of the rural economy

See SO7 and SO8 to support the total value of the indicator.

R.43^{PR} – Limitation of the use of antimicrobials

Thanks to the three related interventions (RD20_G02_ORT_70, RD_33b_G17_AMR_70 and RD01e_E01_FRM_73), the indicator's target of 51.84 % is replaced by 1267400 LU.

Accordingly, nearly all livestock on domestic farms are covered by interventions to limit the use of antimicrobials. This coverage is fully justified as there is a general pattern of unnecessary use of some of the antibiotics in prevention, so the use of reasonable antibiotics in livestock farming (9.2.2) should be widely promoted and animal husbandry practices should be modernised. Similarly, it is essential to improve animal welfare conditions and prevent animal health problems, taking into account husbandry needs (9.1.1), to improve general hygiene and biosecurity conditions, to increase food safety (9.1.2) and to develop and improve predictive systems to prevent animal health problems (9.1.3).

R.44^{PR} – Improving animal welfare

With the four related interventions, the indicator will reach its target value of 49.67 % by 2026, which will continue to be repeated in 2027 as an annual value based on the related interventions. Almost half of the total livestock on domestic farms is therefore covered by interventions to improve animal welfare. This share is particularly justified given the increasing societal pressure on animal welfare, sustainability and healthy food, as demonstrated by research carried out by the EU Food Safety Authority in 2019: in the case of 30-50 % of the population, these issues appear among the aspects considered important or considered when purchasing. However, techniques used in animal husbandry are outdated, high levels of antibiotic use, housing conditions and hygiene need to be improved. Accordingly, all interventions in the indicator are linked to the needs underlying the SO9 specific objective and are primarily active in addressing key needs 1 and 2. To improve animal welfare conditions and prevent animal health problems, they intervene to meet animal welfare requirements and meet the natural needs of farmed animals (9.1.1), focus on improving general hygiene and biosafety conditions, increasing food safety (9.1.2) and supporting the prevention of animal health problems, the development and development of forecasting systems (9.1.3). They also contribute to the dissemination of the rational use of antibiotics (9.2.2).

2.1.SO9.9 Justification of the financial allocation

The objectives of SO are achieved through a wide range of interventions, often linked to other SOs, such as regulating the use of antimicrobials and pesticides within the green superstructure. We have specific measures to improve animal welfare conditions for each major animal species.

Relevant Commission recommendations:

- Contribute to the EU Green Deal target on antimicrobials.
- Improving animal welfare, in particular for pigs, and the biosecurity of farms by supporting better animal husbandry practices.
- Contribute to the EU Green Deal objective on pesticides by strengthening efforts to reduce the quantity and risks of the most hazardous pesticides and promoting the sustainable use of plant protection products, in particular by ensuring the uptake of integrated pest management practices.

The resources allocated allow the recommendations to be met.

2.1.XCO Cross-cutting objective of modernising the sector by fostering and sharing of knowledge, innovation and digitalisation in agriculture and rural areas, and encouraging their uptake

2.1.XCO.1 Summary of the SWOT Analysis

2.1.XCO.1.1 Strengths

- E.1. Some elements of the AKIS are organised
- E.2. There are well-functioning knowledge transfer events among farmers, e.g. organised by integrators, research institutes, chambers
- E.3. High-speed broadband coverage and internet access in rural residential areas above the EU average
- E.4. There are competitive domestic agro-IT developments at international level
- E.5. Strategic programmes exist to support digital transformation (e.g. DAS)
- E.6. Launch of the Digital Agricultural Academy
- E.7 An integrated research network is available
- E.8. In addition to expert advice, knowledge transfer can be facilitated by several networks of professionals, e.g. village farmers network, ARDA network [CCO/1.7], [CCO/1.8], [SO4/5.1], [SO5/7.1]
- E.9 Implement strategies for the development of digital, innovation competences and knowledge base [CCO/1.2], [CCO/3.1], [CCO/4.1], [SO2/3.1], [SO2/3.5], [SO4/5.1]
- E.10. The implementation of strategies for the development of secondary and tertiary education can improve the quality of education, including closer cooperation with tankers and workshops, training open to innovation, adaptation of dual training and the provision of new scholarship applications [CCO/1.1], [CCO/1.9], [CCO/2.1], [CCO/2.2], [SO4/5.1], [SO5/7.3]
- E.11 Development of affordable and easy-to-use applications also for small farms and support for innovative (e.g. joint) use of equipment [CCO/1.4], [CCO/4.4], [SO2/3.1], [SO2/3.5]
- E.12. Promotion of practice-oriented research [CCO/3.3], [SO2/3.6]
- E.13 National increase in agricultural R & D expenditure [CCO/3.2]
- E.14. Cooperation between the relevant organisations (MÁK, Nébih, NAV, government agencies, NAK and other professional agricultural organisations) is increasing [CCO/4.3], [SO4/6.1], [SO5/6.1]
- E.15 Involvement of Profi consultants in agricultural research [CCO/1.3]

2.1.XCO.1.2 Weaknesses

- Gy.1. The structure of the AKIS as a whole and the elements are not yet developed [CCO/1.8]
- Gy.2. Low professional, management, digital and linguistic skills of farmers [CCO/1.2], [CCO/1.1], [CCO/4.1]
- Gy.3. The lack of complex knowledge is typical of the sector [CCO/1.2], [CCO/1.6], [SO3/1.3], [SO4/5.1], [SO5/7.1], [SO5/7.3]
- Gy.4. Training in agriculture is outdated and/or low-quality infrastructure [CCO/1.5], [CCO/2.1], [SO4/5.1]
- Gy.5. Dual education is not attractive for businesses and students [CCO/1.1], [CCO/1.9]
- Gy.6. Dual education in secondary education is not attractive. Only a small number of agricultural enterprises and individual farms would like to employ students [CCO/1.1], [CCO/1.9]
- Gy.7 Lack of relevant research background [CCO/3.2]
- Gy.8. Insufficient support for research workshops [CCO/3.2]
- Gy.9 There is a large gap between science/research and practice [CCO/1.3], [SO2/3.6]
- Gy.10. In terms of R & D expenditure, number of research organisations and number of researchers, the rural area lags significantly behind the capital [CCO/3.2]
- Gy.11. There is a lack of confidence in innovations [CCO/3.1], [SO2/3.1], [SO2/3.5]
- Gy.12 There are problems of “coupling” of innovation actors [CCO/1.3], [SO2/3.6]

Gy.13. Bureaucratic obstacles (e.g. complicated application process) cause problems [CCO/4.3]
 Gy.14. Lack of reliable and readily available data for farmer decisions (weather, plant protection, soil, market information, etc.) [CCO/4.2], [SO4/6.1], [SO9/7.1]
 Gy.15. Administrative systems are separated and farmers provide data on multiple locations [CCO/4.2], [CCO/4.3], [SO5/6.1]
 Gy.16. Insufficient mobile network and internet coverage in agricultural and forest areas [CCO/4.1]
 Gy.17. There is a lack of legislation (e.g. drones, data management) to harness the opportunities of digitalisation [SO2/3.1]
 Gy.18. There is a lack of information on completed innovative procedures [CCO/1.4], [CCO/3.3], [SO2/3.1], [SO2/3.5], [SO3/1.3], [SO5/5.1]
 Gy.19. There is a lack of specialist advisors with knowledge of agro-IT and innovation [CCO/1.7], [CCO/4.1], [SO2/3.1], [SO3/1.3], [SO5/5.1]
 Gy.20. In small farms, some technologies cannot be used or are limited, the return on innovation investment is uncertain [CCO/3.4], [SO2/3.1], [SO2/3.5]

2.1.XCO.1.3 Opportunities

L.1. There is a need for knowledge transfer and innovation events among farmers [CCO/1.2], [CCO/3.1], [SO2/3.1], [SO5/7.3]
 L.2. The activities of schools organised in agricultural centres will be coordinated and coordinated [CCO/2.2]
 L.3. The launch of vocational training becomes demand driven [CCO/1.1] [CCO/1.2]
 L.4. Helping start-ups (e.g. mentoring, coaching, incubation, acceleration) [CCO/3.3], [SO2/3.1], [SO2/3.5]
 L.5. Operation of institutional systems that effectively support innovation activities [CCO/3.3], [SO2/3.1], [SO2/3.5], [SO2/3.6]
 L.6. Implementation of multi-actor (multi-actor) projects [CCO/1.3], [SO2/3.6]
 L.7. Ensure data access for more efficient management (basic maps, environmental data, plant and animal health, market information, etc.) [CCO/4.4], [SO2/3.1], [SO3/1.3], [SO4/6.1], [SO5/5.1], [SO9/7.1]
 L.8. Development of common databases (data integration) from which data is provided to relevant institutions, thus reducing the administrative burden [CCO/4.2], [SO4/6.1], [SO5/6.1]
 L.9. Digital infrastructure in rural areas (both on-farm and forest areas) is developing [CCO/4.1], [SO2/3.1]
 L.10. Development of integrated development and support schemes to stimulate the uptake of digital technologies [CCO/1.4], [CCO/3.4], [SO2/3.1]
 L.11. Regulatory change based on the possibilities offered by digital technologies [SO2/3.1], [SO4/6.1], [SO5/5.1]
 L.12. The contribution of the enterprise sector to R & D expenditure (both on the liabilities side and on the use side) is increased [CCO/3.2]

2.1.XCO.1.4 Threats

F.1 Unfavourable demographic trends in rural areas [CCO/1.6], [SO8/1.2]
 F.2 In agricultural sciences, the share of R & D expenditure in relation to total R & D expenditure decreases [CCO/3.2]
 F.3 The social perception of farming careers continues to deteriorate and the agricultural career is not attractive [CCO/1.5], [CCO/1.6], [CCO/2.2]
 F.4. Input material manufacturers and distributors are further strengthened in technology consultancy [CCO/1.7], [CCO/1.8], [SO5/5.1]
 F.5. Environmental and economic data and digital services required for efficient production are missing and/or not up to date [CCO/4.1], [CCO/4.2], [CCO/4.3], [CCO/4.4], [SO4/6.1]
 F.6. Issues related to the use of data or data rights are not clarified [SO5/6.1]

F.7 Inequality of digitalisation and access to information may exacerbate the disruption of certain producer circles [CCO/1.5] [CCO/1.8] [CCO/4.4], [SO2/3.1]

		cooperation	Innovation Partnership (EIP) operational group projects
RD	KNOW(78) - Knowledge exchange and dissemination of information	RD58_A01_TRA_78 - Training and demonstration programmes	O.33. Number of supported training, advice and awareness actions or units
RD	KNOW(78) - Knowledge exchange and dissemination of information	RD60_A04_ADP_78 - Advisory services	O.33. Number of supported training, advice and awareness actions or units

Overview

1. Main needs: Supporting practice-oriented knowledge transfer in support of sectoral objectives

The SWOT assessment has highlighted a number of factors affecting the transfer of knowledge in practice. The main challenge of knowledge transfer and exchange activities is to bridge the science-practice gap, but also the low willingness to cooperate between practical actors is a major problem; low ICT maturity; lack of communication with consumers and society and lack of trust between actors. The quality of knowledge transfer and exchange is also influenced by the fact that the volume and quality of information available in universities, vocational education and training institutions and specialist consultancies varies widely across the board.

The concept of dual vocational training requires closer cooperation between practical trainers and trainers and thus provides a form of practice-oriented knowledge transfer. At the same time, the popularity of dual training is decreasing on the basis of the number of students participating and the number of host enterprises.

CCO 1.1 Need: Supporting practice-oriented knowledge transfer in support of sectoral objectives

The thematic evaluation of the RDP's knowledge transfer showed that, in the next programming period, it is proposed to support practice-oriented demonstration programmes and study visits among forms of knowledge transfer by means of well-established support schemes. At the same time, the strengthening of the advisory service is also an important element in practice-oriented knowledge transfer, and the launch of demand-driven vocational training can improve practice-oriented knowledge transfer in thematic areas where there is a clear need for farmers and practitioners. (SC11, SC12, SC02, RD60). Thematic technical advice and training in the horticulture sector and the transfer of knowledge in apiculture will help to modernise the sector, learn about and apply innovation through practical knowledge transfer activities (SC11, SC12, SC02).

CCO 1.2 need: Improving farmers' knowledge: strengthening up-to-date management knowledge, practice-oriented knowledge transfer on, inter alia, social and environmental challenges, changing production conditions with climate change, adaptation options, and the impact of agriculture on the environment; integrating innovation practices into everyday workflows, motivating them to pursue closer-to-nature farming

By strengthening the advisory service and launching demand-driven vocational training, practical knowledge transfer can be improved in thematic areas where there is a clear need for farmers and practitioners (SC02, RD60). The SWOT assessment also showed that farmers' professional, management, digital and language skills are low. At the same time, a demonstration plant programme and targeted training will enable the improvement of these competences and the implementation of demonstration plant programmes to acquire practical knowledge and good practices in response to societal and environmental challenges and changing production conditions with climate change (RD58).

CCO 1.3 Strengthening collaborations between researchers and processors to increase innovation potential Support for pooling, such as support for EIP Operational Groups (RD61), ensures cooperation between researchers and processors through the implementation of interactive innovation projects. The link

between knowledge producers and users is established by knowledge transfer actors, in particular trainers, trainers, experts and consultants, with a view to implementing, transferring and informing an innovation project.

CCO 1.6 Knowledge to accelerate generational change in agriculture

In general, the Hungarian agricultural community is characterised by an ageing population, a lack of young supplies, a difference in mind between generations and a slow generational change. Knowledge transfer is an important tool in this process through demonstration programmes, training and advice (RD58; RD59, RD60). Young farmers learn about the latest digital technologies and production methods that characterise agroium, whether abroad or domestically.

CCO 1.7 Training of specialist consultants, adaptation of the advisory system to the specific objectives of the CAP, in particular the integrated approach to low-burden agricultural practices (plant protection product application, GHG, air-circular and particulate matter abatement processes, good nutrient management and composting) and the expansion of sector-specific advisory services

Specialist consultants are clearly expected to provide farmers with up-to-date technological knowledge, specialised knowledge – solutions responding to the challenges of climate change (RD60). It is also expected to provide knowledge/services related to innovation.

CCO 1.9. Encourage the participation of agricultural entrepreneurs in dual training and as hosts

As an incentive scheme, the show-breaking programme allows host enterprises under dual training to take part in demonstration programmes, either domestically or abroad, thereby ensuring a practice-driven transfer of knowledge. Participation in the scheme is an incentive for host enterprises in dual training, which is also targeted by the measure (RD58).

2 Main needs: Development of infrastructure for secondary and higher education establishments, educational establishments, demonstration plants and sample plants

In Hungary, the Ministry of Culture and Innovation is responsible for innovation, research, higher education, vocational training and adult education (except agricultural vocational training). While most of the operational tasks for research and innovation matters have been delegated to the National Office for Research, Development and Innovation (NKFIH). The National Research Infrastructure Commission (NKIB) is involved in its public tasks aimed at the sustainable development and international networking of domestic research infrastructures. Based on the institutional structure, there are indirect tools available in the CAP SP to improve the infrastructure of secondary and higher education institutions, educational establishments, demonstration plants and sample plants.

CCO 2. 1 Developing the preparedness and equipment of secondary and higher agricultural education institutions

·Off-cap activities

CCO 2.2 Development, organisation and subsequent interconnection of demonstration plants, development of knowledge transfer programmes, including demonstration of state-of-the-art and emission reduction technologies

The demonstration plant programme allows farmers to improve their level of knowledge, the quality of their knowledge or their practicality. The demonstration plant programme encourages participation in lifelong learning by supporting an applied professional knowledge transfer service responding to specific needs.

3 Main needs: Promoting practice-oriented research and innovation for sectoral objectives

CCO 3.1 For a competitive, resource-efficient, high value-added and innovative agriculture and food industry, it is essential to promote and create the conditions for practically oriented research and innovation. Raising the level of skills of the workforce in order to use innovative technologies

Innovative technologies can increase competitiveness, but this requires increasing the skills and qualifications of the agricultural workforce. Training and demonstration programmes (TRA_78) will enable farmers and rural workers to improve their level of knowledge, the quality of their knowledge or its practicality. The demonstration operational programme encourages participation in lifelong learning by supporting an applied professional knowledge transfer service responding to specific needs. Advisory services (ADP_78) also have the potential to increase the level of knowledge of the workforce on the use of new technologies.

CCO 3.2 Retention of qualified researchers, support to the RDI sector

The SWOT analysis also showed the need to increase domestic resources for R & D & I and retain qualified researchers. While support for EIP Operational Groups will not be a decisive measure in terms of volume as regards the share of RDI funds in agriculture, it provides significant added value by bringing practical needs closer to research themes in the context of cooperation that fosters innovation.

CCO 3.3 Increasing the innovation of agricultural and food business operators and accelerating their response to changing market needs

Increasing the innovation of agricultural and food business operators is necessary in order to accelerate the response to changing market needs. The low level of innovation among businesses is due, among other things, to a lack of trust among the actors in which support for EIP cooperation can help (EIP_77).

Improvements aimed at adding value and access to the market, technological development of agricultural products, increasing corporate efficiency in food processing and resource efficiency (FON_73), as well as further development of the hail mitigation system (JGR_73), can contribute to meeting the need.

Main Need: Development of digital solutions in production and sectorial registers

Digitalisation of agriculture and food includes hardware (e.g. sensors, drones, robots), data assets (e.g. registries, soil maps, weather data, pest and pathogen surveys), methods and software to provide analysis (e.g. artificial intelligence, decision support software), corporate governance systems, as well as e-government, e-commerce and online banking and digital solutions related to logistics. Digital solutions can help to use resources more efficiently, reduce production risks, reduce losses, increase productivity, traceability and quality assurance, and address labour shortages in some areas. Increasing the efficiency of production has a positive impact on the environment and the climate.

CCO 4.1 Need: Ensuring face-to-face access to broadband internet services and strengthening basic digital skills

The availability of adequate digital infrastructure and network coverage is essential for the uptake and use of digital services. The EU Green Deal also stresses that access to fast broadband internet is essential to deploy the technologies needed to achieve sustainability goals (e.g. precision farming). The development of the broadband network is essentially provided by resources from other operational programmes under the National Digitalisation Strategy up to 2030, and the CAP ST is responsible for connecting to them and developing digital skills. Rural infrastructure developments (e.g. smart villages) contribute to digitalisation efforts, thus reducing the backlog of rural areas (measure RD56).

CCO 4.2 Need: Development and integration of digital sector registries

The assessment of the situation showed that the data of farmers and livestock farmers are recorded by several organisations (MÁK, Nébih, NAV, NAK, professional organisations), which constitutes a significant obligation to provide information. The current practice of different authorities, institutions and organisations imposing different reporting obligations on the same data set is highly detrimental.

However, there are data sets (e.g. antibiotic use) that are currently not available in any of the databases, although knowledge of them would be essential for the development and market transparency of specific sectors. Sectoral registers are of varying degrees of development, such as the vineyard register (VINGIS) is a complete but closed geospatial database, while the register of fruit orchards and fish farms needs to be improved. In a number of planning forums, the need for a grass cadastre was also mentioned, which also records the capacity to retain animals.

The exploration of the situation also identified the need for reliable and readily available basic data (weather, plant protection, soil, market information, etc.) and decision support applications to support farmers' decisions.

Activities outside the CAP.

CCO 4.3 Need: Electronic administration, transparency, traceability

Currently, some mandatory reporting on agricultural management systems can only be done electronically, with gateway identification, while others can still be provided on paper. The possibility of electronic administration should be increased.

For electronic data reporting and traceability, it is important that producers also have adequate digital records and investment should be encouraged (RD02).

Activities outside the CAP

CCO 4.4 Need: Development of digital infrastructure and IT facilities for agri-food businesses

Digital technologies and tools are widely available to domestic farmers and food businesses, but the analysis of the situation has shown that the level of digitalisation of farms is very heterogeneous and overall low, especially in agricultural businesses. Innovative, environmentally friendly production and breeding technologies (RD02) can help to make more efficient use of resources (e.g. fertiliser, pesticides, irrigation water, feed), thus meeting sustainability criteria and increasing competitiveness.

CCO 4.5 Need: Development of digital solutions for quality assurance, certification, traceability, marking and classification

Monitoring due to legal requirements throughout the food chain and with a view to strengthening consumer confidence. Consumer confidence can be gained and maintained by serving food of good and stable quality that can be traced from ingredients to the finished product. This is particularly important in the fruit and vegetables sector (SC17) and animal products. With the development of IT, new digital solutions (e.g. blockchain) are emerging in traceability systems, which require technical advice from actors in the food chain (SC11). Production data underpin the functioning of product tracking systems and therefore support farm level data collection and the use of operational management applications in farm management and decision preparation (RD02). Given the quantity and quality of the raw material, food processing can be optimised, thus improving the yield indicators and the quality of the products.

Due to the coronavirus outbreak, the importance of online marketplaces has been appreciated, so the sale of agricultural products by small municipalities, as well as the purchase of food materials by local public and municipal institutions and small shops, is worth making use of a digital platform. Only products and services that have successfully completed a preliminary validation (SC17) can appear on the digital marketplace.

2.1.XCO.5 Where relevant, a justification for the use of InvestEU, including the amount and its expected contribution to the Specific Objective/Cross-Cutting Objective

Not relevant.

2.1.XCO.8 Selection of the result indicator(s)

Selection of the result indicator(s) for this specific objective

Result indicators [recommended Result indicators for this specific objective are fully displayed in bold]	Target value
R.1^{CU PR} - Enhancing performance through knowledge and innovation Number of persons benefitting from advice, training, knowledge exchange, or participating in European Innovation Partnership (EIP) operational groups supported by the CAP in order to enhance sustainable economic, social, environmental, climate and resource efficiency performance	738,210.00
R.2^{CU} - Linking advice and knowledge systems Number of advisors receiving support to be integrated within Agricultural Knowledge and Innovation Systems (AKIS)	14,640.00
R.3^{CU} - Digitalising agriculture Share of farms benefitting from support for digital farming technology through CAP	7.32 %
R.28^{CU} - Environmental or climate-related performance through knowledge and innovation Number of persons benefitting from advice, training, knowledge exchange, or participating in European Innovation Partnership (EIP) operational groups supported by the CAP related to environmental or climate-related performance	441,726.00
R.40^{CU} - Smart transition of the rural economy Number of supported smart-village strategies	52.00
R.42^{CU} - Promoting social inclusion Number of persons covered by supported social	44,181.00

inclusion projects	

Justification of the targets and related milestones

XCO – Cross-cutting objective of modernising the sector through the promotion and sharing of knowledge, innovation and digitalisation in agriculture and rural areas

The milestone value of each R indicator and the value of the contribution of the related interventions (by year) are set out in the attached table, so they are not described in detail in the text.

R.1^{PR} – Improving performance through knowledge and innovation

A specific feature of the R.1 indicator is that, according to the fiche methodological guide, there is no need to screen the number of persons affected by the related interventions, so there may be duplication within or between interventions, resulting in a high value of R.1 (736240 persons). All related interventions in indicator R.1 are related to the needs underlying xCO and are presented at full value. Related interventions include training, advice and information; the number of persons concerned was calculated on the basis of the services carried out in the previous years in the VP, so it was a reliable value.

It provides 68 % of the target for indicator R.1, so that the RD60_A04_ADP_78 Advisory Services Intervention, which is the operation of the General Advice Network, which will affect 100000 people per year between 2024 and 2028, is key to achieving it; on average, a person receives 4.5 information per year. 37500 people per year are expected to participate in the support of individual advisory services between 2024 and 2028. The number of participants in training courses (RD58_A01_TRA_78) varies annually. Compulsory training is planned in 2026 and 2027, with the number of people affected outliers (at least double in other years) in these two years. In addition to the experience of the VP, the RDP contributed to the calculation of the number of training participants in the new planning period, as well as the additional training needs generated by new interventions. SC04_A01_WIIN_58 – Innovative investments in the wine sector will provide support to an additional 30 people to enhance the market and competitiveness of EU grapevine products, in particular through the development of innovative products, processes and technologies. Interventions ensuring the value of the R.1 will help address the first main need in particular, supporting the acquisition of practical knowledge through a variety of methods (CCO1.1, CCO.1.2), strengthening cooperation between researchers and processors (CCO 1.3), fostering intergenerational dialogue and generational renewal (CCO 1.6). The need for training for special advisers (CCO 1.7) clearly led to the development of high value-added interventions. In addition to improving the knowledge of professionals and farmers, the first priority concerns consumer education and consumer awareness (CCO.1.10), which also reach consumers.

The skills of new entrants to professionals and farmers should already be supported through formal education, for which part of the interventions will also devote resources to the development of demonstration plants (CCO.2.2).

In addition to know-how, openness to innovations needs to be developed (CCO 3.1), so programmes will be explicitly included in the implementation of interventions. The development of innovation and R & D (CCO 3.2, CCO 3.3) is ensured by the European Innovation Partnership (EIP) cooperation, which does not represent an excessive proportion of the target for indicator R.1 in itself, but which is important for the results expectations of the result indicator. The development of digitalisation is supported by interventions in several areas: digital solutions are also needed for quality assurance, certification, traceability and marking of goods (CCO.4.5).

R.2 – Interconnecting advisory and knowledge systems

An important feature of the R.2 indicator, like indicator R.1, is that, according to the fiche, duplication screening is not necessary. Taking this into account, the target of the three related interventions in 2029 is 14640 consultants receiving support, which is a balanced upward value as of 2024.

The training (RD58_A01_TRA_78) intervention (RD58_A01_TRA_78) provides more than half of the target for indicator R.2, which is planned to involve 1000 special advisers and 600 village promoters per year.

The advisory intervention (RD60_A04_ADP_78) involves 760 consultants on an annual basis in

individual advisory services, while the operation of the general advisory network is involved.

In order to address the needs already described in the case of R.1, it is important to involve the full range of advisors, because through advisors, information, knowledge and awareness-raising can reach much more farmers, and reflecting on individual points of view can specifically contribute to the effectiveness of information input and attitude-shaping.

R.3 – Digitalisation of agriculture

Target value for indicator R.03: 7.67 %, representing 18491 beneficiary holdings, compared to a total of 241.000. Both interventions providing the total design value of indicator R.03 respond to one or more needs underlying the xCO specific objective.

Training and demonstration plant programmes (RD58_A01_TRA_78) will provide awareness-raising to 8 thousand farms in 2026 and another 8 thousand in 2027, which, as described in the case of R.1, Main Needs: Supporting practice-oriented knowledge transfer in support of sectoral objectives responds to all its needs. Support for the digital transition of farms (RD02_D01_FRM_73) will provide real support for the development of digital solutions in the three years 2025-2027 between 490 and 530 farms, thus supporting the development of electronic administration, transparency (CCO.4.3) in the software area, as well as the development of digital infrastructure for farmers (CCO.4.4) and the development of digital solutions for quality assurance, certification, traceability, goods marking (CCO.4.5).

R.28 – Environmental or climate performance through knowledge

For indicator R.28, as for R.1 and R.2, there is no need to screen for duplication. The total target is 441726 persons, the role of contributing interventions being the same as for R.1. The R.28 indicator has a strong correlation with indicator R.1: each intervention contributing to both R indicators shows the number of people involved in training, advice and information. For indicator R.1, this is the total number of participants, covering all topics. The R.28 indicator shows how many people from the total number of participants will be affected by knowledge and innovation on environmental or climate-related performance. According to the professional planning, 60 % of trainings, advice and information will deal with this topic, meaning that the number of persons involved for indicator R.28 (per intervention and in total) is 60 % of the values shown for indicator R.1.

A reflection on the related needs and the number of participants in the interventions can be found in the description of indicator R.1.

R.40 – Smart Transition of the Rural Economy

For evidence of the total value of the indicator, see SO8.

R.42 – Promoting social inclusion

For evidence of the total value of the indicator, see SO8.

2.1.XCO.9 Justification of the financial allocation

The objectives of the CCO are achieved through a wide range of interventions, often linked to other SOs. Relevant Commission recommendations:

- Contribute to the EU Green Deal target on broadband connectivity by completing investments in a timely manner for fast broadband connection coverage in rural areas. In doing so it will be important to ensure synergies with other EU and national funds.
- Empower farmers, agri-food businesses and people living in rural areas, by fostering knowledge, skills and technological development, exchange, research, advice, digitalisation and innovation projects by strengthening the existing connections among research, education, and farming advice, and by providing innovation support across the farming and the rural community.

The implementation of the recommendations will be made possible by the resources allocated. The development of broadband networks is provided by resources from other operational programmes, and CAP ST funds consider linking them to them and developing digital skills. Training, research and advice are among the priority objectives of the CAP ST. Therefore, the plan provides more resources than in

previous periods.

2.2 Context Indicators and other values used for the calculation of the targets

Context indicators (PMEF Code)	Baseline value	Baseline year	Updated value	Updated year	Justification/Comments	Source of data
C.01 Total rural population – for LEADER (R.38) (Person)	1,813,276.00	2020	4,058,628.00	2022	Number of inhabitants in settlements below 10.000 + number of settlements above 10.000 inhabitants in rural areas	Central Statistical Office
C.01b Total rural population – for services and infrastructure (R.41) (Person)	1,813,276.00	2020	4,058,628.00	2022	Number of inhabitants in settlements below 10.000 + number of settlements above 10.000 inhabitants in rural areas	Central Statistical Office
C.05 Total forest area (Hectares)	2,416,138.00	2018	1,941,600.00	2021	Under C05, the original value is CORINE, which covers a physical woody cover (land cover). This includes: parks, arboreals, woodlands	National Forest Stock Data Repository 1 January 2021 Section 6(1) of Act XXXVII of 2009 on forests, forest protection and forest management.
C.12 Total number of farms (Farm)	430,000.00	2016	241,000.00	2020	The 2020 agricultural census gives a more up-to-date picture of the number of farms and will be published soon.	Central Statistical Office
C.17 Total utilised agricultural area (UAA) (Hectares)	5,309,520.00	2019				
C.19 Total agricultural area and forest area in Natura 2000 sites (Hectares)	721,099.00	2018	1,433,344.00	2023	C.19 total agricultural area in Natura 2000 Updated value 1 433 344 ha	European Environment Agency Estimates, European Commission, GREX document 02/05/2023
C.23 Total number of livestock units (Livestock units)	2,444,890.00	2016				
D.35 Total number of beehives notified to the EU Commission: average of the latest three years available at the time of establishing the plan. (Beehives)	1,212,009.00	2020				

2.3 Targets Plan

2.3.1 Recapitulative table

Result Indicator	Specific Objective	2023	2024	2025	2026	2027	2028	2029	Overall Target Value
R.1^{CU PR} Enhancing performance through knowledge and innovation Number of persons benefitting from	XCO	100,000.00	244,545.00	390,096.00	543,644.00	694,189.00	738,204.00	738,210.00	738,210.00

Result Indicator	Specific Objective	2023	2024	2025	2026	2027	2028	2029	Overall Target Value
advice, training, knowledge exchange, or participating in European Innovation Partnership (EIP) operational groups supported by the CAP in order to enhance sustainable economic, social, environmental, climate and resource efficiency performance									
R.2^{CU} Linking advice and knowledge systems Number of advisors receiving support to be integrated within Agricultural Knowledge and Innovation Systems (AKIS)	XCO	582.00	3,506.00	6,430.00	9,354.00	12,278.00	14,639.00	14,640.00	14,640.00
R.3^{CU} Digitalising agriculture Share of farms benefitting from support for digital farming technology through CAP	SO2, XCO	0.00 %	0.00 %	0.01 %	3.47 %	6.93 %	7.32 %	7.32 %	7.32 %
R.3 Numerator: Number of beneficiaries from relevant paid support		0.00 farm	0.00 farm	24.00 farm	8,360.00 farm	16,695.00 farm	17,636.00 farm	17,636.00 farm	17,636.00 farm
R.3 Denominator: Total number of farms		241,000.00 farm	241,000.00 farm	241,000.00 farm	241,000.00 farm	241,000.00 farm	241,000.00 farm	241,000.00 farm	241,000.00 farm
R.4 Linking income support to standards and good practices Share of utilised agricultural area (UAA) covered by income support and subject to conditionality	SO1		94.17 %	94.17 %	94.17 %	94.17 %	94.17 %		94.17 %

2.3.2 Planned interventions and outputs with a direct and significant link to result indicators

See the table in SFC2021 application

2.3.3 Consistency with and contribution to the Union targets for 2030 set out in the Farm to Fork Strategy and the EU Biodiversity for 2030

As stated in the Strategic Resolution: the Hungarian CAP Strategic Plan makes a substantial contribution to achieving the objectives of the European Green Deal.

Below we look at the targets of the Farm to Fork (F2F) Strategy and the Biodiversity Strategy for agriculture and the food industry, and present our plan's contribution to meeting these targets.

Objective F2F: Reduce nutrient losses by 50 % while soil fertility does not deteriorate

In Hungary, the basic principles of soil use are laid down in *Act CXXIX of 2007 on the protection of soil*, which, in addition to the general protection of soils, covers protection against erosion, the preservation of organic matter in soils, the cultivation of saline and sour soils and environmentally sound nutrient management, as well as the prevention and elimination of excessive soil compaction, thereby improving its water management. *Government Decree No 90/2008 on the detailed rules for drawing up a soil protection plan (VII. 18) Decree of the Minister for Agriculture and Rural Development* lays down, in accordance with the above Act, the activities for which soil protection plans are to be drawn up (e.g. irrigation, slurry, sewage and sewage sludge in agriculture, implementation of technical soil protection interventions against erosion, etc.).

GAEC standards 5, 6 and 7 apply to the protection of soils in our Strategic Plan. These requirements aim, on the one hand, to reduce the risk of soil degradation and soil erosion and, on the other hand, to preserve *the soil potential in accordance with Act CXXIX of 2007 on the protection of arable land*. The **agro-ecological programme** (intervention code: Among the optional requirements of DP17_G01_ECOS_16), winter soil cover, non-rotational tillage, use of soil conditioners, nitrogen inhibitors, microbiological preparations, cover between plantations, crop diversification and maintenance of higher non-productive areas (e.g. fallow, nitrogen-fixing crops, secondary green manure) help preserve and improve soil potential, protect and improve soil structure and soil biodiversity, increase the nutrient and water retention capacity of soils and protect against erosion. **AGRI -environmental payments (AKG)**, intervention code: Several of the general requirements of RD19_G01_AEC_70 cover sustainable nutrient management (preparation of a nutrient management plan based on soil analysis, limiting the application of the nitrogen active substance), soil conservation management (non-rotated tillage, erosion control measures, soil protection crop structure, etc.) and, in addition, specific sets of requirements have been drawn up for areas that are vulnerable to erosion, inland water or drought. While the primary objective of the set of anti-erosion standards is the reduction of alluvial and pollutant pressures from soil erosion and/or surface runoff, water retention in inland water sensitive areas and water retention in drought-sensitive areas are encouraged good practices. **Support for organic farming** (interventions code: RD20_G02_ORT_70) directly contributes to improving the gross nutrient balance of agricultural land, reducing soil extortion and restoring soil organic matter due to the principles and rules in the EU organic production legislation applied in farming mode. All these standards go beyond the basic requirements detailed above, thereby contributing to the achievement of the F2F objective.

F2F and Biodiversity Strategy objective: 25 % of the EU's agricultural area is managed organically

In Hungary, support for organic farming is considered as a priority in the light of the objectives of the Biodiversity Strategy and the Farm to Fork Strategy. We ensure a proportionate allocation of resources and an increased level of specific support for both the transition and the maintenance period.

Support for organic farming already present in previous rural development programmes (EAD, intervention code: RD20_G02_ORT_70) and to ensure continuity of support is also a priority in a national policy dimension, as organic farming is a form of farming with significant environmental added value, contributing a significant amount of land and resources to our environmental and climate efforts. With an increased unit cost from 2022, with a commitment period of 3 years, the new OAD call under the rules of the VP was launched, followed by a new OAD call from 2025 onwards, in accordance with the rules of the Strategic Plan. This means that in 2022: Article 28 (Agri-environment-climate operations) and Article 29 (Organic farming) of Regulation (EU) No 1305/2013, while from 2023 we will conclude under Article 70 (Environmental, climate and other management commitments) of the CAP Strategic Plan Regulation. The launch of the new EAD in 2025 will be an opportunity to develop sets of specifications that address new needs and/or problems that have arisen even more effectively.

As IFOAM pointed out in its publication (link: https://www.organicseurope.bio/content/uploads/2021/11/IFOAMEU_policy_CAP_externalbriefing_17112021.pdf?dd), we have put a strong emphasis in the planning of the CAP strategy in Hungary in order to achieve the strongest possible synergy with the parallel National Organic Action Plan (ÖCST). The team responsible for the two programmes has worked in close cooperation over the past year.

The main objective of the Action Plan is to **double the size of the land under domestic organic farming by 2027, reaching a 10 % eco-area ratio**, thus contributing significantly to the achievement of the ambitious EU target. A significant part of the resources needed to implement the measures of the Action Plan can be integrated into the Hungarian CAP Strategic Plan. The Hungarian CAP Strategic Plan will therefore support the measures on a number of points:

- The Ministry of Agriculture holds regular technical meetings with the relevant sectoral organisations (Seed Column and Product Council, National Association of Cereal Producers, FruitVeB, Poultry Product Council, Milk Interprofessional Organisation and Product Council, Slaughter and Meat Interprofessional Organisation and Product Council, Association of Responsible Food Manufacturers, etc.) and the Managing Authority of the Ministry of Agriculture in order to **align the CAP calls with eco-targets and achieve a successful ecological transition** rate from 2022.
- Ministry of Agriculture 26/2018 on national recognition of quality schemes for agricultural products and foodstuffs and voluntary agricultural product certification schemes (X. 1.) Decree of the Minister for Agriculture (X. 1.) recognises, as part of the **KMÉ trade mark system, an ÖKO-KMÉ trade mark until 2023, which**, by further strengthening existing quality schemes, encourages full transition and highlights the higher quality of bio-products (international examples: Austrian AMA Biosiegel, similar to the German Bio-Siegel).
- The Ministry of Agriculture is particularly **encouraging** (e.g. significant application points) farmers who are particularly susceptible to innovation, as well as young farmers, fresh fruit and vegetables producers for **organic production** and the development of feed integration (e.g. milk, pigs, eggs and poultry and small ruminant lines) for the **conversion of smaller organic livestock holdings** from 2023.
- On behalf of the Ministry of Agriculture, the NAK publishes **sector-specific technology guides and factsheets** for farmers from 2022 to promote successful ecological transition, to learn organic livestock farming, nutrient fertilisation, certified production, and to raise awareness of the contribution of organic farming to climate, biodiversity and health protection objectives.
- The Ministry of Agriculture **will increase the number of producers participating in eco-product integration by 20 per cent by 2027 through the** relevant CAP calls (e.g. food processing investment calls).
- The Ministry of Agriculture **clarifies the requirements for REL collaborations** and supports the **creation of organic short supply chains** with a share of eco-area-proportional share of the envelope of the relevant CAP calls, in particular the costs of setting up and operating eco-molnar

co-operations and community-supported organic agricultural systems (AMAP schemes) until 2027.

- The Ministry of Agriculture encourages **organic animal production (e.g. dairy products, honey, fish, meat, eggs) with a proportion of eco-** areas under the relevant CAP calls, with a particular focus on the **ecological status of livestock farming linked to eco-** grass (e.g. farmyard development, support for livestock acquisition costs associated with the conversion of organic livestock) and the exploitation of the potential of small ruminants by 2027.
- The Ministry of Agriculture encourages the **doubling of the number of processing plants for certified eco-food production by 2027 with the share of eco-** area allocation under the relevant CAP calls.
- The Ministry of Agriculture supports the accession of enriched eco **-product producers to other quality management systems** (IFS, BRC GLOBALG.A.P., etc.), at least with the share of eco-areas of the CAP call for access to quality management systems as of 2023.
- The Ministry of Agriculture shall provide a tendering framework for **sustainable packaging and logistics improvements and** investments in certified eco-product plants, in line with the EU Circular Economy Action Plan, at least with the share of eco-areas in the relevant CAP calls as of 2023.
- The Ministry of Agriculture devotes 15 % of the Hungarian agricultural marketing envelope to the **promotion of organic products**, which it will implement by means of tenders for CAP information obligations and other national tendering frameworks until 2027.
- The Ministry of Agriculture supports the **acquisition and promotion of the ÖKO-KMÉ trade mark as part of the organic certification and the KMÉ trade mark** system, with the share of eco-areas in the envelopes of the CAP calls for joining quality schemes and promoting quality schemes.

Biodiversity Strategy objective: 10 % of the agricultural area of the Member States is covered by high-diversity landscape features

In Hungary, Act LIII of 1996 on the conservation of nature states in general that the **conservation of wild organisms and their populations and communities must be ensured in conjunction with the conservation of their** habitats, that all activities must be carried out in a manner that protects the habitats of wild organisms and their biodiversity, and that sustainable use must be ensured, including sustainability, the use of nature-friendly methods and the protection of biodiversity. The natural and close-to-nature status of the landscapes must be preserved, as well as the preservation of the natural assets, natural systems and unique landscape values that determine the aesthetic conditions and nature of the landscapes.

In our Strategic Plan, Statutory Management Requirement 3 for Natura 2000 sites and SMR 4 are listed in our Strategic Plan 275/2004 on areas of conservation of European Community importance. Government Decree No 269/2007 of 8 October 2007 on land use rules for maintaining NATURA 2000 grasslands Government Decree (X. 18.) of 18 October 2006. The legal requirements cover the general protection of Natura 2000 sites (e.g. activities subject to authorisation) and, in the case of grasslands, minimum land use standards for their conservation. Among the conditionality requirements, **GAEC 1** (protection of permanent grasslands), **GAEC 2** (protection of wetlands and bogs), **GAEC 8** (maintenance of non-productive elements, protection of landscape features and restrictions on the nesting period) and **GAEC 9** (Natura 2000 sensitive grasslands) contribute to maintaining and increasing the diversity of farmland habitats, thereby helping to improve the status of species in unfavourable conservation situations. The **agro-ecological programme** (intervention code: Among the optional provisions of DP17_G01_ECOS_16), the conservation of permanent grasslands at farm level, the increased **maintenance rate of 10 % non-productive elements**, the maximisation of field size, the restriction of pesticides hazardous to bees, the use of authorised agents in organic plant protection, and the selection of cropland cover and intermediate cropping practices also contribute to maintaining and increasing the diversity of habitats associated with agricultural land, reducing over-use of pesticides, thus helping to

improve the status of species in unfavourable conservation situations. **AGRI -environmental payments** (AKG, intervention code: RD19_G01_AEC_70) eight sets of standards specifically target the conservation of species of Community interest linked to cultivated grassland and arable land with species-specific requirements in High Natural Value Areas. In addition, the other sets of standards include provisions that can contribute to the conservation of habitats and species associated with agricultural land, thereby also helping to improve the status of species in unfavourable conservation status. **Compensation payments for Natura 2000 grassland and forest areas** (interventions codes: RD23_G06_NAG_72, RD34_F01_NAF_72) is intended to compensate for the additional costs and income losses caused by the specific land use regulations applicable to these areas, which contributes to improving the status of species in unfavourable conservation status. **Agro -ecological non-productive investments and payment encouraging agro-ecological land use change** to maintain them (interventions code: RD21_G04_LCI_73, RD22_G05_LCP_70) aims to promote land-use change in arable land currently cultivated at the limits of economy, with the aim, inter alia, of creating biodiversity-relevant habitat types such as long-lasting greenugars (bee-grazing), grass strips, species-rich grasslands, conservation forest strips, woody pastures, wetlands and grassland protection strips. The resulting habitats, which are maintained according to appropriate standards, contribute to improving the status of species in unfavourable conservation status. **Support for the maintenance of multiannual commitments in forestry for environmental or climate purposes** (EIU, intervention code: Measure RD35_F02_FEC_70) contributes to improving the natural status of existing forests also in Natura 2000 forest areas through forest-environmental commitments going beyond the obligations set by the forest authority in the forest plan (continuously improved renovation, reduction of intensively transmitted alien trees and shrub species, reconversion of cleansing, manual maintenance of forest stands and environmentally friendly material handling). Investments to **improve the climate and environmental performance of forests by transforming forest** structures and increasing mixing contribute to improving the natural status of existing forests also in Natura 2000 forest areas on the basis of a forest plan approved by the relevant forest section authority. (intervention code: RD41_F08_INN_73)

Objective F2F: Reduce the use of pesticides and specifically the use of risky pesticides by 50 %

In Hungary, the Hungarian rules on the use of plant protection products are mainly laid down in Act XLVI of 2008 on the food chain and its official supervision, and on plant protection activities. (IV. Decree No 23/1999 of the Minister for Agriculture and Rural Development. These standards also comply with **statutory management requirements 7 and 8 (placing on the market and sustainable use of plant protection products)** within the conditionality.

In our Strategic Plan, the **agro-ecological programme** (intervention code: DP17_G01_ECOS_16) several of the optional provisions that go beyond the above regulations relate to the sustainable use of pesticides, such as restricting the use of specific or moderately hazardous or risky pesticides for bees or encouraging the use of biological agents authorised in organic farming. Maintaining non-productive elements helps beneficial living organisms, which are part of integrated pest management. **AGRI -environmental payments** (AKG, intervention code: RD19_G01_AEC_70) covers the sustainable use of plant protection products (limitation of active substances that may be used) and the use of integrated pest management solutions (use of plant protection forecasting, aid to beneficial living organisms). **Support for organic farming** (interventions code: RD20_G02_ORT_70) contributes directly to the reduction of pesticide pollution from agricultural sources as a result of the principles and rules laid down in EU legislation on organic production in farming mode. All these standards go beyond the basic requirements detailed above. Among the **sustainable and digital development of agricultural holdings** and **interventions in the fruit and vegetables sector**, climate change mitigation and adaptation measures are all an opportunity to support investments that can effectively reduce the use of pesticides by farmers (interventions code: SC18_G02_FVL_47, RD01_E01_FRM_73, RD02_D01_FRM_73).

Objective F2F: Reduce the volume of antimicrobials placed on the market by 50 %

The rearing of farm animals has changed significantly in recent decades. Furthermore, in addition to the use of healthy food by consumers, sustainability and animal welfare have also come to the fore.

The **preventive health measures and treatments included in our CAP Strategic Plan lead to an improvement in the overall health and hygiene status of livestock**. This reduces the number of cases, thereby reducing the need to provide treatments, including antimicrobials, antibiotics. This reduces the risk of developing antibiotic resistant pathogenic strains and spreading in domestic populations. As of 28 January 2022, new Union legislation directly applicable in all Member States will be introduced. Regulations (EU) 2019/6 on veterinary medicinal products and (EU) 2019/4 of the European Parliament and of the Council on medicated feed give priority to AMR and include a number of measures and tightening measures to promote responsible use of antibiotics in animal health, which we have of course taken into account when designing our CAP interventions. (intervention codes: RD29_G12_AWR_70, RD30_G12_AWC_70, RD31_G12_AWS_70, RD32_G12_AWP_70, RD33_G15_AWB_70)

In line with international guidelines, a **national veterinary action plan to reduce AMR was developed** in April 2018, including a target of 128/2009. (X. 6.) FVM. The new domestic provisions introduced in August 2021 help reduce the use of antibiotics and promote prudent and responsible antibiotic use, taking into account the common protection of animal and public health, in line with national professional policy efforts. Key changes include: (I) antibiotics must be prescribed by a veterinarian only on prescription (not to be used by a client) in sufficient quantities for treatment for a maximum of seven days; (II) prophylactic use of so-called critically important active substances for human health is forbidden and may only be used for therapeutic purposes after a resistance test has been carried out; (III) As of January 2022, the use of antibiotics should be recorded in a medical treatment log with more data than at present and data will be provided in Nébih's online system.

Food chain inspection bodies, authorities contribute to the responsible antibiotic use through targeted checks, review of antimicrobial authorisations, intensive contacts with professional organisations, relevant international tasks, and guidance and training.

3 Consistency of the Strategy and complementarities

3.1 Overview of the environmental and climate architecture

3.1.1 A description of the overall contribution of conditionality to the specific environmental- and climate-related objectives set out in points (d), (e) and (f) of Article 6(1)

GAEC standards support each of the specific environmental and climate objectives set out in points (d), (e) and (f) of Article 6(1). They contribute to climate change mitigation and adaptation, as well as to the diffusion of sustainable energy. They support sustainable development and efficient management of natural resources such as water, soil and air. They help protect biodiversity, enhance ecosystem services and protect habitats and landscapes.

- GAEC 1 maintenance of permanent grassland helps to sequester carbon, participates in the regulation of local climate systems, helps protect soils against erosion and, as habitats and landscape features, contributes to the protection of biodiversity and the preservation of habitats and landscapes.
- Wetlands and peatlands preserved under GAEC 2 contribute to the proper management of carbon-rich soils. Due to proper preparation for implementation, the requirement will only be introduced as of 2025.
- GAEC 3 is a ban on burning stubble, cane and other plant residues that helps to preserve soil organic matter and biological status and contributes to reducing air pollution
- Within GAEC 4, the requirements for buffer strips contribute to protection against water pollution by limiting the application of nutrients.
- GAEC 5, as an anti-erosion measure, contributes to avoiding soil degradation and preserving soil stocks by setting minimum land management standards for site-specific minimum land management to limit erosion.
- GAEC 6 protects against erosion by ensuring soil cover in sensitive periods, helps carbon sequestration and prevents water loss, and contributes to increasing soil organic matter content, improving soil structure and soil potential by growing a soil cover crop.
- The provisions of GAEC 7 on crop conversion help preserve soil potential and reduce the use of plant protection products by establishing the correct crop order and greater diversity.
- Under GAEC 8, non-productive landscape features and plant protection product free crops for agro-ecological purposes, N-fixing crops, contribute to the protection of biodiversity, the preservation of habitats and landscapes and the protection of soils.
- GAEC standard 9 contributes to the protection of biodiversity and the conservation of habitats and landscapes by maintaining NATURA 2000 grasslands.

3.1.2 Overview of the complementarity between the relevant baseline conditions, as referred to in Article 31(5) and Article 70(3), conditionality and the different interventions addressing environment and climate-related objectives

1. Minimum requirement for agricultural areas in accordance with Article 4(2) STR

An agricultural area shall be considered to be maintained in good condition if it is subject to agricultural production or, if there is no agricultural production, is maintained in such a way that there is no severe weeding on a large scale. (See the relevant SFC chapter for the detailed specification: 4.1.1.2.)

2. Reduction of fertiliser use

2.1. Mandatory requirements and statutory management requirements (SMR) and GAEC standards laid down in national legislation

As regards the use of fertilisers, Article 42 of Act CXXIX of 2007 on the protection of arable land states in general that agricultural land must be subject to environmentally sound nutrient management that takes into account the nutrient supply of soil and the nutrient requirements of cultivated crops.

In addition, Decree No 59/2008 laying down detailed rules for the action programme for the protection of waters against pollution caused by nitrates from agricultural sources and the procedures for reporting and recording data (IV. The mandatory requirements of Good Agricultural Practice laid down in Decree No 29/1999 of the Minister for Agriculture and Rural Development correspond to SMR 2 within the conditions (Council Directive 91/676/EEC concerning the protection of waters against pollution caused by nitrates from agricultural sources).

2.2. CAP Strategic Plan contribution to the objective

Among the optional requirements of the **agro-ecological programme**, the requirement to use soil conditioning and microbiological preparations contributes indirectly to the reduction of fertiliser use (intervention code: DP17_G01_ECOS_16).

Many of the general requirements for **agri-environmental management (AEM) payments** cover sustainable nutrient management (preparation of a nutrient management plan based on soil analysis and leaf analysis, restriction of nitrogen active substance application, application of organic fertilisers) thus contributing to the rational use of fertilisers and the reduction of fertiliser application. (intervention code: RD19_G01_AEC_70)

Support for organic farming contributes directly to reducing the use of fertilisers as a result of the principles and rules laid down in EU legislation on organic production in farming. All these standards go beyond the basic requirements detailed above. Both the relevant sectoral (DP) and rural development (RDP) interventions effectively serve this headline objective (interventions code: RD20_G02_ORT_70, SC13_G01_FVO_47).

Among the **sustainable and digital development of agricultural holdings** and interventions in the **fruit and vegetables sector**, climate change mitigation and adaptation measures are all an opportunity to support investments that can effectively reduce the use of fertilisers by farmers (Code of interventions: SC18_G02_FVL_47, RD01_E01_FRM_73, RD02_D01_FRM_73).

3. Reduction of the use of plant protection products

3.1. Mandatory requirements and statutory management requirements (SMR) and GAEC

standards laid down in national legislation

The Hungarian provisions on the use of plant protection products are mainly laid down in Act XLVI of 2008 on the food chain and its official supervision, and on plant protection activities. (IV. Decree No 23/1999 of the Minister for Agriculture and Rural Development. These standards also comply with **statutory management requirements 7 and 8** (placing on the market and sustainable use of plant protection products) within the conditionality.

3.2. CAP Strategic Plan contribution to the objective

Several of the optional provisions of the **agro-ecological programme**, which go beyond the above rules, relate to the sustainable use of pesticides, such as restricting the use of specific or moderately hazardous or risky pesticides for bees or encouraging the use of biological agents authorised in organic farming. Maintaining non-productive elements helps beneficial living organisms, which are part of IPM (intervention code: DP17_G01_ECOS_16).

Several of the general requirements for **agri-environmental management (AEM) payments** cover the sustainable use of plant protection products (limitation of active substances that may be used) and the use of integrated pest management solutions (use of plant protection forecasting, aid to beneficial living organisms). **Support for organic farming** contributes directly to the reduction of pesticide pollution of agricultural origin as a result of the principles and rules laid down in EU legislation on organic production in farming. All these standards go beyond the basic requirements detailed above. Both the relevant sectoral (DP) and rural development (RDP) interventions are effectively served by the headline target (interventions code: RD20_G02_ORT_70; SC13_G01_FVO_47).

Among the **sustainable and digital development of agricultural holdings** and interventions **in the fruit and vegetables sector**, climate change mitigation and adaptation measures are all an opportunity to support investments that can effectively reduce the use of pesticides by farmers (interventions code: SC18_G02_FVL_47, RD01_E01_FRM_73, RD02_D01_FRM_73).

4. Animal welfare requirements

4.1. Mandatory requirements and statutory management requirements (SMR) and GAEC standards laid down in national legislation

The Hungarian provisions on animal welfare are laid down in Decree No 32/1999 of 1999 on animal protection rules for the keeping of farm animals. (III. Decree No 31/2001 of the Minister for Agriculture and Rural Development. The rules cover the conditions of individual and group rearing and the keeping and handling of calves, pigs and poultry and other farmed animals. This legislation corresponds to **statutory management requirements 9, 10 and 11** (protection of calves, pigs and animals kept for farming purposes) within the conditionality.

4.2. CAP Strategic Plan contribution to the objective

We plan to extend **animal welfare support** to most farm animal species (cattle, poultry, small ruminants and beekeeping). In the case of animal welfare aid, in addition to the above legislation, we would require, inter alia, greater space, more frequent checks, higher technological standards, the provision of natural husbandry conditions, prevention and the use of smart antibiotics, and the provision of feed of sufficient purity, quality and mineral content, and drinking water. (Intervention codes: RD29_G12_AWR_70, RD30_G12_AWC_70, RD32_G12_AWP_70, RD33_G15_AWB_70).

Sustainable and digital farm development interventions are an opportunity to support investments that effectively contribute to the establishment of animal farms with favourable conditions for animal health and welfare, for example by developing manure management, feeding, ventilation or ammonia sequestration (interventions code: RD01_E01_FRM_73, RD02_D01_FRM_73).

5. Other mandatory requirements: Soil protection

5.1 Binding requirements and GAEC standards laid down in national legislation

The basic principles of soil use are laid down in Act CXXIX of 2007 on the protection of soil, which, in addition to the general protection of soils, covers, in addition to the general protection of soils, the protection of soil organic matter, the cultivation of saline and sour soils and environmentally sound nutrient management, as well as the prevention and elimination of excessive soil compaction, thereby improving its water management. Government Decree No 90/2008 on the detailed rules for drawing up a soil protection plan (VII. 18) Decree of the Minister for Agriculture and Rural Development lays down, in accordance with the above Act, the activities for which soil protection plans are to be drawn up (e.g. irrigation, slurry, sewage and sewage sludge in agriculture, implementation of technical soil protection interventions against erosion, etc.).

Within the Conditionality **GAEC standards 5, 6 and 7** apply to the protection of soils. These requirements aim, on the one hand, to reduce the risk of soil degradation and soil erosion and, on the other hand, to preserve the soil potential in accordance with Act CXXIX of 2007 on the protection of arable land.

5.2. CAP Strategic Plan contribution to the objective

Among the optional requirements of the **agro-ecological programme**, winter soil cover, non-rotational tillage, use of soil conditioners, microbiological products, cover between plantations, crop diversification and maintenance of higher non-productive areas (e.g. fallow, nitrogen-fixing crops, secondary green manure crops) help preserve and improve soil potential, protect and improve soil structure and soil biodiversity, increase the capacity of soils to retain water, and protect against erosion (intervention code: DP17_G01_ECOS_16).

Several of the general requirements for **agri-environmental management (AEM) payments** cover sustainable nutrient management (preparation of a nutrient management plan based on soil analysis, limitation of nitrogen application), conservation farming (non-rotated tillage, erosion control measures, soil conservation crop structure, etc.) and in addition specific sets of requirements have been drawn up for areas that are vulnerable to erosion, inland water or drought. While the primary objective of the set of anti-erosion standards is the reduction of alluvial and pollutant pressures from soil erosion and/or surface runoff, water retention in inland water sensitive areas and water retention in drought-sensitive areas are encouraged good practices. (intervention code: RD19_G01_AEC_70)

Support for organic farming contributes directly to improving the gross nutrient balance of agricultural land, reducing soil extortion and restoring soil organic matter as a result of the principles and rules applied in the farming mode, as laid down in the EU legislation on organic production. All these standards go beyond the basic requirements detailed above. Both the relevant sectoral (DP) and rural development (RDP) interventions are effectively served by the headline target (interventions code: RD20_G02_ORT_70; SC13_G01_FVO_47).

Among the **sustainable and digital development of agricultural holdings** and interventions in the **fruit and vegetables sector**, climate change mitigation and adaptation measures are all an opportunity to support investments that effectively help farmers to manage soils (interventions code:

6. Other mandatory requirements: Qualitative and quantitative protection of waters

6.1. Mandatory requirements and statutory management requirements (SMR) and GAEC standards laid down in national legislation

Government Decree No 123/1997 on the protection of water bases, long-term water bases and water facilities for the supply of drinking water. (VII. Government Decree No 18/1999 contains restrictions on the use of protection zones for surface water and groundwater bases.

Decree No 220/2004 on rules for the protection of surface water quality. (VII. Government Decree No 21/2001 lays down the general rules on the discharge of waste water. In order to safeguard water quality, the environmental requirements for the discharge of waste water are set out in a permit for the discharge of waste water. On amendments to Decree No. 219/2004. (VII. Government Decree No 21/2001 lays down requirements to prevent or limit the discharge of pollutants into groundwater or geological formation.

Government Decree No 83/2014 on the use and use of areas vulnerable to large water basins, coastal strips, watercourses and the resulting waters and rules on the procedures and content of the preparation of the large water basin management plan in the case of rivers (III. On the basis of Government Decree No 14/2001, agricultural use and use in areas on the exempted side of flood defence draughts that break into the surface due to flood water pressure and are vulnerable to leaking waters may be carried out only on the owner's or user's own responsibility.

Soil protection rules to protect against erosion are also linked to water quality (see above)

Act CXIII of 2019 on Irrigation Management contains detailed rules on the establishment of irrigation servitude, the recognition and control of sustainable water management communities and the approval of environmental district plans, and the implementing rules are laid down in Decree 302/2020 on the implementation of the Law on Irrigation Management. (VI. Government Decree No 29/1999.

Government Decree No 147/2010 laying down general rules on activities and facilities for the exploitation, protection and prevention of water damage (IV. Government Decree No 29/1999 lays down the general rules on water management, including, inter alia, the general requirements for waste water treatment and disposal, flood remediation, water management and agricultural water use, e.g. irrigation. Further rules on activities subject to authorisation under water law, including water use for irrigation purposes, are laid down in Decree 72/1996 on the exercise of water management authority powers. (V. 22.) Gov. Decree. This legislation corresponds to the part of the **farmer requirement in legislation 1** which concerns Article 11(3)(e) of Directive 2000/60/EC of the European Parliament and of the Council establishing a framework for Community action in the field of water policy (authorisation of water abstractions and reservoirs). Domestic legislation on Article 11(3)(h) (protection against diffuse pollution of phosphates) is still in the process of being drawn up, but its content will be in line with the manure application rules of the Good Farming Practice for Nitrate Control in Sloping Areas, extending it to non-nitrate-sensitive sloping areas.

In addition, Decree No 59/2008 laying down detailed rules for the action programme for the protection of waters against pollution caused by nitrates from agricultural sources and the procedures for reporting and recording data (IV. The mandatory requirements of Good Agricultural Practice laid down in Decree **No 29/1999 of the Minister for Agriculture and Rural Development correspond to SMR 2 within the conditions** (Council Directive 91/676/EEC concerning the protection of waters against pollution caused by nitrates from agricultural sources).

Among the GAEC standards, the **GAEC standard 4** (water buffer strips) directly contributes to the achievement of the objectives of the River Basin Management Plan by reducing nutrient or pesticide pollution from agricultural sources, reducing alluvial and polluting loads from soil erosion and/or surface runoff, and regulating the authorisation of water use for irrigation. The provisions of **GAEC 5** (tillage for erosion control) and **SMR 8** (sustainable use of pesticides) contribute indirectly to reducing pressures on surface waters. The provisions of GAEC 1 (protection of permanent grasslands), **GAEC 2 (protection of aquatic habitats and bogs)** and **GAEC No 8** (maintenance of **non** -productive elements, protection of landscape features) support natural water retention, improvement of water treatment conditions and the provision of ecological water quantity.

6.2. CAP Strategic Plan contribution to the objective

Among the optional requirements of the **agro-ecological programme**, winter soil cover, non-rotational tillage, the use of soil conditioners and microbial products, the obscuration of plantations help to increase the water retention capacity of the soils and to protect against erosion, such as reducing alluvial and pollutant pressures from soil erosion and/or surface runoff. In plantations for irrigation, the promotion of micro-irrigation promotes sustainable water use, while restrictions on pesticide use can contribute to reducing pesticide pollution from agriculture (intervention code: DP17_G01_ECOS_16).

Many of the general requirements for **agri-environmental management (AEM) payments** cover sustainable nutrient management (preparation of a soil-based nutrient management plan, limitation of nitrogen application), conservation farming (non-rotated tillage, erosion control measures, soil conservation crop structure, etc.) and the sustainable use of pesticides (limitation of active ingredients that may be used, application of plant protection prediction, etc.) contributing to the reduction of nutrient or pesticide pollution from agricultural sources. In addition, specific sets of standards have been established for erosion, inland water and drought-sensitive areas. While the primary objective of the set of anti-erosion standards is the reduction of alluvial and pollutant pressures from soil erosion and/or surface runoff, water retention in inland water sensitive areas and water retention in drought-sensitive areas are encouraged good practice. (intervention code: RD19_G01_AEC_70)

Support for organic farming contributes directly to the reduction of nutrient and pesticide pollution from agriculture, as a result of the principles and rules laid down in EU legislation on organic production. Both the relevant sectoral (DP) and rural development (RDP) interventions are effectively served by the headline target (interventions code: RD20_G02_ORT_70; SC13_G01_FVO_47).

Agro -ecological non-productive investments and the **payment to encourage agro-ecological land-use change** to maintain them are intended, on the one hand, to encourage the long-term conservation of surplus waters in a given area through land-use change, the creation of wetlands and the creation of small-scale water retention facilities, and, on the other hand, to reduce nutrient loads and pollution in their waters by establishing certain erosion control facilities and the establishment of agriculturally uncultivated buffer zones surrounding watercourses. (interventions code: RD21_G04_LCI_73, RD22_G05_LCP_70).

As part of the intervention to support **investments in water efficiency** and sustainable water management communities, we aim to support investments in irrigation that improve water efficiency and the development of water retention facilities by ensuring the sustainable management of water resources. By supporting certain land-use activities, we aim to improve the water management capabilities of the soil (interventions code: RD12_W01_WTO_74, RD15_W04_COP_77).

Among the **sustainable and digital development of agricultural holdings** and interventions in the **fruit and vegetable sector**, climate change mitigation and adaptation measures are all an opportunity to support investments that effectively contribute to the introduction of water saving measures by farmers on

farms and livestock farms. They can also promote the introduction of soil-saving technologies that promote water-saving management by increasing the water retention capacity of the soil (interventions code: SC18_G02_FVL_47, RD01_E01_FRM_73, RD02_D01_FRM_73).

7. Other mandatory requirements: GHG emission reduction, carbon sequestration

7.1. Binding requirements and GAEC standards laid down in national legislation

Under Section 23(2) of Act LIII of 1996 on nature protection, all bogs are protected under national significance by operation of law. Láp is defined as land that is permanently or intermittently exposed to water, that has intermittently water saturated soils, has a significant proportion of Logic cohabitation or living organisms, and its soils are characterised by varying peat content and peat formation processes.

Among the conditionality requirements, **GAEC 2** (protection of wetlands and bogs) contributes directly to the conservation of carbon-rich soils, but **GAEC 1 (maintenance of permanent grassland)** also makes a major contribution to the carbon sequestration of agricultural land. Furthermore, **GAEC 8** (maintenance of non-productive elements) increases the sequestration of carbon stocks in soil and biomass.

7.2. CAP Strategic Plan contribution to the objective

Among the optional requirements of the **agro-ecological programme**, winter soil cover, non-rotational tillage, obscuration of plantations and maintenance of higher non-productive areas contribute to the carbon sequestration of agricultural land and, on the other hand, the use of soil conditioners and microbial products contributes to reducing fertiliser application, thereby reducing ammonia emissions (intervention code: DP17_G01_ECOS_16).

Several of the general requirements for **agri-environmental management (AEM) payments** cover sustainable nutrient management (preparation of a nutrient management plan based on soil analysis and leaf analysis, restriction of nitrogen active substance application, application of organic fertilisers) thus contributing to the reduction of fertiliser application and thus to the reduction of ammonia emissions. (intervention code: RD19_G01_AEC_70)

Support for **organic farming** contributes directly to the reduction of ammonia emissions from agriculture as a result of the principles and rules laid down in EU legislation on organic production in farming. Both the relevant sectoral (DP) and rural development (RDP) interventions are effectively served by the headline target (interventions code: RD20_G02_ORT_70; SC13_G01_FVO_47).

Agro -ecological non-productive investments and the **payment to encourage agro-ecological land-use change** to sustain them are intended to promote land-use change of arable land currently cultivated at the limits of economy, including through the planting of grasslands and the creation of wetlands, to promote land-use change in favour of carbon sequestration, to store carbon in soil and biomass, and to increase the organic carbon stock of soils. (interventions code: RD21_G04_LCI_73, RD22_G05_LCP_70).

One of the key objectives **of intervention to support the development and maintenance of afforestation** and creation of woodland is to reduce the effects of climate change through land-use change and to significantly sequester carbon dioxide. (interventions code: RD39_F05_AFI_73, RD36_F06_AFM_70).

Investments to **improve the climate and environmental performance of forests aim at** counteracting the spread of growing and increasingly extreme abiotic environmental damage conditions and events (such as forest and vegetation fires, frost and storm damage caused by water scarcity and drought) and

new biotic pathogens and pests, both by preventing damage to forest potential and restoring them in a more resilient way. In addition, the long-term quality renewal, restructuring and reconditioning of forests with climate-resistant material are also a priority. Forest restructuring can improve the age structure, mix and biodiversity of forest stocks, thus improving the resilience and carbon sequestration capacity of forest ecosystems. (intervention code: RD41_F08_INN_73).

The **cooperation** aims to support voluntary partnerships between forest managers and specialised public bodies for the development and implementation of modern, sustainable, multi-farmer planning and implementation of forest fire prevention and mitigation. By preventing forest fires, emissions of greenhouse gases and gases with atmospheric pressures can be reduced and the carbon balance of forest stands can be maintained and their climate adaptive renewal can be facilitated. (intervention code: RD37_F04_FRC_77).

Among the **farm sustainability development and the digital transition of agriculture**, as well as **interventions in the fruit and vegetables sector**, climate change mitigation and adaptation measures are all an opportunity to support investments that contribute to reducing ammonia emissions from agriculture. In crop production, for example, the introduction of techniques for the application of manure that facilitate or inject continuous soil cover, and on livestock farms the management, storage, use of manure, ammonia sequestration (interventions code: SC18_G02_FVL_47, RD01_E01_FRM_73, RD02_D01_FRM_73).

8. Other mandatory requirements: Protecting biodiversity

8.1. Mandatory requirements and statutory management requirements (SMR) and GAEC standards laid down in national legislation

In general, Act LIII of 1996 on nature conservation states that the conservation of wild organisms and their populations and communities must be ensured in conjunction with the conservation of their habitats, that all activities must be carried out in a manner that protects the habitats of wild organisms and their biodiversity, and that sustainable use must be ensured, including sustainability, the use of nature-friendly methods and the protection of biodiversity. And to preserve the natural and close-to-nature status of the landscapes and to ensure the preservation of the natural assets, natural systems and unique landscape values that determine the aesthetic and nature of the landscapes.

SMR 3 for Natura 2000 sites and Statutory Management Requirement 4 (Statutory Management Requirement No. 4) on sites of European Community Importance (SCI) No 275/2004. Government Decree No 269/2007 of 8 October 2007 on land use rules for maintaining NATURA 2000 grasslands Government Decree (X. 18.) of 18 October 2006. The legal requirements cover the general protection of Natura 2000 sites (e.g. activities subject to authorisation) and, in the case of grasslands, minimum land use standards for their conservation.

Among the conditionality requirements, **GAEC 1** (protection of permanent grasslands), **GAEC 2** (protection of wetlands and bogs), **GAEC 8** (maintenance of non-productive elements, protection of landscape features and restrictions on the nesting period) and **GAEC 9** (Natura 2000 sensitive grasslands) contribute to maintaining and increasing the diversity of farmland habitats, thereby helping to improve the status of species in unfavourable conservation situations. These areas are eligible for aid under Article 4(4)(b)(i) and (ii) of the SPR Regulation, thus ensuring their highest possible presence, thus increasing the diversity of habitats linked to agricultural areas.

8.2. CAP Strategic Plan contribution to the objective

Among the optional requirements of the **agro-ecological programme**, the maintenance rate of permanent grasslands at farm level, the maintenance rate of the increased non-productive element, the maximisation

of field size, the restriction of pesticides hazardous to bees, the use of authorised agents for organic plant protection, and the selection of cropland cover and intermediate cropping practices also contribute to maintaining and increasing the diversity of habitats associated with agricultural land, reducing over-use of pesticides, thus helping to improve the status of species in unfavourable conservation situations (intervention code: DP17_G01_ECOS_16).

Eight of the **agri-environmental management payments** (AKG) packages specifically target the conservation of species of Community interest linked to cultivated grassland and arable land with species-specific standards in High Natural Value Areas. In addition, the other sets of standards include provisions that can contribute to the conservation of habitats and species associated with agricultural land, thereby also helping to improve the status of species in unfavourable conservation status. (intervention code: RD19_G01_AEC_70)

The **compensation payments for Natura 2000 grassland and forest** areas are intended to compensate for the additional costs and income losses incurred as a result of the specific land use regulations applicable to these areas, which contributes to improving the situation of species in unfavourable conservation status. (interventions codes: RD23_G06_NAG_72, RD34_F01_NAF_72)

Agro- ecological non-productive investments and an agro -ecological land-use change payment to sustain agro-ecological land use are intended to promote land- use change in arable land currently cultivated at the limits of economy, with the aim, inter alia, of creating habitat types that are important for biodiversity, such as long-lasting greenugars (beegrass) that protect biodiversity, grass strips, species-rich grasslands, conservation forest strips, woody pastures, wetlands or grassland water buffer strips. The resulting habitats, which are maintained according to appropriate standards, contribute to improving the status of species in unfavourable conservation status. (interventions code: RD21_G04_LCI_73, RD22_G05_LCP_70).

Intervention to **support the maintenance of multiannual commitments in forest management for environmental or climate purposes** (EIA) contributes to improving the natural status of existing forests also in Natura 2000 forest areas, with forest-environmental commitments going beyond the obligations set out by the forest authority in the forest plan. Such increased obligations could include transition to a continuous forest cover mode, continuous restructuring or improved renovation, reduction of intensively transmitted alien trees and shrub species, reconversion of cleansing, manual management of forest stands, or nature-friendly material handling (intervention code: RD35_F02_FEC_70).

Investments to **improve the climate and environmental performance of forests by transforming forest** structures and increasing mixing contribute to improving the natural status of existing forests also in Natura 2000 forest areas on the basis of a forest plan approved by the relevant forest section authority (intervention code: RD41_F08_INN_73).

While bees are not covered by the Hungarian legislation laying down the basic requirements, we believe that it is important to mention **interventions in the apiculture sector**. The maintenance of the domestic bee stock plays a key role in preserving domestic biodiversity through ecosystem services.

9 – Overview of the building-up of interventions to achieve specific environmental and climate protection objectives

1. Talaj szervesanyag tartalmának védelme, talajpotenciál megőrzése, talajszerkezet

1. szint: Támogatható terület fogalmának bővítése (AÖT)

- Mezővédő erdősávok
- Fűves, cserjés védősávok

2. szint: Kötelező környezeti alapfeltételek (kondicionalitás)

- Talrlóégetés tilalma
- Minimális talajborítás
- Vetésváltás és terménydiverzifikáció
- Ökológiai másodvetés
- N-megkötő növények
- 12 % feletti lejtőn kapás kultúra csak megkötésekkel termesztendő
- Erózióvédelmi teraszok megőrzése ültetvényekben

3. szint: Önkéntes agro-ökológiai alapprogram (AÖP, eco-scheme)

- Téli talajtakarás
- Talajkondicionálók, mikrobiológiai készítmények alkalmazása
- Forgatás nélküli talajművelés
- Emelt szintű terménydiverzifikáció
- Ültetvény talajtakarás, sorközgyepesítés
- Táblaméret maximalizálása

4. szint: Önkéntes emeltszintű agro-ökológiai átállást segítő beavatkozások

- AKG szántó tematikus előíráscsoportok
- AKG erózióérzékeny szántó tematikus előíráscsoportok
- ÖKO területek támogatása
- Földhasználat váltással létrehozott gyeptelepítés fenntartása
- Földhasználat váltással létrehozott mezővédő fasorok és fásítás fenntartása Nem termelő beruházások kapcsolódó elemei:
- Ültetvények sorközgyepesítése
- Erózióvédelmi védősávok és létesítmények kialakítása
- Mezővédő erdősáv kialakítása
- Gyeptelepítés- Ültetvények sorközgyepesítése

5. szint: Egyéb fenntarthatóságot szolgáló beavatkozások

- Talajvédő gazdálkodáshoz szükséges gépek
- Szerves-trágyafeldolgozó üzemek és kijuttató gépek
- Precíziós talajművelő eszközök

Horizontális támogatás: AKIS beavatkozások és a KAP Hálózat

• Tájékoztatási szolgáltatás • Tanácsadási szolgáltatás • Képzések és bemutató üzemi programok • Innováció (EIP)
• Innovációt és digitalizációt támogató egység
• Környezet- és klímavédelmi célkitűzéseket támogató egység

2. Vízviszartartás a talajban, tájban és víztestek minőségi és mennyiségi védelme

1. szint: Támogatható terület fogalmának bővítése (AÖT)

- Védett táji elemek
- Időszakosan belvízzel borított területek, vizes élőhelyek
- Gyepesített part menti védősávok
- Fűves, cserjés védősávok
- Mezővédő erdősávok

2. szint: Kötelező környezeti alapfeltételek (kondicionalitás)

- Állandó gyepesítés védelme
- Vizes élőhelyek és lipok megőrzése
- Minimális talajborítás
- Nem termelő táji elemek megőrzése
- Vízvédelmi sávokra vonatkozó előírások
- Nitrát-érzékeny területek korlátozásai
- Vízkészlethasználatra vonatkozó szabályok
- Foszfátok elleni védelem
- 12 % feletti lejtőn kapás kultúra csak megszorításokkal termesztendő
- Erózióvédelmi teraszok megőrzése ültetvényekben
- Fenntartható növényvédőszer használat

3. szint: Önkéntes agro-ökológiai alapprogram (AÖP, eco-scheme)

- téli talajtakarás
- talajkondicionálók, mikrobiológiai készítmények alkalmazása
- forgatás nélküli talajművelés
- ültetvény talajtakarás, sorközgyepesítés
- Méhekre veszélyes növényvédőszer korlátozása
- Mikroöntözés ültetvényekben
- Ökológiai növényvédelemben engedélyezett ágensek használata

4. szint: Önkéntes emeltszintű agro-ökológiai átállást segítő beavatkozások

- AKG aszály- és belvíz érzékeny, gyepes, nádas, MTET AKG tematikus előíráscsoportok
- Ökogazdálkodás
- Földhasználat váltással létrehozott gyeptelepítés fenntartása, új vizes élőhely fenntartása, vízvédelmi pufferzóna fenntartása
- Nem termelő beruházások kapcsolódó elemei: Gyeptelepítés
- Ültetvények sorközgyepesítése, élővilág kultúrákkal való telepítése
- Vizes élőhelyek kialakítása, területi vízviszartartás beruházásai
- Vízvédelmi pufferzóna és Vízviszartartási kialakítása
- Erózióvédelmi védősávok és létesítmények kialakítása
- Mezővédő erdősáv kialakítása

5. szint: Egyéb fenntarthatóságot szolgáló beavatkozások

Erdőtelepítés
Beruházások környezet-, klímavédelmi és adaptációs elemei
- Harmadlagos művek és víztározók kialakítása és fenntartása
- Víztaérekos öntözésfejlesztés és korszerűsítés
- Talajvédő gazdálkodáshoz szükséges gépbeszerzés
- Szervestrágyaszóró gépbeszerzés
- Precíziós növényvédőszer és műtrágya kijuttatás technológiájának bevezetése

Horizontális támogatás: AKIS beavatkozások és a KAP Hálózat

• Tájékoztatási szolgáltatás • Tanácsadási szolgáltatás • Képzések és bemutató üzemi programok • Innováció (EIP)
• Innovációt és digitalizációt támogató egység • Környezet- és klímavédelmi célkitűzéseket támogató egység

3. Klimavédelem: szénmegkötés, ÜHG és ammónia-emissziócsökkentés

1. szint: Támogatható terület fogalmának bővítése (AÖT)

- Időszakosan belvízzel borított területekkel, vizes élőhelyekkel történő bővítés

2. szint: Kötelező környezeti alapfeltételek (kondicionalitás)

- Állandó gyepek védelme
- Vizes élőhelyek és lápok megőrzése
- Tarlóégetés tilalma
- Minimális talajborítás
- Natura 2000 JFGK

3. szint: Önkéntes agro-ökológiai alapprogram (AÖP, eco-scheme)

- Téli talajtakarás
- Talajkondicionálók, mikrobiológiai készítmények alkalmazása
- Forgatás nélküli talajművelés
- Ültetvény talajtakarás, sorközgyepezítés
- Állandó gyepek gazdaság szintű megőrzése

4. szint: Önkéntes emeltszintű agro-ökológiai átállást segítő beavatkozások

- AKG gyepek tematikus előíráscsoportok
- AKG nádas tematikus előíráscsoport
- Földhasználat váltással telepített gyepek fenntartása
- Földhasználat váltással létrehozott új vizes élőhely fenntartása
- Natura 2000 kompenzációs kifizetés gyepterületeken
- Nem termelő beruházások: - gyeptelepítés, - ültetvény sorközgyepezítése, - vizes élőhelyek kialakítása

5. szint: Egyéb fenntarthatóságot szolgáló beavatkozások

- Erdőtelepítés
- Állattartótelep felújítása a takarmányozás, a trágyakezelés, trágyatárolás, szellőzőrendszer és megújuló energetikai rendszer fejlesztésével
- Szerves-trágyaszóró és hígtrágya kijuttató gépek (csoroszhány, csőfüggyönyös, injektoros)
- Talajvédő gazdálkodáshoz szükséges gépbeszerzés
- Precíziós tápanyagkijuttatás technológia bevezetése

Horizontális támogatás: AKIS beavatkozások és a KAP Hálózat

• Tájékoztatási szolgáltatás • Tanácsadási szolgáltatás • Képzések és bemutató üzemi programok • Innováció (EIP)
• Innovációt és digitalizációt támogató egység
• Környezet- és klímavédelmi célkitűzéseket támogató egység

4. Biodiverzitás- és tájvédelem

1. szint: Támogatható terület fogalmának bővítése (AÖT)

- Védett táji elemek
- Időszakosan belvízzel borított területek, vizes élőhelyek
- Mezővédő erdősávok
- Gyepes vízvédelmi sávok
- Fűves, cserjés sávok

2. szint: Kötelező környezeti alapfeltételek (kondicionalitás)

- Állandó gyepek védelme
- Vizes élőhelyek és lápok védelme
- Natura 2000 területek védelme
- Nem termelő elemek fenntartása
- Fészkelési időszakra vonatkozó korlátozások
- Natura 2000 érzékeny gyepek feltérési tilalma

3. szint: Önkéntes agro-ökológiai alapprogram (eco-scheme)

- állandó gyepek gazdaság szintű megőrzése
- ültetvény talajtakarás, sorközgyepezítés
- emelt szintű nem termelő elem arány
- táblaméret maximalizálása
- méhekre veszélyes növényvédőszer korlátozása
- ökológiai növényvédelemben engedélyezett ágensek használata

4. szint: Önkéntes emeltszintű agro-ökológiai átállást segítő beavatkozások

- AKG MTÉT, nádas tematikus előíráscsoport
- Ökológiai gazdálkodás
- Natura 2000 kompenzációs kifizetés
- Biodiverzitás védelmi tartós zöldugor fenntartása
- Gyeptelepítés fenntartása és degradált gyepek helyreállítása
- Földhasználat váltással létrehozott mezővédő fásítá, fás legelők, vizes élőhelyek fenntartása
- Natura 2000 kompenzációs kifizetés
- Nem termelő beruházások: - Biodiverzitás védelmi tartós zöldugor kialakítása, - Fűves cserjésávok kialakítása, - Gyeptelepítés, - Mezővédő erdősáv kialakítása, - Fás legelő kialakítása, - Vizes élőhelyek Gyepes vízvédelmi sávok kialakítása

5. szint: Egyéb fenntarthatóságot szolgáló beavatkozások

- Állati in-situ, ex-situ és in-vitro génmegőrzés
- Növényi ex-situ és in-situ génmegőrzés
- Erdészeti génmegőrzés

Horizontális támogatás: AKIS beavatkozások és a KAP Hálózat

• Tájékoztatási szolgáltatás • Tanácsadási szolgáltatás • Képzések és bemutató üzemi programok • Innováció (EIP)
• Innovációt és digitalizációt támogató egység • Környezet- és klímavédelmi célkitűzéseket támogató egység

3.1.3 Explanation on how to achieve the greater overall contribution set out in Article 105

1. CAP Strategic Plan Presentation of Increasing Environmental Ambition

One of the most prominent objectives of the Common Agricultural Policy (CAP) 2023-2027 is to promote environmental protection and climate action in agriculture and forestry and to contribute to the achievement of the European Union's environmental and climate objectives.

Overall, through the interventions of the green architecture of the Hungarian CAP Strategic Plan, it contributes more to the achievement of the specific objectives set out in points (d), (e) and (f) of Article 6(1) compared to the 2014-2022 period. For the specific objectives, the following quantified increase can be identified in the related interventions.

For reasons of clarity and to avoid unnecessary duplication, the interventions and programme elements that are relevant for all three environmental specific objectives (SOs) are first presented. Later, those that can be assigned more decisively to one SO or to another SO.

Findings for each of the three specific environmental objectives on the level of environmental ambition of each measure

Extension of the definition of eligible areas

Areas eligible for support under Article 4(4)(b)(i) and (ii) of the SPR Regulation are also areas which normally do not meet the definition of agricultural area and are accounted for as landscape features and non-productive elements under GAEC 8 and AÖP. These are areas that are currently either excluded at the time of inspection or are not already covered by the definition of eligible area, but are highly valuable from an environmental and climate policy perspective (e.g. protective forest strips, ecological buffer strips, tree and bush groups, submerged field margins, uncultivated field margins, uncultivated coastal strips of watercourses, intermittent inland areas, stormy areas, wetlands, saline areas). With this new high level of ambition, our aim is to increase the eligible area by around **100 thousand hectares compared to the areas currently eligible, ensuring** that our producers are not encouraged by the basic area-based income support (BISS) to reduce or at least not increase the size of these valuable areas. The increase does not result in a substantial decrease in the level of the BISS support and therefore does not jeopardise its income stabilisation objective.

Confirm Conditionality Specifications

The system of standards for conditioning, including the Good Environmental and Agricultural Conditions (GAEC), is extended to include the conditions for the payment for agricultural practices beneficial for the climate and the environment ('greening') in force in 2015-2022, such as the preservation of permanent grassland and the maintenance of ecological focus areas. **The inclusion of these standards as a basic condition for direct and certain rural development area payments in itself ensures a higher contribution compared to the expectations of the previous period.** In addition, the GAEC specifications are currently set out in 50/2008. We will continue to implement and confirm the requirements set out in the Decree of the Minister for Agriculture and Rural Development as follows:

1. The protection of wetlands and bogs is a new element, but due to the specificities of the Member States and the preparation of the necessary implementation tasks, the introduction of this standard will only be possible as of 2025. (GAEC 2)
2. In buffer strips along watercourses, the application of fertilisers and manure will be regulated uniformly, maintaining stricter requirements for organic fertilisers and prohibiting the use of pesticides with a width of at least 5 m (GAEC 4)
3. In the context of erosion control, in areas with a slope of more than 12 %, the scope of the restricted crops covers all grub crops, including the cultivation of maize and sunflower and autumn swede rape with a spacing of more than 24 cm. This means that these species may only be grown on a contour or by means of anti-erosion strips or by direct sowing in areas with a slope of more than 12 %. (GAEC 5)
4. It will be mandatory for all farmers to maintain non-productive areas or landscape features on a certain proportion of their arable land. Greening is increased to 7 % compared to the 5 % EDF area, including nitrogen-fixing and secondary crops, of which at least 3 % must be non-productive. (GAEC 8)

Under the **Basic Income Support for Sustainability (DP01_E01_BISS_16)**, the planned target area **per year is 5.000 ha -EUR 789700000 per year**. The approved SAPS area for 2020 was 4 942 768 ha.

DP17_G01_ECOS_16 Agro-ecological programme

The optional provisions of the newly developed measure contribute to the achievement of all three environmental objectives (e.g. increasing carbon sequestration by maintaining permanent grasslands at farm level, reducing ammonia emissions, soil protection standards, biodiversity protection by requiring maintenance rates for the increased non-productive element, etc.).

Given that the measure had no direct history in the 2014-2022 period, its introduction clearly contributes to an increase in the level of ambition. The target output of **the measure is 2.500.000 ha** of agricultural area, the total indicative financial allocation per year is **EUR 202.125,000/year**.

RD19_G01_AEC_70 – Agri-environmental management payments (AKG)

The continuation of the **AEM** measure and ensuring the continuity of support is a priority given that AKG support is a form of farming with high environmental added value, contributing to environmental and climate spending in a significant amount of areas and with significant resources.

With an increased unit cost in 2021, with a commitment period of 3 years, new AKG and ÖKO calls under the rules of the VP, starting in 2022, will be followed by another AKG/ÖKO call under the rules of the Strategic Plan as of 2025. Thus, in 2022, payments are still made under Article 28 (Agri-environment-climate) and Article 29 (Organic farming) of Regulation (EU) No 1305/2013, while from 2023 onwards, we will close it to Article 70 of the CAP Strategic Plan Regulation (Environmental, climate and other management commitments). The launch of the new AKG 2025 will be an opportunity to develop sets of standards that better respond to emerging needs and address emerging problems more effectively.

The annual output target of the intervention in the CAP Strategic Plan **shall be 961 324 ha of agricultural land**.

In the 2014-2022 Rural Development Programme, an average of **697 thousand hectares of agricultural land** was supported per year, whereas the CAP Strategic Plan calculates an annual subsidy of **961 thousand ha** of agricultural land, an **increase of approximately 38 %**.

RD20_G02_ORT_70 – Support for organic farming

The continuation of the **ÖKO** action and ensuring the continuity of support is a priority given that ÖKO grants are types of farming with high environmental added value, which contribute to environmental and climate spending in a significant amount of areas and with significant resources.

With an increased unit cost in 2021, with a commitment period of 3 years, new AKG and ÖKO calls under the rules of the VP, starting in 2022, will be followed by another AKG/ÖKO call under the rules of the Strategic Plan as of 2025. Thus, in 2022, payments are still made under Article 28 (Agri-environment-climate) and Article 29 (Organic farming) of Regulation (EU) No 1305/2013, while from 2023 onwards, we will close it to Article 70 of the CAP Strategic Plan Regulation (Environmental, climate and other management commitments).

The annual output target of the intervention **shall be 279 415 ha of agricultural land**.

In the 2014-2022 Rural Development Programme, an average of **178 thousand ha** of agricultural land was supported per year, whereas the CAP Strategic Plan calculates an annual subsidy of almost **280 thousand ha** of agricultural land, an **increase of approximately 56 %**.

RD21_G04_LCI_73 – Agro-ecological non-productive investments and

RD22_G05_LCP_70 – Payment encouraging agro-ecological land-use change

Non-productive investments for agro-ecological purposes aim to support investments that help mitigate and adapt to adverse climate change caused by agriculture, protect not only biodiversity but also soil, water and air, and preserve and restore landscape features and diversify habitats. The effectiveness of habitats, landscape or conservation features created by agro-ecological NPIs and the willingness of farmers to do so is increased by the fact that the resulting habitats, landscape or conservation features do not lose their eligibility for support and thus remain eligible for BISS support. Furthermore, under Article 70, we intend to establish a **multi-annual maintenance** support for individual non-productive investments, independent from the agri-environmental management programme (AKG).

While a total of 348 projects were supported under the **non-productive investments for habitat development and water protection announced under the RDP**, the target for the intervention for agro-ecological NPIs (RD21_G04_LCI_73) is **1420 projects with a total allocation of EUR 19.910.350**. In addition, under the unprecedented **agro-ecological land-use change payment** (RD22_G05_LCP_70), we intend to support land-use change at a total of 9.500 ha with a **total allocation of EUR 28.829.000**.

RD38_F05_AFI_73 – Support for investments in afforestation and woodland and

RD39_F06_AFM_70 – Care and income replacement support for investments in afforestation

The afforestation ambition will not be higher in nominal terms, in terms of area coverage, than in the previous period – 5 000 ha per year – as the negative effects of climate change also mean that areas suitable for afforestation in the long term are also declining and heavily transforming. As such, a forced quantitative increase is not justified, but it is important to maintain afforestation ambitions and thus ensure a sustained increase in forest areas. However, quality ambitions are clearly increasing. Support for afforestation already introduced in 2019 an amendment to specifically encourage the planting of rare blends. This also resulted in a significant increase in the installation unit cost, so the increased amount of aid was already reflected in the applications submitted from 2021. As the ex-post incentive element of the aid is popular, we plan to continue to do so so that the promotion of the planting of forests of equal but higher biodiversity value will be achieved at a higher level of expenditure. In order to attract land users to change the use of land through highly costly and long-return afforestation, nursing work will also be supported until it is completed, and agricultural income foregone will also be compensated under the afforestation investment and income replacement measure.

For the Rural Development Programme afforestation aid measure (8.1.1), 4.304 aid applications were received by 2022, of which 4.213 aid applications for traditional afforestation and 99 aid applications for plantations for industrial purposes. During the implementation of the measure, more than **43.000 ha** have already received aid applications for afforestation. A **significant part of the implementation of these afforestations will be carried over to the CAP Strategic Plan period**, with a total of 40 000 hectares of new forest land expected to be completed by 2024.

In addition, the new CAP ST start-up action target of **20.000 ha** over the entire CAP ST timeframe, the total indicative financial allocation is **EUR 63.350.137**, including the maintenance premium, which will support the **maintenance of 45.000 ha** of newly planted forests at the end of the CAP ST period with a total financial envelope of **EUR 155.200.000**.

RD41_F08_INN_73 – Investments for environmental sustainability in forestry (non-profit)

The objective of investment to improve the climate resistance and environmental value of forests is to compensate for the spread of growing and increasingly extreme abiotic environmental damage conditions and events (such as forest and vegetation fires, frost damage and storm damage caused by water scarcity and drought) and new biotic pathogens and pests, both by potentially preventing damage to forest potential and restoring them in a more resilient manner. In addition, the long-term quality renewal, restructuring and reconditioning of forests with climate-resistant material are also a priority. Forest restructuring can improve the age structure, mix and biodiversity of forest stocks, thus improving the resilience and environmental value of forest ecosystems. The measure was designed by merging and

complementing the VP measures 8.3.1, 8.4.1 and 8.5.1 of the Rural Development Programme 2014-2022. In the next period, we plan to place a strong emphasis on this group of interventions, regardless of the form of ownership, which will have a funding framework that will be more than double that used under the RDP. In addition to restructuring as defined in the legislation, the scope of interventions will be broadened by encouraging ‘improved renovation’, which, in addition to increasing blending, will also encourage the shortening of protracted reforestation times.

Under measures 8.3.1, 8.4.1 and 8.5.1 of the Rural Development Programme, 1906 projects were supported as previous interventions.

The measure has a target output of **2000 operations** over the entire CAP ST timeframe, with a total indicative financial allocation of **EUR 4.778.588**.

Objective-specific findings on the level of environmental ambition of each measure

—SO4 Contribution to climate change mitigation and adaptation and the promotion of sustainable energy, including by reducing greenhouse gas emissions and enhancing carbon sequestration

RD01c_E01_FRM_73 – Support for green investments in agricultural holdings and RD04b_E03_FOF_73 – Support for green investments linked to the enhancement of agricultural products

One of the aims of the interventions is to increase the self-sufficiency of agricultural and food processing plants and to reduce energy dependency by supporting the reduction of carbon emissions and energy use on farms by improving energy efficiency and supporting renewable energy sources, including biomass-based energy sources. The intervention also encourages the implementation of projects following a circular biomass economy model based on the non-food use of in-situ biomass resources and the use of by-products generated (e.g.: soil improvement, fibre extraction, biorefining, substitution of fossil feedstocks). The aim is to exploit geothermal thermal energy potential, based on the country’s geological conditions, to which the intervention contributes by supporting farm development, for example in the context of greenhouse heating. The intervention covers the reduction of energy use in agricultural and food processing plants in order to reduce the environmental impact of the sector: it improves the energy efficiency of livestock farms and horticultural plants, mainly through renovations and renovations in buildings energy, engineering and energy supply.

Measure *RD01c_E01_FRM_73* has an output target of **4180 operations** over the entire CAP ST timeframe, a total indicative financial allocation of **EUR 26.744.186**. Measure *RD04b_E03_FOF_73* has a target output of **334 operations** over the entire CAP ST timeframe and a total indicative financial allocation of **EUR 13.380.057**.

In the period 2014-2022, an average of **701 projects** per year were supported under focus area 5B of the Rural Development Programme aimed at increasing the efficiency of energy use by agriculture and the food processing industry. CAP ST, on the other hand, calculates an annual average of approximately **903 projects** in the two relevant interventions, an **increase of 28.7 %**. A dedicated green investment measure under the Rural Development Programme was not available.

RD01d_E01_FRM_73 – Farm development to reduce ammonia emissions

Under Directive 2016/2284 of the European Parliament and of the Council (‘NEC Directive’), Hungary is to reduce ammonia (NH₃) emissions by 32 % by 2030 compared to 2005 levels. Around 92 % of domestic NH₃ emissions come from agriculture. Against this background, aid granted under the intervention can achieve environmental objectives that reduce ammonia and GHG emissions, improve air quality and improve pressures on surface and subsurface water. The intervention’s output target for the entire CAP ST timeframe is **154 operations** and the total indicative financial allocation is **EUR 8.139.535**. In comparison to the previous period, the intervention is a fundamental novelty aimed at reducing ammonia emissions in Hungary, and the design of the intervention allowing a dedicated resource also reflects the higher

level of ambition.

RD27_G10_GPX_70 – Ex situ conservation of plant genetic resources and micro-organisms and RD28_G11_GPI_70 – In situ conservation of plant genetic resources

The annual output target for interventions **shall be 94131 lots for ex situ gene conservation, 150 varieties for in situ gene conservation and 30 260 ha.** Interventions are aimed at the conservation of genetic resources in agriculture and aim to support the conservation of agricultural plant species and micro-organisms of high genetic value and often threatened with extinction/genetic erosion, which can serve as a basis for the breeding of varieties with sufficient tolerance to adapt to the effects of climate change. An increase is also expected for the claims for items already supported under the Rural Development Programme, and Hungary plans to make significant changes from the Strategic Plan period onwards in order to increase the level of environmental ambition, as the intervention “RD28_G11_GPI_70 – Conservation in situ of plant genetic resources” will be introduced as a **new element**.

In the period 2014-2022, support for plant gene conservation was implemented with an average of EUR 2832876 per year in the Rural Development Programme, whereas under the CAP Strategic Plan, the Member State plans to support the promotion of plant gene conservation of EUR 5479452 per year.

RD37_F04_FRC_77 – Co-operative support for forest fire prevention and risk reduction

As a new measure, we intend to support voluntary partnerships between forest managers and specialised public bodies for the development and implementation of modern, sustainable, multi-farmer planning and implementation of forest fire prevention and mitigation, with a role to play in forest water supply.

The measure has an output target of **10 operations** over the entire CAP ST timeframe, with a total indicative financial allocation of **EUR 7.290.698**.

The imposition of the measure, given its lack of history in the period 2014-20022, will in itself contribute to an increase in the level of ambition.

— SO5 Support sustainable development and efficient management of natural resources such as water, soil and air, including by reducing chemical dependency

RD01c_E01_FRM_73 – Support for green investments in agricultural holdings and RD04b_E03_FOF_73 – Support for green investments linked to the enhancement of agricultural products

One of the aims of the interventions is to increase the self-sufficiency of agricultural and food processing plants and to reduce energy dependency by supporting the reduction of carbon emissions and energy use on farms by improving energy efficiency and supporting renewable energy sources, including biomass-based energy sources. The intervention also encourages the implementation of projects following a circular biomass economy model based on the non-food use of in-situ biomass resources and the use of by-products generated (e.g.: soil improvement, fibre extraction, biorefining, substitution of fossil feedstocks). The aim is to exploit geothermal thermal energy potential, based on the country's geological conditions, to which the intervention contributes by supporting farm development, for example in the context of greenhouse heating. The intervention covers the reduction of energy use in agricultural and food processing plants in order to reduce the environmental impact of the sector: it improves the energy efficiency of livestock farms and horticultural plants, mainly through renovations and renovations in buildings energy, engineering and energy supply.

Measure *RD01c_E01_FRM_73* has an output target of **4180 operations** over the entire CAP ST timeframe, at a total indicative financial allocation of **EUR 26.744.186**. Measure *RD04b_E03_FOF_73* has a target output of **334 operations** over the entire CAP ST timeframe and at a total indicative financial allocation of **EUR 13.380.057**.

In the period 2014-2022, an average of **701 projects** per year were supported under focus area 5B of the Rural Development Programme aimed at increasing the efficiency of energy use by agriculture and the food processing industry. CAP ST, on the other hand, calculates an annual average of approximately **903 projects** in the two relevant interventions, an **increase of 28.7 %**.

RD01d_E01_FRM_73 – Farm development to reduce ammonia emissions

The intervention's output target for the entire CAP ST timeframe is **154 operations** and the total indicative financial allocation is **EUR 8.139.535**. In comparison to the previous period, the intervention is a fundamental novelty aimed at reducing ammonia emissions in Hungary, **and the design of the intervention allowing a dedicated resource also reflects the higher level of ambition**. Under Directive 2016/2284 of the European Parliament and of the Council ('NEC Directive'), Hungary is to reduce ammonia (NH₃) emissions by 32 % by 2030 compared to 2005 levels. Around 92 % of domestic NH₃ emissions come from agriculture. Against this background, aid granted under the intervention can achieve environmental objectives that reduce ammonia and GHG emissions, improve air quality and improve pressures on surface and subsurface water.

— SO6 Contribution to halting and reversing biodiversity loss, enhancing ecosystem services and preserving habitats and landscapes

RD24_G07_GAX_70 – Ex situ conservation of animal genetic resources

RD25_G08_GAI_70 – Conservation in situ of animal genetic resources

RD26_G09_GAV_70 – In vitro conservation of animal genetic resources

RD27_G10_GPX_70 – Ex situ conservation of plant genetic resources and micro-organisms

RD28_G11_GPI_70 – In situ conservation of plant genetic resources

Interventions are aimed at the conservation of genetic resources in agriculture and aim to support the conservation of agricultural plant species and micro-organisms of high genetic value and often threatened with extinction/genetic erosion, which can serve as a basis for the breeding of varieties with sufficient tolerance to adapt to the effects of climate change. An increase is also expected for the claims for items already supported under the Rural Development Programme, and Hungary has planned significant changes in order to increase the level of environmental ambition:

- In the case of the conservation of animal genetic resources, with regard to ex situ, in situ and in vitro conservation, the previously supported varieties **will be extended** to include black mangalica, akhal cows, Carpathian ribbons, Hungarian cold-blooded horses and Hungarian giant rabbits, and in the case of in vitro gene conservation, embryonic cells and sexual organ tissues will also be eligible as new elements.
- In the case of plant genetic conservation, the intervention "RD28_G11_GPI_70 – Conservation of plant genetic resources in situ" will be introduced as a **new element** from the Strategic Plan period.

Annual output target for interventions

4000 LU for the ex situ conservation of animal genetic resources,

31573 LU for the in situ conservation of animal genetic resources,

13000 samples for the in vitro conservation of animal genetic resources,

94131 lots in the case of ex situ gene conservation of plant genetic resources and micro-organisms,

—aid for plant genetic resources **in situ gene conservation 150 varieties and 30 260 ha.**

In the period 2014-2022, support for plant gene conservation was implemented with an average of EUR 2832876 per year in the Rural Development Programme, whereas under the CAP Strategic Plan, the

Member State plans an average of EUR 5479452 per year to support the promotion of plant gene conservation. Support for the conservation of animal genetic resources was implemented in the Rural Development Programme with an average of EUR 13751902 per year, whereas during the CAP Strategic Plan, the Member State plans an average of EUR 24657533 per year to support the conservation of animal genetic resources. It is also important to note that, in the case of genetic conservation, a lengthy technical consultation has led to the development of the range of varieties to be supported (e.g. the inclusion of Hungarian giant rabbits and varieties under reconstruction in the aid scheme), and in line with the needs of the sector, we expect not only a quantitative but also a qualitative increase from the period of the Strategic Plan.

RD33_G16_ANB_70 – Animal welfare aid in the apiculture sector: the annual output target of the intervention is **to support 98630 LU**. The aim of the intervention is to improve animal welfare conditions and prevent animal health problems by applying a higher standard than mandatory standards. Hungary has introduced significant changes to improve animal welfare conditions already from the transition period, in order to increase the level of environmental ambition. The animal welfare aid for the apiculture sector was introduced by Hungary for the first time in 2022, and the intervention in the CAP Strategic Plan can be considered as an increase in basic ambition compared to the previous period.

RD35_F02_FEC_70 Forest-environment multiannual commitments (ECV)

The EJU measure contributes to improving the natural status of existing forests through forest-environmental commitments going beyond the obligations set out by the forest authority in the forest plan (continuous restructuring or improved renovation, reduction of intensively transmitted alien wood and shrub species, reconversion of cleansing, manual maintenance of forest stands, and the management of nature-friendly materials).

The output target of the measure shall be 50.000 ha in the first planned year (2025), **80.000 ha** per year in subsequent years, the total indicative financial allocation per year for the first year (2025) shall be EUR 6082317/year, for the following years EUR 9.940.000/year and EUR 45.643,800 for the **whole** period.

The current earmarking of forest-environment multiannual commitments under the Rural Development Programme amounts to almost EUR 41 million for the entire programme period and the current EAFRD Regulation excluded public forest managers from receiving support. This will lead to higher ambitions in both quantity and quality in the next period. State-owned forests, such as forest holdings, national parks, water bodies, are also eligible. A number of new sub-measures, such as continuous restructuring or improved renovation to improve the environmental value of renewable forests, as well as small-scale (modular) ecosystem services, will be included to increase the level of quality ambition, with pledging options that allow farmers of non-natural forest stands to make a realistic environmental commitment. In relation to sub-measure 15.1 of the Rural Development Programme, the target area covered by Forest Environmental Contracts was 8.082 ha and 1.430 aid applications were received under the sub-measure 8.302 forest sections.

RD36_F03_GEN_70 – Forest genetic multiannual commitments

Climate change projections show that, from a forest management perspective, the speed of displacement of climate zones exceeds the natural adaptability of forest stands. The key issue for the long-term sustainability of forests is therefore, in the first place, the provision of material that is resilient to or adapted to the effects of climate change, while preserving the necessary genetic diversity. This is only possible if both in-situ and ex-situ gene conservation and development tools are exploited and developed. During in situ conservation, the stock of genes to be conserved is maintained by natural methods in its original environment or in a similar site or habitat, so that the processes affecting and shaping the gene set can continue to take place without hindrance. Where the conditions for **in situ** conservation are not met, the genotypes to be preserved shall be placed **in ex situ** collections. The subsequent utilisation of

conservation genetic material may result in synthetic populations of the specimens thus archived. They can henceforth serve as a source of propagating material for forestry interventions for climate protection and nature conservation purposes.

During the 2014-2022 period of the Rural Development Programme, a total of 89 aid applications were received under the *conservation of Forest Genetic Resources (VP4-15.2.1.1-16)* and the *Development of Forest Genetic Resources (VP4-15.2.1.2-17)* measures.

The output target of the measure planned under the CAP Strategic Plan is **to support 2.000 hectares of forest land involved in forest gene conservation with a total financial allocation of EUR 6.000.000**. In addition, ex situ gene conservation.

RD23_G06_NAG_72 – Natura 2000 compensatory payments for agricultural areas

The compensatory aid for **Natura 2000 grasslands** is a support scheme that already covers its third cycle, the maintenance of which is of utmost importance. Given the finite coverage of Natura 2000 grasslands and the order of magnitude of the areas receiving compensatory aid in recent years, no substantial increase in the level of ambition of the intervention is expected. The Rural Development Programme's target for 2014-2020 was 241.790 ha, compared to which the CAP ST is **planned to support 287,000 ha with a financial allocation of EUR 33.005.000 per year**. In addition, the subsidy amount has been increased.

If the legal obligations underlying the compensation payments under Article 72 of the STR Regulation are also introduced for other Natura 2000 agricultural areas, in particular arable land, the intervention could be supplemented by an amendment to the CAP Strategic Plan by compensating these areas, which could further increase the contribution of this intervention to environmental objectives. The same is true of any compensation payments related to the WFD and the National River Basin Management Plan.

In the case of **Natura 2000 arable land**, we consider the necessary government decree regulation to be realistic in the second half of 2024. Thus, as of 2025, the compensation payment under Article 72 will also apply to Natura 2000 arable land.

RD34_F01_NAF_72 – Natura 2000 compensation payments for forest areas

In the case of support for Natura 2000 forest areas, the eligible areas will be extended up to 5 % of Natura 2000 designated areas with areas not designated but protected or specially protected on the basis of national legislation and classified as natural forests, nature forests, derived forests and transitional forests in accordance with Act XXXVII of 2009 on forests, forest protection and forest management (the Forest Act). In addition, the payment entitlement will be extended to non-private forests. Accordingly, **instead of the aid currently used for around 110.000 hectares, we calculate 230.000 hectares of aid with a total financial allocation of EUR 27.490.427 per year**.

2. Detailed description of the green superstructure of the CAP Strategic Plan

The Hungarian CAP Strategic Plan's environmental and climate plan for agriculture and forestry ('green superstructure'), compiled from Pillar I and Pillar II interventions of the Hungarian CAP, can be summarised as follows:

Level 1: Detailed description of the definition of eligible area (APE)

The achievement of the environmental objectives of the Common Agricultural Policy starts with the designation of **eligible areas**, as area payments have a significant impact on the state of the ecosystems linked to farming. At present, area aid is only available on agriculturally cultivated areas, where minimum standards are to be met. These standards help to maintain farmland in the state of cultivation and avoid excessive weeding, but they are not always beneficial from an ecological point of view. Unfortunately, recent decades have shown that in order to comply with the eligibility criteria, i.e. the above minimum

requirements, and the existence of the largest eligible area, the species-rich field margins, bars, watersheds and inland water spots disappear. This is worrying not only for nature conservation reasons, but also poses serious economic risks due to changes in the soil condition, microclimate and water balance in the area, with the deterioration of the soil status and the increase in the drought situation.

On the basis of Article 4(4)(b)(i) and (ii) of the EU CAP Strategic Plan Regulation, it has been made possible to include in the concept of 'eligible hectare' the uncultivated areas or landscape features to be maintained under the Good Agricultural and Environmental Conditions (GAEC) or the eco-scheme (AEB) framework, which will be presented at a later stage, as well as areas on farms which do not comply with the basic definition of eligible hectare due to other obligations (e.g. Natura 2000 standards, afforestation, etc.).

By extending the definition of eligible area, it is therefore possible to become eligible areas for so-called agro-ecological areas (AEBs) which are important for climate and environmental reasons and which are closely linked to agricultural areas, such as forest strips, ecological buffer strips, uncultivated coastal strips of watercourses, marshland, silky, occasionally covered in inland water, saline areas which are currently excluded either at the time of control or do not fall under the definition of eligible area. At the same time, agricultural areas where this type of habitat or agro-ecological area is newly created will not lose their payment entitlements. As these units, ACS, are not agricultural land, they are not subject to the cultivation obligation.

This approach will help to achieve the objectives set out in the New Green Deal Strategies from Place to Fork and Biological Diversity; in particular, those aimed at using 10 % of agricultural land without production. If non-productive areas that are useful in many respects become eligible, farmers will not have an interest in making them ploughed or new areas may develop landscape and non-productive features. Agro-ecological areas that help achieve soil protection and erosion objectives also contribute to our EU obligations to protect waters against nitrate and phosphate pollution, to protect soils and, not least, to protect pollinators. Such an extension of the eligible area can also significantly improve the effectiveness of higher levels of rural development measures (e.g. AKG) to protect these areas.

On the basis of land cover databases, taking into account the heterogeneity of ownership and land use rights, the expected area increase is likely to be around 100.000 ha. However, in addition to the obvious environmental-ecological advantage, the question arises, in particular by producers who do not have this type of area, as to how much territorial expansion reduces the specific amount of the basic payment at national level. As the current eligible area of 5 million hectares would be increased by only 2 % according to our calculations, the specific BISS support could be reduced by two to three euros.

Level 2: Detailed description of mandatory baseline environmental conditions (conditionality)

The **system** of standards for conditioning, including the Good Environmental and Agricultural Conditions (GAEC), is extended to include the conditions for the payment for agricultural practices beneficial for the climate and the environment ('greening') in force in 2015-2022, such as the preservation of permanent grassland and the maintenance of ecological focus. The inclusion of these standards as a basic condition for direct and certain rural development area payments in itself ensures a higher contribution compared to the expectations of the previous period. In addition, the GAEC specifications are currently set out in 50/2008. We will continue to implement and confirm the requirements set out in the Decree of the Minister for Agriculture and Rural Development as follows:

1. The protection of wetlands and bogs is a new element, but due to the specificities of the Member States and the preparation of the necessary implementation tasks, the introduction of this standard will only be possible as of 2025. (GAEC 2)
2. In buffer strips along watercourses, the application of fertilisers and manure will be regulated uniformly, maintaining stricter requirements for organic fertilisers and prohibiting the use of pesticides with a width of at least 5 m (GAEC 4)
3. In the context of erosion control, in areas with a slope of more than 12 %, the scope of the restricted crops covers all grub crops, including the cultivation of maize and sunflower and autumn swede rape with

a spacing of more than 24 cm. This means that these species may only be grown on a contour or by means of anti-erosion strips or by direct sowing in areas with a slope of more than 12 %. (GAEC 5)

4. It will be mandatory for all farmers to maintain non-productive areas or landscape features on a certain proportion of their arable land. Greening is increased to 7 % compared to the 5 % EDF area, including nitrogen-fixing and secondary crops, of which at least 3 % must be non-productive. (GAEC 8)

Level 3: Detailed description of the voluntary agro-ecological programme (AÖP, eco-scheme)

Among the direct aids, the **agro-ecological programme measure** (eco-scheme) (DP17_G01_ECOS_16) is introduced, with a much higher level of ambition in terms of quality standards than the greening payment in force in 2015-2022. Based on the positive experience of the greening payment and the rural development programme's agri-environmental management payment, we have defined optional standards that are already somewhat known, understandable and environmentally useful for farmers. A well-targeted intervention aims to achieve an environmentally effective support programme in a relatively large part of agricultural land, involving many farmers. In order to ensure that the majority of farmers find the best standard for them, optional standards have been formulated per utilisation method. These standard agricultural practices focus on soil and water protection, biodiversity protection and climate change mitigation.

Level 4: Detailed description of EAFRD interventions to support voluntary advanced agro-ecological transition or nature-friendly forestry

The voluntary advanced agro-ecological transition interventions (Natura 2000 grassland and forest land compensation, AKG and ÖKO, sectoral support and forest EJU interventions) are intended to ensure that our farmers and foresters meet higher environmental and climate standards than mandatory and voluntary basic conditions (levels 2 and 3). These are interventions and standards that are known and are still being used in large numbers, so we plan to fine-tune them in line with new EU requirements. In forest management, voluntary commitments can take the form of investments (RD 41) and multi-annual commitments (RD 35 and DR 36). In order to involve the widest possible range of farmers, both the supply and the funding framework will be significantly expanded. The non-productive investments needed for the agro-ecological transition, as well as the support for maintaining these investments, are new or redesigned interventions, with a significant increase in ambition. By re-designing the interventions and significantly increasing their resources, we want to change the low interest of producers in the current period and thus help as many farmers as possible to meet the requirements of Levels 2 to 4.

The continuation of the **AKG** (RD19_G01_AEC_70) and **ÖKO** (RD20_G02_ORT_70) actions and ensuring continuity of support is a priority, given that AKG and ÖKO support are high environmental added-value farming, which contribute to environmental and climate spending in a significant amount of land and resources.

The aim of the measures is to support agricultural practices, going beyond mandatory standards, aimed at preserving and improving the environment (soil and water), preventing environmental pressures from agriculture, preserving biodiversity, strengthening agricultural practices based on the sustainable use of natural resources, which contributes to combating adverse climate change through a change in production patterns and land use, and to encourage the conversion of conventional land into organic farming and to maintain farming practices in organic areas. These measures will strengthen natural self-regulation processes, improve soil biological status, reduce negative environmental impacts from inappropriate use of plant protection products and poor nutrient management, and enhance food safety.

With an increased unit cost in 2021, with a commitment period of 3 years, new AKG and ÖKO calls under the rules of the VP, starting in 2022, will be followed by another AKG/ÖKO call under the rules of the Strategic Plan as of 2025. Thus, in 2022, payments are still made under Article 28 (Agri-environment-

climate) and Article 29 (Organic farming) of Regulation (EU) No 1305/2013, while from 2023 onwards, we will close it to Article 70 of the CAP Strategic Plan Regulation (Environmental, climate and other management commitments). The launch of the new AKG 2025 will be an opportunity to develop sets of standards that better respond to emerging needs and address emerging problems more effectively.

As in other countries around the world, Hungary has seen a significant increase in the number of organic controlled areas and organic farms in recent years. In 2020, 301.430 hectares of organic farming were controlled in Hungary, of which 193 215.3 ha were already under conversion and 108 215.1 ha were in conversion. **Organic farming** accounted for 6.12 % of domestic agricultural land in 2020, making Hungary the third largest development among Member States (after Croatia and Bulgaria). It should also be highlighted that Hungary is the 10th most dynamic developing country in the world in terms of the expansion of organic farming areas.

The AKG and ÖKO grants also respond to the needs of the Strategic Plan and contribute to the achievement of the objectives of the Green Agreement. Support for organic farming is of particular importance in the light of the objectives of the Biodiversity Strategy and the Farm to Fork Strategy. The coordination of the new calls with the 'Green body' system, which is currently being designed, is an important aspect of its design, so that particular attention should be paid to ensuring that there is no overlap between the AÖP (Agri-ecological Programme) and the AEM/EGO requirements.

The **Natura 2000 grassland** compensation scheme (RD23_G06_NAG_72) is a support scheme that already covers its third cycle, the maintenance of which is of utmost importance. The size of Natura 2000 grasslands is finite, so the size of the areas receiving compensation has not changed in recent years.

If the legal obligations underlying the compensation payments under Article 72 of the STR Regulation are also introduced for other Natura 2000 agricultural areas, in particular arable land, the intervention may be supplemented by an amendment to the CAP Strategic Plan by compensating these areas. The same is true of any compensation payments related to the WFD and the National River Basin Management Plan (OVGT).

In the case of **Natura 2000 forest** areas (RD35_F01_NAF_72), the eligible areas are extended up to 5 % of Natura 2000 designated areas with areas not designated but protected or specially protected under national legislation and classified as natural forests, nature forests, derived forests and transitional forests in accordance with Act XXXVII of 2009 on forests, forest protection and forest management (the Forest Act). In addition, the payment entitlement will be extended to non-private forests.

Under **non-productive investments for agro- ecological purposes** (RD21_G04_LCI_73), we aim to **support investments that help mitigate and adapt to harmful climate change caused by agriculture, protect not only biodiversity but also soil, water and air, and preserve and restore landscape features and diversify habitats.** The effectiveness of habitats, landscape or conservation features created by agro-ecological NPIs and the willingness of farmers to do so is increased by the fact that the resulting habitats, landscape or conservation features do not lose their eligibility for support and thus remain eligible for BISS support. Furthermore, in the framework of Article 70, we intend to establish a **multi-annual maintenance** support for certain non-productive investments (RD22_G05_LCP_70) *independent of the agri-environmental programme (AKG).*

The **forest-environment multiannual commitments measure EV (RD35_F02_FEC_70)** contributes to improving the natural status of existing forests with forest-environmental commitments going beyond the obligations set out by the forest authority in the forest plan (continuous restructuring or improved renovation, reduction of intensively transmitted alien wood and shrub species, reconversion of cleansing, manual maintenance of forest stands, and management of nature-friendly materials).

Support for non-profit investments for the environmental sustainability of forest management (RD41_F08_INN_73) aims to compensate for the spread of growing and increasingly extreme abiotic environmental damage conditions and events (such as forest and vegetation fires, frost damage and storm damage caused by water scarcity and drought) and new biotic pathogens and pests, both by potentially preventing damage to forest potential and restoring them in a more resilient way. In addition, the long-term quality renewal, restructuring and reconditioning of forests with climate-resistant material are also a priority. Forest restructuring can improve the age structure, mix and biodiversity of forest stocks, thus improving the resilience and environmental value of forest ecosystems.

Level 5: Description of other environmental, climate and adaptation interventions

Interventionssupporting gene conservation effectively contribute to the achievement of the green objectives:

1. Aid for ex situ gene conservation RD24_G07_GAX_70: Supports the conservation of males (other than poultry) implementing an approved breeding programme for protected autochthonous, endangered agricultural breeds and agricultural animals undergoing breed reconstruction, in an ex situ environment other than the original rearing conditions.
2. Aid for in situ gene conservation RD25_G08_GAI_70: Supports the maintenance of females or, in the case of poultry, mixed females carrying out an approved breeding programme for protected indigenous, endangered agricultural and breed-restructuring breeds of animals with a low number of animals, under in situ conditions similar to the original rearing and feeding conditions.
3. Support for animal In vitro gene conservation RD26_G09_GAV_70: It shall support the collection, preparation for deep-frozen storage, storage under laboratory conditions of genetic material (semen, embryos or ova) of animals implementing an approved breeding programme for protected autochthonous, endangered agricultural and breed-reconstructed agricultural animals, and genetic testing of protected indigenous, endangered agricultural animals and animals undergoing breed reconstruction.
4. Ex situ conservation of genetic resources of rare and endangered plant varieties and micro-organisms RD27_G10_GPX_70: It supports the protection and maintenance of landscapes, home garden varieties, excluded varieties and ecotypes of other crops, wild and related species and micro-organisms of agricultural and food plant species.
5. Preservation of plant genetic resources in situ RD28_G11_GPI_70: It supports the preservation of the diversity of agricultural and food plant species in use (on-farm), the cultivation of sufficient sizes of landscape varieties, domestic garden varieties and varieties excluded from cultivation, as well as the preservation of crop ecotypes and wild related species in the natural habitat (in situ), and the production and use of propagating material of natural flora.

Under the **multi-annual forest genetic commitments** (RD36_F03_GEN_70), we are using and developing both in-situ and ex-situ gene conservation and development tools. During in situ conservation, the stock of genes to be conserved is maintained by natural methods in its original environment or in a similar site or habitat, so that the processes affecting and shaping the gene set can continue to take place without hindrance. Where the conditions for **in situ** conservation are not met, the genotypes to be preserved shall be placed in **ex situ** collections. The subsequent utilisation of conservation genetic material may result in synthetic populations of the specimens thus archived. They can continue to serve as a source of material for forest interventions for climate protection and nature conservation purposes, ensuring the availability of material that is resilient to or adaptable to the effects of climate change, while preserving the necessary genetic diversity.

A significant extension of animal **welfare measures** aims at the sustainable development of animal husbandry in terms of both animal species and expectations, helping our animal keepers to apply stricter animal welfare, hygiene, husbandry and feeding standards than those required. In doing so, they increasingly meet the increasingly demanding consumer expectations and the objective of the Green Deal to reduce the use of antibiotics, as reflected in the Green Deal Strategy from Place to Fork. In addition to the current dairy cow measure, we introduce this intervention for poultry, small ruminants and bees.

—RD29_G12_AWC_70 – Animal welfare subsidies in the small ruminant sector

—RD30_G13_AWC_70 – Animal welfare premiums in the cattle sector

- RD32_G15_AWC_70 – Animal welfare subsidies in the poultry sector
- RD33_G16_ANB_70 – Animal welfare aid in the apiculture sector

The compensatory payment(RD_33b_G17_AMR_70) in the fight against antimicrobial resistance(RD_33b_G17_AMR_70) takes advantage of international , EU and domestic professional efforts, strategies and recommendations to promote responsible sustainable use of antimicrobials, in particular antibiotics, in domestic animal husbandry, in particular to reduce the use of active substances that are critical for human health. The aid scheme compensates for additional costs in food-producing livestock resulting from commitments to combat antimicrobial resistance that go beyond the requirements established at Union level.

The development of agricultural holdings to reduce ammonia emissions (RD01d_E01_FRM_73) is a fundamental novelty compared to the previous period aimed at reducing ammonia emissions in Hungary. Under Directive 2016/2284 of the European Parliament and of the Council ('NEC Directive'), Hungary is to reduce ammonia (NH3) emissions by 32 % by 2030 compared to 2005 levels. Around 92 % of domestic NH3 emissions come from agriculture. Against this background, aid granted under the intervention can achieve environmental objectives that reduce ammonia and GHG emissions, improve air quality and improve pressures on surface and subsurface water.

Support for green investments on agricultural holdings (RD01c_E01_FRM_73) and support for green investments linked to the enhancement of agricultural products (RD04b_E03_FOF_73) are aimed at increasing the self-sufficiency of agricultural and food processing plants and reducing energy dependency by improving energy efficiency and supporting renewable energy sources, including biomass-based energy sources, to support the reduction of carbon emissions and energy use on farms. The intervention also encourages the implementation of projects following a circular biomass economy model based on the non-food use of in-situ biomass resources and the use of by-products generated (e.g.: soil improvement, fibre extraction, biorefining, substitution of fossil feedstocks). The aim is to exploit geothermal thermal energy potential, based on the country's geological conditions, to which the intervention contributes by supporting farm development, for example in the context of greenhouse heating. The intervention covers the reduction of energy use in agricultural and food processing plants in order to reduce the environmental impact of the sector: it improves the energy efficiency of livestock farms and horticultural plants, mainly through renovations and renovations in buildings energy, engineering and energy supply.

Increasing carbon sequestration is one of the most significant interventions to combat and mitigate climate change. The agricultural economy can also contribute to this goal by, among other things, shifting land use. Woody introductions from the root zone through the ground level serve this purpose with their full tree crown, therefore we support the establishment of additional **afforestation and woodland (RD38_F05_AFI_73 and RD39_F06_AFM_70)** and **the uptake of agroforestry systems specifically designed** to protect the environment and climate (RD21_G04_LCI_73 and RD22_G05_LCP_70).

Presentation of horizontal interventions supporting all levels

In addition to the increase in the level of ambition presented for each AKIS intervention, we consider it more important to plan for organisational development already in 2022 ahead of the start of the new **CAP by setting up the CAP network** and the AKIS coordination unit. In addition to the Rural Development Unit of the current ARDA, the CAP Network plans to create an Innovation (EIP) and Digital Transition and a Green Transition Unit. With this early AKIS organisational development, we aim to develop individual AKIS actors and interventions into an active and strong knowledge-network until the start of the new programme. Our aim is to develop a knowledge-network that can help our producers meet the increasingly fast-changing green and digital expectations with science-based, yet 'close-to-the-ground' practicalities.

As part of the **information service**, the smallest 110 thousand farmers receive on a number of occasions every year personal information on changes to the standards and assistance in drawing up the necessary reports and applying for the support available. We are planning to strengthen this intervention in order to meet growing environmental and climate protection requirements.

The sustainability assessment and compliance advice to be developed as part of the **advisory service** is part of all environmental and climate protection standards, thus directly and indirectly supporting the green transition of our producers. There is also a positive environmental and climate protection impact of advisory interventions in the apiculture and fruit sector, which will also be integrated into the AKIS system in the future. We are planning to significantly increase the resources for all three advisory interventions and thus the number of farmers available. The increase in ambition is the most significant among AKIS interventions.

All environmental and climate protection requirements will be part of the **compulsory consultancy training planned to be supported by training and demonstration operational programmes**. Three handbooks dealing with agricultural climate regulation and practices in the joint care of the Chamber of Agriculture (NAK) and the Ministry of Agriculture (as part of the Climate Action Plan: <https://www.nak.hu/kiadvanyok/kiadvanyok>) was already completed at the beginning of 2021 and was already part of this year's mandatory consultancy training. Furthermore, the requirements are also part of the compulsory training of producers for AKG and organic farming support. Furthermore, training and demonstration programmes for the digital transformation of producers are expected to have an indirect but significant positive impact on the environment and climate protection. There is also a positive environmental and climate protection impact of training interventions in the apiculture and vegetable and fruit sector (DP), which will also be integrated into the AKIS system in the future.

In the **Innovation (EIP-Agri) tenders**, most operational groups continued to deal with soils and the use of smart inputs in the 2014-2020 period, so we plan to keep environmental and climate-related initiatives a priority in the new period. Knowledge in Operational Groups would be turned into thematic analyses, training materials and policy recommendations based on these, with the help of the innovation and green transition units of the CAP Network.

3. CAP Strategic Plan presentation of “ring-fencing” to increase the level of green ambition

As stated in the Chapter 1 strategic declaration, Hungary is committed to contemporary action to ensure a green future. In the Hungarian CAP Strategic Plan, this is reflected in a higher share of green expenditure than in previous periods. The financial overview under chapter 6.1 shows in numerical terms that:

1. For rural development support (EAFRD), more than 74 % of EU funding will be spent on environmental and climate-related interventions. Those expenditures included only all the interventions in levels 1 to 4 of the ‘Green superstructure’, as well as those relating to level 5 which serve only and exclusively such purposes. I.e. interventions under Articles 70, 72 and 73 and 77 were recorded as green spending. The interventions under Articles 73 and 77 relating to other ‘Green superstructure’, but only partly for environmental and climate policy purposes, have not been taken into account.
2. As the EAFRD interventions for environmental and climate policy “Our green superstructure” are so robust, we would like to apply the derogation provided for in Article 97(2) of Regulation (EU) 2021/2115.
3. On the basis of the derogation referred to in the previous point, in the case of direct aids (EAGF), we will dedicate at least 15 % of EAGF resources to the agro-ecological programme (eco-scheme, AÖP) by establishing it for the envelope resulting from the transfer between pillars. Consequently, this amount will also be higher than 15 % of the EAGF allocation to Hungary in Annex V to

Summary:

In addition to the technical aspects, Hungary meets the significantly higher level of green ambition compared to the previous programming period, with the five-tier ‘green superstructure’ developed in the CAP Strategic Plan. On the basis of professional considerations and taking into account the results of a number of dedicated socialisation events, we decided on green superstructure I (EAGF) and II. The green standards for (EAFRD) pillar interventions and the resources allocated to them. Our aim was to set up a rational agro-ecology programme (eco-scheme) for Pillar I (EAGF) that reaches **as many farmers as possible on as many hectares as possible, thus providing strong AKIS support to drive a wide-ranging change in farming’s mindset (‘moving a few forwards’)**. Building on this, we have put more emphasis than ever on Pillar II dedicated agri-environmental and climate interventions that can take into account territorial and challenging differences, thus ensuring much greater targeting and longer engagement (**“go-to-targeted”**).

A description of the interventions and practices to compensate for the potential negative environmental impacts of coupled aid (CIS) would be included here, but will be uploaded in a separate document due to character limitations in the section “Other documents”.

3.1.4 Explanation of how the environmental and climate architecture of the CAP Strategic Plan is meant to contribute to already established long-term national targets set out in or deriving from the legislative instruments referred to in Annex XI

1. Directive 2009/147/EC of the European Parliament and of the Council of 30 November 2009 on the conservation of wild birds; and

2. Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora;

1.1. Related objectives of national environmental and climate plans

V. National Nature Conservation Basic Plan (The 5th National Plan for Nature Conservation) Annex 1 of the National Environment Programme)

1. Improve the status of species in unfavourable conservation status, in particular those listed in the annexes to the Habitats and Birds Directives, and specially protected species.

National Natura 2000 Priorised Action Plan (PAF) for the Multiannual Financial Framework 2021-2027

The PAF document proposes the following measures from the EAFRD:

1. Support for grazing and mowing management in private areas. Size of target area: 46.822 ha, estimated annual cost: EUR 8569590/year

2. Zonal programmes for the conservation of species of Community interest linked to cultivated grassland and arable land in High Natural Value Areas (LPAs) – species-specific agri-environmental management payments. Size of target area: pasture: **145.500 ha**, estimated annual cost: **EUR 5269223 per year for arable land: 58.000** his the estimated annual cost: **EUR 25514196/year**

3. Compensation for additional costs and loss of income due to specific land use regulations for grassland

areas in the Natura 2000 network – Relevant for all managed private grassland habitat types of community interest. Target area of **287.000 ha**, estimated annual cost: **EUR 23534029/year**

4. Forest-environment payments for nature conservation in private forest areas **14.083 ha**, estimated annual cost: **EUR 7130845/year**

5. Compensation for additional costs and loss of income due to compliance with forest management obligations for forest areas of the Natura 2000 network – Size of target area relevant for all private grassland habitat types of community interest affected by forest management: **90.000 ha**, estimated annual cost: **EUR 13500000/year**

Contribution of the CAP Strategic Plan to national long-term objectives

Agricultural measures:

Extending the range of **areas eligible for direct area payments** will help to increase the diversity of farmland habitats and thus help to improve the status of species in unfavourable conservation situations.

Among the conditionality requirements, GAEC 1 (protection of permanent grasslands), GAEC 2 (protection of wetlands and bogs), GAEC 8 (maintenance of non-productive elements, protection of landscape features and restrictions on nesting periods) and GAEC 9 (Natura 2000 sensitive grassland mowing ban) and SMR 3 and 4 for Natura 2000 sites also contribute to the maintenance and diversity of farmland habitats, thereby helping to improve the status of species in unfavourable conservation status.

Under the Basic Income Support for *Sustainability (DP01_E01_BISS_16)*, the planned **target area per year is 5.000 ha** -EUR 789.700/year.

Among the optional provisions of the **agro-ecological programme (DP17_G01_ECOS_16)**, the conservation of permanent grasslands at farm level, the maintenance rate of the non-productive element at farm level, the maximisation of field size, the restriction of pesticides hazardous to bees, the use of authorised agents for organic plant protection, and the selection of cropland cover and interurban practices also contribute to maintaining and increasing the diversity of farmland habitats, reducing over-use of pesticides, thus helping to improve the status of species in unfavourable conservation situations.

The target output of **the measure** is 2.500.000 ha of agricultural area, the total indicative financial allocation per year is **EUR 202.125,000/year**.

Eight of the sets of standards for **agri-environmental management payments (AKG) (RD19_G01_AEC_70)** specifically target the conservation of species of Community interest linked to cultivated grassland and arable land with species-specific standards in High Natural Value Areas, which overlap with the Natura 2000 network on average 55.6 %. In addition, the other sets of standards include provisions that can contribute to the conservation of habitats and species associated with agricultural land, thereby also helping to improve the status of species in unfavourable conservation status. However, as part of the AKG support, Natura 2000 areas are also eligible due to the overlapping of requirements only by reducing the aid amount for agri-environmental management payments for Natura 2000 grassland by the amount of the compensatory aid for Natura 2000 grassland, thus avoiding double financing.

The target output of the measure is 961,324 ha to support agricultural land, the total indicative financial allocation per year is **EUR 373.253,570 per year**. In the case of AKG, no more detailed target and allocation of funds has been set, however, the share of MTET standard groups significantly overlapping with the Natura 2000 network in the AKG is close to 30 % on the basis of the aid data so far.

The **compensation payments for Natura 2000 grasslands (RD23_G06_NAG_72)** are intended to compensate for the additional costs and income losses caused by the specific land use requirements for

these areas, which contributes to improving the situation of species in unfavourable conservation status. The output target of the measure is 287,000ha grassland, the total indicative financial allocation per year is **EUR 33.005.000 per year**, which is higher than the target set in the National Natura 2000 Priorised Action Plan. Natura 2000 arable land is not subject to specific land use requirements laid down in legislation, so no compensatory aid can be granted for these areas.

Agro- ecological non-productive investments (RD21_G04_LCI_73) and the agro-ecological land-use change payment (RD22_G05_LCP_70) are intended to promote land-use change in arable land currently cultivated at the limits of economy, including the creation of habitat types that are important for biodiversity, such as permanent green sward (beegrass) that protects biodiversity, grass strips, species-rich grasslands, forest strips, woody pastures, wetlands and grassland water protection strips. The resulting habitats, which are maintained according to appropriate standards, contribute to improving the status of species in unfavourable conservation status. The investment measure will include Natura 2000 sites as selection criteria. The commitment period of the maintenance measure shall be at least 5 years.

The investment measure has an output target of **1451 operations** over the entire CAP ST timeframe, with a total indicative financial allocation of **EUR 19.854.465.78**.

The target output of the maintenance measure in the last payment year of the CAP ST is **14,500ha**, an indicative financial allocation for the entire period of **EUR 34.242.833.33**.

Forestry measures:

The **compensation payments for Natura 2000 forest areas (RD34_F01_NAF_72)** are intended to compensate for the additional costs and loss of income caused by the special forest use requirements for these areas adopted by the competent public authorities in the district forest plan, which contributes to improving the situation of species in unfavourable conservation status.

For forest areas, the measure's output target is **230.000 ha** of forest land, the total indicative financial allocation per year is **EUR 27.490,427 per year**, which is higher than the target set in the National Natura 2000 Priorised Action Plan.

Support for maintaining the multiannual commitments of forest management for environmental or climate purposes (EKV) (RD35_F02_FEC_70) through forest-environmental commitments going beyond the obligations set out by the forest authority in the forest plan (continuous restructuring or improved renovation, reduction of intensively transmitted alien wood and shrub species, reconversion of clearings, manual maintenance of forest stands and environmentally friendly material handling) contributes to improving the natural status of existing forests also in Natura 2000 forest areas.

The measure's output target is 50.000 ha in the first planned year (2025), **80.000 ha** per year in subsequent years, the total indicative financial allocation per year in the first year (2025) is EUR 6082317/year, in subsequent years EUR 9 940 000 /year, **which is higher than the target set in the National Natura 2000 Priorised Action Plan**

Investments for the environmental sustainability of forest management (non-profit) (RD41_F08_INN_73) contribute to improving the natural status of existing forests also in Natura 2000 forest areas on the basis of a forest plan approved by the relevant forest section authority, by restructuring forest structures and increasing their mix. The priority objective of the measure is also the long-term quality renewal, restructuring and restoration of forests with climate-resistant material. Forest restructuring can improve the age structure, mix and biodiversity of forest stocks, thus improving the resilience and environmental value of forest ecosystems and helping to recharge forest habitats by creating and improving water retention facilities. In forest management interventions, we include Natura 2000 forest areas as selection criteria in line with the proposals in the PAF, e.g. reducing alien species, encouraging forest restructuring, encouraging mode change, etc. At the same time, we cannot take into account, for example, the proposal to 'encourage grazing', as the Forest Law prohibits grazing in all high-

or medium-natural forest stands (from 1 to 6 naturalness categories) – not only protected or under NATURA designation – for specific reasons of habitat and biodiversity protection. We support more gentle and cautious ways of curbing unwanted vegetation.

The measure has a target output of **2000 operations** over the entire CAP ST timeframe, with a total indicative financial allocation of **EUR 4.778.588**.

All elements of CAP AKIS measures (information service, advice, training, innovation and digitalisation) directly contribute to addressing specific environmental needs, effectively supported by the innovation and green support unit of the enlarged CAP network. The main task of the Green Support Unit is to support green interventions in Pillar I and Pillar II of the CAP Strategic Plan, which contributes to the development and awareness-raising of farmers' practices that protect biodiversity.

3. Directive 2000/60/EC of the European Parliament and of the Council of 23 October 2000 establishing a framework for Community action in the field of water policy (Water Framework Directive, WFD);

3.1. Related objectives of national environmental and climate plans

Third River Basin Management Plan (OVGT) of Hungary for the period 2022-2027 (the OVGT was adopted by the Government on 28 April 2022).

1. Reduction of nutrient pollution from agricultural sources by encouraging the application of good farming practices (nitrate sensitive areas)
2. Additional measures for agricultural production to reduce nutrient loads and losses and to increase the uptake of nutrients
3. Other soil improvement and protection interventions
4. Crop change (arable grassland, cropland – forest, cropland conversion) and maintenance of existing grasslands, forests and wetlands
5. Screening of inland waters from agricultural land prior to introduction into the receiver (filter field)
6. Reduction of pollutant and alluvial leaching using crop production techniques
7. Protection against soil erosion by planting vegetation
8. Technical facilities for soil erosion, development of terrain formations (sequestration of water scrubbing, dams, etc.)
9. Establishment of buffer zones and buffer zones adjacent to watercourses and lakes
10. Protection against wind erosion to reduce atmospheric deposition
11. Reduction of erosion and runoff in forest areas as part of good forest management practice
12. Territorial retention of water on agricultural land to increase infiltration and reduce run-off
13. Retention of water by storage in hilly areas, storm reservoirs on small watercourses and possibly permanent reservoirs
14. Retention of water by storage in plains in inland water reservoirs or in extended sections
15. Promoting and regulating the utilisation of sewage sludge For agricultural use of sewage sludge,
16. Single removal and utilisation of sludge and bed vegetation accumulated in watercourses and stagnant waters
17. Use of water-saving and green energy solutions in crop production (crops, irrigation technology, energy efficiency)
18. Promoting alternative water uses in agriculture
19. Modernisation of livestock farms on the basis of the EU Nitrate Directive and promotion of the use of livestock manure
20. Regulating the use of plant protection products under the EU Pesticide Directive, implementation of the National Plant Protection Action Plan

21. Use of pesticides in accordance with voluntary environmental conditions

Long-term targets included in the National Water Strategy (SCI):

1. Gradual improvement of water status until good status/potential is reached
2. Water retention for better use of our waters

3.2. CAP Strategic Plan contribution to national long-term objectives

From available water resources, in order to protect them, irrigation water needs can only be ensured if, in combination with other abstractions, the abstractions do not deteriorate the quantitative and qualitative status of the relevant surface water or groundwater resource in accordance with the WFD. If the needs cannot be met from the available resources, steps may need to be taken to increase stocks or reduce water demand. One of the solutions to this is the retention and storage of water in the framework of the Irrigation Strategy. Another solution is the diffusion of water-efficient irrigation technologies, the improvement of water efficiency in irrigation equipment and the development and reconstruction of water-efficient irrigation infrastructure (regulated, automated technical solutions) and related artefacts.

It is also necessary to ensure the development of water scarcity at a later stage, i.e. storage from autumn and winter precipitation, by using the appropriate agro-technical method, maintaining the moisture content in the soil, cultivating drought-tolerant crop varieties, and by retaining water in the region, creating a favourable microclimatic environment, which we intend to promote at all levels of the CAP ST's green superstructure, also through area-based aid.

The **expansion of the area eligible for direct area payments** by maintaining different types of land cover and sparsely areas promotes natural water retention, thus also contributing to the improvement of water conditions and the availability of ecological water.

Among the conditionality requirements, GAEC 4 (water buffer strips) and SMR 1 (protection of water resources and protection against phosphorus pollution) and SMR 2 (protection against pollution caused by nitrates) contribute directly to the achievement of the objectives of the River Basin Management Plan by reducing nutrient or pesticide pollution from agricultural sources, alluvial and polluting pressures from soil erosion and/or surface runoff, and by regulating water use for irrigation purposes subject to authorisation. GAEC 5 (Sustainable Pesticide Use) and SMR 8 (Sustainable Pesticide Use) indirectly contribute to reducing pressures on surface waters. The provisions of GAEC 1 (protection of permanent grasslands), GAEC 2 (protection of aquatic habitats and bogs) and GAEC 8 (maintenance of non-productive elements, protection of landscape features) help to maintain natural water retention, improve water treatment and ensure ecological water quantity.

Under the Basic Income Support for *Sustainability (DP01_E01_BISS_16)*, the planned **target area per year is 5.000 ha** -EUR 789.700/year.

Among the optional requirements of the **agro-ecological programme (DP17_G01_ECOS_16)**, winter soil cover, non-rotational tillage, use of soil conditioners, microbiological products, obscuration of plantations help to increase the water retention capacity of the soils and protect against erosion, such as reducing alluvial and pollutant pressures from soil erosion and/or surface runoff. Encouraging micro-irrigation in plantations for irrigation helps the sustainable use of water.

The target output of **the measure** is 2.500.000 ha of agricultural area, the total indicative financial allocation per **year is EUR 202.125,000/year**.

Several of the general requirements for **agri-environmental management payments (AKG) (RD19_G01_AEC_70)** cover conservation farming (non-rotated tillage, erosion control measures, conservation sowing, etc.) contributing to the maintenance of soil moisture content and improving soil water management. In addition, specific sets of standards have been established for drought-sensitive areas, where water retention tillage is a good practice supported.

The target output of the measure is 961,324 ha to support agricultural land, the total indicative financial allocation per year is **EUR 373.253,570 per year**.

The measure **supporting organic farming (RD20_G02_ORT_70)** contributes directly to the reduction of nutrient or pesticide pollution from agricultural origin as a result of the principles and rules in the EU organic production legislation applied in farming.

The annual output target for the measure is 134,564 ha to support agricultural land, the total indicative financial allocation per year shall be **EUR 98.632.794.63 per year**.

One of the main objectives of **agro- ecological non-productive investments (RD21_G04_LCI_73)** and the **agro- ecological land-use change payment (RD22_G05_LCP_70)** is to encourage the conservation of surplus waters for as long as possible in a given area through land-use change, the creation of wetlands and the creation of small-scale aquatic facilities for land retention.

The investment measure has an output target of **1451 operations** over the entire CAP ST timeframe, with a total indicative financial allocation of **EUR 19.854.465.78**.

The target output of the maintenance measure in the last payment year of the CAP ST is **14,500 ha**, an indicative financial allocation for the entire period of **EUR 34.242.833.33**.

In **-farm investment to improve water efficiency (RD12_W01_WTO_74)** is targeted at water retention:

- Target 2: Support for water retention facilities by ensuring the sustainable management of water resources: The target area supports the technical solutions necessary for collecting and storing rainwater, which causes more damage than tolerable damage from cultivated areas, prior to its subsequent utilisation. Reservoirs improve the region's resilience to climate change, reduce climate change risks, damage, losses, and balance water scarcity and water surpluses, and establish buffer zones to achieve water quality and quantity targets.

- Target 3: Support for improvement of land use and water efficiency: The target area typically supports land-related land on the farm and the development of improvement pathways. Rainwater, which falls in large quantities, has a physical, rarely chemical effect on agricultural land roads, which must be protected by appropriate drainage solutions and the stability of the road's track structure. Water management should aim at retaining usable water and ensuring that only surplus, non-storable water is decoupled. Agricultural water management is responsible, inter alia, for intervention to prevent water damage. The soil is the largest aquifer and, in order to fulfil this function, it is also necessary to rehabilitate the natural geological and soil conditions of the area. As a result of cultivation, the resulting watertight layer must be loosened in order to allow the soil to store the rainwater. The intervention can significantly reduce the damage caused by water scarcity and excess water.

In addition, the objective of irrigation water efficiency is to support the efficiency of irrigation water use under target area 1 of RD12_W01_WTO_74 – In-farm investment to improve water efficiency, where beneficiaries may receive support for the refurbishment, optimisation of existing irrigation equipment, the creation of new irrigation works, the introduction of energy-efficient irrigation technologies and the construction of a drought monitoring station. It is important to note that the increase in irrigated areas does not necessarily entail an increase in irrigation water. The description of the intervention refers in several places to the importance of optimal irrigation and mentions the intended efficiency of irrigation, under which the introduction of a complex water-saving method, which takes into account the specific characteristics of the area to be irrigated (soil conditions, crop, topography and precipitation conditions) and predicts the need for irrigation and the quantity of irrigation water, and the automation of the irrigation system. These can be achieved through the acquisition, development and expert advice of computer software, supported by the intervention. If irrigation is tailored to the area to be irrigated, it will in any event have a positive impact on the conservation of water resources in the long term.

The measure has an output target of **1070 operations** over the entire CAP ST timeframe, with a total indicative financial allocation of **EUR 17,202,932**.

The aim of the intervention is to **support sustainable water management communities (RD15_W04_COP_77)** to improve the efficiency of the water sector in order to support the functioning of sustainable water management communities. Irrigation farming involves high investment

needs and high operating costs, but it is more worthwhile to continue in a larger area, lower unit costs, reduced losses and more efficient organisation of work. All these factors contribute to the optimal use of available water resources in areas of sustainable water management communities. The dissemination of targeted precision irrigation methods, in which water volumes can be accurately measured, leaks and leaching can be reduced and water stress (over-irrigation) within the field to be avoided, will also contribute to increasing water use efficiency. This kind of resource-intensive investment by communities, prepared with support under this intervention, is essential for the efficient use of water resources. Supporting sustainable water management communities also promotes the introduction of water-efficient irrigation technologies, the optimisation of water use in irrigation systems, the development of water-efficient irrigation infrastructure and related structures, and the optimal operation, maintenance, energy-saving irrigation technologies and optimisation of the energy use of irrigation systems. Against this background, the intervention contributes to increasing water efficiency and the sustainability of in-situ water use and utilisation.

The measure's output target for the entire CAP ST timeframe is **27 operations**, with a total indicative financial allocation of **EUR 1.274.291**.

All elements of CAP AKIS measures (information service, advice, training, innovation and digitalisation) directly contribute to addressing specific environmental needs, effectively supported by the innovation and green support unit of the enlarged CAP network. The main task of the Green Support Unit is to support green interventions in Pillar I and Pillar II of the CAP Strategic Plan, which contributes to the efficient use of water by farmers and their management for water retention, as well as awareness-raising.

All measures take into account the recommendations of the River Basin Management Plan (VGT 2, VGT 3 from 2022) on agricultural measures. Accordingly, the basic objective of the intervention is to support the measures necessary to bring and/or maintain the good status of surface and subsurface water bodies, including water retention, the sustainable management of our water resources, the uptake of saving irrigation technologies, climate-resilient production methods and sustainable land use.

Instruments outside the framework of the CAP ST

The strategic objective of Hungary is to retain rainfall waters and to better contain and utilise water flows through its territory by increasing natural water storage opportunities (e.g. soil, groundwater reservoirs, beds and their floodplains). The improvements made and planned in the area of water retention (municipal storm water management, inland water management) and drainage, as well as the adaptation of the operation of inland drainage and dual-operated channels are aimed at controlling natural runoff for water retention purposes. Reservoirs equalise the gap between water scarcity and availability in water over extended periods of time, establishing a match between water demand and water availability. The planned measures will focus on surface water resources, as our groundwater reserves are also risky in quantitative terms in the areas most affected by water scarcity, and stratified waters are the most important and conserved water base for public water supply. The use of subsurface resources is conceivable in an area if groundwater enrichment takes place there.

The KEHOP Plus priority 1 Water Management and Disaster Risk Reduction specifically aims at climate change adaptation and disaster risk prevention and fostering resilience, taking into account ecosystem-based approaches. To this end, support will be given to water management projects that protect the population, assets and the security of water supply in the landscape and living environments (e.g. flooding, inland water), relate to other surface water or groundwater (e.g. groundwater level, water scarcity), address significant water quality problems and improve water retention, utilisation (e.g. irrigation, rainfall and fire water storage), water use and water management efficiency. In particular, the establishment and renewal of water reservoirs, the development of blue infrastructure (benefits from near-nature water retention), investments in climate adaptation resilience, investments to keep storm water on the ground, and small-scale nature-based water retention options for municipalities. In addition, land-based projects will be eligible, which address the problems caused by water damage and water scarcity in a complex manner. In particular, investments in hills and plains, investments to improve groundwater

levels, complex water protection, water management, ecological-based/inclusive investments at the level of the landscape, the establishment of temporary and permanent water retention areas, investments necessary to operate run-off, retention and good ecological conditions (swabbling, dredging, wetlands) are eligible for investments aimed at the natural retention of water in dead branches, side branches, targeted groundwater storage and additional investments to achieve the VKI objectives.

The primary objectives of water management component D of the draft Recovery and Adaptation Plan (RRF) are water replenishment in water scarcity areas, increasing water retention, enabling regional water transfers, protecting groundwater resources, balancing the uneven distribution of water resources in space and over time in order to protect surface and groundwater bodies and habitats and to mitigate adverse impacts from excess or scarcity of water. Other objectives include extending the area of impact of water replenishment, preserving wetlands, increasing the proportion of water bodies with good status under the Water Framework Directive (WFD), raising awareness to protect water resources, and establishing a monitoring system and a public information system. The objectives may be achieved through measures such as reconstructing existing water replacement systems, interconnecting them, creating new systems, investments in water reclamation, developing appropriate water governance practices, adapting previous operations, examining the potential for re-utilisation of urban purified waste water, making better use of the capacity of line installations, delaying run-off, reducing the run-off ratio, examining and creating options for inland water irrigation, taking into account quality requirements (irrigation – nature protection).

4. Council Directive 91/676/EEC of 12 December 1991 concerning the protection of waters against pollution caused by nitrates from agricultural sources (Nitrate Directive);

4.1. Related objectives of national environmental and climate plans

Nitrate Action Programme (27/2006) (II. Government Decree No 59/2008 on the protection of waters against pollution caused by nitrates from agricultural sources. (IV. Decree No 29.) of the Minister for Agriculture and Rural Development on the detailed rules of the action programme necessary for the protection of waters against pollution caused by nitrates from agricultural sources and on the procedures for the provision of data and records)

1. Protecting water quality from pollution of nitrates from agriculture to soil and surface waters by encouraging the application of good farming practices

Soil Action Plan

1. The conscious and environmentally sound use of soils by farmers, among other things, increases the organic matter content of soils, improves the supply capacity of nutrients, reduces the amount of fertilisers used and strengthens erosion control, which also prevents agricultural phosphate loads in surface waters.

Third River Basin Management Plan (OVGT) of Hungary for the period 2022-2027 (the OVGT was adopted by the Government on 28 April 2022).

1. Reduction of nutrient pollution from agriculture by encouraging the use of good farming practices (nitrate sensitive areas)

2. Modernisation of livestock farms on the basis of the EU Nitrate Directive and promotion of the use of livestock manure

National Strategy for the Conservation of Biological Diversity 2021-2030 (draft to be approved 2021)

1. Significantly reduce the environmental impact caused by crops and performance-enhancing agents used in agriculture.

4.2. CAP Strategic Plan contribution to national long-term objectives

According to the Nitrate report: ‘When comparing the assessment of eutrophication status of surface waters with the results of the previous period, the proportion of monitoring points classified as eutrophic has increased significantly as a result of the new assessment standard under point 5.3.2 of the 2020 Nitrate Reporting Guidelines (new definition of eutrophic potential eutrophic classification), the increased number of water samples and climate change: 77 % of watercourses and 32 % of stagnant waters became eutrophic. The eutrophic state is caused by phosphorus emissions in addition to nitrogen (and in many cases to a greater extent)’ The load is caused by various load routes, which include point waste water loads, significant erosion from agriculture and groundwater, but also the so-called secondary load when past pollution from the effluent is returned to the water. In addition, research from the Institute of Soilology of the Research Centre for Agricultural Sciences has shown that nutrient leaching in Hungary is not caused by excessive nutrient application, as the growing soils in Hungary are particularly nutrient deficient but mainly due to erosion.

In this context, a number of anti-erosion protection standards have been drawn up at all levels of the green superstructure.

The **extension of the payment entitlement** will allow erosion control strips, bars of trees and coastal buffer zones maintained under GAEC 8 or AÖP to retain their payment entitlements, making it attractive for farmers to set up such areas as well.

Among the **conditionality** requirements, GAEC 4 (water buffer strips) and SMR 2 (protection against nitrate pollution) directly promote the protection of waters against pollution caused by nitrates from agricultural sources by complying with them to reduce nutrient pollution from agriculture both by limiting land application and reducing erosion. Farmers in Nitrate Vulnerable Zones are required to have soil tested every five years and, based on the results, to draw up a nutrient management plan every year. However, GAEC 5 (tillage for erosion) and GAEC 6 (soil cover in sensitive periods) also contribute significantly to reducing surface water pressures by reducing erosion. Under GAEC 5, the cultivation of sloping crops, including maize and sunflower, as well as winter cabbage sown on a wide range of rows, is restricted in sloping areas. These species may only be grown contoured or by means of erosion protection strips or by direct sowing in areas with a slope of more than 12 per cent.

Under the Basic Income Support for *Sustainability (DP01_E01_BISS_16)*, the planned **target area per year is 5.000** ha -EUR 789.700/year.

Among the optional requirements of the **agro-ecological programme (DP17_G01_ECOS_16)**, winter soil cover, non-rotational tillage, use of soil conditioners and microbiological products, obscuring the spacing of plantations by improving the soil structure and minimising the uncovered soil surface, helps to protect against erosion, such as reducing alluvial and pollutant pressures from soil erosion and/or surface runoff. Furthermore, non-productive elements to be maintained on arable land have an erosion-reducing effect, including anti-erosion bars, woody strips, grassland and shrub protection strips, water protection strips not under arable cultivation; terraces, erosion control facilities, wetlands fixed in the LPIS. Equally, maintaining grassland at field level for non-sensitive permanent grasslands has an erosion-reducing effect.

The target output of **the measure** is 2.500.000 ha of agricultural area, the total indicative financial allocation per **year is EUR 202.125,000/year**.

Many of the general requirements for **agri-environmental management (AEM) payments** cover sustainable nutrient management (preparation of a nutrient management plan based on soil analysis, limitation of nitrogen application, application of livestock manure, green bedding, rotation of stem residues, etc.) and conservation farming (non-rotated tillage, erosion control measures, protective crop structure with leguminous crops, etc.) contributing to the reduction of nutrient pollution from agricultural sources. In addition, specific sets of standards have been established for erosion-sensitive areas, which also contribute to reducing alluvial and pollutant pressures from soil erosion and/or surface runoff. Support for **organic farming** contributes directly to the reduction of nutrient pollution from agriculture, as a result of the principles and rules laid down in EU legislation on organic production in farming.

The output target of the **AEM** measure is 961,324 ha to support agricultural land, the total indicative financial allocation per year is **EUR 373.253,570 per year**.

The annual output target for **support for organic farming (RD20_G02_ORT_70)** is 134,564 ha of agricultural area, the total indicative financial allocation per year is **EUR 98.632.794.63 per year**.

Agro-ecological non-productive investments (RD21_G04_LCI_73) and the **agro-ecological land use change payment (RD22_G05_LCP_70)** are specifically aimed at developing non-productive land uses which, among other things, effectively contribute to the reduction of erosion events, thereby also reducing nutrient loads and pollution in our waters. Investments specifically contributing to anti-erosion protection and reducing the entry of nutrients into surface waters shall be:

- grassland strips intended for erosion control on arable land or plantations;
- grassland plantation for soil protection;
- development and development of technical facilities for erosion control;
- establishment and development of a coastal water protection buffer zone not under arable land;
- establishment of rows of protective trees and forest strips of several rows of trees and shrubs

The investment measure has an output target of **1451 operations** over the entire CAP ST timeframe, with a total indicative financial allocation of **EUR 19.854.465.78**.

The target output of the maintenance measure in the last payment year of the CAP ST is **14,500 ha**, an indicative financial allocation for the entire period of **EUR 34.242.833.33**.

Farm development to reduce ammonia emissions (RD01d_E01_FRM_73) is intended to support technological development activities promoting the reduction of ammonia emissions on agricultural holdings, whereby the agricultural sector contributes to the domestic NH₃ emission reduction target. The intervention will support, inter alia, the purchase of up-to-date injection and instantaneous manure application technologies, the modernisation of manure management inside and outside stables, in-house development (e.g. acquisition of flooring, roof insulation, drip-free drinking, air scrubber equipment), covering existing manure storage facilities, building new covered manure storage facilities. Support under the intervention can achieve environmental objectives that reduce ammonia and GHG emissions, improve air quality and improve pressures on surface and subsurface waters.

The measure has an output target of **154 operations** over the entire CAP ST timeframe, with a total indicative financial allocation of **EUR 8.139.535**.

All elements of CAP AKIS measures (information service, advice, training, innovation and digitalisation) directly contribute to addressing specific environmental needs, effectively supported by the innovation and green support unit of the enlarged CAP network. The main task of the Green Support Unit is to support green interventions in Pillar I and Pillar II of the CAP Strategic Plan, which contributes, inter alia, to the protection of farmers against erosion, to the development of farming practices that reduce nutrient leaching, and to raising awareness.

5. Directive 2008/50/EC of the European Parliament and of the Council on ambient air quality and cleaner air for Europe; and

6. Directive (EU) 2016/2284 of the European Parliament and of the Council of 14 December 2016 on the reduction of national emissions of certain atmospheric pollutants, amending Directive 2003/35/EC and repealing Directive 2001/81/EC;

5.1. Related objectives of national environmental and climate plans

Air Quality Action Plan

1. The combined aim of the air quality plans and the LCsT is to ensure compliance with air quality limit values throughout the country. They do not include only objectives and targets directly or indirectly linked to agriculture or the Common Agricultural Policy, but agriculture, in particular, makes a significant

contribution to the emission of ammonia, which contributes to the development of secondary particulate matter (PM), and the reduction of their emissions is essential to meet the air quality limit values for PM10 and PM2.5.

National Airload Reduction Programme Agriculture Sub-programme

1. Covering slurry stores,
2. Technological development specifications in this regard,
3. Promoting the use of organic fertilisers,
4. Organised manure – laying down conditions for land application,
5. Supporting the practical application of nutrients – farming,
6. Prohibition of outdoor combustion of crop residues and waste and forest biomass residues from agricultural harvests

5.2. CAP Strategic Plan contribution to national long-term objectives

Among the **conditionality** requirements, GAEC 3 (prohibition of burning stubble) contributes directly to the protection of air quality by prohibiting the burning of stubbles, reeds, plant residues and grasslands, unless this is necessary for phytosanitary reasons.

Under the Basic Income Support for *Sustainability (DP01_E01_BISS_16)*, the planned **target area per year is 5.000** ha -EUR 789.700/year.

Of the optional requirements of the **agro-ecological programme (DP17_G01_ECOS_16)**, winter soil cover, tillage without rotation and the spacing of plantations help protect air quality by minimising the surface of the soil. The use of soil conditioners and microbiological products contributes to reducing fertiliser application, thereby reducing ammonia emissions. Requiring the application of urea fertilisers by rotation or inhibitor directly reduces ammonia emissions.

The target output of **the measure** is 2.500.000 ha of agricultural area, the total indicative financial allocation **per year is EUR 202.125,000/year**.

Several of the general requirements for **agri-environmental management (AEM) payments** cover sustainable nutrient management (preparation of a nutrient management plan based on soil analysis and leaf analysis, restriction of nitrogen active substance application, application of organic fertilisers) thus contributing to the reduction of fertiliser application and thus to the reduction of ammonia emissions. Support for **organic farming** contributes directly to the reduction of ammonia emissions from agriculture as a result of the principles and rules laid down in EU legislation on organic production in farming.

The output target of the **AEM measure** is 961,324 ha to support agricultural land, the total indicative financial allocation **per year is EUR 373.253,570 per year**.

The annual output target for **support for organic farming (RD20_G02_ORF_70)** is 134,564 ha of agricultural area, the total indicative financial allocation **per year is EUR 98.632.794.63 per year**.

Farm development to reduce ammonia emissions (RD01d_E01_FRM_73) is intended to support technological development activities promoting the reduction of ammonia emissions on agricultural holdings, whereby the agricultural sector contributes to the domestic NH₃ emission reduction target. The intervention will support, inter alia, the purchase of up-to-date injection and instantaneous manure application technologies, the modernisation of manure management inside and outside stables, in-house development (e.g. acquisition of flooring, roof insulation, drip-free drinking, air scrubber equipment), covering existing manure storage facilities, building new covered manure storage facilities. Support under the intervention can achieve environmental objectives that reduce ammonia and GHG emissions, improve air quality and improve pressures on surface and subsurface waters.

The measure has an output target of **154 operations** over the entire CAP ST timeframe, with a total indicative financial allocation **of EUR 8.139.535**.

All elements of CAP AKIS measures (information service, advice, training, innovation and digitalisation) directly contribute to addressing specific environmental needs, effectively supported by the innovation and green support unit of the enlarged CAP network. The main task of the Green Support Unit is to support green interventions in Pillar I and Pillar II of the CAP Strategic Plan, which also contributes to the transition and awareness-raising of farmers' practices in reducing emissions.

7. Regulation (EU) 2018/841 of the European Parliament and of the Council of 30 May 2018 on the inclusion of greenhouse gas emissions and removals from land use, land use change and forestry in the 2030 climate and energy framework, and amending Regulation (EU) No 525/2013 and Decision No 529/2013/EU and

8. Regulation (EU) 2018/842 of the European Parliament and of the Council of 30 May 2018 on binding annual greenhouse gas emission reductions by Member States from 2021 to 2030 contributing to climate action to meet commitments under the Paris Agreement and amending Regulation (EU) No 525/2013

7.1. Related objectives of national environmental and climate plans

Second National Climate Change Strategy 2018-2030 with a 2050 perspective

1. Domestic Decarbonisation Tool: sectoral priority lines and tasks for reducing domestic greenhouse gas emissions
2. Agriculture; Opportunities to mitigate climate-related damage in agriculture
3. Geospatial basis for territorial climate vulnerability assessment, need for a complex monitoring system

National Energy and Climate Plan

1. Greenhouse gas emissions should be reduced by at least 40 % by 2030 compared to 1990, i.e. gross emissions should not exceed 56.19 million tCO₂e in 2030, or 7.6 million tCO₂e in 2017.
2. The primary objective of reducing agricultural emissions is the requirement of good agricultural practices and various support instruments.
3. In order to enhance CO₂ sink capacities, in line with the National Forest Strategy, we will significantly increase the share of forest and other woodland cover.

National Clean Development Strategy 2021 (draft)

1. Hungary strives for net-zero GHG emissions, i.e. climate neutrality by 2050
2. Full integration of climate change as an edge condition into agricultural policies and practices by 2050, taking into account decarbonisation requirements and actual climate changes
3. Reducing GHG emissions in agriculture by means that also promote yields;
4. Reducing ammonia emissions from agriculture by 32 % by 2030;
5. Enhancing carbon sequestration (carbon storage in soil by increasing the organic carbon stock of soils and in biomass);
6. Improving the gross nutrient balance of agricultural land, reducing extortion and replenishment of organic matter;
7. Increasing the area and proportion of the total agricultural area covered by agri-environmental programmes;
8. Encourage climate investments and agro-technical solutions through producer cooperation.
9. Fully integrate climate change as an edge condition into forest policies, taking into account decarbonisation requirements and actual climate changes.
10. Increased protection of forests, forest degradation, prevention of forest fires, negative impacts and reduction of carbon emissions.

11. The development of the wood industry capable of processing wood to the greatest extent possible, which provides a high-quality wood raw material, greater use of wood as a renewable raw material, greater energy investment and the replacement of raw materials and products produced with high GHG emissions.

National Forest Strategy 2016-2030

1. The role of forests in carbon sequestration, promoting the adaptation of forests to the effects of climate change
2. The role of forests in mitigating climate change through its positive micro-, meso- and macroclimatic effects, promoting adaptation of forests to the effects of climate change

Action Plan for the Conservation of Climate and Nature

1. For column 5: As part of the action point (we plant 10 trees per child), we aim to reach 27 % forest cover in Hungary.

7.2. CAP Strategy Plan contribution to national long-term objectives

Extending the scope of areas eligible for direct area payments by maintaining different types of land cover and sensible areas will help change land use in favour of carbon sequestration, store carbon in soil and biomass, and increase the organic carbon stock of soils.

Among the **conditionality** requirements, GAEC 2 (protection of wetlands and bogs) contributes directly to the conservation of carbon-rich soils, but GAEC 1 (maintaining permanent grassland ratios) also makes an important contribution to carbon sequestration of agricultural land. Furthermore, GAEC 8 (maintaining non-productive elements) increases carbon stock sequestration in soil and biomass.

Under the Basic Income Support for *Sustainability (DP01_E01_BISS_16)*, the planned **target area per year is 5.000 ha** -EUR 789.700/year.

Among the optional requirements of the **agro-ecological programme (DP17_G01_ECOS_16)**, winter soil cover, non-rotational tillage, use of soil conditioners, microbiological products, obscuration of plantations and maintenance of higher non-productive areas also contribute to carbon sequestration of agricultural land. Winter soil cover, tillage without rotation and cover between plantations help protect air quality by minimising the uncovered soil surface. The use of soil conditioners and microbiological products contributes to reducing fertiliser application, thereby reducing ammonia emissions. Requiring the application of urea fertilisers by rotation or inhibitor directly reduces ammonia emissions.

The target output of the **measure** is 2.500.000 ha of agricultural area, the total indicative financial allocation per **year is EUR 202.125,000/year**.

Many of the general requirements for **agri-environmental management (AEM) payments** cover sustainable nutrient management (preparation of a nutrient management plan based on soil analysis and leaf analysis, limitation of nitrogen application, application of organic manure) and conservation farming (non-rotated tillage, erosion control measures, protective crop structure, etc.) thus contributing to improving the gross nutrient balance of agricultural land, reducing soil extortion and restoring soil organic matter stocks. Support for **organic farming** contributes directly to improving the gross nutrient balance of agricultural land, reducing soil extortion and restoring soil organic matter as a result of the principles and rules applied in the farming mode, as laid down in the EU legislation on organic production.

The output target of the **AEM measure** is 961,324 ha to support agricultural land, the total indicative financial allocation per **year is EUR 373.253,570 per year**.

The annual output target for **support for organic farming (RD20_G02_ORT_70)** is 134,564 ha of agricultural area, the total indicative financial allocation per year is **EUR 98.632.794.63 per year**.

Agro -ecological non-productive investments (RD21_G04_LCI_73) and the **agro-ecological land-use change payment** to maintain them (RD22_G05_LCP_70) are intended to promote land-use change of arable land currently cultivated at the limits of economy, including through the planting of grasslands and the creation of wetlands, thus promoting land-use change in favour of carbon sequestration, the storage of carbon in soil and biomass, and increasing the organic carbon stock of soils.

The investment measure has an output target of **1451 operations** over the entire CAP ST timeframe, with a total indicative financial allocation of **EUR 19.854.465.78**.

The target output of the maintenance measure in the last payment year of the CAP ST is **14,500ha**, an indicative financial allocation for the entire period of **EUR 34.242.833.33**.

One of the key objectives of the intervention to support the development and maintenance of **afforestation and creation of woodland (RD38_F05_AFI_73)** is to reduce the effects of climate change through land use change and to significantly capture carbon dioxide.

The measure's output target for the entire CAP ST timeframe is **20,000ha** and the total indicative financial allocation is **EUR 63.350.137**.

Investments for the environmental sustainability of forest management (non-profit) (RD41_F08_INN_73) aim, inter alia, at counteracting the spread of growing and increasingly extreme abiotic environmental damage conditions and events (such as forest and vegetation fires, frost damage and storm damage caused by water scarcity and drought) and new biotic pathogens and pests, both by potentially preventing damage to the forest potential and restoring them in a more resilient way. In addition, the long-term quality renewal, restructuring and reconditioning of forests with climate-resistant material are also a priority. Forest restructuring can improve the age structure, mix and biodiversity of forest stocks, thus improving the resilience and carbon sequestration capacity of forest ecosystems.

The measure has a target output of **2000 operations** over the entire CAP ST timeframe, with a total indicative financial allocation of **EUR 4.778.588**.

In *the framework of the cooperation, we intend to support, through the cooperation-based support for forest fire prevention and risk reduction (RD37_F04_FRC_77)*, voluntary partnerships between forest managers and specialised public bodies to design and implement a complex multi-farmer planning and implementation of modern, sustainable, territorial forest fire prevention and mitigation. By preventing forest fires, emissions of greenhouse gases and gases with atmospheric pressures can be reduced and the carbon balance of forest stands can be maintained and their climate adaptive renewal can be facilitated.

The measure has an output target of **10 operations** over the entire CAP ST timeframe, with a total indicative financial allocation of **EUR 7.290.698**.

All elements of CAP AKIS measures (information service, advice, training, innovation and digitalisation) directly contribute to addressing specific environmental needs, effectively supported by the innovation and green support unit of the enlarged CAP network. The main task of the Green Support Unit is to support green interventions in Pillar I and Pillar II of the CAP Strategic Plan, which also contributes to the transition and awareness-raising of farmers' practices in reducing emissions.

9. Directive 2009/28/EC on the promotion of the use of energy from renewable sources; and

10. Directive (EU) 2018/2002 of the European Parliament and of the Council of 11 December 2018 amending Directive 2012/27/EU on energy efficiency, and

11. Regulation (EU) 2018/1999 OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 11 December 2018 on the Governance of the Energy Union and Climate Action, amending Regulations (EC) No 663/2009 and (EC) No 715/2009 of the European Parliament and of the Council, Directives 94/22/EC, 98/70/EC, 2009/31/EC, 2009/73/EC, 2010/31/EU, 2012/27/EU and 2013/30/EU of the European Parliament and of the Council, Council Directives 2009/119/EC and (EU) 2015/652 and repealing Regulation (EU) No 525/2013 of the European Parliament and of the Council

9.1. Related objectives of national environmental and climate plans

National Energy Strategy 2030

1. Enlarge the use of renewable energy and improve energy efficiency

National Energy and Climate Plan

1. Increasing the use of renewable energy and improving energy efficiency

9.2. CAP Strategic Plan contribution to national long-term objectives

Support for green investments in agricultural holdings (RD01c_E01_FRM_73) and green investments linked to the enhancement of agricultural products (RD04b_E03_FOF_73) are aimed at increasing the self-sufficiency of agricultural and food processing plants and reducing energy dependency by improving energy efficiency and promoting renewable energy sources to support the reduction of CO₂ emissions and energy use in agricultural and processing plants. The intervention also encourages the implementation of projects following a circular biomass economy model, based on the use of in-situ biomass resources and the use of by-products generated (e.g.: improvement of soil). The aim is to exploit geothermal thermal energy potential, based on the country's geological conditions, to which the intervention contributes by supporting farm development, for example in the context of greenhouse heating. The intervention covers the reduction of energy use in agricultural and processing plants in order to reduce the environmental impact of the sector: it improves the energy efficiency of livestock farms and horticultural plants, mainly through renovations and renovations in buildings energy, engineering and energy supply. Hungary would like to achieve a share of at least 21 % of renewable energy in gross final energy consumption by 2030. The intervention also contributes to this objective of Hungary.

Measure *RD01c_E01_FRM_73* has an output target of **4180 operations** over the entire CAP ST timeframe, with a total indicative financial allocation of **EUR 26.744,186**.

Measure *RD04b_E03_FOF_73* has an output target of **334 operations** over the entire CAP ST timeframe, with a total indicative financial allocation of **EUR 13.380,057**.

The **cooperation** will support voluntary partnerships (*RD52_R12_BIC_77 – Rural development cooperation for the development of the biomass economy*) in which forest or agronomists producing indigenous biomass feedstock and providers of local public services find long-term solutions to replace imports of fossil fuels in the relevant public infrastructure using in-situ biomass feedstock, using the best available technologies (BAT).

The measure has a target output of **21 operations** over the entire CAP ST timeframe, with a total indicative financial allocation of **EUR 1.274,302**.

Investment support for **afforestation and woodlanding** (*RD38_F05_AFI_73*) will increase the provision of in-situ biomass-based renewable energy, which reduces dependence on imported fossil energy sources.

The measure's output target for the entire CAP ST timeframe is **20,000ha** and the total indicative financial allocation is **EUR 63.350.137**.

All elements of CAP AKIS measures (information service, advice, training, innovation and digitalisation) directly contribute to addressing specific environmental needs, effectively supported by the innovation and green support unit of the enlarged CAP network. The main task of the Green Support Unit is to support green interventions in Pillar I and Pillar II of the CAP Strategic Plan, which also contributes to the development of energy-efficient farming practices and awareness-raising among producers.

12. Directive 2009/128/EC of the European Parliament and of the Council of 21 October 2009 establishing a framework for Community action to achieve the sustainable use of pesticides;

12.1. Related objectives of national environmental and climate plans

National Plant Protection Action Plan

1. Pesticide use according to specifications, rational crop protection (chemical, biological, agrotechnical) and timely and appropriate methods, mitigation of risks from pesticide use
2. Introduction of integrated crop production technology

National Strategy for the Conservation of Biological Diversity 2021-2030 (draft to be approved 2021)

1. Significant reduction of the environmental impact caused by crops and performance-enhancing agents used in agriculture.

12.2. Contribution of the CAP Strategic Plan to the achievement of the strategic objectives

Among the **conditionality** requirements, SMR 8 (sustainable use of pesticides) contributes directly to the sustainable use of plant protection products, and the crop change rules in GAEC 7, as one of the basic elements of the IPM, help the optimal development of the crop and thus its pest-competence.

Under the Basic Income Support for *Sustainability (DP01_E01_BISS_16)*, the planned **target area per year is 5.000** ha -EUR 789.700/year.

Several of the optional provisions of the agro-ecological programme (DP17_G01_ECOS_16) relate to the sustainable use of pesticides, such as restricting the use of specific or moderately hazardous or risky pesticides for bees or encouraging the use of biological agents authorised in organic farming. Maintaining non-productive elements helps beneficial living organisms, which are part of integrated pest management.

The target output of **the measure** is 2.500.000 ha of agricultural area, the total indicative financial allocation per year is EUR 202.125,000/year.

The basic requirement **for agri-environmental management payments (AKG (RD19_G01_AEC_70))** and support for organic farming is the application of IPM. Accordingly, the AKG support was designed to contribute, inter alia, to reducing the application of plant protection products through requirements going beyond the basic requirements.

At the level of specific specifications, this contribution can be presented as follows:

The thematic group of standards on arable land (Areas of Natural Value) requires the establishment of pesticide-free edges with a width of at least 6 metres. This provision is also included in the optional specifications of the horizontal cropland Thematic Specifications, where the border shall be constructed at a width of 3 or 6 metres in at least 25 % of the perimeter of the contiguous area covered by the commitment, with the planting of permanent green springs or bee pastures. These pesticide-free margins should be maintained permanently (at least 2 or 3 years) and thus contribute to reducing pesticide use in the longer term.

The AKG also contributes to reducing the risk of environmental pollution from pesticide use by limiting the range of pesticide active substances to be used in all arable and plantation areas under the measure. The use of a pesticide active substance which is not environmentally sound and the list of non-applicable products shall be reviewed and published by the competent authority every calendar year.

The rules limit the use of pesticides in cropland in a timely manner, thereby reducing the risk associated with the use of the product. The application of pesticides on arable land between 15 April and 1 July shall not be permitted for the cultivation of perennial crops, cultivated cereals and green springs.

In order to reduce the number of treatments and the rational use of pesticides, the measure supports the involvement of a plant protection manager in farming and the operation of a plant protection forecasting system that significantly reduces the environmental risk of pesticide use.

In both horizontal and SWOT grasslands, the establishment and spread of invasive and off-site plant species must be prevented by mechanical control or specific pesticide application. With regard to the

requirement, it is important that control is necessary with accurate, drop-free and targeted application of chemicals, thereby reducing unnecessary pesticide application.

The target output of the measure is 961,324 ha to support agricultural land, the total indicative financial allocation per year is **EUR 373.253,570 per year**.

In the case of **support for organic farming (RD20_G02_ORT_70)**, we aim to increase the area under organic production, in line with EU expectations. Farmers receiving support will have to comply with Council Regulation (EC) No 834/2007 and, as of 1 January 2022, with the requirements of national legislation corresponding to Regulations (EU) 2018/848 of the European Parliament and of the Council.

Support for organic farming aims to maintain and enhance biodiversity, strengthen natural self-regulatory processes, protect and improve soil biological status, reduce negative environmental impacts from the misuse of plant protection products and poor nutrient management, and ensure food safety. The aid is also intended to encourage the organicisation of conventional areas and to maintain farming methods in organic areas. Any use of chemicals may be carried out under strict control and with close registration. The records of the plant protection treatment (spray log) shall be recorded on the day of the treatment, as opposed to the other elements of the farming logbook to be recorded. The minimum requirement for the use of plant protection products must be complied with in addition to the requirements of organic farming, including the professional collection, treatment and destruction of packaging and packages which have been emptied during plant protection activities (e.g.: plant protection product packaging may not be used for other purposes, even when cleaned).

In addition to the above, the sustainable and digital development of agricultural holdings, as well as climate change mitigation and adaptation measures in the fruit and vegetables sector, all provide opportunities to support investments that can effectively reduce the use of plant protection products by farmers.

The annual output target for the measure is 134,564 ha to support agricultural land, the total indicative financial allocation per year shall be **EUR 98.632.794.63 per year**.

All elements of **CAP AKIS measures** (information service, advice, training, innovation and digitalisation) directly contribute to addressing specific environmental needs, effectively supported by the innovation and green support unit of the enlarged CAP network. The main task of the Green Support Unit is to support green interventions in Pillar I and Pillar II of the CAP Strategic Plan, contributing to the development of sustainable pesticide use and awareness-raising for farmers

3.1.5 Where relevant, CAP contribution towards LIFE projects

3.2 Overview of the generational renewal strategy

1. Need for a strategic approach based on an analysis of the situation

Despite direct support for rural development in recent years and a number of interventions adopted under national competence, the income and skills of young farmers set up are still inadequate. The SWOT analyses and identified needs for each specific objective (in particular SO7 and SO8 and CCO) show that Hungary, like most European Member States, is experiencing an ageing farming society and therefore generational renewal is one of the most important social policy issues. Non-exhaustive expectations in the needs analysis: SO7: Encouraging business start-ups among young people in agriculture and forestry; Reducing the administrative burden for the intergenerational transfer of agri-businesses; Making agricultural careers attractive to young generations. SO8: Reducing labour migration CCO: Knowledge transfer to accelerate generational renewal in agriculture and forestry.

The SO7 analysis concludes that direct and rural development support to farmers in recent years reduces the rate of population decline in rural areas, but the improvement of the farming age structure has so far not been achieved. The analysis shows that as digitalisation rises, agricultural careers can become more attractive for young people. The experience of social consultations, the findings of the SWOT analysis and the needs derived from it suggest that further development of policy tools is essential for the 2023-2027 period.

Hungary's strategic approach to generational renewal

Since 2018, the Ministry of Agriculture has been focusing on generational renewal in agriculture, bringing it to the level of a policy programme, which has been effectively supported by the process of analysis and socialisation of the CAP Strategic Plan. By the end of 2019, we had developed four action plans:

- Legislation facilitating family farming and farm transfers
- Expanding awareness-raising
- Reinforce training
- Extension of aid (described under point 3).

Generational renewal is indirectly but significantly supported by digitalisation, Hungary also has a Digital Agricultural and Food Strategy (DAS and dés). Both sectoral digitalisation strategies have a key role to play in improving skills and retraining, therefore their implementation also directly serves the goal of generational renewal. In addition, both strategies have served as the basis for and complement the interventions of our CAP Strategic Plan. Details of Hungary's strategic approach to digitalisation and its interventions are set out in Chapter 8.

The Central Statistical Office, hereinafter referred to as 'the Central Statistical Office', HCSO) based on the 2020 farm structure survey data, the age composition of both individual farmers and managers of enterprises is unfavourable, most of them belonging to the old age group. According to the latest data, the number of individual holdings is 231.351 thousand, with 645 thousand livestock units, and the number of companies is 9.651.

36 % of individual farmers aged 65 or over (82.406 persons), a further 25 % between 55 and 64 years old (56.686); 22 % of managers of enterprises were aged 65 or over (2.153 persons) and another 27 % between 55 and 64 years (2.637). At the same time, the proportion of individual farmers under 40 is 10 % (23.150); and 12 % of managers of enterprises are under 40 (1.157 persons).

Similarly, the age composition of the managers of viable enterprises is higher than the standard output value (SO) of EUR 6000 identified as the entry threshold in the applications of the Rural Development Programme, which developed as follows:

Based on the age composition of managers of **viable holdings**, **28 % of the managers** of individual holdings were aged 65 or over and 25 % were between 55 and 64 years old, as identified as the entry threshold in the RDP applications. The share of people under 40 in 2020 was 13 %. Looking at the age composition of managers of enterprises, 22 % were aged 65 or over (1.632), 27 % were aged between 55 and 64 (1.986 persons), 13 % under 40 years old (942)

	Under 40 years of age	40 to 55 years old	55 to 64 years old	65 years or over
Managers of individual holdings	13 %	34 %	25 %	28 %
Managers of enterprises	13 %	38 %	27 %	22 %

The support of young farmers in the last two programming cycles is mainly due to the fact that the age group under 54 accounts for 47 % of farmers who are normally engaged in agriculture. Without these subsidies, it is likely that there would be a much greater difference between those aged 55 and over.

Overall, when comparing the HCSO farm structure census data for 2016 and 2020, the age composition of

both groups deteriorated and, on the other hand, the problem is more pronounced among individual farms, as they affect more people in many of them, the data are poorer, and they do not have established legal possibilities for economic activity compared to social enterprises (economic organisations).

Around 90 % of young agronomic producers take over primarily operating farms. A significant part of the successful generational change depends on the most efficient transfer of farms. As a result of the historical characteristics of domestic agriculture, the generation of founders of farms starting at the time of system change is largely now reaching the age at which the farm is naturally transferred to young people.

Fortunately, this happens within a family. At the same time, both within and outside the family, there is no domestic tradition and established order.

In view of the results of recent surveys, administrative tasks are, in their own view, the greatest difficulty for the stakeholders interviewed when it comes to transferring or taking over the farm. Therefore, as a next step in the process of generational renewal, in order to ensure that farm transfers are still taking place in the farmers' lives, we have aimed at easing the administrative burden associated with the transfer, as there is a professional and social consensus on this issue.

Since the vast majority of farmers in agriculture are primary farmers and self-employed farmers, the first step in the measures to promote generational renewal was the entry into force of **Act CXXIII** of 2020 on family farms, which regulated the legal status of primary farmers, the family farms of primary producers and the conditions for obtaining a family farm certificate. More favourable regulation and taxation entered into force in 2021, which had been used by the end of the year with 66 thousand family farms, and we believe that this is the most important base for generational renewal. In view of the results of recent surveys, after financial reasons, the administrative burden in transferring and taking over the economy was the greatest difficulty. Therefore, a new single-gate farm transfer contract has been drawn up as a next step in order to ensure that farm transfers still take place in farmers' lives. The new legal instrument and the associated benefits are set out in **Act CXLIII** of 2021 on the transfer of agricultural holdings, which was published at the end of December, which, as of 1 January 2023, helps the generational renewal of Hungarian agriculture. In line with the new regulations, we planned the interventions provided by the CAP Strategic Plan.

It is important to **develop farmers' attitudes through continuous campaigns** in order to consciously plan and prepare for the transfer of the farm even if it is not finalised in their lives. Overall, the Economic Service is a long process in which the first steps, i.e. the failure to take a decision on the transfer, lead to an insufficiently planned transfer, which therefore ends with the splitting or abandonment of the economy, i.e. failure. Attracting young generations to farming is hampered by the particularly low prestige of agri-food professions. Reaching out to the young generation and raising awareness is important, in which youth programmes organised by various professional associations play a key role. NAK TechLab innovation competitions (<https://www.naktechlab.hu/>) and Agrovirtus(<https://agrovirtus.hu/>) innovation competitions are prominent among university students' programmes. After the COVID pandemic, we hope to launch a more intensive communication and awareness-raising campaign than is currently the case. We will continue to prioritise the active involvement of the MNVH, of course involving the key sector actors mentioned above.

We also have important tasks with regard to the training of farmers. We need to make the sector more attractive when choosing a career, and this is also the aim of **the transformation of Hungary's secondary and tertiary education system in 2020 and 2021**. In both secondary and tertiary agriculture, the number of enrolled students has increased in recent years. In the case of vocational education and training, dual training has been emphasised by increasing training periods in agricultural and food businesses following a basic sectoral examination, thus helping to promote generational renewal and labour shortages in agriculture. It is necessary to strengthen the benefits of digitalisation in modern training, to raise awareness among learners of the best available technology, as technological progress and innovation are expected to reduce physical work, thereby improving the perception of agricultural professions by young people and skilled job-seekers. The planned interventions on digitalisation are explained in detail in Chapter 8, but two interventions directly related to generational renewal are also

highlighted here. As of 2021, the virtual reality training room and programme set up at the Agricultural Training School in Handhalm, which was implemented with the support of the MNVH, serves to reach out to the secondary school age group. Another important step will be the development of the demonstration plant planned in 2022 under the Rural Development Programme, aiming at the digitalisation of secondary and higher agricultural education establishments' educational holdings. With this planned new application, the new CAP AKIS interventions are intended to create the background for the new CAP AKIS interventions, as modernised educational farms provide not only students in public education but also an attractive place for adult education.

The increased ambition of the CAP Strategic Plan to achieve the target

As stated in the strategic statement under Chapter 1, Hungary is committed to promoting a successful generational renewal of agriculture. Five of the interventions foreseen in the CAP Strategic Plan directly support Article 6(1), point (g), to attract and maintain a career in agriculture for young farmers and new farmers and to promote sustainable business development in rural areas. In addition to reducing administrative burdens, awareness-raising and training, it is crucial to increase the level of support for generational renewal, as families' decision-making is most affected by the availability of secure livelihoods.

In **Pillar I**, with regard to the application of Article 30 of the Strategic Plan Regulation, the following basic principles have been laid down (intervention DP03_B01_YFS_16):

- On the basis of Article 30(2), we will give young farmers starting before 2023 the possibility to make full use of the five-year support period under new, more favourable conditions;
- As of 2023, **1.4 % of direct aids from Pillar I to start-up** area payment for young farmers, i.e. EUR 18690804 per year, instead of 1 % before;
- The increased financial envelope provides for both the possibility to increase the unit payment from 67 to EUR 157/ha and the area ceiling from 90 to 300 ha;
- A minimum relevant agricultural qualification threshold and/or a condition for agricultural practice will also be required in Pillar I to address skills gaps;
- Given that the area available to young farmers at the time of the first application is on average around 15 hectares, the effect of the redistributive (redistributive) support under Article 29 can increase the average level of support for young farmers through that intervention.

Support for young farmers and, accordingly, for Pillar II **rural development interventions**, the following basic support targets have been laid down. Within the framework of the rural development pillar set out in Article 69, the issue of generational renewal, the support for young farmers in Article 75 and the dedicated part of the investments in Article 73 continue to be an important element of the allocation of funds of **1.6 % of direct aids**. For interventions with a direct impact, the planned envelopes are also included, but not for indirect effects.

Support for the **setting-up of young farmers** is granted on the basis of Article 75(2)(a). Basic know-how and production potential, which can serve as a basis for reaching out to young farmers in their business plan, is a prerequisite for the effective start-up and further development of agricultural activity. They are therefore defined as eligibility criteria for receiving aid. The aim is for young people to maintain their activities in the long term, which is the implementation of specific commitments such as mandatory investment (RD05_B01_YFS_75, intervention in the previous period, with a planned envelope of EUR 93 million, which represents an increase of + 68 % compared to 2014-2020).

On the basis of Articles 75 and 77, **support is provided for the takeover of operational farms and the transfer** of farms with a business start-up aid in the previous case, while the latter would be a cooperation type of aid. We see the continued operation and development of well-performing farms as an effective means of maintaining competitive agriculture. The transfer of operational holdings facilitates generational renewal, whereby younger farmers take over farms close to retirement age and intending to cease their

activity. Under Article 75, the transferee of the holding is supported in the form of start-up aid, while under Article 77 the transferor of the holding is granted a cooperation aid of between EUR 10 and 100 thousand. Support for generational renewal, including Farming, is essentially aimed at improving the age structure of farmers, but it is also important to ensure that well-functioning, competitive farms are not closed, thus ensuring that rural employment is maintained, contributing to increasing the population retention power of the countryside (RD06_B02_YFY_75, RD07_B03_YFO_77, new interventions with a planned envelope of over EUR 87 million).

Like agricultural enterprises, forest managers are characterised by ageing. The extremely long payback period for forestry and the necessary capital and credit to reach rational farm sizes are extremely cumbersome for professionals in the sector. Accordingly, it is necessary to provide **targeted incentives for young forest professionals to set up their own businesses** under Article 75, the main objective of which is to improve the negative age structure also in forest management. The associated objective is to re-manage forests without land managers where possible. Hungary intends to help young forest managers start up with specific lump sum support (RD08_B04_BIS_75; new intervention with a planned envelope of ~EUR 9.5 million, as the intervention also aims to support start-ups other than forestry, so that only half of the envelope is shown here).

In addition to the above, linked to the promotion of generational renewal, we also provide opportunities **to set up rural businesses producing or providing goods for local needs** and to develop small farms capable of developing (RD08_B04_BIS_75, RD09_B05_SML_73).

The increased aid intensity for the development of young farmers' holdings has proven to be a successful tool for applications supporting investments under the Rural Development Programme in the previous programming period. Therefore, under Article 73, young farmers can continue to rely on an increased support rate for investment aid for **farm development**, and at a higher rate of 15 % than before (RD01_E01_FRM_73, RD02_D01_FRM_73, RD03_E02_FON_73).

All **AKIS interventions** planned under Articles 78 and 75 serve young farmers (information service, advisory service, training, innovation). Most directly, the training and demonstration plant intervention is planned to provide, as in the current period, mandatory and optional training for those receiving Pillar II support, with 100 % aid intensity (RD54_A01_TRA_78, RD57_A04_ADP_78, RD58_A05_EIP_77).

In its CAP Strategic Plan, Hungary planned an intervention with a direct impact with significantly more and more resources than the 2014-2020 period to facilitate the strategic decision-making of rural families. Thus, in addition to professional aspects, interventions for generational renewal also meet the significantly higher level of ambition in financial terms compared to the previous programming period. On the basis of professional considerations, and in cooperation with organisations representing young farmers' interests, we decided on the I (EAGF) and II. The content of (EAFRD) pillar interventions and the resources allocated to them.

3.2.1 Where relevant, CAP contribution towards Erasmus projects

We did not plan to fund Erasmus projects.

At the same time, we consider the opportunities offered by Erasmus applications to be a priority. Therefore, according to our plans, the Rural Development (MNVH) and Innovation and Digitalisation (EIP) unit of the CAP Network will be responsible for informing and assisting young farmers and institutions responsible for secondary and higher agricultural education in applying.

3.3 Explanation on how the interventions under coupled income support as referred to in Subsection 1 of Section 3 of Chapter II of Title III are consistent with the Water Framework Directive - 2000/60/EC

I. Presentation of the national legislative environment in Hungary as a guarantee of compliance

with the Water Framework Directive

The presentation is made by describing, on the one hand, the water use authorisation and, on the other hand, the system of rules for intensive livestock farms as a potential risk to water quality.

In our view, consistency with the Water Framework Directive should not be achieved through the eligibility criteria for CIS schemes. The authorisation and monitoring process for the abstraction of water for irrigation purposes and, for example, for the establishment and operation of intensive livestock farms (with particular emphasis on manure storage) and its possible extension, is carried out on a case-by-case basis, taking into account the criteria set out in the Water Framework Directive. Our aim is to demonstrate, through the presentation of the regulatory environment, that this ensures consistency horizontally, so it is not necessary to include additional rules at the level of eligibility criteria.

Facts on the situation of agricultural irrigation in Hungary

	EU	Hungary
Share of irrigated agricultural land	8 %	2.4 %
Use of dynamic surface water resources	80 %	30 %
Installation of water replacement systems	8-9 %	1-2 %

Source: At the National Chamber of Agricultural Economics

Droughts are now a serious problem in Hungary, for which solutions need to be found in the short term. The CAP Strategic Plan seeks to achieve a positive impact on several sides. These include requiring the use of certified material, precision investments or irrigation improvements (e.g.: replacement of elements of the existing obsolete system: installation of new modern (water- and energy-saving) machinery, equipment and fittings or watertight insulation of reservoir spaces. We also call for the development of sustainable water management communities, which can facilitate investments in irrigation and re-irrigate areas that have been irrigated in the past. As can be seen in the table, Hungary is significantly below the EU average in terms of the prevalence and coverage of irrigation.

Description of the water authorisation process

Hierarchy of norms

- According to the Government's division of labour, the Minister of Interior is responsible for regulating water licensing procedures.
- In Hungary, interventions into surface and groundwater, with the exception of activities subject to notification, are subject to a water right permit. (*Act LVII of 1995 on water management*).
- Procedural rules for permitting water use for irrigation within water uses: *Government Decree No 72/1996 on the exercise of water management authority powers* *Government Decree No 273/2007 of 22 May 2004*.
- Substantive rules for irrigation: *Government Decree No 147/2010 laying down general rules on activities and facilities for the exploitation, protection and prevention of water damage (IV. Government Decree No. 29*.
- Legislation requiring measurement of the amount of irrigation water abstracted: *Decree 30/2008 of the European Parliament and of the Council on technical regulations applicable to activities and installations for the exploitation, protection and prevention of damage to waters (XII. Decree No 31/2001 of the Minister for Environment and Water; Government Decree No 43/1999 on the calculation of the water resource contribution (XII. Decree No 26/2000 of the Minister for EIA*.

Forms of water licensing

An important premise is that all water abstraction for agricultural irrigation is carried out under official control. The individual procedures are described in the following summaries.

Pre-notification

Exceptional use of water for irrigation during a prolonged period of water stress, for short-term irrigation only from surface water. In this case too, the parameters for abstraction are laid down by law. According to the legal provisions, the use of water for exceptional irrigation purposes is possible once without a water right permit on the basis of a declaration by the water user. Irrigation is not carried out from groundwater, but directly from surface water with a temporary pumping station, with a maximum volume of 120 mm/hectare (1 200 m³/hectare) applied over a maximum area of 100 hectares for a maximum duration of one month.

The operator of surface water subject to abstraction shall give its consent only if the abstraction does not endanger the surface water ecosystem affected by the abstraction and the interests of water management as defined by law, and may set the conditions for abstraction in the consent.

Notification

Refers to the construction and maintenance of wells for agricultural irrigation which:

- They are not more than 50 metres deep,
- only groundwater is used,
- do not affect a water-base protection area (*designated water bases that provide water supply for drinkingwater*),
- only self-owned land is irrigated,
- equipped with digital well meters.

The National Land Centre (hereinafter: NFK). In the course of the procedure, it examines whether the notified well falls within the authorisation or notification category in accordance with the legal conditions. It also examines whether it meets the conditions for notification and asks the **competent water directorate, since the water directorates have data on the quantitative and qualitative status of the water body concerned**. An expert opinion on the possibility of water abstraction is drawn up by the Water Directorate with territorial competence.

Subject to the opinion of the Water Directorate, and in view of the status of the water base and the impact of the planned well on the water base, the procedure will be concluded by approval or rejection in an official decision.

It is important that the operator is also responsible for ensuring that groundwater is used only to such an extent that the balance between abstraction and replenishment is maintained without any deterioration in quality and that the requirements for achieving the objectives of good water status are met.

Permission

Issued by the water authority for other aquatic installations not falling under the above categories. In the case of 'house' wells, the tasks of the water authority are performed by the NFK in the case of notary, agricultural irrigation wells and, in other cases, by the competent Disaster Management Directorate. **The procedure ends with the granting or refusal of a water right permit.** The permit may be theoretical (entitled to further planning), construction (entitlement to construction), operation (entitles to operate), termination (entitles to dismantle existing installations), survival (entitles to maintain and continue to operate an existing facility).

Upon submission of the plan drawn up by the designer with the designer's rights and the necessary

annexes, the competent licensing authority (NFK or the Disaster Management Directorate) shall examine the documentation in terms of form and content, contact the competent authorities to be involved and issue the necessary rectifications.

In the course of the procedure, the licensing authority shall contact any authority whose field of expertise is covered by the plan. The approval of the competent water directorate for water abstraction is a mandatory part of the permit dossier, without the permit being issued.

Upon receipt of the **opinions of the competent authority and the rectification of the missing information, if the licence can be issued, the licensing authority shall draw up the decision specifying the exact technical content and the conditions under which it contributes to the establishment, operation, termination or survival. If the authorisation cannot be issued or if the missing information is not completed, the authority shall refuse the authorisation.**

A set of rules to ensure that water quality is preserved from the point of view of the establishment and operation of livestock holdings

A. Official approval prior to the establishment of animal holdings

Under national law, prior to the commencement of a major investment, the environmental impact assessment must include the determination of the likely effects of the activity on the environmental elements (land, air, water, wildlife, built environment), their systems, processes, structures (in particular the landscape, settlement, climate), the health status of the population concerned and their social and economic situation (quality of life, land use conditions).

Authorisation procedures

Decree 314/2005 of 314/2005 on environmental impact *assessment and uniform environmental use permit procedures for the carrying out of activities causing significant environmental pressures or potentially causing significant pollution* to the environment. (XII. Government Decree No 25/2002 (hereinafter: The following procedure(s) shall be carried out:

Preliminary examination,

(2) an environmental impact assessment,

A uniform environmental use permit procedure.

(1) Preliminary test procedure

In the case of the activities specified in the Government Decree, the user of the environment shall initiate a preliminary investigation with the environmental authority. The purpose of the procedure is to determine whether the activity constitutes an environmental use which justifies a detailed environmental impact assessment procedure or a uniform environmental use permit procedure.

The question of water is already raised in the preliminary proceedings: (Annex 4)

'preliminary estimation of the expected effects on each environmental compartment during the transport, storage, storage, water treatment necessary for installation and implementation, during the installation, operation or abandonment of the activity, taking into account, in particular, the factors affecting them,

...

(FF) impacts on surface and groundwater bodies and on areas of protection designated for the abstraction of drinking water in accordance with the Government Decree on certain rules of river basin management, taking into account the content of the river basin management plan;

(g) measures proposed to reduce adverse environmental impacts identified pursuant to point (f)(ff) that cause deterioration of water status; "

As a result of the preliminary examination, the competent authority shall, in its decision:

- ascertains whether the implementation of the planned activity is likely to result in significant environmental impacts:
 - if a significant environmental impact is assumed: establish the content requirements of the environmental impact assessment and, where appropriate, of the application for a single environmental use permit,
 - if no significant environmental impact can be assumed: provide information on the other authorisations to commence the activity;

· If the preliminary examination documentation contained several variants, indicate the version(s) for which it considers possible;

· Where a ground for non-authorisation of the activity has been identified during the preliminary examination, no authorisation shall be granted to carry out that activity as requested;

· If a Natura 2000 site is expected to have significant effects on the environment, it shall set the content requirements of the environmental impact study taking into account the specifications defining the content of the Natura 2000 impact assessment documentation.

· An environmental or integrated environmental use permit may be requested within two years of the decision becoming final, which may be extended once by a maximum of one year.

Examples of activities subject to an environmental impact assessment depending on the preliminary assessment decision are:

- Agricultural and other non-urban water management,
- Irrigation plant,
- Conversion to intensive agricultural land use in areas recorded as abandoned,
- Open-surface main irrigation channel,
- **Intensive livestock farm:**
 - **Cattle rearing: 200 livestock when applying slurry technology;**
 - **Cattle rearing: in a water-base protection zone (if not excluded by the legislation on the protection of water bases, long-term water bases and water facilities for drinking water supply in the protection zone), a protected natural area, a Natura 2000 site or a protection zone for caves from 50 livestock;**

(2) Environmental Impact Assessment (EIA) procedure

On the basis of the classification of the Government Decree, an environmental impact assessment procedure is always required for certain activities, while in other cases the authority has to decide individually whether the project may have significant effects on the environment that require such a procedure.

The purpose of the procedure is to determine the environmental effects of the proposed investment and to establish the conditions for its use.

When determining whether an environmental impact assessment is necessary, the authority shall examine, inter alia, the following:

‘in the case of the relative scarcity, quality, regeneration capacity of the natural resources concerned, the status of the water body concerned on the basis of monitoring measurements carried out in accordance with the river basin management plan under the Government Decree on certain rules on river basin management and the ministerial decree on certain rules for groundwater assessment and the ministerial decree on certain rules for monitoring and assessing the status of surface waters’ (Annex 5 to the Government Decree)

Among the **content elements of the environmental impact assessments** submitted in the context of the procedure, the following deserve particular attention from the point of view of water: (Annex 6 to the Government Decree)

4. Estimation and assessment of expected environmental impacts

...

(AA)anassessment of <https://net.jogtar.hu/jogszabaly?docid=a0500314.kor - lbj306idabec>the change in the status of waters as defined in the river basin managementplan in accordance with the Government Decree on certain rules on river basin managementdue to water impacts and atimetable for the achievement of the environmental objective specified in the plan for the relevant water bodies and protected areas.'

As a result of the environmental impact assessment procedure, the authority takes a decision on the basis of the content of the environmental impact assessment submitted, the findings of its own and of the authorities and the comments of the clients concerned. **The authority may decide to issue an environmental permit or reject the application.** An application for an environmental permit shall be rejected if:

—practicing the planned activity would hinder the achievement of the environmental target statuses set out in the National Environment Programme (*this document deals with the protection and sustainable use of waters, in particular with regard to the achievement of the objectives of the Water Framework Directive.*);

—Fulfilment by Hungary of its environmental or nature conservation obligations under an international treaty;

During the successful environmental impact assessment procedure, the environmental permit will be issued, providing for measures to avoid, reduce and bring to an end adverse effects on the environment, as well as other permits falling within the authority's competence, if the conditions for doing so are met.

Examples of activities subject to an environmental permit (with specific thresholds, conditions) are:

Agriculture, hunting, forestry and fishing:

- Intensive livestock farm,
- Use of forest,
- Wildlife park,
- Fish farming in an intensive cage or bathing plant,
- Ponds or lake systems (if they cover more than 30 hectares of protected sites of national importance).

3) Uniform environmental authorisation procedure (IPPC permit)

The integrated environmental use permit is issuedas an authorisation for the activities listed in Annex 2 to the Government Decree. **(Intensive dairy cattle, relevant for coupled support, are not included in this Annex.)**

Examples of activities subject to a single environmental use permit (with specific thresholds, conditions) are:

- Food industry
 - Slaughterhouses.
 - Treatment and processing for the production of food or feed (from animal or vegetable raw materials).
 - Treatment and processing of milk.

- Processing of animal materials (disposal or recycling of animal carcasses or animal by-products).
- Large numbers of livestock (intensive rearing of poultry or pigs).

The significant difference between the single environmental use permit and the environmental permit is that **the permit** must include provisions on the application of the best available techniques (BAT).

In its decision on a single environmental use permit, the environmental authority shall, inter alia, set out measures, environmental requirements and emission limit values for the prevention of water pollution and the environmentally sound management of waste, and a deadline for compliance.

Environmental auditing

An environmental review is required, inter alia, if the environmental permit expires, a single environmental use permit is required every five years in the course of the activity, in the event of a substantial modification of the authorised activity.

It may be necessary to carry out a partial and complete environmental review, which shall be submitted to the competent environmental authority in the form of an environmental review dossier.

During the environmental review, the installation to be reviewed and the technology used shall be known, verified and analysed in depth with the 5-year series of activities.

B. Manure management

In Hungary, the **general rules on manure storage are laid down** in *Government Decree No 27/2006 on the protection of waters against pollution caused by nitrates from agricultural sources*. (II. Laid down in Government Decree No 7/2000. The Government Decree:

- It designates Nitrate Vulnerable Zones and makes it subject to regular review.
- It prohibits the establishment and extension of livestock farms in the waverooms, protection areas for water bases, flood reservoirs, coastal and buffer zones.
- In addition, manure storage may not be set up within 100 metres of surface water and in the 300-metre coastal strip of the ponds.
- It provides that compliance with the rules is to be monitored by the water protection and soil protection authorities and, depending on the seriousness of the non-compliance, the farm may suspend, restrict or prohibit its activities.
- Nitrate pollution in waters and eutrophication status of surface waters are monitored as part of national monitoring.

Detailed rules for the storage of manure are laid down in *Decree 59/2008 laying down detailed rules for the action programme for the protection of waters against pollution caused by nitrates from agricultural sources and the procedures for the provision of data and records*. (IV. Decree No 29.) of the Minister for Agriculture and Rural Development (hereinafter: nitrates Regulation). The territorial scope of the Nitrates Regulation only covers nitrate vulnerable zones, i.e. it regulates in detail the storage of manure in almost 70 % of Hungary's territory.

Storage – Intensive housing systems

As a general rule, no manure storage facility may be set up in a water-base protection area.

(a) Farm manure:

Under the Nitrates Regulation, livestock **manure** produced in livestock farms, i.e. livestock facilities that exceed the household needs of individuals, must be stored in a leak-proof, insulated-based manure storage with a collection channel and a shaft for collecting manure. The capacity of the farmyard manure storage facility shall be sufficient for the storage of 6 months' volume of farmyard manure.

(b) Slurry, manure juice:

Slurry and manure liquid may be stored only in tanks or basins provided with technical protection. The material of the storage tank or pelvis shall be such that it is resistant to corrosion and has a minimum life of 20 years. The slurry storage capacity shall be adapted to absorb 6 months of slurry.

The target values and the minimum technical parameters for the design of manure storage facilities are laid down in a separate annex to the Nitrates Regulation.

Storage – Extensive livestock production

In the case of deep litter and extensive grazing livestock, it is not necessary to build a manure storage facility provided that it is ensured that the manure accumulated is stored in the house or temporary accommodation for 6 months, and the manure produced is directly onto arable land. The technology used shall also ensure that no application occurs during the period not suitable for fertilisation.

In the case of grazing husbandry the capacity of the farmyard manure storage facility shall be determined in view of the length of time spent by the animals in their barns.

Temporary manure stores without protection against leakage shall not be built:

- within a distance of 100 metres from the coast of surface waters on the agricultural plate.
- water walks, in a stagnation area and on a drained plate,
- from 30 November to 15 February on a plot under agricultural cultivation and on frozen, water-saturated, continuous snow cover.

Farmyard manure may be stored for a maximum of 2 months in the temporary manure heap.

Additional rules

(a) manure application

In order to protect surface waters, the Nitrates Regulation lays down a strict set of rules for fertiliser, manure and slurry land application, in line with the requirements of the relevant Good Agricultural Practice.

The following applications are not allowed:

- fertilisers within 2 metres of the coastline of surface waters;
- organic manure
 1.
 - 20 m from the coastline of lakes;
 - 5 metres from other surface waters;
 - at a distance of 25 metres from sources, wells for human consumption or watering animals;

At the time of planning the nutrient management of agricultural areas, the volume of nutrients to be applied shall be calculated in view of the nutrient supply of the soil and the nutrient demand of the crop that is necessary for a crop yield adjusted to the conditions of the actual habitat. For the calculation of the amount of nutrients to be applied, the values used shall not exceed those laid down in the Regulation.

The soil of the irrigated area and, if the groundwater level is reached within 5 metres, the level and quality of groundwater must be checked every 5 years by the holder of a water right permit for irrigation. Data on groundwater quality and water test results received by the soil protection authority as part of the soil protection plan shall be sent annually to the water protection authority.

(b) Record-keeping obligation

The farmers concerned shall also keep continuous records of this aspect of their activity on the farm logs relating to nutrient management, fertilisation, parcel cultivation data and livestock farming. This is controlled by the National Food Chain Safety Office (NFCSSO).

II. Impact of the CAP Strategic Plan conditionality requirements on water saving of coupled support

Strengthened environmental conditionality will also become one of the basic conditions for access to support for coupled support as of 2023. Accordingly, the beneficiaries of these interventions also comply with all the standards set out in Annex III to Regulation (EU) 2021/2115 that directly or indirectly protect water as a priority natural resource. This is the following:

- GAEC 2 (Protection of wetlands and peatlands): Protection of soils with high carbon content;
- GAEC 4 (Development of buffer strips along water courses): Protection against water pollution and prevention of depletion of water resources;
- SMR 2 (Council Directive 91/676/EEC concerning the protection of waters against pollution caused by nitrates from agricultural sources)

In addition, among the elements of conditionality valid from 2023 onwards, the SMR 1 contains a specific baseline standard for the implementation of certain elements of the WFD, which can also be held accountable to producers through the system of monitoring and penalties of conditionality. Article 11(3)(e) and (h) of the Directive are also a mandatory basic measure for each river basin management plan. The proper national implementation and control of the standard thus establishes a link between the authorisation procedures for water abstraction for irrigation and the payment of payments under the CAP.

III. Additional guarantees to strengthen the coherence between the Coupled Income Support (CIS) and the Water Framework Directive

The domestic water licensing system includes adequate guarantees to achieve the objectives of the Water Framework Directive. **In addition to the existing official control, a new targeted inspection will be introduced as of 2023 to detect possible illegal abstractions or abstractions other than those covered by the permit. In the case of coupled aid, this control provides additional guarantees that farmers interested in it treat water in a sustainable way as a priority resource in the course of their agricultural activities.**

The new control level will be structured as follows:

1. Farmers submitting an application under the coupled aid scheme shall declare, when submitting the single application, whether or not irrigation is being carried out during the cultivation of the crops covered by the aid. The information thus produced will be cross-checked with the water permit database maintained by the water authority, which would, in the context of an administrative check, confirm that applicants are in possession of a water use permit.
2. If the water authorities become aware of practices significantly different from those covered by the permit, thereby seriously jeopardising some of the objectives of the Directive, the authority shall send these findings to the Paying Agency.
3. When processing the applications, the Paying Agency shall examine, on the basis of the information received, whether the practice indicated occurs in the context of the cultivation of irrigated crops subject to coupled aid. If justified, it shall exclude the applicant concerned from the payment of the relevant entitlement for the year in question.

4. In addition to the feedback referred to in point 3, in order to ensure that more targeted checks are carried out in the case of coupled aid, the Paying Agency shall carry out an on-the-spot check to verify that the irrigation farmers act in accordance with their water rights permit. The size of the control sample is set at 3 %. The control sample will be drawn from the beneficiaries of the schemes relevant to compliance with the Water Framework Directive (sugar beet, rice, arable vegetables, industrial vegetables, intensive and extensive fruit) where the crops covered by the aid can be linked to a water body of less than good status. If, during the on-the-spot check, an irregularity is found which does not comply with the authorisation, thereby seriously jeopardising some of the objectives of the Directive, the Paying Agency shall exclude the applicant concerned from the current payment of the entitlement in question during the processing of the applications.
5. In the case of farmers participating in the dairy cow premium, the new control level examines whether the activity is carried out in accordance with the provisions of the environmental permit. If practices other than those specified in the environmental permit are discovered during the soil protection and water authority inspection or the on-the-spot check carried out by the Paying Agency, thus presenting a serious risk to the quality of the water, the aid linked to production cannot be paid for the year concerned. Water quality protection is also ensured by the fact that SMR 1 on diffuse pollution and SMR 2 on compliance with the Nitrates Directive are among the elements of conditionality.

In addition to this additional level of control, an element of “prudent treatment of water as a resource” will be included in a broad communication campaign on the new CAP system. In this context, particular attention will be paid to key elements of the legislative environment (e.g. water abstraction monitoring).

IV. Other CAP Strategic Plan interventions that can help users of coupled aid to comply with the Water Framework Directive

As a complementary piece of information, it can be noted that through the investment schemes financed under Pillar II of the CAP Strategic Plan, significant resources are planned for the **sustainability development of agricultural holdings** to improve compliance with the Directive, from which the modernisation of additional livestock holdings can be achieved (intervention code: RD01_E01_FRM_73) significant funding was available for the modernisation of livestock holdings in Hungary in the 2015-2022 cycle. The protection of water from a quality point of view is a priority objective, including manure storage and distribution in accordance with the requirements of the Nitrates Directive.

With the intervention foreseen in Pillar II of the CAP Strategic Plan, we also want to encourage the widest possible uptake of **precision farming**, promoting a more rational and sustainable use of natural resources (including water) in each sector (intervention code: RD02_D01_FRM_73). Furthermore, we are and will continue to support the introduction of **water-efficient irrigation technologies**, the optimisation of water use in irrigation systems, the development of water-efficient irrigation infrastructure and related structures, and the introduction of energy-saving irrigation technologies. We also aim to scale up the use of digital technologies and support investments to support the digitalisation transition of producers. Modern and professional irrigation management, optimised precision irrigation technology increases water efficiency. The purchase and development of such technologies can lead to significant additional costs for producers, but also contribute to saving water and energy, avoiding over-irrigation. The dissemination of targeted precision irrigation methods, in which water volumes can be accurately measured, leaks and leaching can be reduced, contributes to increasing efficiency (interventions code: RD02_D01_FRM_73; D12_W01_WTO_74; RD15_W04_COP_77).

ADDENDUM

How does the water licensing in Hungary take into account medium-term climate scenarios?

Authorisation for water abstraction is subject to the consent of the Water Directorates. The Water Directorates are responsible for the preparation of the River Basin Management Plans (RBMPs), which include the assessment of the status of water bodies. In accordance with the quantitative status of bodies of **water, abstraction may be authorised for both groundwater and surface water only if ecological water demand is ensured.**

Ecological water demand is protected by strong guarantees during authorisation. It is therefore not one of the many aspects of examination/balancing, but rather a guiding principle. According to the logic of the Water Framework Directive, the quantitative status **taken by the authority as the starting point does not indicate that there is a high or low level of free water resources at a point in the water network, but rather whether the already authorised uses of water cause the abstraction of ecological water.** For example, a small watercourse may be of good quantitative status because it is not subject to abstraction, but its usable water resources are quite insignificant, which does not provide for meaningful abstraction, as it has already dried due to previous surface water abstractions or the lowering of the groundwater (soil) level, or has become an intermittent watercourse because groundwater resources with a descending trend are not able to provide the basic flow of the watercourse either. In **the planning of the irrigation investment, the amount of water abstraction must therefore be determined in such a way as to ensure that the ecological water demand of the system affected by the abstraction of water is ensured.**

In Hungary, we call for the development of sustainable water management communities in order to facilitate investments in irrigation, who may require the preparation of **environmental district plans** (ESCPs) in order to obtain the water rights permit required for the investment, which, pursuant to Section 10(1) of Act CXIII of 2019 on *Irrigation Management*, have been drawn up by the National Land Centre as an irrigation administrative body with experts, thereby facilitating the water licensing process.

Sustainable water management communities operate in the irrigation area and the SARs are prepared for these irrigation areas. The **preliminary assessment documentation** (EVD) is a mandatory element of environmental district plans. Government *Decree 314/2005 on the environmental impact assessment and the uniform environmental use permit procedure*. (XII. The content of the EVD and the consultation request is set out in Annex 4 to Government Decree No 25/1999. On the basis of the Government Decree, the **mandatory element of the EVD is to demonstrate the impact of the planned activities/investments on certain environmental elements**, in which the issue of climate change is addressed in a number of points:

1. Climate **sensitivity analysis** of the investment;

2. analysis of **potential impacts for certain climatic factors**;

A description of **adaptation to the effects of climate change** for the planned activity;

4. describe the impact of the planned activity on the potential area of impact **and climate change adaptation capacity**.

The Hungarian authorities therefore clearly aim to spread sustainable water management through the water licensing criteria. As a result, the increase in irrigated areas does not result in a necessary or straight increase in water use (irrigated water). In the case of irrigation farming, priority should be given to technical solutions that take into account the scarcity of surface water and groundwater resources and thus lead to maximum water savings.

List of legislation that directly sets out the obligation to assess environmental aspects and climate change aspects at each stage of water licensing:

—*Environmental impact assessment and uniform environmental use permit procedure 314/2005*. (XII.

Government Decree No 25/2002

— Government Decree No 72/1996 on the exercise of water management authority powers Government Decree No 487/2015 of 22 May 2013

— Decree No 221/2004 on certain rules on river basin management (VII. Government Decree No 21/2000

— No 223/2014 on the designation of bodies performing the tasks of water administration, water protection authority and water protection authority. (IX. Government Decree No 4/2000

— Government Decree No 1242/2022 (IV. Decision No 28) on the 2021 River Basin Management Plan of Hungary (VGT3)

Act LIII of 1995 on the general rules on environmental protection

On the basis of the above, it can be summarised that the implementation of environmental and climate change aspects in the permit procedure must be examined as part of the involvement of a specialised authority or as a specialised issue. If, in the course of an administrative procedure, legislation requires an examination of a specific environmental issue (if applicable, water protection), the operative part of the decision closing the procedure must contain the fact, the outcome of the examination of the technical question and the specific requirements established on the basis thereof, and the detailed findings made during the examination of the technical question must be set out in the statement of reasons.

3.4 Overview as regards the aim of fairer distribution and more effective and efficient targeting of income support

Need for a strategic approach based on the analysis of the situation

The SWOT analyses carried out for each specific objective (in particular SO1, SO3, SO9) and the needs identified highlight the fact that, in line with global societies and economic changes, the way in which small farmers live in rural areas is becoming less attractive and sustainable in Hungary. Non-exhaustive requirements in the needs analysis: SO1: A predictable basic income for farmers; Reducing income fluctuations due to natural (weather) and market risks; Improving the profitability of small farms; SO3: Development of short supply chains, development of local cooperation in product production, distribution and marketing; SO7: Promoting on-farm/off-farm diversification, with a view to developing multi-build rural businesses; SO9: Raising consumer awareness.

(2) Hungary's strategic approach to strengthening small farms (targeting)

We believe that diversity is a fundamental element of Hungarian and European culture, not only for biological funds, but also for food systems. In order to maintain the diversity of food systems, we need to use as many tools as possible to support the small producers and food producers, which is the main guarantor of this diversity. Based on the needs assessment and the experience of technical and social consultations, it can be concluded that the support scheme applied in 2015-2022 needs to be further developed, for which the interventions of the CAP Strategy Plan provide a good opportunity.

Hungarian policy decisions result in a more targeted direct support scheme. Thus, **much stronger incomes compared to 2015-2022 will be redirected** towards small and medium-sized farms (10 % compared to less than 3 % in 2020). We also wish to maintain **coupled support** for sensitive sectors, as this is crucial, based on the findings of the SWOT analyses, consultations with partners and emerging needs and experience:

- Preserving the rural population through job creation.
- Security of income (SO1 Sub-necessity 1.1.1: A predictable basic income for farmers; SO1: Sub-requirement 1.1.3: Improving the profitability of small farms).
- Maintaining a diversified agricultural production structure and export potential and achieving environmental and climate objectives through strengthened conditionality, the agro-ecological programme and coherence with the Water Framework Directive (SO5-2). Main need: Improving

the ecological and chemical status of surface and shallow groundwater).

3. Augmented ambitious contribution of the CAP Strategic Plan to the achievement of the objectives set

Using the option provided for in Article 147 of Regulation (EU) 2021/2115, we will continue to maintain transitional national aid to support sensitive sectors, with their phasing out. In order to improve targeting, we make use of the possibility to change the reference period to 2018. To ensure that interventions in the form of direct payments effectively help meet the identified needs, **it is essential to increase the financial resources available for direct payments** through flexibility between pillars. This does not jeopardise the financing of rural development interventions, as the maximum national co-financing of 80 % in Pillar II will be available.

Against this background, from 2023 onwards, **we plan to implement the system of Pillar I direct payments along the following key elements:**

- Through a transfer between pillars, 25 % of EAFRD resources are grouped into direct payments;
- The Basic Income Support for Sustainability (BISS) is introduced without territorial discrimination, but by extending the definition of eligible hectare (DP01_E01_BISS_16).
- By redistributing funds to small and medium-sized farms, including a fairer distribution of direct payments from 2023 onwards, we will facilitate the use of redistributive income support (redistribution, CRIS) instead of support for small farmers (former SFS) and degression and capping (DP02_E02_CRIS_16).
- We do not use the derogation, and we plan to apply the redistributive support (CRIS) up to 14 % of direct support.
- The implementation of the agro-ecological programme (AÖP) has been developed in such a way that ambitious commitments allow the participation of small farms and access to additional support (DP17_G01_ECOS_16).
- In the case of Pillar I support for young farmers, the financial resources, the unit rate of support and the area boundary increase significantly, while allowing young farmers starting before 2023 to make full use of the five-year support period (DP03_B01_YFS_16).
- Coupled income support (CIS) remains available for sensitive sectors targeting a large number of small farms mainly active in the fruit and vegetables or livestock sectors (DP04_E03_CISB_16-DP16_E15_CISP_16).
- Using the possibility provided for in the Strategic Plan Regulation, transitional national support to the sensitive sectors concerned will be maintained with a phasing out, with an update of the reference period to 2018.

In Pillar II, intervention for small farms is planned in the form of flat-rate support under Article 73 of Regulation (EU) 2021/2115. The purpose of this intervention is to support the development of small farms. Objectives: market stabilisation and development, modernisation and diversification of product mix, production and processing of traditional artisanal products, modernisation of production methods, increased environmental efficiency, increased added value and digitalisation (RD09_B05_SML_73).

An important element is the implementation of tourism development, support for rural areas may include rural tourism development grants (RD51_R11_TUC_77). The contribution of the CAP Strategic Plan to the development of tourism services is essential, as the development of local product systems, the preservation of biodiversity, the enhancement of ecosystem services and the protection of landscapes are all key pillars of tourism attractions and services.

With a collaborative approach, we want to help to shorten the supply chain and involve producers and consumers in short supply chains (RD49_R09_SCC_77). Emphasis will be placed on supporting social

innovation cooperation, social enterprises, including social cooperatives (RD50_R10_SEC_77). Digitalisation-focused development is also a priority, as the digital transition is important both in rural areas and in agriculture to enable them to catch up. Through the LEADER intervention, support will be provided to local action groups already operating or set up in the territories of the country, which play a significant role in the territorially balanced development of rural areas and communities, taking into account previous experiences (RD57_R15_LDR_77).

Better targeting of aid is supported by the inclusion in the selection principles of each intervention, in part based on the results and experience of the previous period, of criteria such as the mainstreaming of regional criteria, which will help to give priority to applicants wishing to develop in less-favoured rural areas. Priority may also be given to developments under the Roma Inclusion Programme, which take place in areas well below average.

ADDITIONAL INFORMATION

Focus of the redistribution strategy

Our redistribution strategy focuses mainly on small farms. It is important to highlight that the examination of the implementation of the CRISS intervention alone does not provide a complete picture of our ambitions in this regard.

Contribution of the various elements of the Strategic Plan to strengthening the focus on small farms:

- Hungary dedicates 14 % of direct aids to CRISS intervention, and no derogation is requested in terms of the instruments used or the expenditure rate.
- As a result of the strategy, indicator R.6 increases from 100 % to above 112 %.
- 62 % (~104 thousand farmers) of the increased specific amount of the CRISS payment is allocated to their entire area as they operate on a maximum of 10 hectares.
- The minimum requirements for the use of direct aids (EUR 1 ha or EUR 100) have been designed in such a way as not to limit the number of potential beneficiaries to the detriment of small farms.
- In line with the same principles, the minimum number of eligible animals for livestock schemes for coupled aid is set at 1 animal, precisely in order to include the smallest operators in the aid scheme. In accordance with the consultations with the Commission, this will be consolidated for all animal production schemes in the plan.
- In order to reduce the administrative burden on small farms:
 - Farmers with a maximum of 10 hectares of arable land are exempted from compliance with GAEC 7 and GAEC 8.
 - Applications from small farms will be evaluated under a simplified procedure, which significantly reduces decision-making time.
- In Pillar II, we will also launch an intervention targeting smaller farms, focusing on the sustainability improvements of small farms, as per Article 73 of Regulation (EU) 2021/2115.

Combined effect of direct support schemes on a fairer distribution of resources

It is important to highlight that CRISS is not the only intervention that helps to deliver targeted support for small farms. We therefore agree with the Commission's observation that the combined effect of the direct aid elements should also be examined. This is shown in the graphs below.

In the case of complementary income support for young farmers (CIS-YF) and several coupled aid schemes (CIS) (mainly fruit and vegetables), most of the beneficiaries are small and small-medium farms.

Figure 1: Assessment of the combined effect of direct aid schemes (per hectare)

Source: Based on FADN data, AKI calculations

Explanation: As can be seen in the chart, using the proposed model, the specific net added value per unit of area would increase most for size classes < 10 ha, while for other size classes it would develop at approximately the same level. *Eco-scheme payments* are not included in the calculation, given that there is considerable uncertainty about the size of producers willing to make additional commitments in return for the aid and their size.

Figure 2: Impact of CRISS in the 10-150 ha category

Source: Based on FADN data, AKI calculations

Figure 3: Change in net value added per hectare for 2023-2027 (*without eco-schemes*) vs. 2014-2020

comparison by holding size between 10 and 150 ha

Source: Based on FADN data, AKI calculations

Figure 4: Assessment of the combined effect of direct support schemes (per annual work unit)

Source: Based on FADN data, AKI calculations

Explanation: As shown in the chart, the specific net value added per annual work unit increases the most for size classes 10 to 150 ha, while it would lead to less progress in size classes below 10 ha. The distortion of data is caused by the fact that, for larger farms, the additional support can be achieved with a lower use of labour. *Eco-scheme* payments are not included in this calculation either.

Importance of medium farms in Hungarian agriculture

- For decades, the Hungarian farm structure has shown a rather polarised picture, with a large number of self-sufficient and ancillary farms cultivating a small share of agricultural land, and there is a large category of farms with relatively few operators cultivating a significant part of the area. As a result of the policy choices made over the last decade, a medium-sized, goods-producing and family-run economy has emerged and continues to grow.
 - According to data from the Central Statistical Office, a significant part of the agricultural area (39.7 %) is used by medium-sized market-producing farms with between 1 and 150 hectares, which use almost three quarters of the vineyard and fruit area, 40 % of arable land and 55 % of grassland. This group accounted for around one third (31 %) of farmers with land in 2020.
 - Overall, the number of farms decreased by 31.3 % between 2010 and 2020 as a result of land concentration. At the same time, the number of farms between 5 and 150 hectares increased by 6.4 % (+ 4515 heads). During this period, the area cultivated by farms between 5 and 150 hectares increased by 17.3 %. In hectares, the growth of farms between 5 and 150 hectares was decisive (+ 287.9 thousand hectares), with these medium-sized farms cultivating around one third of the agricultural area in 2020.
- Not supporting the medium to medium-sized category of holdings would run counter to our objective of improving the competitiveness and efficiency of Hungarian agriculture, as it would significantly reduce net value added production.
- The risk of artificial splitting of farms would therefore be significantly increased due to the abolition of the unit value 2. The reduced specific value therefore plays an important role in mitigating the potential *threshold effect*.
- It is important to see that, in the context of the technological conditions of the 21st century and the conditions of growing international competition, a 150-hectare farm for arable crops cannot be considered large.
- In addition to being actively involved in the employment of the rural workforce, improving the quality of life in rural areas and contributing to achieving our environmental goals, small and medium-sized family farms have a key role to play in ensuring food supplies. The Russian-Ukrainian conflict is having a drastic impact on the global food supply chain, so maintaining the quality of production and supporting it from EU and national sources is more important than ever.

Adequacy of the redistribution strategy

Under the New Delivery Model, Member States' visions presented in the Strategic Plans are necessarily different and Member States' commitments are difficult to compare. The reason for this is that there are different plant structures, different starting positions and therefore different needs arising from the analyses. We believe that the CAP, starting from 2023, will partially provide different responses to Member States' needs, yet use common tools. However, even in this situation, a strengthened set of indicators, which reflects the results of the Member States' models on the basis of a uniform methodology, can adequately support the comparison.

According to our preliminary calculations for indicator R.6 for a fairer distribution of resources, the proposed implementation method can clearly improve the fair distribution of direct payments. The estimated value of R.6 rises to above 112 %, compared to ~100 % in 2019. This demonstrates that the chosen implementation mode is appropriate to achieve the objective set at EU level.

R.6 showed a slow, steady rise in the current cycle and as a result of the current implementation model (see table below). By comparison, the planned implementation model from 2023 will lead to a significant leap from the first year. Given that other interventions having an impact on the value of indicator R.6 would not materially change, it can therefore be clearly concluded that capping and degression, as well as simplified support for small farmers, did not approach the redistributive effect that the model described in the strategic plan could bring. The sharp increase in R.6 is driven by a change in the redistribution model, which promotes a fairer distribution of direct aids.

<i>Year</i>	<i>R.6 (%)</i>
2015	97,7
2016	98,8
2017	99,6
2018	99,9
2019	100,3

Explanation of the non-application of degression and capping

Technical considerations

The focus on small and medium-sized farms already determined Hungary's decisions on the use of EU agricultural support funds in 2015-2022. As a result, Hungary applied the strictest withdrawal in the EU by removing in full the amount of the basic payment element (*SAPS*) in excess of EUR 176 thousand. This was complemented by a simplified scheme for smallfarmers, which, however, was only partially able to meet the hopes brought about by the imperfectness of the regulatory environment. At the same time, we saw simplification as a real and tangible tool. During the reform negotiations, the Hungarian position aimed to create a more ambitious system than the model presented, which would continue the measures of capping, degression and small farmers' support already known to producers, while at the same time making it more flexible on the regulatory side and significantly reinforcing small farmers' support from the source side.

Given that this path was not possible in the final form of the basic act, the focus has shifted towards a redistributive payment (CRISS), which, according to our analysis, not only replaces our efforts to a higher level by meeting the minimum expenditure rate set out in the Regulation, but also brings our ambition to a substantially higher level. This can also be clearly demonstrated by the value of indicator R.6, which could not increase above 100 % before 2023, while under the new conditions it could already reach 112 % in financial year 2024.

Based on the experience of the SWOT analyses (in particular SO1 and SO8), the needs assessment (in particular needs 1.1.3) and consultations with partners, there is a strong need to redistribute direct

payments in the opposite direction of the economy.

Our preliminary analyses found that, under the conditions laid down in Article 17 of Regulation (EU) 2021/2115, partial (degression) or total capping could only have been carried out in a manner adapted to the Hungarian land structure with the operation of an exceptional bureaucratic system. Another factor in the decision was that wage compensation would have created unequal conditions between the higher mechanised crop production and the more labour-intensive livestock sectors.

On the basis of the unit value of the basic payment (BISS) provided for in the plan, the total withdrawal of the part in excess of EUR 100 thousand would mean that, without compensation, it would enter from a holding size of ~630 hectares, which would make it impossible to manage a significant part of viable commodity production plants in Hungary. It is precisely the layer that has been strengthened as a result of the policy decisions taken over the last decade. In the case of an arable crop farm, this wage compensation would also not be meaningful.

However, in view of the previous ceiling of EUR 176 thousand, the largest farms (farms above 1 200 hectares) would be excluded from CRISS.

Simplification, practical aspects

Simplification was also taken into account when developing the proposed implementation model, along the following lines:

- The use of the Redistributive Payment Scheme (CRISS) simplifies the aid scheme both at the level of producers and at the level of the Paying Agency. CRISS replaces degression, capping and small farmers' support as a single intervention.
- It facilitates the implementation of CRISS by complementing the amount of the BISS and its eligibility criteria are almost identical to the BISS.
- The estimated product of reduction is uncertain, which could pose a risk both in Pillar I (if the abstract amount is redistributed to the BISS or CRISS envelope) and Pillar II (if the abstract resources were to be redeployed and targeted to increase the source of an intervention).
- For the smallest farms, uncertainty due to the inflexible rules of the small farmers scheme will be removed.
- In contrast to small farmers' support, small farms will also be able to make additional contributions to the basic agro-ecological programme under this scheme.

In summary, the redistribution implementation model presented in the plan was designed on the basis of policy and simplification aspects, making use of regulatory opportunities. At the same time, it is important to stress that it does not claim sacrifice in meeting the objective set at EU level (fairer allocation of resources), but rather represents substantial progress and an increased level of ambition. This is clearly confirmed by the planned development of indicator R.6.

Justifications on the derogation related to second subparagraph of Article 29(1) and Article 98

Hungary does not wish to make use of the possibility provided for in the second subparagraph of Article 29(1). We aim to achieve a fairer distribution of direct aids through the CRISS intervention, allocating 14 % of direct aids. Thus, we do not intend to derogate either in terms of intervention used or in terms of minimum spending rate.

3.5 Overview of the sector-related interventions

3.5.1 Fruit and Vegetables

The need for a strategic approach based on an analysis of the situation

The fruit and vegetables sector faces both the strong pressure from highly concentrated retail and discount chains, which play a significant role in setting market prices, and the harsh competition from third-country products that combine better quality with relatively low prices and have a rapidly growing market share. The players in the sector are typically micro, small and medium-sized enterprises and therefore have

relatively weak bargaining power vis-à-vis the much more concentrated food trade and the manufacturing industry.

The sector's export-import balance is still positive, but an increasing share of domestic consumption is imported. Nowadays, there are no longer only imports for the purpose of southern fruits or range, with a stronger supply of temperate fruit and vegetables, which have become a major competitor of our domestic supply. Fruit and vegetable producers also face increasing competition on domestic markets for solvent demand. Around half of the production is consumed fresh and the other products are processed by the domestic food industry.

On the upstream side, concentration vis-à-vis suppliers is further increased by sourcing associations that have been developed by food retail companies as horizontal strategic partners. By running these pools, participants coordinate their demand, thus further improving their bargaining power vis-à-vis suppliers. Large-scale supplies achieve a reduction in unit costs. The concentration of trade thus results in a weak bargaining power for the producers who supply it, so that a large proportion of producers in the fruit and vegetable sector are essential to concentrating supply. Producer organisations (POs) and their operational programmes (OPs) have been a key element of grouping the supply of fruit and vegetables in recent years.

Hungary's strategic approach to the fruit and vegetable sector

Based on international and domestic experience, POs are still the most effective in cooperating with highly concentrated retail and discount chains. The aim remains that producer organisations should as much as possible take over the organisation of the market, represent supply and demand and the interests of producers, thereby further improving their bargaining power on the market. In order to increase efficiency, it is necessary to further encourage the establishment of new producer organisations in certain areas, the integration of new producer members and the rational merger of smaller organisations. In order to increase the efficiency of production, further assistance is needed for the activities of operators in the sector.

The strengthening of producer organisations remains the first priority in the Hungarian fruit and vegetable production strategy, as they can increase the technical and technological standards of the sector and create sectoral advice. Based on the needs of producer organisations, market-oriented applied research and professional training could be strengthened. They help to strengthen the transparency of primary production, which is regrettably low, and to develop specific marketing in the sector. The strengthening of POs would not only support the development of an ever-growing fresh market, but would also increase the interest of the processing industry, which is currently majority foreign-owned in Hungarian products.

The key issue of market-oriented production development is the need to ensure consistency between technological and technological development, adaptation to climate change, education and research and expert advice, and to make the necessary resources available in the short and long term. The main objective is to ensure an adequate income for producers by improving the market value of products in line with consumer expectations.

Crisis management measures should be applied in the short term and communicated to non-organised producers in order to put an end to the emergence of insufficient quality and quantity of goods causing market disruption and, in the longer term, to create the conditions for modern production and production, as well as the development of specific product marketing in the targeted sector.

Hungary's environmental aspects are highly suitable for producing the best quality fruit and vegetables. The objective of reducing the burden on the environment while decoupling it from economic growth should be taken into account in the farming activity and in the activities of producer organisations. In agriculture, it is particularly important to stop pollution at source. The role of Producer Organisations

(POs) is also key in this area, as effective interventions should be defined for each of the above areas, so that the objective of reducing environmental pressures and decoupling it from economic growth is effectively implemented.

Contribution of CAP Strategic Plan interventions to the development goals of the sector

On the basis of the needs resulting from **the assessment of the situation, the measures taken under the operational programmes** to achieve the sectoral objectives are recognised producer organisations and associations of **recognised producer organisations in the fruit and vegetables sector**. The intervention follows the support for the operational fund for fruit and vegetables producer organisations used under the national strategy for sustainable operational programmes. The purpose of the intervention is to ensure that production is planned and adapted to demand, to concentrate supply, to increase the value and quality of commercial goods, and to promote and market the products produced by its members. And increasing the consumption of fruit and vegetables products, improving competitiveness through modernisation, stabilising production costs and producer prices. And the development of sustainable production methods, including increasing resilience to pests, diseases, climate change, contributing to climate change mitigation, promoting environmentally sound cultivation practices and production techniques, crisis and risk management and improving employment conditions.

The planned rate of support shall be 4.1 % of the value of marketed production of the reference period for producer organisations, 4.5 % for associations of producer organisations and 5 % for transnational producer organisations and associations. An additional 0.5 % may be used only for research and development of sustainable production methods, the promotion of environmentally sound techniques, the protection of the environment, climate change mitigation, the enhancement of the commercial value and quality of products, the promotion and marketing of products. Union support shall not exceed 50 % of the actual expenditure. However, the ceiling may be raised to 60 %, 80 % and 100 % respectively, provided that the conditions laid down in the Regulation are met. 15 % of the aid must be allocated to climate and environmental measures consisting of at least three activities and 2 % to research development. Expenditure for interventions of the types of intervention referred to in points (f), (g) and (h) of Article 47(2) of Regulation EU/2021/2115 shall not exceed one third of the total expenditure. In addition to EU support, given the low level of producer concentration, national financial assistance is granted up to 10 % of the value of marketed production, up to a maximum of 80 % of the contributions paid by the producer organisation or its members (interventions code: SC11_A03_FVA_47, SC12_A04_FVT_47, SC13_G01_FVO_47, SC14_B01_FVE_47, SC15_E10_FVP_47, SC16_E11_FVQ_47, SC17_E12_FVC_47, SC18_G02_FVL_47, SC19_I01_FVF_47, SC20_I02_FVV_47, SC21_I03_FVS_47, SC22_I04_FVR_47, SC23_I05_FVW_47, SC24_I06_FVG_47, SC25_I07_FVN_47, SC26_I08_FVH_47, SC27_I09_FVM_47, SC28_E01_FVI_47, SC29_I10FVC_47).

In view of the low level of organisation of the fruit and vegetable sector, in addition to sectoral interventions, the system of **coupled aid**, which is also available to non-organised producers and differs from sectoral interventions, is crucial for the operation of each path. 13 % of the national envelope could be used for this, and a further 2 % of the Hungarian envelope for protein crops was allowed to be allocated to producers in the form of coupled aid. The following coupled support interventions are planned for the product areas covered by the sectoral intervention: vegetables, industrial vegetables, industrial oil plants, extensive fruit, intense fruit. The interventions are planned to be maintained because it is of the utmost importance for fruit and vegetable producers and their families that coupled with the basic payment, coupled with the basic payment, constitute a genuine safety net ensuring an expected level of resilience in the event of income fluctuations resulting from these weather and market risks. The specific aid value for interventions has been adjusted to reflect changed market conditions (interventions code: DP06_E05_CISV_16, DP07_E06_CISI_16, DP08_E07_CISO_16, DP09_E08_CISE_16, DP10_E09_CISF_16).

Among the interventions under Pillar II, primarily **farm** sustainability development and the digital

transition of agriculture, as well as interventions to improve water efficiency, all provide opportunities to support **investments** that contribute to a more sustainable functioning of the fruit and vegetable sector, while increasing competitiveness. Many of these interventions are now well known and popular, so we plan to increase the level of ambition mainly through an increased budget and a growing number of beneficiaries (interventions code: RD01_E01_FRM_73, RD02_D01_FRM_73, RD12_W01_WTO_74, RD15_W04_COP_77).

All elements of AKIS measures (information service, advice, training, innovation and digitalisation) directly contribute to addressing the challenges of the fruit and vegetable sector. In addition to increasing the resources in the new period, we also plan to increase the level of ambition by involving experts and organisations implementing AKIS-type actions in the sectoral programmes more in the knowledge network than is currently the case. The AKIS Coordination Unit and the CAP Network (interventions code: RD02_D01_FRM_73 RD58_A01_TRA_78, RD59_A02_INF_78, RD60_A04_ADP_78, RD61_A05_EIP_77).

3.5.2 Apiculture products

Theneed for a strategic approach based on an analysis of the situation

Due to the natural conditions, the entire territory of Hungary is suitable for beekeeping. Bee density (12 colony/km²) is high in Europe. The volume of production varies from one vintage year, but almost every year there is more honey harvest than that consumed by the population, which means that significant quantities are exported, crucially to the Member States of the European Union, which require high food quality.

However, **the needs of the sector have changed compared to the period of successful apiculture programmes so far. Given the crucial importance of foreign markets for our apiculture products, it is particularly problematic in recent years that in the traditional EU export markets for Hungarian products, to which we export 80 % of our honey production, they are currently in competition with substantially cheaper or lower quality products from third countries.**

The sector has faced an unprecedented crisis with unprecedented speed, as our traditional EU honey markets are getting more and more from outside the EU to low-quality but low-quality honey. As a result, demand for high-quality Hungarian honey with higher production costs has been drastically reduced by large European honey processors, which are primarily profit-oriented.

The departure of honey processors is due to the fact that, as a result of repeated difficulties, the European consumer market has also shifted towards price sensitivity to the detriment of quality products.

In the context of competition on the honey market, the price advantage granted by bilateral agreements for non-EU products cannot be compensated by the production of high-quality EU products, by improving the level of processing and by increasing promotion and marketing activities.

The price of apiculture equipment has increased significantly over this period. In this context, the incentive to invest in the sector has been significantly reduced.

Given that it is increasingly difficult for full-time beekeepers to earn their livelihoods, some of them are slowly placed on the labour market and beekeeping, as an ancillary activity, contributes to their income. As a result of this sudden drop in investment, bee flocks are unsold, but in cases of beekeeping as an ancillary activity, there is no time to carefully treat bees. The latter is also the case for some of Hombian beekeepers. Lack of revenue, reduced time spent on the activity and lack of marketability of stocks lead to neglect of treatments.

Given that Hungary has one of the highest bee density in the EU, under these conditions there is an increased risk of an animal health epidemic for other apiaries. This obliges other beekeepers to make more frequent and increased use of rotating equipment, such as medicinal products, vehicles, application equipment, protective equipment, frames and wax exchange. Moreover, the prices of those current assets have doubled in recent years.

In summary: instead of investing in production and processing to promote quality and cost-effectiveness, the need for the sector, in the absence of an appropriate market, has shifted towards maintaining the health of the bee population as a key to the survival of the sector, seeking to overcome a difficult period which is likely to persist until the situation on the honey market is resolved.

Hungary's strategic approach to the apiculture sector

The beekeeping sector has typically been a secondary activity in previous decades. In the years prior to accession to the European Union (2004), there were 16-17 thousand beekeepers with around 850 thousand bee colonies. The specific yield was between 18 and 20 kg per bee colonies, with low live labour efficiency. The sector produced honey production in the range of 10 to 15 thousand tonnes, two thirds of which were exported.

Since accession to the European Union (2004), as part of Hungarian agriculture, the Hungarian apiculture sector has undergone significant changes, both in its form and in its content, due to its social and economic influence.

The number of beekeepers and bee colonies has increased significantly. The number of beekeepers decreased slightly after a peak of 22 thousand in 2017, and is still above 20 thousand. The number of bee colonies was similar and, after almost 1.3 million peaks in 2017, is currently between 1.1 and 1.2 million.

As the sector develops, the beekeepers' society has been divided. Intensive commodity-producing, full-time beekeepers have emerged, and beekeepers have been maintained as a secondary activity. The average number of bee colonies per beekeeper is between 50 and 60. The proportion of full-time professional beekeepers with at least 150 bee colonies is less than 7 %, while around a third of bee colonies are treated.

The average age of the beekeeper society is rather high, at the age of 45-50 years.

The apiculture sector has been in crisis in recent years, owing, on the one hand, to reduced yields due to climatic changes, but mainly to the anomalies on the honey market. In times of crisis, the deterioration of bee health is at risk and particular attention should therefore be paid to supporting efforts to maintain the health of bee colonies.

The vast majority of beekeepers are members of an association of beekeepers. There are around 110 beekeepers' associations with more than 13 thousand members. Beekeeper associations are grouped together by the Hungarian Apiculture Association, as the main representative body of beekeepers and an interbranch organisation.

Beekeepers' associations are democratic professional organisations organised on a territorial basis. On the basis of their financial means, OMME is a member organisation of OMME or a local organisation of OMME as a separate legal entity.

OMME and the Ministry of Agriculture will jointly seek appropriate solutions to professional challenges in the framework of a Strategic Cooperation Agreement.

Facilitating the functioning of organisational life contributes greatly to the exchange of practice-oriented knowledge in support of sectoral objectives. Sector-specific advisory and service systems enhance farmers' knowledge of the impact of agriculture on the environment, help to raise awareness of close-to-nature farming, promote the importance of biodiversity and ecosystem services.

It is important for the beekeeper society to develop and, where possible, standardise theoretical knowledge and technology. Bee density in bee pastures is also higher than the average, which poses a risk to bee

health. It is therefore of great importance to support the purchase of medicinal products, native pure-bred queen bees. Due to the current difficulties in the beekeeping sector, it is expected that some of the main beekeepers will be forced to look for a different occupation, while there is no realistic demand for the sale of a large number of bee colonies, which is leading to an increase in the number of bee colonies mistreated. This requires additional intervention for other herds in order to maintain the health of bee colonies.

Honey production around 10-15 thousand tonnes prior to accession to the European Union (2004) has increased hactically every year, but has increased significantly, with the average of good vintages being doubled. The negative record was reported with 14 thousand tonnes of honey production in 2020 and 2021, compared to 25 thousand tonnes of honey in 2022. The specific honey yield in 2020-2021 was only 11-12 kg per colony, compared to 21 kg in 2022. Our main honey varieties are sunflower (35-50 %), acacia (30-45 %, rapeseed (5-15 %), mixed flower honey (5 %) and other varietal honeys (2-10 %).

The marketing structure of Hungarian apiculture products is multi-channel. There is a substantial difference between the direct producer selling price of honey and the wholesale commercial purchase price in favour of direct sales. However, direct sales to consumers are only 30 %. The largest share of bulk sales to purchasers (64-66 %). Only 3-5 % are sold to retailers and shops for resale, while only 1 % is sold to confectionery users (honey bread, sweets).

Compared to the EU accession result, the volume of honey exported almost doubled in good vintages (20-22 thousand tonnes/year; 2018-22 thousand tonnes; 2019-21 thousand tonnes). However, in recent years, the honey market has been severely restricted on our traditional European markets due to cheap honey, often of poor quality, coming into the EU from countries outside the EU. Thus, only 12 thousand tonnes of honey were exported in 2022 and 4.5 thousand tonnes in the first half of 2023.

Despite deteriorating sales conditions, Hungary continues to seek to maintain beekeeping, given the role of the beekeeping sector in pollination, which is important for the safety of food production and the maintenance of biodiversity beyond the sector's ability to generate income. In line with the needs of the sector, maintaining the health condition of the bee population is of primary importance. It is also important to support knowledge transfer, marketing and modernisation, as well as quality development. Therefore, should the export market situation improve in the following years, a revision of the weighting of interventions according to changing needs may be warranted in line with the current trend.

Confident in our strengths, such as centuries-old beekeeping traditions, unique bee-grazing and diverse beekeeping technology, which have helped to overcome the problems of the sector in other difficult times, we are trying to overcome the danger of current market anomalies. Bearing in mind that beekeeping is a sensitive sector with high exposure to climatic and market conditions, we are determined to maintain the apiculture sector because of the contribution of GDP and its ecological role in addition to its direct economic benefit. However, we have limited possibilities for Member States, with a pan-European solution to improve the situation. We do not expect any improvement in the short term, given that we have called for a tightening of the origin labelling of honey since our accession to the European Union. In 2017, the Commission adopted the 'Honey Report', which also considered this ambition to be necessary, in 2023, the results of the European Commission's honey inspection 'from capteries', which showed that almost 50 % of honey marketed in the EU did not comply with EU honey standards, was published. As a result, new rules for the classification of honey should be developed over several years. The development and introduction of this rule goes beyond the implementation period of the CAP Strategic Plan 2022-2027. Therefore, maintaining the health status of the bee population is now a priority, which is also an opportunity to save the apiculture sector and to provide opportunities for future development.

Contribution of CAP Strategic Plan contributions to the development goals of the sector

Based on the needs resulting from this assessment of the situation, three targeted interventions are planned in the financing of **Pillar I** of the CAP Strategic Plan to achieve the sectoral objectives in accordance with Article 55(1)(a), (b) and (f) of Regulation (EU) 2021/2115 of the European Parliament and of the Council.

The well-functioning measures of the national apiculture programme will be continued through the sectoral measures of the CAP, with priority being given to areas that have an impact on bee health. The focus is on the areas of awareness raising, modern technologies, food safety, bee health, efficient migration, quality genetic foundations, marketing and product development.

The **aim of Pillar I of the CAP Strategic Plan** is to operate professional organisations and a network of specialist advisers and service providers, which contributes to the coordinated operation of the sector, to the development of knowledge, to the dissemination of innovation and to the modernisation of the sector. International and regional professional events, study visits and training in beekeeping and other ways of disseminating knowledge (professional newspapers, films, publications, etc.) serve to enhance and share knowledge. Training and organisational support increase the resilience of the sector, which also contributes to food security. The bee health and environmental impact assessment reveals malpractice in agricultural technologies. An annual publication of the results of the monitoring is produced to enhance and share knowledge. In the new period, experts and organisations implementing **AKIS-type actions** of sectoral programmes will be more involved in the knowledge network than is currently the case. The AKIS Coordination Unit and the CAP Network (intervention code: SC02_A01_BE55).

Due to the crisis in the sector, interest in beekeeping training is expected to decrease, so knowledge transfer aid will play a lesser role in the coming period, so this has to be taken into account in resource planning.

The aim of the **apiculture marketing** intervention under Pillar I of the CAP Strategic Plan is to control market products, carry out promotion and marketing activities to increase consumer confidence, increase consumer awareness, market orientation and consumer awareness.

During a period of crisis when apiculture products are available for sale, marketing and promotion are much needed, but a smaller amount of resources is needed due to reduced supply and a reduction in the number of beekeeping.

The aim of the intervention is to **improve the competitiveness of the hive sector, to improve the health and genetic status of bee populations and to rationalise transhumance**, to continually innovate technology, to develop market-oriented activities in order to increase the efficiency and competitiveness of the activity and to support the purchase of medicinal, alternative and preventive measures against bee pests and agents and controlled breeding material in order to maintain the number and health of bee colonies, preserve the indigenous gene pool and maintain ecosystem services.

The current crisis in the beekeeping sector is expected to lead to an increase in the number of bee colonies mistreated and require additional intervention for the rest of the herds in order to maintain their health. On the basis of the above, we have taken into account in the planning of the CAP Strategic Plan and in the strategic design of the sector that the crisis in the sector is likely to reduce investment in apiculture equipment in the near future, while maintaining the health status of the bee population will generate significant additional costs. Addressing the epidemic threat has become a priority for the survival of the sector, which absorbs significant additional resources due to the need to increase the number of treatment sequences and to procure more efficient products. These resources will be provided by reducing the range of apiculture facilities supported within the intervention and the number of aids.

The increased effort to maintain the health of bee populations is a condition for achieving the SO6 objective, since if a large part of the bee population dies, it will lead to a significant loss of biodiversity in the areas concerned.

This intervention (intervention code: SC03_E02_BEI_55) has been designed to be complemented by Pillar II Innovation Cooperation (EIP) intervention (intervention code: RD61_A05_EIP_77) and investment support for small farms (intervention code: RD09a_B05_SML-73) and animal welfare support for the apiculture sector (intervention code: RD33_G15_AWB_70).

In order to avoid double funding, Pillar I and Pillar II support objectives are either different, or at the level of the call for proposals, the possibility of co-financing from other sources is excluded. The Paying

Agency monitors the relevant databases to detect the possibility of double funding. Apiculture sector interventions do not support the implementation of research programmes on apiculture products. Therefore, double funding of research programmes implemented with Pillar II innovation cooperation support is excluded. In the call for proposals under Pillar II for investment aid for small farms, the reason for excluding eligibility is the use of sectoral apiculture interventions for the same investment. The obligation to support animal welfare in the apiculture sector under Pillar II is fulfilled. The imposition of the obligation serves a different purpose than the improvement of bee health and genetic condition in the apiculture sector. The Pillar II requirement serves the short-term purpose of permeating the poor period of bee pasture in a given place in the population of individual beekeepers, while Pillar I intervention pursues a long-term objective of improving the bee health and genetic status of the entire bee population.

The **social function** of beekeeping is also reflected in strengthening the rural population retention capacity and supplying high-quality apiculture products. In all cases, apiculture measures must be in line with agricultural, forestry and rural development standards, taking into account biodiversity requirements, the need for broad pollination of arable crops and horticulture, and the appearance of honey and other apiculture products in the short supply chain (REL) and rural tourism (honey roads) (interventions code: RD49_R09_SCC_77, RD51_R11_TUC_77).

Furthermore, most of the green interventions in Pillar I and Pillar II help at least indirectly the situation of beekeeping and bees by reducing pesticide use and developing landscape features favourable to bees. Such planned reinforced level of ambition interventions mainly concern conditionality, the agro-ecological programme, AKG, Öko, Natura, non-productive investments facilitating land use change and their maintenance (interventions code: DP17_G01_ECOS_16, RD19_G01_AEC_70, RD20_G02_ORT_70; SC13_G01_FVO_47, RD21_G04_LCI_73, RD22_G05_LCP_70).

Aid financed by the EAGF is 50 % and EAFRD co-financing rate 43-57 %.

The 2023 budget differs from the budget for additional years in that the 2023 CAP envelope will finance the 2022 extended period of the apiculture programme previously financed by the EAGF. The amount of EUR 689200 planned to cover the support needs arising during this transitional period will be deducted from the 2023 CAP envelope, with a proportional reduction of the indicators.

Description of an established reliable method for determining the number of beehives ready for wintering in the territory of the Member States between 1 September and 31 December each year

Method to calculate the number of beehives

The number of beehives ready for wintering in the territory of the Member States between 1 September and 31 December shall be calculated each year according to an established reliable method laid down in the CAP Strategic Plans.

First method:

For the establishment of beekeeping, registration with the competent county veterinary authority (County Government Office) is required. In Hungary, Decree No 119/2007 on the national system for the registration of enclosures, holdings and certain data relating thereto. Decree (X. 18.) of the Minister for Agriculture and Rural Development regulates the register of beekeepers. Under Section 4(1)(g) of the Decree, all beekeeping, with the place where bees are permanently kept, must be notified to the keeper and registered in the National Database. The National Data Base is a public register maintained by the National Food Chain Safety Office as the state animal health and registration authority. Beekeepers are registered as bee-keepers at the request of the client, based on the data of the bee keeper (not necessarily the owner of the bees) and the location where the bees are kept. The number of bee colonies kept also has to be provided upon registration. Any change (increase, decrease, termination) shall be notified to the authority maintaining the register.

Second method:

Under the authority of the veterinary authority, Decree 70/2003 on the protection of bee flocks and the prevention and control of certain honeybee diseases (VI. On the basis of Decree No 27/1999 of the Minister for Agriculture and Rural Development – the bee health officers assisting the official veterinarian shall carry out a full inspection of all bee colonies during the mandatory autumn bee health inspection carried out on 30 September of each year. A report on the results of the inspection shall be drawn up as an official document signed by the bee health officer and the beekeeper, covering the number of bee colonies prepared for wintering in the apiary inspected and the type of beehive, summarising the number of beehives per type if several types of hives are used.

The data for the first and second methods are available at the veterinary authority. IN CASE 119/2007. The obligation to notify changes under Decree No 70/2003 of 18 October 2003 of the Minister for Agriculture and Rural Development (VI. (27) Decree of the Minister for Agriculture and Rural Development was placed at the time of monitoring. IN CASE 70/2003 (VI. The autumn bee health inspection laid down in Decree No 27/1999 of the Minister for Agriculture and Rural Development is a series of official inspections covering the entire domestic bee population, and the result is that the national data are very accurate.

The second of the two methods for the establishment of bee colonies is determined on the basis of the interlinked results, which are suitable for verifying the data given on the basis of the first method and, if necessary, the number of beehives. For the first method, the beekeeper carrying out the actual activity is the notifying client. There is nothing to prevent beekeepers from renting bee flocks or managing bees on the basis of an agreement, so the beekeeper is not always the same owner of the bee population and the beekeeper declaring the continuation of the activity. The latter is registered as a client in the national database as a person carrying out beekeeping activities. The national regulatory environment does not support the owner of the productive capital, but the actual holder of the agricultural activity.

3.5.3 Wine

1. Need for a strategic approach based on an analysis of the situation

Hungary is a traditional wine-producing country. Hungary is the 7th largest wine-producing country in the European Union. The result of the joint work of Hungarian viticulture and winegrowing and Hungarian grape and wine producers, i.e. the importance of Hungarian wine, goes far beyond itself: it is an identity-forming factor in Hungarian agriculture and an important national imager and creation force. Many of our rural areas are affected by some form of wine-growing and wine-making. The area under vines is around 65 thousand hectares, with a multiannual average of 3 million hectolitres of wine production. The sector provides livelihoods for around 100000 people. According to a 2017 market survey commissioned by the National Council of Wine Communities, around 22 % of the population aged 18 and over in Hungary (around 1.7 million people) consumes wine at least once a week and another 26 % (2 million people) at least once a month.

2. Hungary's strategic approach to the wine sector

Together with the Ministry of Agriculture, the National Council of Wine Communities has drawn up a strategy for the sector, setting out the following objectives. The National Council of Wine Communities is an inter-branch organisation and is also the largest professional organisation, bringing together almost all operators in the sector.

The condition, age, structure and varietal composition of the productive funds (plantations) and the modernisation of the wine processing capacity based on it are fundamental factors for the competitiveness of the Hungarian wine sector. The modernisation of obsolete infrastructure is still significant by operators, as demonstrated by the persistent need for support for the restructuring and conversion of vineyards, as

well as by the popularity of aid for the modernisation of major wine-growing holdings. Thanks to improvements in the last decade, the competitiveness of Hungarian wine products has increased, as can be seen in export data. However, without supporting information campaigns in the European Union or promotion activities outside the European Union, we cannot preserve, expand or increase our markets in value. There is a significant backlog in marketing and product communication, as domestic consumption is stagnating. It is necessary to increase the export price per litre of wine in order to improve the sector's ability to generate income and to provide an attractive way of living for the next generation of wine production and wine production.

Constantly evolving market needs call for innovation as a new intervention. In the context of innovation in the wine sector, we will provide support for the introduction of new technologies or processes that are not yet in use in Hungary, enabling operators in the sector to increase their efficiency through new markets and consumers and reduce their costs, thereby achieving a more sustainable and competitive operation. Innovation also has the potential to develop and market technological solutions that are environmentally sound and contribute to reducing the environmental impact of the sector. Changing consumer needs, increasing environmental awareness and decreasing consumption in the European Union also require Hungary to adopt innovation and facilitate the introduction of innovative solutions in the wine sector.

The use of **advisory services** to operators in the wine sector plays a key role in improving their economic competitiveness. Advice covers general information on legal obligations and compliance with complex legal obligations such as excise legislation or waste management. The advisory service provides an opportunity to present good practices, to develop and deliver solutions for a wide range of operators in the wine sector, which will make it easier and more efficient for operators in the wine sector to work on a daily basis.

The intervention **to promote wine tourism** is intended to increase the reputation of vineyards in Hungary and to develop wine tourism in wine-growing regions. Wine tourism is able to showcase the characteristics of making the wines, give them an insight into their landscape and highlight the importance of vineyards in the region. Wine tourism, through direct contact with the producer, contributes to the dissemination of knowledge and to the presentation of the cultured and moderate consumption of wine, and the communication of the relevant messages.

Improving market knowledge through intervention aims to increase the efficiency, resilience and competitiveness of the wine sector. Improving the performance of operators in the wine sector with regard to the efficient use of sustainable economic, social, environmental and climate resources makes a major contribution to improving their available market knowledge, access to current knowledge and regular information on current developments in the wine and wine markets.

3.CAP Strategic Plan interventions contribute to the development goals of the sector

On the basis of the above, it is necessary to continue to increase the operational and commercial efficiency of production and the creation of modern production capacities through the chosen interventions. In **Pillar I of the CAP Strategic Plan, the seven interventions chosen for the wine sector** can make a major contribution to the competitive growth of the Hungarian wine and wine sector, preserving jobs, improving the quality of life in rural areas by helping to add value from vineyards to innovation and marketing, adapting to market needs, improving marketing conditions and opportunities.

The provision of **information under Pillar I of the CAP in the Member States** has been used by Hungary as of 2020 under the National Support Programme for the wine sector. The conditions for support have made the use of the aid much more targeted from its initial application.

For the intervention, the following conditions have been set in order to achieve effectively the objectives presented:

- the role of using a uniform wine image has been given a key role;
- taking into account the needs of operators working in each wine region through the use of regional promotion plans.

This will make better use of the efficiency and synergistic effects of communication. The national information campaign contributes greatly to the competitive growth of the Hungarian wine sector. The

Government of Hungary pays particular attention to the preservation and creation of jobs. Preserving the population of rural areas and protecting and developing local employment opportunities therefore play an important role. In Hungary, tourism income and tourism flows are increasing. Wine is an important tourist attraction, so we need to improve the knowledge of wine consumers by providing information on the value of the different geographical indications and the responsible consumption of wine.

Eligible beneficiaries: The identified beneficiaries are the same as those referred to in Article 40 of EU Delegated Regulation 126/2022.

(intervention code: SC09_E08_WIN_58)

The **promotion of Pillar I of the CAP in third countries** has been implemented by Hungary as of 2012 under the National Support Programme for the wine sector. The conditions for support have made the use of the aid much more targeted than the first application of the intervention. For the intervention, the following conditions have been set in order to achieve effectively the objectives presented:

—the role of using a uniform wine image has been given a key role;

—taking into account the needs of operators working in each wine region through the use of regional promotion plans.

This will make better use of the efficiency and synergistic effects of communication. Promotion in third countries greatly contributes to the competitive growth of the Hungarian wine sector. Hungary needs to build new markets in third countries to reach new customers and increase the volume and value of exports outside the EU.

Eligible beneficiaries: The identified beneficiaries are the same as those referred to in Article 40 of EU Delegated Regulation 126/2022.

(intervention code: SC10_E09_WIP_58).

The **restructuring and conversion of vineyards under** Pillar I of the CAP has been implemented by Hungary as of 2008 under the National Support Programme for the wine sector. Restructuring aid is an important intervention contributing to the creation of competitive productive funds.

For the intervention, the following conditions have been set in order to achieve effectively the objectives presented:

—We consider it important to plant varieties that are most linked to the soil and climate conditions of the wine-growing region and to the wine-growing tradition and for which there is a long-term demand;

—our objectives include the implementation of restructuring aid in the best production sites and areas; therefore, preference is given to producers whose area is above average according to the vineyard register.

—preference will be given to producers who have a secure outlet, purchase contract or a producer organisation through which the long-term exploitation of vineyards from renovated vineyards is assured

The identified beneficiaries are the same as those referred to in Article 40 of EU Delegated Regulation 126/2022.

(intervention code: SC05_E04_WIR_58).

The intervention of the **green harvesting measure under** Pillar I of the CAP has been applied by Hungary in the National Support Programme for the wine sector as of 2019. In order to maintain a balance between supply and demand, certain market intervention instruments may be used. Green harvesting is an effective tool for immediate reduction of the supply side, which we intend to use in a given year when a crisis occurs. In the case of an intervention, the conditions for contributing to the objectives of the Plan can only be defined in the light of the scale and territorial impact of the crisis that has arisen.

The identified beneficiaries are the same as those referred to in Article 40 of EU Delegated Regulation 126/2022.

(intervention code: SC07_E06_WIG_58)

The **intervention of by-product distillation under Pillar I of the CAP** has been implemented by

Hungary in the National Support Programme for the wine sector from 2008. The by-product distillation intervention serves to control the extraction of by-products, thereby helping producers who use it. The by-product distillation intervention facilitates the cost-effective and environmentally sound extraction of wine by-products. During the design of the measure, the cost-effectiveness and safe disposal of by-products was carefully considered as regards the available means of extraction and their availability and availability.

For the intervention, the following conditions have been set in order to achieve effectively the objectives presented:

—the destruction of wine lees by distillation is compulsory above a certain holding size.

The identified beneficiaries are the same as those referred to in Article 40 of EU Delegated Regulation 126/2022.

(intervention code: SC07_E06_WIG_58).

The intervention of **Pillar I of the CAP in the wine sector** has been applied by Hungary as of 2010 under the National Support Programme for the wine sector. The wine sector requires targeted investment support, which is planned to provide long-term funding. In parallel with the renewal of areas planted with vines, the modernisation of wine-growing capacity should be encouraged. In order to achieve the right market results, it is necessary to develop all elements of the sector so that producers can respond to evolving consumer needs and use the latest technologies.

For the intervention, the following conditions have been set in order to achieve effectively the objectives presented:

—only the purchase of new machinery and equipment, which is not yet useful, is possible within the measure,

—the purchase of machinery and equipment related to the production, quality control and marketing of wine products is eligible.

The identified beneficiaries are the same as those referred to in Article 40 of EU Delegated Regulation 126/2022.

This intervention is complemented by **investment-type interventions from Pillar II of the CAP**, such as support for the sustainability and digital transition of farms, added value and water efficiency (intervention code RD01_E01_FRM_73, RD02_D01_FRM_73, RD03_E02_FON_73, RD04_E03_FOF_73, RD12_W01_WTO_74, RD15_W04_COP_77).

The intervention of **Pillar I of the CAP for innovation** in the wine sector has not yet been applied by Hungary. However, the reform of the CAP and the decrease in consumption have brought about changes in the wine sector to which the Hungarian wine sector also needs to adapt and find new innovative solutions to new expectations and challenges. The CAP reform amended Regulation (EU) No 1308/2013, which allowed the production and marketing of de-alcoholised and de-alcoholised wine products. Greater market demand for such products is an opportunity for operators to prepare and market such products.

Through this intervention, we want to support:

—the development of new technologies for the production of de-alcoholised and de-alcoholised wine products,

—research into the use of new environmentally friendly packaging in the wine sector;

—The development and deployment of new technological and IT (IT) solutions are not yet in use in Hungary.

Therefore, no aid may be granted as part of the intervention for machinery, equipment, technological and IT solutions eligible for the investment measure. Intervention code: SC04_A01_WIIN_58.

All elements of AKIS measures (information service, advice, training, innovation and digitalisation) can directly contribute to addressing the challenges of the wine sector. In addition to increasing the budget in the new period, we plan to increase the level of ambition by involving experts and organisations implementing the AKIS-like measures of sectoral programmes in the Knowledge Network more than is currently the case. The AKIS Coordination Unit and the CAP Network will play a major role in this work (intervention code: RD02_D01_FRM_73, RD58_A01_TRA_78, RD59_A02_INF_78,

3.5.4 Hops

The Hungarian Strategic Plan does not include any intervention targeted at supporting the hops sector, so the presentation of complementarity is not relevant in this case.

3.5.5 Olive oil and tables olive

The Hungarian Strategic Plan does not include any intervention targeted at supporting the hops sector, so the presentation of complementarity is not relevant in this case.

3.5.6 Beef and veal

The beef and veal sector receives aid from a number of schemes, which are intended to support the various parts of cattle rearing for meat production. These are presented below.

In general, the purpose of transitional national aid is to contribute to the achievement of SO1 objectives through the fulfilment of identified needs through complementarity. However, this complementarity is gradually weakened, given that the maximum size of sectoral envelopes is reduced from year to year.

1. Foie grip bulls

In the case of bulls, premiums come from two sources: EU-funded coupled subsidies and transitional national aids financed by national funds. While the EU leg is coupled to production, the transitional national aid scheme operates in a decoupled form, so that the number of beneficiaries does not overlap completely. This part will be improved by the amendment of the reference period. Of the two items, the EU budget is more certain (EUR 54.35) and the unit value of the transitional national aid varies depending on current national budgetary possibilities, around EUR 60 per entitlement over the last 2 years. However, this is significantly below the indicative EUR 101,07. The use of the approved financial envelope is not close to the approved maximum value, which has been below 80 % in recent years.

As indicated in the presentation of the foie gripped bull premium, it is of utmost importance for fattening farmers and their families that coupled coupled payments that specifically support genuine production and transitional national aid together constitute a genuine safety net ensuring an expected level of resilience even in the event of fluctuations in income due to weather and market risks.

This is the basis for the decoupled transitional national aid for cattle extensification, the amount of which varies according to current national budgetary possibilities, around EUR 60 per entitlement over the last 2 years. At the same time, the complementary nature of this can be seen at sectoral level, as only a part of the cattle farms keeps their herds extensively.

2. Suckler cow premium

In the case of suckler cows for meat production, premiums come from two sources: EU-funded coupled premiums and transitional national aids financed by national funds. Both schemes operate in a production-linked form, although the number of beneficiaries is not the same. This is because for the transitional national aid there is a cap on the number of eligible animals, which is capped at 117000 animals. Using the option provided for in the Strategic Plan Regulation, the ceiling on the number of eligible animals will be increased to the number of suckler cows receiving support under the Voluntary Coupled Support Scheme in 2018 (229215), which will significantly bring the number of beneficiaries in line with each other. Of the two items, the EU budget is more predictable (~EUR 140), the unit value of the transitional national aid varies according to current national budgetary possibilities and will be halved (to a level of

around EUR 30) as a result of this update.

As indicated in the presentation of the suckler cow premium, it is of particular importance for suckler cow farmers and their families that coupled payments for genuine production and improved targeted transitional national aid constitute a genuine safety net ensuring an expected level of resilience even in the event of fluctuations in income due to weather and market risks.

This is the basis for the decoupled transitional national aid for cattle extensification, the amount of which varies according to current national budgetary possibilities, around EUR 60 per entitlement over the last 2 years. At the same time, the complementary nature of this can be seen at sectoral level, as only a part of the cattle farms keeps their herds extensively.

In summary, the Hungarian CAP Strategic Plan improves the situation in the beef and veal sector in a complex manner through several interventions. Targeted coupled sources of direct aid help to improve the income situation of those active in the sector and to promote sustainability. This will be gradually degressive but supplemented by the related transitional national aid schemes, partly coupled and partly decoupled. For the beef and veal sector, the aids presented are not combined with market intervention.

3.5.7 Milk and milk products

In the case of dairy cows, the premiums come from two sources: EU-funded coupled premiums and transitional national aids financed by national funds. While the EU leg is coupled to production, the transitional national aid scheme operates in a decoupled form, so that the number of beneficiaries does not overlap completely. As a result of the review of the reference period, the overlap between the beneficiaries of the two schemes will be improved. Of the two items, the EU budget is more predictable (~EUR 317) and the unit value of the transitional national aid varies depending on current national budgetary possibilities. Comparison/complementarity is made difficult by the fact that coupled aid is paid on an animal basis and transitional national aid is paid per kilogram of milk calculated.

In general, the purpose of transitional national aid is to contribute to the achievement of the SO1 and partly SO8 objectives through the fulfilment of identified needs. However, this complementarity is gradually weakened, given that the maximum size of sectoral envelopes is reduced from year to year.

As indicated in the presentation of the dairy cow premium, it is of utmost importance for dairy farmers and their families that coupled payments that specifically support genuine production and transitional national aid together constitute a genuine safety net ensuring an expected level of resilience even in the event of fluctuations in income due to weather and market risks.

The aim of the intervention is to maintain the economic, social and environmental services provided by the sector by maintaining the profitability of milk production and, indirectly, to supply the raw material for milk processing in Hungary within a reasonable transport distance.

It should also be pointed out that even before 2023, the support for dairy cow farms was supplemented by an animal welfare intervention in Pillar II, where additional payments may be requested in case of additional animal welfare commitments. This will continue under the CAP Strategic Plan.

In summary, the improvement of the situation in the milk sector in the Hungarian CAP Strategic Plan is therefore done in a complex manner through several interventions. Targeted coupled sources of direct support help improve the income situation of those active in the sector and promote sustainability. This is gradually degressive but complemented by the transitional national aid in decoupled form. Animal welfare measures will also help operators in the sector to address the identified needs in a complex manner. For the milk sector, the aids presented are not accompanied

by market intervention.

3.5.8 Sheep and goat

In the case of ewes, the premiums come from two sources: EU-funded coupled premiums and transitional national aids financed by national funds. Both schemes operate in a form linked to production, so that the number of beneficiaries is virtually the same. Of the two items, EU funds account for the largest part (EUR 28.4) and the unit value of the transitional national aid is marginal, i.e. only EUR 0,05 per animal. It is worth mentioning that the specific value for ewes involved in milk production is lower (EUR 0.04), but producers of sheep's milk may apply for an additional payment in Pillar II in case of additional animal welfare commitments.

As indicated in the presentation of the ewe premium, it is of utmost importance for ewe farmers and their families that coupled payments that specifically support genuine production and transitional national aid together constitute a genuine safety net ensuring the required level of resilience even in the event of fluctuations in income due to weather and market risks.

In general, the purpose of transitional national aid is to contribute to the achievement of the SO1 and partly SO8 objectives through the fulfilment of identified needs. However, this complementarity is gradually weakened, given that the maximum size of sectoral envelopes is reduced from year to year.

This is the basis for the additional transitional national aid scheme for animals kept in less-favoured areas in decoupled form, with a specific amount of EUR 4.83. However, the complementary nature of the aid can be seen at sectoral level, as it reaches only a limited number of ewe farmers.

The support under these three schemes is intended to contribute to the economic and environmental sustainability of the sector and, by requiring the use of registered farmers, to guarantee a quality product base.

In summary, the Hungarian CAP Strategic Plan improves the situation in the sheep sector in a complex way through several interventions. Targeted coupled sources of direct support help improve the income situation of those active in the sector and promote sustainability. This will be gradually degressive but complemented by transitional national aid. Animal welfare measures will also help operators in the sector to address the identified needs in a complex manner. For the sheep sector, the aids presented do not go hand in hand with market intervention.

3.5.9 Protein crops

Only coupled aid is available to growers of grain and coarse protein fodder, so complementarity is not relevant.

3.5.10 Sugar beet

Only coupled aid is available to sugar beet growers, so complementarity is not relevant.

3.5.11 Other sectors

Only coupled aid is available to rice growers, so complementarity is not relevant.

Complementarity is limited in the case of tobacco production, given that targeted support under the CAP Strategic Plan will only be channelled through transitional national aid. At the same time, the update of the reference period will provide an opportunity to improve the link between the holders of entitlements and the number of farmers who become active in tobacco production.

3.6 Overview of the interventions that contribute to ensure a coherent and integrated approach to risk management, where relevant

In Hungary, weather risks are managed under the risk management system introduced in 2012. The system, which initially started with 2 pillars (Agri-Scale Reduction Scheme, Insurance Premium Support), has been expanded to include four pillars in 2021:

- Pillar I: a nationally funded agricultural mitigation scheme notified to the European Commission;
- Pillar II: EU co-financed agricultural insurance premium subsidy (for crop insurance);
- Pillar III: the national ice mitigation system (JÉGER) developed from EU funds and operated from national sources;
- Pillar IV: agricultural crisis insurance scheme.

Pillar I is significantly affected by the 2023 amendment, as the system, previously financed by producer contributions and at least equivalent national budgetary resources, is now using EU funds by transforming it into a mutual fund in 2024. In order to ensure the long-term financial sustainability of the measure, we also see a need to mobilise EU funds in view of the increase in natural damage over the last few years. With the introduction of the new measure, it is possible to plan the amount of the compensation for damage with greater precision and to compensate for damage to producers to a greater extent than before.

Among the hazards, losses caused by hail, winter, spring and autumn frost, storms, droughts, agricultural floods and cloud breaks are also managed and mitigated by Pillar I and Pillar II, but the Agricultural Damage Mitigation/Agricultural Damage Mitigation Risk Management Fund also covers, in addition to all these threats, inland water damage (Figure 1). The above risk management tools are complemented by producer investment proposals announced in the Rural Development Programme to prevent climate and weather risks (rail, hail, spring frost).

Figure 1: Risks covered by the pillars of the agricultural risk management system

Source: Prepared by the AKI's Financial Research Department

Specific objective No 1 'Supporting viable farm income and resilience in the European Union in order to maintain food security' is linked to the main need 2 'Reduction of income fluctuations due to natural (weather) and market risks', which justifies the continuation of the intervention in 2023-2027. Out of the three main needs identified in relation to Specific Objective 1, the 2nd of the main needs identified in the context of Specific Objective 1. Reducing income fluctuations due to natural (weather) and market risks is the one for which risk management tools can have an impact on sub-needs.

One of the sub-needs under main requirement 2 is to *address 2.1 adverse climatic events and damage to farmers caused by climate change in agriculture (crop, livestock farming, horticulture)*. The three pillars of the risk management system are the protection of crop-growing sectors against weather risks and thus climate change, which has been identified as strength by SWOT analysis (*E.3. A well-functioning agricultural risk management system and its continuous improvement*). The increasing demand for risk management tools, thus underpinning the need, is reflected by the increasing volume of compensation for damage caused annually by agricultural damage compensation and the steady increase in the area covered by voluntary subsidised crop insurance, the number of producers benefiting from premium payments and the stock of premiums since its introduction in 2012. The first agricultural crisis insurance scheme (pillar IV) introduced in the EU as the first instrument to protect livestock sectors against weather risks (also) as a new instrument from 2021 onwards.

Offsetting and mitigating the impact of market risks to sub- needs is Gy.6. of the weaknesses identified in the SWOT analysis. *There is a lack of management of risks other than weather risks, a low share of animal insurance*, and an under-utilisation of derivative market risk management tools, which indicates that existing agricultural risk management tools do not protect against non-weather risks. The crisis insurance scheme introduced as of 2021 provides this possibility, the effects of which, as well as the management of the identified need, will, as a result of its operation, first become visible to the members of the scheme as of 2022. The increasing spread of crisis insurance is also the solution to Gy.2 as identified in the SWOT analysis. *Strong income fluctuations in several agricultural sectors (e.g. some fruit and vegetables, pig fattening, bull fattening, etc.) and the response to F.1. Climate change, the increasing incidence of weather extremes, the emergence of new pathogens, pests, the spread of zoonoses and the consequent increase in costs and reduced incomes.*

On the one hand, *the sub-requirement to encourage agricultural insurance (self-care)* takes the form of a premium on plant insurance, which may amount to up to 70 % of the premium paid. On the other hand, sub-demand 2.4 is also met through the agricultural crisis insurance, where a significantly higher amount is available to compensate for income fluctuations compared to farmers' contributions (which account for 30 % of total resources).

CAP supported risk management tools

Pillar II offers subsidised insurance for those who wish to mitigate their weather risks to agricultural production to a greater extent than the protection provided by the Agricultural Damage Mitigation Risk Management Fund. Under the subsidised insurance measure, with an aid intensity of up to 70 % (65 % up to 2019), producers may take out insurance in the form of three types of insurance ('A', 'B' and 'C'). Insurance A' is a package insurance which simultaneously protects against the eight risks mentioned above and which can be used for arable crops or plantations (in addition to stone fruit crops as of 2019). Business B and C are specific insurance, which can also be covered separately for all risks (from 2019 onwards). Insurance B is optional for vegetable and plantation crops, insurance C is only available for arable crops, excluding arable vegetables. Participation in Pillar II is voluntary, but closely linked to Pillar I, the farmer is entitled to half of the compensation due to him if he does not have an insurance policy for an event specific to that crop. The amount of compensation payable to an insured producer shall include the amount of compensation paid by the insurer.

The importance of subsidised crop insurance is that, with their introduction in 2012, several previously uninsured risks, such as drought, cloud breaks, spring frost, or agricultural floods, or a wider range of insurable crops, have become more covered.

The number of producers taking out subsidised insurance has been steadily increasing since the introduction of the scheme: while only 3 market insurers offered subsidised insurance in 2012, 4 market insurers and 7 non-profit mutuals already offered in 2021. The number of subsidised crop insurance increased from HUF 5 679 million in 2014 to more than HUF 14 000 million in 2020. In 2020, almost 21 thousand farmers made use of this risk management tool and the area covered by insurance exceeded

1 650 thousand hectares, which is more than 40 % of the area planted. To cover the growing needs, the available funding has been increased several times: HUF 5 billion from 2018, HUF 7 billion in 2020 and HUF 14.3 billion in 2022. The intervention will be financed from the Rural Development Programme envelope until the end of 2025 and from ST in subsequent years.

Hungary is one of the few EU Member States with a relatively large number of operators (13 insurance companies and insurance associations) on the agricultural insurance market.

The measure is also highly successful in the international context, as evidenced by the positive opinion of the European Court of Auditors in its report.

It is also true that subsidised insurance for the livestock sector is not available in Hungary. The reasons are twofold:

- a loss threshold of 20 % under EU conditions would result in a high level of compensation payments that market-based insurance companies would not undertake in the absence of a return;
- epidemics that cause very high losses in the Insurance Conditions for animal insurance typically do not qualify as insurance events (excluded)

However, animal welfare support can be found in the Hungarian CAP Strategic Plan (RD31_G12_AWC_70; RD32_G12_AWC_70; RD33_G15_ANB_70). The preventive health measures and treatments covered by the aid will lead to an improvement in the overall **health and hygiene** status of livestock. This **reduces the number** of cases, thereby reducing the need to give treatments, including antimicrobials, antibiotics. This also **reduces the risk of the development and spread of antimicrobial resistance**. In addition to these risk-mitigating solutions, we have set up a **specific intervention** aimed at **compensatory payments to combat antimicrobial resistance**. The aid scheme compensates for additional costs in food-producing livestock resulting from commitments to combat antimicrobial resistance that go beyond the requirements established at Union level.

The risk of outbreaks of various **epizootic diseases** in livestock holdings **can be reduced by the use of a number of technologies**. Hungary also plans to support this type of development of livestock holdings through the CAP Strategic Plan RD01e_E01_FRM_73 – Support for disease control investments in livestock holdings and by reducing tail docking in the pig sector.

The risk of loss of income in the livestock sector is managed by the **agricultural crisis insurance scheme** (RD17_I02_IST_76), which also compensates for the low level of animal insurance.

However, despite the above, animal insurance can be covered on a market basis by some insurance companies. These insurances are mainly for breeding animals of higher value.

Pillar IV, the agricultural crisis insurance scheme, goes beyond the other pillars in terms of the risks covered and mitigates income volatility, regardless of the reason for it. The crisis insurance scheme compensates not only for the effects of weather but also for all production, market and economic risks. Another important factor is that it is available to the agricultural sector as a whole, including livestock production, where risk management tools are less widespread under market conditions.

Members voluntarily joining the scheme shall be compensated by payment of the crisis insurance contribution for loss of income exceeding 30 per cent compared to the average of previous years, up to 69.9 per cent of the loss. The source of reimbursement is 30 per cent of contributions paid by members, 70 % EAFRD support. The crisis insurance scheme will be financed by the end of 2026 from VP funds and from ST funds for the years 2027 and 2028 for a planned envelope of 2-2 billion. The compensation for Pillar I and Pillar II of the risk management system shall be taken into account when determining the loss of income.

Non-CAP supported risk management tools

Members of the Agricultural Damage Mitigation Scheme/Agricultural Damage Mitigation Fund (Pillar I) may receive, in addition to payment of the compensation contribution paid, a compensation payment in the event of a reduction in yield of more than 30 per cent at crop level or a reduction in yield values

exceeding 15 per cent. The compensation shall be limited to 80 per cent of the reduction in yield value if the farmer has adequate crop insurance (in the absence thereof, only 40 per cent). The damage is covered by the funds available in the Agricultural Damage Reduction Risk Management Fund, which consists of producer payments, a national budget top-up at least equal to the amount of the producer's payment and EU funds. Participation in the Agricultural Damage Mitigation Risk Management Fund is compulsory above certain size limits (10 hectares of arable crops, 5 hectares of arable vegetables, 1 hectare of plantations). Voluntary accession is possible below the indicated area sizes. The number of participants in the risk pool has ranged from 72 to 78 thousand since the start of Pillar I in 2012, with the area covered in 2019 being 3 722 thousand hectares, 92.7 % of the area planted.

Pillar III of the MKR is the national Ice Damage Reduction System (JÉGER), which helps to protect against one of the most common hazards in Hungary. The system, launched in May 2018, was designed to cover the whole country with the installation of around 1000 soil generators. The investment was carried out under the Rural Development Programme and it covers the annual financing of the operation. Silver iodide evaporated from ground surface equipment reduces the size of the ice grains. The technology significantly reduces hail prices, the volume of which has been lower since the start of the system compared to the years prior to its introduction. Pillar III not only protects agriculture against hail damage, but reduces losses caused by the ice price across the national economy, regardless of sector (Figure 2).

Figure 2: Potentially affected by the benefits of the agricultural risk management system

Source: Prepared by the AKI's Financial Research Department

The agricultural risk management system operates under the continuous monitoring of the Ministry of Agriculture, which allows the legislative framework to be continuously amended in the light of operational experience.

Linked to risk management, support will be provided under rural development types of interventions for investments to mitigate or prevent adverse effects, such as those resulting from unpredictable weather conditions. They have a direct impact on people living in agriculture: they face a series of spring frosts, drought periods or extreme precipitation. To meet these challenges, farmers need to modernise their production systems and implement technological developments to mitigate or avoid adverse impacts. Under Articles 73 and 74, we provide opportunities for various weather risks (e.g.: frost, frost damage, damage to rainfall) and to develop facilities for water retention and disposal, and to improve improvement and efficiency in water use.

Risks beyond climatic conditions are presented as follows:

Risk: Strong income volatility, market risks

Intervention code	Intervention Name	Risk managed
DP01_E01_BISS_16	The basic income support for sustainability	Income uncertainty The basic income support for sustainability is the primary pillar of the direct support scheme to ensure farmers' income security.
DP02_E02_CRIS_16	Complementary redistributive income support for sustainability	Income uncertainty The aim of the redistributive payment is to provide additional support for the first hectares of small and medium-sized farms, recognising their difficulties and disadvantages due to their size and at the same time providing them with an expected level of income.
DP04_E03_CISB_16; DP05_E04_CISR_16; DP06_E05_CISV_16; DP07_E06_CISI_16; DP08_E07_CISO_16; DP09_E08_CISE_16; DP10_E09_CISF_16 DP16_E15_CISP_16 DP11_E10_CISS_16 DP12_E11_CISC_16 DP13_E12_CISM_16 DP14_E13_CISD_16 DP15_E14_CISG_16	Aid for sugar beet cultivation; aid for rice production; Aid for vegetable crop production; Aid for the production of industrial vegetable crops; Aid for the production of industrial oil crops; Aid for fruit production (Extensive); Aid for fruit production (Intensive); Support for the cultivation of protein feedgrains; Aid for the production of coarse protein crops, support for the rearing of sheep; Suckler cow premium; Foield bull premium; Aid for dairy cow farming;	Income uncertainty It is of utmost importance for the farmers and animal keepers concerned, as well as their families, that coupled payments targeted at real production, together with the basic payment, constitute a genuine safety net ensuring an expected level of resilience in the event of income fluctuations due to weather and market risks.
SC19_I01_FVF_47	mutual funds – fruit and vegetables;	Dealing with losses arising from market risks
SC20_I02_FVV_47; SC21_I03_FVS_47	investments making the management and joint storage of quantities placed on the market	Management of marketing risks

	more efficient; joint storage of products, including, where necessary, collective processing of products	
SC24_I06_FVG_47	green harvesting consisting of the total harvesting on a given area of unripe non-marketable products which have not been damaged prior to the green harvesting, whether due to climatic reasons, disease or otherwise	Market risk management The purpose of the intervention is to reduce the volume of wine grapes that is much higher than the demand for wine grapes. the entry of grapes into the market, thereby preventing the formation of tensions in the harvest market
SC25_I07_FVN_47	non-harvesting – fruit and vegetables	Addressing market disturbances
SC27_I09_FVM_47	communication activities to raise awareness and inform consumers – fruit and vegetables	Management of marketing risks
RD17_I02_IST_76	Agricultural crisis insurance scheme	The crisis insurance scheme includes risks other than those arising from weather/climatic changes (e.g.: risks arising from changes in market prices; animal health and plant health risks).

Farmers are encouraged to reduce their exposure to climate risks through the following measures:

The increasing impact of climate change, coupled with a further increase in extreme weather events, is expected in the near future. In changing weather conditions, the role of control against various types of damage is appreciated, and also for reasons of food safety, it is important that crop farmers have the technologies and tools to mitigate their exposure to adverse weather effects. Hungary intends to support farmers through the CAP Strategic Plan intervention “**Farm sustainability development**” (RD01_E01_FRM_73) to **prevent damage to** farmers. On the basis of the intervention, farmers can be supported, inter alia, **for the purchase of technologies and equipment to control spring frost, rainfall, hail damage**.

We intend to address farmers’ exposure to weather risks through a number of other interventions. Rural development area and livestock support are all intended to counteract the negative effects of climate change. **Agro-environmental management payments** (RD19_G01_AEC_70) and **organic farming (RD20_G02_ORT_70) support** for climate adaptation already in place in the 2014-2020 period, as well as climate change mitigation measures, will be continued in the CAP Strategic Plan with strengthened conditionality and with the standards aligned with the Agri-ecological Programme (DP17_G01_ECOS_16). It also includes **support for environmentally beneficial investments**: Support for green investments on agricultural holdings, farm development to reduce ammonia emissions, on-farm support for green investments linked to the enhancement of agricultural products (RD03_E02_FON_73), support for green investments linked to the enhancement of agricultural products outside the farm (RD04_E03_FOF_73). In addition, agro-ecological non-productive investments and payments to encourage agro-ecological land use change to maintain them (RD21_G04_LCI_73, RD22_G05_LCP_70)

should also be highlighted.

These interventions aim to support the reduction of CO₂ and ammonia emissions, the reduction of energy use and the installation of renewable energy technologies on farms.

Among the optional requirements of the **agro-ecological programme**, winter soil cover, non-rotational tillage, use of soil conditioners, microbiological products, cover between plantations, crop diversification and maintenance of higher non-productive areas (e.g. fallow, nitrogen-fixing crops, secondary green manure crops) help preserve and improve soil potential, protect and improve soil structure and soil biodiversity, increase the capacity of soils to retain water, and protect against erosion (intervention code: DP17_G01_ECOS_16).

Maintaining **multiannual commitments in forest management for environmental or climate purposes** (intervention code: RD32_F02_FEC_70) with forest-environmental commitments going beyond the obligations set out by the forest authority in the forest plan (*transition to a continuous forest cover mode, continuous restructuring or improved renovation, reduction of intensively transmitted alien wood and shrub species, reconversion of cleansing, manual maintenance of forest stands, and management of nature-friendly materials*) will contribute to improving the natural status of existing forests also in Natura 2000 forest areas. Investments to **improve the climate and environmental performance of forests by transforming forest** structures and increasing mixing contribute to improving the natural status of existing forests also in Natura 2000 forest areas on the basis of a forest plan approved by the relevant forest section authority. (intervention code: RD38_F08_INN_73)

The target area for support for water retention facilities for investments on agricultural holdings improving water efficiency is intended to support the technical solutions necessary for collecting and storing rainwater, which causes more than tolerable damage from cultivated areas, before its subsequent use. Contributing to reducing yield volatility in agricultural production by draining and utilising surplus waters, achieving water damage control and ensuring water-efficient, sustainable management of water resources. (interventions Code: RD12_W01_WTO_74)

By **requiring the use of certified material**, coupled support can contribute to the EU's environmental and climate objectives. The aim of the standard is to ensure that farmers grow resistant varieties that can cope with the negative effects of climate change, thereby helping to adapt agriculture to climate change. The use of certified material has been laid down in five of the coupled crop titles. (interventions code: DP06_E05_CISV_16; DP07_E06_CISI_16; DP08_E07_CISO_16; DP15_E14_CISG_16; DP16_E15_CISP_16)

The Digital Transformation of the National Agricultural Ice Damage Reduction System supports the further development of the national ice mitigation system, which was established in 2018. The ice control system built at national level, based on the application of silver iodide into airspace, is also designed to support thermal safety and also strengthens adaptation to extreme climatic conditions. (intervention code: RD18_I03_JGR_73)

Within Hungary's complex **four-pillar agricultural risk management system**(MKR), subsidised agricultural insurance (Pillar II) and the agricultural crisis insurance scheme (Pillar IV of the MKR) also serve to increase farmers' self-care. Furthermore, the aforementioned interventions are also among the sectoral interventions of the Strategic Plan. (interventions code: RD16_I01_INS_76; RD17_I02_IST_76; SC26_I08_FVH_47; SC19_I01_FVF_47)

Hungary's **AKIS system** provides this assistance to support green transition and climate adaptation activities. Interventions in the **fields of training, advice and innovation to increase farmers' climate change and adaptation** skills (codes: RD58_A01_TRA_78, RD60_A04_ADP_78, RD61_A05_EIP_77) and their respective thematic priority areas. In addition, the **Green Support Unit** established **under the National CAP Network** (see section 4.4 of the Strategic Plan) oversees and coordinates these activities by providing training for trainers and advisers, which ensures that the most up-to-date information can be provided to farmers on knowledge-sharing platforms.

3.7 Interplay between national and regional interventions

3.7.1 Where relevant, a description of the interplay between national and regional interventions, including the distribution of financial allocations per intervention and per fund

Not relevant.

3.7.2 Where relevant, where elements of the CAP Strategic Plan are established at regional level, how does the interventions strategy ensure the coherence and the consistency of these elements with the elements of the CAP Strategic Plan established at national level

Not relevant.

3.8 Overview of how the CAP Strategic Plan contributes to the objective of improving animal welfare and reducing antimicrobial resistance set out in point (i) of Article 6(1), including the baseline conditions and the complementarity

The types of animal welfare interventions of the Strategic Plan aim at improving animal welfare conditions and encouraging measures to prevent animal health problems. Meeting the natural needs of farm animals, improving husbandry conditions, improving general hygiene conditions and preventing animal health problems are essential to ensure animal welfare.

In the 2014-2020 period, the dairy cattle sector and the dairy small ruminant sector (sheep and goat) received animal welfare support for rural development support. With the animal welfare support to be announced under the Strategic Plan, Hungary plans to introduce animal welfare measures for the apiculture, whole cattle and small ruminants and poultry sectors.

In the case of the CAP Strategic Plan, rural development support will also be granted to animal breeds that have previously received animal welfare support under national support. In order to avoid double funding, most animal species receive animal welfare support from rural development funds. It is important to stress that Hungary has opted for an 80 % top-up of national resources, so that all forms of support, including animal welfare aid, can benefit from higher support, thus providing greater environmental added value and making animal welfare a more popular form of support and a significant improvement.

The interventions aim at improving animal husbandry by providing support for the implementation of strict animal welfare, hygiene and feeding conditions and conditions for the benefit of the animals.

The rearing of farm animals has changed significantly in recent decades. These changes in breeding, rearing and feeding technology have an impact on the health and fitness of animals. Furthermore, in addition to the use of healthy food by consumers, sustainability and animal welfare have also come to the fore, but the extra costs of these are difficult to realise in finished products. It is therefore appropriate to support farmers who undertake to provide animals with stricter hygiene, feeding and husbandry conditions. The preventive health measures and treatments covered by the aid will lead to an improvement in the overall health and hygiene status of livestock. This reduces the number of cases, thereby reducing the need to provide treatments, including antimicrobials, antibiotics. This reduces the risk of developing antibiotic resistant pathogenic strains and spreading in domestic populations. AMR monitoring data shows that there is a significant incidence of resistant zoonotic and commensal pathogens in tissues derived from food-producing animals. The most commonly used antibiotic groups and pharmaceutical forms make it likely that a significant proportion of the antibiotic mass used today is used for preventive purposes and is intended to compensate for errors in husbandry technology, which is the most significant in the pig and poultry sectors. As of 28 January 2022, new Union legislation directly applicable in all Member States will be introduced. Regulations (EU) 2019/6 on veterinary medicinal products and (EU) 2019/4 of the European Parliament and of the Council on medicated feed give priority to AMR and include a number of

measures and strengthening measures to promote responsible use of antibiotics in animal health.

In line with international guidelines, a national veterinary action plan to reduce AMR was developed in April 2018, including a target of 128/2009. (X. 6.) FVM. The new domestic provisions introduced in August this year help reduce the use of antibiotics and promote prudent and responsible antibiotic use, taking into account the common protection of animal and public health, in line with national professional policy efforts.

Key changes:

- an antibiotic should only be prescribed by a veterinarian on prescription (not to be used) in sufficient quantity for treatment for up to seven days
- preventive use of so-called critically important active substances for human health is forbidden and may only be used for therapeutic purposes after a resistance test has been carried out
- As of January 2022, the use of antibiotics should be recorded in a medical treatment log with more data than at present, data will be started in Nébih's online system

Food chain inspection bodies, authorities contribute to the responsible antibiotic use through targeted inspections, review of antimicrobial authorisations, intensive contacts with professional organisations, relevant international tasks, and guidance and training.

We design our standards of animal welfare in accordance with the rules laid down in Decree No 32/1999 on animal protection rules for the keeping of farm animals in Hungary (Decree No 32/1999 on animal protection rules for the keeping of farm animals). (III. (Decree No 31 of the Minister for Agriculture and Rural Development) and beyond the requirements of European Union legislation (Council Directive 2008/119/EC, Council Directive 2008/120/EC, Council Directive 2008/98/58/EC).

In the case of animal welfare in beekeeping, we focus in particular on the requirement to leave honey, as this standard best enhances the capacity of bee colonies to provide ecosystem services by promoting the health, balanced development of bee colonies or their calcination, thereby increasing the ecosystem provision of healthy bee colonies and thus improving the quality of the honey produced.

In general, the benefits of compliance with animal welfare standards can be said to reduce the risk of developing diseases (deficiency diseases and infectious diseases) due to reduced stress, thus reducing the use of medicines and antibiotics, thus reducing the chances of developing antibiotic resistant pathogenic bacterial strains. In addition, decreasing production costs due to decreasing use of medicines and thus increasing the efficiency of the livestock sectors are expected. These effects are all the positive effects of compliance with animal welfare standards, which ultimately lead to a reduction in the negative externalities of the livestock sector, one of the most important sectors of domestic agricultural production.

When developing animal welfare interventions, we aim to develop commitments aimed at promoting more environmentally friendly and animal welfare-oriented livestock farming:

—The feed commitment is mostly a mineral supplement: in the case of sheep, selenium holiday ponds. The requirement is expected to prevent the build-up of shortage diseases and to avoid reproductive problems.

—In the rules on animal density, we require a space that goes beyond the mandatory standards, which is expected to reduce stress, prevent disease development and, as a consequence, reduce the use of responsible medicines and antibiotics.

—Preventive control is an important element of the regulations, which may consist of predicting species-specific diseases, ensuring hygiene and actual treatment. The commitment to prevent is also expected to reduce the use of medicines and antibiotics!

—The obligation to take care of care is a very important element of our animal welfare standards before causing stress or disease.

The general objective of the intervention 'Animal welfare premiums in the beef cattle sector'

(RD31_G14_AWC_70) to be introduced in 2023 is to improve the overall welfare of domestic meat-producing bovine herds by providing more care supervision, control of internal and external parasites, the use of mineral supplements, the provision of shank care and additional littering, and the provision of more living spaces and pasture. The preventive health measures, treatments and needs covered by the support will lead to an improvement in the general reproductive, health, hygiene and condition of beef cattle herds, while reducing the specific environmental burden on livestock farming (less use of medicines, more efficient production), which is in line with the objectives of the EU Green Deal, the Methane Strategy and the Farm to Fork Strategy.

3.9 Simplification and reducing the administrative burden

Hungary is committed to simplification and the reduction of administrative burdens. We have recently been active participants in EU initiatives in this direction. The implementation of the CAP is a difficult and complex task, while making life easier for farmers is a priority.

One of the most important tasks, together with the Hungarian State Treasury, is to continuously assist farmers in the multifaceted aid application system, to review applications immediately, and to simplify the application process and reduce the administrative burden from the submission of the application to the payment of the aid.

The Treasury is committed to improving the quality of applications, therefore thousands of checks carried out with alphanumeric and geospatial tools for the benefit of farmers are carried out on the submitted data and provides feedback on any errors or omissions detected. In many areas, it already indicates to the applicant that there is even a possibility of clerical errors.

To this end, inter alia, the following improvements, functionalities and data services have been introduced in recent years to reduce the burden on customers, which are currently facilitating the application process for producers:

1. Transfer of data between authorities: The clients are not charged with unnecessary data reporting by the Hungarian State Treasury, but the intermediary offices provide each other with the necessary data. In addition, the transfer of data should be fully automated. Example 9/2015 (Rules for the use of coupled direct aids) (III. Section 11(4) and 13(5) of Decree No 5/2015 of the Minister for Agriculture on certain issues relating to the use of the single area payment financed by the European Agricultural Guarantee Fund and the related transitional national aid (II. Section 14(1a) of the Decree of the Minister for Agriculture states: ‘Data on the absence of tuberculosis, brucellosis and leukosis of the flock in the holding shall be sent to the Treasury within sixty days of the request by the CGO, acting in its food chain safety and animal health powers, at the request of the farmer at the request of the farmer.’)

2. Prior checking: Since 2016, the Hungarian State Treasury has continuously applied the legal instrument of ex-ante verification of the Single Application with increasing content, in which it informs the economic operators by sending a letter to the client gateway if they find a potential problem, are likely to be affected by error. Producers can still improve their requests on the issues included in the notifications, thus avoiding future sanctions. In 2020, the ex-ante verification was extended by a further examination: using and analysing high-resolution satellite image time series produced by the Sentinel satellite family funded by the European Space Agency. This audit introduced some of the controls that will subsequently be used in the monitoring system on a pilot basis. Starting from autumn 2020, the State Treasury will collect and use automated image processing technology to identify the possible parcel boundaries and the crop of the parcels, which are available on average every 5 days from the country’s territory. This will enable them to provide information to farmers in the pre-check order if the analysis suggests that it is possible to:

- The farmer did not declare in reality the use of the crop present on the parcel in the application;
- The location and boundaries of the parcel were not correctly marked on the EC map.

3. ‘Mobile application’ In 2021, the Treasury developed a new mobile application for agricultural and rural development aid applicants. The app, known as the mobile GAZDA, benefits the parties involved in the application, speeds up and facilitates the administration.

The application aims to inform farmers in real time and through a more direct channel of communication about the opportunities and obligations of their support. The use of the application enhances the exchange of information and requests can be made more accurate, facilitating smoother processing of applications, earlier grant decisions and faster payments. In addition to a more dynamic administration, there may be fewer on-the-spot checks for farmers to make good use of the app.

Many functionalities are available to users. The application allows the Treasury to provide information to customers quickly and easily, as well as for enterprises to share data easily and quickly with the Treasury.

The application currently contains various client service functions (time booking, contact details, Q & A interface), customer registration (visiting data, requesting an official certificate), information for clients and submission of applications related to the single application (submission of duplicate and agrotechnologies, declaration of force majeure, view of area data).

4. LPIS browser: The LPIS browser website, a publicly available platform for the Agricultural Parcel Identification System (LPIS), was subject to a comprehensive overhaul at the beginning of 2021, with a new user interface (MePAR Portal) and its functionality. The revamped LPIS Portal allows farmers to follow changes in LPIS data more effectively, to access information on the LPIS cover linked to their parcels and to participate more effectively in the management of their parcels. In addition, the new design of the LPIS portal will pave the way for further development in order to directly serve the growing and multifaceted data needs.

Compared to the previously existing public LPIS browser website, users see a more modern interface with graphic features adapted to the challenges of the time. In addition to serving raw functionality, the design of the design included improving the user experience. A more transparent search function, which is easier to navigate, allows the user to find an area more quickly and to find a quicker answer.

In parallel with the spread of smartphones, we have kept in mind that websites are increasingly visited by users not only via computers or laptops, but increasingly via mobile devices, smartphones or tablets. The new website has also been designed for mobile-friendly use, so the new website can also be used on a mobile device in a transparent way.

The management of the map covers has become obvious and the possibility to choose the different aerial photographs available at the Treasury each year has been added. Measurements of length, area and radiation are available in a renewed form, also with clear handling. Using the new browser, you can easily identify coordinates in WGS and EOVI format. You are not available before, but it is a very useful feature to print the current map view. This tool gives users the possibility to extract a map with a professional appearance instead of using traditional “screen photo” tools.

5. Electronic communication: The Treasury is increasingly focusing on electronic communication, thereby supporting timely and accurate submissions and notifications. In addition to the measures of the single application and the Rural Development Programme, an increasing number of legal bases are used to submit applications, observations, data and documents via an electronic interface (ENTER). We have also been able to switch from paper-based correspondence to electronic communication of decisions and requests for information in an increasing number of cases. This will shorten the lead time for the procedural steps, and a comprehensive verification of the submitted data will take place as necessary at the moment of submission.

3.10 Conditionality

3.10.1 Main issue: Climate change (mitigation of and adaptation to)

3.10.1.1 GAEC 1: Maintenance of permanent grassland based on a ratio of permanent grassland in relation to agricultural area

3.10.1.1.1 Summary of the farm obligation (e.g. prior authorisation system and reconversion obligation)

There is no obligation at farm level to maintain permanent grassland at national level compared to the reference ratio. This rate may not decrease by more than 5 % compared to the reference year 2018.

The re-establishment obligation shall be imposed on farmers who, on the basis of their single area payment application submitted in the two calendar years preceding the year of reduction of the ratio of permanent grassland no longer allowed, hold land which has been converted from land under permanent grassland or permanent pasture to land for other uses, broken.

Where afforestation has taken place on permanent grassland, there shall be no obligation to restore that area. As an exception, a Christmas tree plantation or energy tree plantation has been installed in the course of afforestation, since there is also an obligation to restore the plantation.

The level of the farmer's obligation to restore land shall be determined in proportion to the size of the land that has been broken down.

The Paying Agency (Hungarian State Treasury) shall establish, in a decision taken by 31 December of the current year, the obligation to restore the farmer and the deadline for the reinstatement obligation, which shall not be longer than the deadline for submitting the single application for the following year. The restoration obligation can be fulfilled not only by restoring the broken area, but also by converting other land into grassland, excluding forest land, or by converting existing temporary grassland into permanent grassland. If, on the other hand, the broken area is classified as environmentally sensitive permanent grassland, the re-establishment shall be carried out on the same area. The re-establishment shall be carried out on an agricultural area of at least 0.25 ha each. Areas reconverted to permanent grassland or established as permanent grassland shall be considered as permanent grassland from the first day of reconversion or establishment and shall be maintained for five years from the date of restoration or establishment. In the case of conversion of existing temporary grassland to permanent grassland, the maintenance obligation shall apply for a period of five years from the date of planting of temporary grassland.

The enterprise must declare in the following year's single application that the recovery obligation has been complied with. It shall indicate the areas of permanent grassland established for the previous year's reconversion obligation. In addition, in the case of conversion of temporary grassland into permanent grassland, the farmer must declare for how many years the area in question is considered to be temporary grassland retroactively.

If the farmer breaks or converts environmentally sensitive permanent grassland, he or she has an obligation to restore it. Farmers are formally notified of the re-establishment obligation by the territorially competent nature protection authority, ordering the restoration of the broken or modified grassland without delay. The notification shall give precise instructions on the reset method. Compliance with the restoration obligation is verified by the nature conservation authority through an on-the-spot check. The obligation can only be met if the area is fully restored, partial fulfilment is not acceptable.

GOVERNMENT DECREE NO 94/2015 (XII. The general rules of force majeure laid down in Decree No 31/1999 of the Minister for Agriculture shall not apply in the event of unauthorised hacking of environmentally sensitive permanent grassland.

3.10.1.1.2 Territorial scope (national, regional, farm-level, group-of-holdings)

national

3.10.1.1.3 Value of the reference ratio (including calculation method)

Ratio **14.41**

Explanation

The reference rate for Hungary is 14.41 % established on the basis of point 3.1(e)(i) of Annex I to Commission Implementing Regulation (EU) 2021/2289 and the method for calculating the reference ratio provided for in Article 48(1) of Commission Delegated Regulation (EU) 2022/126, read in conjunction with Article 1 of that Regulation.

Article 48(1) of Commission Delegated Regulation (EU) 2022/126 states that:

*(1) For the maintenance of permanent grassland in relation with GAEC standard 1 as listed in Annex III to Regulation (EU) 2021/2115, Member States shall ensure that the ratio of permanent grassland in relation to agricultural area does not decrease by more than 5 % **compared to a reference ratio to be established by each Member State in its CAP Strategic Plan by dividing areas of permanent grassland by the total agricultural area.** In order to establish the reference ratio referred to in the first subparagraph:*

‘permanent grassland’ means: permanent grassland declared in 2018 by farmers receiving direct payments in accordance with point (a) of the first subparagraph of Article 72(1) of Regulation (EU) No 1306/2013 of the European Parliament and of the Council (16), determined as referred to in point (23) of Article 2(1) of Commission Delegated Regulation (EU) No 640/2014 (17) and adjusted, where necessary, by Member States to take into account the impact of a possible change, in particular as regards the impact of a change in the definition of grassland by Member States pursuant to Article 4(3), point (c), of Regulation (EU) 2021/2115;

‘total agricultural area’ means: the agricultural area declared in 2018 by farmers receiving direct payments in accordance with point (a) of the first subparagraph of Article 72(1) of Regulation (EU) No 1306/2013, determined as referred to in point (23) of the second subparagraph of Article 2(1) of Delegated Regulation (EU) No 640/2014 and adjusted where necessary by the Member States, in particular to take into account the impact of a possible change in the determination of agricultural area by Member States pursuant to Article 4(3) of Regulation (EU) 2021/2115.

Against this background, Hungary’s calculation methodology is as follows:

The permanent grassland (PP) declared in 2018 is divided by the total agricultural area (AA) declared in 2018. This division results in a reference percentage of 14.41 %.

Expressed by formulae: $709\,159.12\text{ ha} / 4\,921\,538.45\text{ ha} = 0.14409298$ i.e. 14.41 %.

This reference rate is taken as the basis for the 5 % tolerance laid down in the basic act.

3.10.1.1.4. Type of farmers concerned (all farmers that have permanent grasslands)

All producers eligible for area payments

3.10.1.1.5 Explanation of the contribution to achieve the main objective of the GAEC standard

Permanent grasslands help carbon sequestration, participate in the regulation of local climate systems, protect soils against erosion and contribute as habitats and landscapes to the protection of biodiversity and the preservation of habitats and landscapes.

3.10.1.2 GAEC 2: Protection of wetland and peatland

3.10.1.2.1 Summary of the on-farm practice

The maintenance of objects delimited as a striking area in the LPIS is mandatory.

Maintenance rules:

As a general rule, ploughing, draining water and preventing the establishment of dangerous weeds and invasive plants in the area covered by the cover must be prohibited. Once water has been drained or leaked, agricultural production may be carried out in the area.

Additional maintenance rule on arable land: ploughing and any tillage in areas protected under GAEC 2 on arable land shall be prohibited.

Additional maintenance rule on grassland: if a GAEC 2 protected area is delineated on grassland, it must not be converted into arable land.

In all cases, legal land use is a condition for eligibility.

3.10.1.2.2 Year of application of the GAEC

Please select year: **2025**

Justification

Hungary wishes to make use of the possibility offered in Annex III to Regulation (EU) 2021/2115 to apply GAEC 2 only from 2025. The justified reasons for the subsequent introduction are as follows.

Due to the geographical characteristics of Hungary, a significant part of the country's agricultural land is watered in some way or at least directly adjacent to such areas.

The proper management of such areas in the LPIS is a challenge for the Member State, as wetland environments vary not only between years, but also within the year, between areas that are still under temporary agricultural use and those that are continuously covered with natural vegetation and/or water typical of such habitats (some 31000 physical blocks are in such a volatile state and boundary).

The follow-up and management of this continuous change in the LPIS required the development of a specific methodology, the development of which was a year-long process. The essence of the methodology is to determine, on the basis of the time series of space uptake for the years of the LPIS renovation cycle, the areas which, due to their persistence and, more specifically, their inability to use agriculture, should be classified as 'SAPS ineligible'. On the basis of experience with the design and application of this methodology, we know that **the current process of reforming and developing the current CAP can only be done in an equally sound manner**. In order to be implemented, we therefore consider it necessary, first and foremost, to learn about the recommendations expected from the final results of the JRC SEPLA project and to integrate it systematically into our geospatial systems. As the launch of the 2023 CAP Strategic Plan requires a number of key improvements to the LPIS, for example to implement the Area Monitoring System (AMS), the final outcome of the JRC SEPLA project could not be expected.

The first phase of the development of the LPIS required by the CAP Strategic Plan includes a task to pave the way for the 2025 roll-out by reviewing, in accordance with the methodology currently applied in the LPIS, the striking areas with a volatile boundary previously identified for monitoring purposes and their immediate surroundings and buffer zones, and, as a result of the review, will continue to treat them in a single cover, which will be applied in the application and its verification.

In the next phase of LPIS development, as of spring 2023, other similar areas will be identified in addition to the areas already delimited in the first phase. Remote sensing (picture analysis) procedures are also used to fully identify wetlands. Finally, these areas will be delimited through a full visual interpretation review. The delineation will be based on a methodology developed taking into account the recommendations resulting from the final outcome of the JRC SEPLA project.

3.10.1.2.3 Territorial scope and area designated

Throughout the country, based on the relevant LPIS coverage.

Application of GAEC 2 from 2025:

The GAEC 2 LPIS delimitation methodology has been established, which is attached as an annex to the plan. As reflected in the demarcation methodology, the areas were included in the coverage according to three main aspects: a sufficient degree of connection with agricultural land, a higher than average carbon content, as well as the nature of the area's waterfall and its cover with intermittent water. The areas covered by the cover will be subject to strict maintenance rules as of 2025. If more precise data are available in the future, we will update and complete the current GAEC 2 cover.

3.10.1.2.4 Type of farmers concerned

All farmers eligible for area payments.

3.10.1.2.5 Explanation of the contribution to achieve the main objective of the GAEC standard

Conservation of high-carbon land (including peatlands) contributes to the proper management of carbon-rich soils, thereby facilitating carbon sequestration and combating climate change.

3.10.1.3 GAEC 3: Ban on burning arable stubble, except for plant health reasons

3.10.1.3.1 Summary of the on-farm practice

Ban on burning stubble: The burning of stubbles, reeds and plant residues is prohibited, except in the event of the appearance of a quarantine pest and ordered by official decision.

3.10.1.3.2 Territorial scope

Throughout the country

3.10.1.3.3 Type of farmers concerned

All producers eligible for area payments

3.10.1.3.4 Explanation of the contribution to achieve the main objective of the GAEC standard

A ban on burning stubble, reed and other plant residues helps to preserve soil organic matter and biological status and contributes to reducing air pollution.

3.10.2 Main issue: Water

3.10.2.1 GAEC 4: Establishment of buffer strips along water courses

3.10.2.1.1 Summary of the on-farm practice

Establishment of buffer strips along water courses:

Fertilisers, organic fertilisers and pesticides, plant and soil conditioning agents and microbiological preparations shall not be applied

— in a strip of 5 metres measured from the shoreline of other surface watercourses graphically marked in the LPIS, by reducing the protection distance to 3 metres if the agricultural field is not wider than 50 metres and has an area of less than 1 ha.

— in the case of dam-locked fish ponds, within a strip of 5 m from the coastline,

— in a 20 m strip measured from the shoreline of standing waters above 5000 square meters graphically marked in the LPIS,

In the case of livestock manure, the defined protection distances do not apply to manure that is dead by grazing animals if it occurs due to access to the drinking area.

3.10.2.1.2 Minimal width of buffer strips (in m)

3.10.2.1.3 Territorial scope, including water courses definition

Based on the relevant LPIS coverage throughout the country

The basis for the development of the buffer strips and the water body coverage included in GAEC4 was based on data from the National Directorate-General for Water Management (OVF) compliant with the Water Framework Directive (data for the vicinity of 2015).

The data of the OVF were revised in the design of the LPIS water body cover compared to the current ortho-photo, but the review should be understood only as data purification and possibly clarification of the boundaries and coastlines of water bodies, so it can be stated that the coverage of the **LPIS water body overlaps with the data of the OVF WFD.**

3.10.2.1.4 Type of farmers concerned

All producers eligible for area payments

3.10.2.1.5 Explanation of the contribution to achieve the main objective of the GAEC standard

Standards for buffer strips contribute to protection against water pollution

3.10.3 Main issue: soil(protection and quality)

3.10.3.1 GAEC 5: Tillage management, reducing the risk of soil degradation and erosion, including consideration of the slope gradient

3.10.3.1.1 Summary of the on-farm practice

Tillage or other appropriate agronomic technology limiting the risk of soil degradation, taking into account the slope:

Site-specific minimum land management requirements for limiting erosion:

—The cultivation of crops with a slope of more than 12 %, including maize and sunflower, and the cultivation of winter swede rape at rows of more than 24 cm shall be prohibited, except in the case of direct sowing, contour cultivation and/or grassed or wooded buffer strips parallel to the strata or which prevent erosion from occurring;

—the preservation of terraces against erosion is mandatory in the case of vineyards.

3.10.3.1.2 Territorial scope (including erosion risks areas and the slope gradient)

Slopes (arable areas and permanent crops) with a slope greater than 12 % on the basis of the relevant LPIS coverage throughout the country.

Standard GAEC 5 covers 32.98 % of Hungary's agricultural area declared in the single application on the basis of 2021 data.

3.10.3.1.3 Type of farmers concerned

All producers eligible for area payments.

3.10.3.1.4 Explanation of the contribution to achieve the main objective of the GAEC standard

Anti-erosion measures help to avoid soil degradation and preserve soil resources.

3.10.3.2 GAEC 6: Minimum soil cover to avoid bare soils in period(s) that are most sensitive

3.10.3.2.1 Summary of the on-farm practice (including the period concerned)

Minimum soil cover in the most sensitive period(s) and areas:

Minimum soil cover on arable land shall be maintained at least until 15 July – 30 September:

— the presence of the main crop grown in the current year;

— after the summer and autumn harvests have been abandoned, by creating an autumn crop or secondary sowing, or by preserving the stubble or, at most, by carrying out shallow stubble and nursing or by a medium-deep relaxation without altering/mixing the soil, with a view to helping the autumn precipitate into a deeper soil layer.

In the case of plantations on a slope above 12 %, the soil cover of the spacing shall be ensured at least by mulching or sowing annual crops.

For each plantation, once the plantation has been grubbed up, if the farmer intends to replant, the soil cover shall be ensured in the area between the grubbing-up and the replanting.

On areas used for the production of underwater crops (rice, indirect rice), it is not mandatory to maintain a minimum soil cover in the year of set-aside if a crop under water is grown on the land in the year preceding the set-aside. The detailed technological description and arguments are attached as an annex to the Plan. This shows that in the year intended for set-aside, it is more important, from a soil protection point of view, to ventilate the soil more than the soil cover.

3.10.3.2.2 Territorial scope

The whole territory of the country. Under glasshouses and films, there is no obligation to cover the soil, as the growing equipment itself protects the soil surface.

3.10.3.2.3 Type of farmers concerned

All producers eligible for area payments.

3.10.3.2.4 Explanation of the contribution to achieve the main objective of the GAEC standard

Ensuring soil cover protects against erosion, helps to sequester carbon and prevent water loss, and, by growing mulching, helps to increase soil organic matter and improve soil structure and potential.

In Hungary, taking into account the annual precipitation distribution and the evolution of the intensity of (harmful) solar radiation, the period at the end of the summer represents the highest risk in terms of soil degradation. Soil cover is critical in this period of dry and intense radiation.

3.10.3.3 GAEC 7: Crop rotation in arable land except for crops grown under water

3.10.3.3.1 Summary of the on-farm practice for crop rotation

The crop conversion and crop diversification rules applicable in Hungary for the period 2023-2027 are as follows:

GAEC 7 requires farmers to change crop or crop diversification on their arable land.

I. Rules on crop conversion:

The main rule is the annual crop change in arable land.

A second sowing adequately sown between two main crops shall be considered as fulfilling the sowing change. A crop harvested for the reference year after the first crop declared in the single application has been harvested until sowing of the first crop of the following year or turned into the soil as a green manure crop shall be considered as such a second crop; where agronomically justified time shall be allowed for soil works, both after the first main crop has been replaced and before sowing of the second main crop. The second crop shall be a different crop from both main crops.

Under the flexibility provided for in Article 13 of the basic act, the farmer has the possibility to:

—does at least 33.33 % of arable land in the part of its holding not affected by the exceptions below or by hybrid maize production, but

—ensure that all arable land not covered by the exceptions below is switched within a maximum of three years, with different main crops at least once out of three years as in the other two years.

The following plants may not be sown even if the farmer makes use of the flexibility referred to above: potatoes, sunflower, swede rape, soya beans, sugar beet, oil pumpkins and melons.

Hybrid maize sown for seed production may be grown consecutively for a maximum of four years.

II. Crop diversification rules:

(a) a farmer with more than 10 hectares but no more than 30 hectares of arable land shall grow in the reference year at least two types of arable crops with a maximum of 75 % of the arable land on the largest area,

(b) a farmer with more than 30 hectares of arable land shall grow at least three types of crops with a maximum of 75 % of the arable land on the largest area, and the combined cultivation of the two largest areas shall not exceed 95 % of the arable land.

For the purpose of calculating the proportion of different crops, the period from 1 May to 30 September of the year of submission of the single application shall be taken into account.

III. Common rules:

Exceptions:

Holdings with less than 10 hectares of arable land.

Holdings where more than 75 % of the eligible agricultural area is permanent grassland and is used for the production of grasses or other herbaceous forage or for the production of crops flooded with water for a significant part of the year or the crop cycle, or a combination thereof.

Holdings where more than 75 % of the arable land is used for the production of grasses or other

herbaceous forage, as land lying fallow, for the production of leguminous crops or for several of those uses.

Area under perennial arable crops.

Arable crops grown under flooding (water).

Land left fallow.

Hungary shall apply the following **when defining the crop**:

‘[...] ‘crop’ means any of the following:

(a) any culture or mixture of different genera as defined in the botanical classification of crops (a mixture is considered to be a different culture from a previous or a subsequent culture or mixture if all its components are considered to be different cultures from the pre-cropment and the duplicate),

(b) a culture of any species belonging to the families of Brassicaceae, Solanaceae and Cucurbitaceae,

(C) land lying fallow,

(D) grasses or other forage plants.’

In addition, a second crop fulfils the obligation to change sowing if the agronomically justified time has been taken into account both after the first main crop has been abandoned and the second main crop has been planted, and the second crop belongs to a crop different from the previous and the next main crop, with plants of the species *Brassica napus* (feed rape), *Sinapis alba* (white mustard), *Raphanus sativus* (retek) being inseparable.

(IV) Derogations:

Derogation in claim year 2023:

Hungary makes use of the derogation provided for in Implementing Regulation (EU) 2022/1317 to exempt farmers from the obligation to switch sowing in 2023.

Potatoes, sunflowers, brassica, soya beans, sugar beets, oil pumpkins and melons may not be cultivated on its own in 2023.

Furthermore, the exemption does not affect the baseline requirement level of producers participating in the Agro-ecological Programme and the Agri-Environmental Management Programme.

Derogation in claim year 2024:

According to the 2024 simplification package of Regulations (EU) 2021/2115 and (EU) 2021/2116, Hungary already applies the following simplification option for claim year 2024 for GAEC 7:

Crop diversification is added to GAEC 7 as follows:

(a) a farmer with more than 10 hectares but no more than 30 hectares of arable land shall grow in the reference year at least two types of arable crops with a maximum of 75 % of the arable land on the largest area,

(b) a farmer with more than 30 hectares of arable land shall grow at least three types of crops with a maximum of 75 % of the arable land on the largest area, and the combined cultivation of the two largest areas shall not exceed 95 % of the arable land.

The types of plants exempted are the same as for crop conversion. For the purpose of calculating the proportion of different crops, the period from 1 May to 30 September of the year of submission of the single application shall be taken into account.

3.10.3.3.2 Summary of the farm practice for crop diversification

Hungary applies crop diversification under conditionality as of 2024 as an alternative practice equivalent to sowing in the context of the simplification package.

As there are common rules for the two practices, the detailed rules for crop diversification, together with the sowing change, are presented in chapter 3.10.3.3.1.

3.10.3.3.3 Territorial scope

Throughout the country

3.10.3.3.4 Type of farmers concerned

☐ All farmers who have at their disposal arable land (no exemption)

☒ Exemptions that apply

With a size of arable land up to 10 hectares (footnote 5 of annex III, point (1)(c))

Where more than 75% of the eligible agricultural area is permanent grassland (footnote of Annex III, point(1)(b))

Where more than 75% of arable land is used for the production of grasses or other herbaceous forage, is used for land laying fallow, cultivation of leguminous crops, or is subject to a combination of those uses (footnote of Annex III, point(1)(a))

3.10.3.3.5 Explanation of the contribution to achieve the main objective of the GAEC standard (notably if MS has chosen crop diversification)

Crop conversion requirements help to preserve the soil potential and reduce the use of plant protection products by establishing a correct crop sequence and greater diversity.

3.10.4 Main issue: Biodiversity and landscape (protection and quality)

3.10.4.1 GAEC 8: Retention of landscape features. Ban on cutting hedges and trees during the bird breeding and rearing season. As an option, measures for avoiding invasive plant species

3.10.4.1.1 Summary of the in-farm practice

Standard of minimum share:

☒ At least 4% of arable land at farm level devoted to non-productive areas and features, including land lying fallow.

Share (%) of arable land devoted to non-productive areas and features : **4.0%**

☐ At least 3% of arable land at farm level devoted to non-productive areas and features, including land lying fallow when the farmer commits to at least 7% of arable land devoted to non-productive areas and features, including land lying fallow, under an enhanced eco-scheme in accordance with Article 31(5a).

☒ At least 7% of arable land at farm level devoted to non-productive areas and features, including land lying fallow, and catch crops and nitrogen fixing crops, cultivated without the use of plant protection products, of which 3% shall be non-productive areas and features, including land lying fallow. Member States should use the weighting factor of 0,3 for catch crops.

Share (%) of arable land devoted to non-productive areas and features and to catch crops or N-fixing crops : **7.0%**

List of features (Indicative list of features and non-productive areas eligible for calculating the minimum share)

☐ Buffer strips

☐ Cairns

☒ cultural features

Explanation

Kunhalom, goose well

Weighting factor: 1

Kunhalms and goggles that are delineated in the LPIS and protected in GAEC are acceptable. Kunhalms and goose wells shall be located on arable land. Kunhalms are polygonically indicated in the LPIS with their entire area. Each point-marked goggle well is delimited by an area corresponding to 25 m².

According to the GAEC requirements for the goose well, the farmer has to maintain the goose wells as assessed by the Hungarian State Treasury in 2010.

According to the GAEC standards for kunhalom, no agricultural soil work may be carried out in the area of kunhalom. Preparatory action to restore grassland land cover is an exception. In addition, during felling in the kunhalom area, disturbance of the farm is prohibited.

☐ Ditches

☒ Fiel margins, patches or parcels buffer strips

Explanation

Ecological boundary:

Weighting factor: 1,5

Minimum area: 0.01 ha

Land covered with woody and/or soft-shank vegetation, with a minimum average width of three, up to 20 metres, typically with a strip-like area, which is:

(a) on the arable land or directly adjacent to the arable land, inside the physical block affected by the arable land,

(b) an artificial element interrupted by a maximum of two metres in length, contact with arable land at least thirty metres long, and

(D) less than 30 % of the circumference of the whole element is in contact with a permanent grassland area.

In the case of ecological boundaries characterised by predominantly woody vegetation, a significant reduction in woody vegetation should be prevented. A significant reduction is the reduction of at least 20 per cent of space that the Territorial Monitoring System (TMR/AMS) will be objectively able to perceive when it becomes technologically suitable.

Erosion control band:

Weighting factor: 1,5

Area covered with woody or herbaceous vegetation parallel to the stratum line and specifically intended to prevent and mitigate water erosion.

Additional characteristics:

- an average width of not less than three and not more than 20 metres;
- at least thirty metres long;
- where the sides of the plate parallel to the slope are on average less than 30 metres apart, the erosion control band shall connect the two edges of the plate.

☒ Hedgerows individual or group of trees rows

Explanation

Lonely standing timber:

Weighting factor: 1,5

Solitary trees which are protected by the GAEC Decree and delimited in the LPIS are acceptable. These are isolated trees on arable land with a tree crown of at least 4 metres in diameter. According to GAEC, loneliness trees cannot be felled. Each single tree marked as spot is delimited by an area equivalent to 20 m².

Groups of trees and bushes

Weighting factor: 1,5

Groups of trees and bushes which are delimited in the LPIS and protected by the GAEC Decree are acceptable.

In the LPIS, groups of trees and bushes are defined that are smaller than 5000 square metres, typically with non-line ski dispersion and covered with plants with at least 50 % tree stalks, which are surrounded

by arable land in at least 20 % or 50 % in contact with grassland land cover.

The delimited groups of trees and bushes may in any case be placed on arable land. The groups of trees and bushes are displayed on the single application form, thus helping to designate EDF areas.

According to GAEC, all agricultural soil work is prohibited in the area of wood and bushes. This is an exception for preparatory action to restore reforestation or grassland cover.

☒ Land Lying fallow

Explanation

Weighting factor: 1

The minimum set-aside period of land lying fallow shall be from 1 January to 31 August, during which no plant protection product is used throughout the area. During the period of set-aside, the soil must be covered by crop cover or stubble residue. Mechanical weed control is permitted in order to maintain the state of culture in the fallow area.

For more than five years, the area accounted for as lying fallow under GAEC 8 shall continue to be considered as arable land.

Difference in application year 2023:

Hungary makes use of the derogation provided for in Implementing Regulation (EU) 2022/1317 to allow farmers to cultivate a food crop in an area intended to be left fallow and accounted for as such in 2023.

Maize and soybeans may not be cultivated in those areas in accordance with that Implementing Regulation. The list of crops eligible for food shall be published by the managing authority in national legislation.

Furthermore, the exemption is without prejudice to the baseline requirement level for farmers participating in the Agro-ecological Programme and the Agricultural Environmental Management Programme.

☒ Others

Explanation

Plant for the protection of erosion in arable land under non-productive investment:

Weighting factor: 2

An erosion control facility established in arable land as part of a non-productive investment delimited in the LPIS.

Non-cultivated buffer strip on arable land:

Weighting factor: 1,5

The buffer strips defined in the LPIS may be recognised. Buffer strips of 5 m from the shoreline of surface watercourses and 20 m along lakes are delineated in the LPIS.

No buffer is possible between the declared arable land and the buffer strip. Agricultural production is prohibited in the buffer strips to be accounted for, except for mechanical weed control to maintain the agricultural condition. Compliance with GAEC requirements on water buffer strips is mandatory. May not be transferred in accordance with GAEC requirements

- fertiliser in a 5 m strip measured from the shoreline of surface waters graphically marked in the LPIS;
- organic manure;
- pesticides;
- plant conditioning agent;
- soil conditioning agent.

- microbiological preparation

20 m from the shoreline of standing waters above 5 000 m² graphically marked in the LPIS,

5 m from the coastline in the case of dam-locked fish ponds,

In a strip of 5 metres from the shoreline of other surface watercourses graphically marked in the LPIS, by reducing the protective distance to 3 metres if the agricultural field is less than 50 metres and less than 1 hectare.

The protection distance for organic manure shall not apply to manure that is dead by grazing animals if this occurs due to the approach to the drinking site.

Ecologically important duplicate:

Weighting factor: 0,3

Eligible area under the LPIS planted by 1 October of the current year with a mixture of at least two species, used as green manure or winter cover, is present on the farmer's land for at least 60 days from sowing, during which period a plant protection product is prohibited, including the use of treated seed, and which is rotated before sowing the first crop in the following year. Only a second set of species listed in separate national legislation may be accepted as ecologically important.

Derogation for application year 2024:

Hungary makes use of the derogation provided for in Implementing Regulation (EU) 2024/587, according to which the weighting factor for the second crop taken into account as a non-productive area shall be 1 for the year 2024.

Area sown with nitrogen-fixing crops

Weighting factor: 1

In order to be accepted as nitrogen-fixing areas, an area eligible for aid in the LPIS shall be sown with a nitrogen-fixing crop or a mixture of nitrogen-fixing crops listed in the list below or a mixture of nitrogen-fixing crops and other non-nitrogen-fixing crops in which the proportion of seeds of the nitrogen-fixing crop exceeds 50 %.

In addition, in the case of annual crops, from sowing to harvest and, in the case of perennial crops, the use of plant protection products and treated seed for the part of the calendar year of the application during which the crop is on the area, the use of plant protection products and treated seed shall be prohibited unless the area sown with the perennial crop is accounted for in the year or years following sowing.

White-flowered haemorrhage (*Melilotus albus* Medik.)

Cornered peas (*Lathyrus sativus* L.)

Chickpeas (*Cicer arietinum* L.)

Common cork (*Securigera varia* (L.) Lassen)

Eastern goat clover (*Galega orientalis* L.)

Deer (*Lotus corniculatus* L.)

Lucerne (*Medicago sativa* L.)

Lucerne (*Medicago lupulina* L.)

Sárkerep lucerna (*Medicago wallcata* L.)

Dried beans (common or seed beans) (*Phaseolus vulgaris* L.)

Lenses (principal lenses) (*Vicia lens* (L.) Coss. & GERM.)

Green peas (*Lathyrus oleraceus* Lam.)

Yellow peas (*Lathyrus oleraceus* Lam.)

Field peas (*Lathyrus oleraceus* Lam.)

Melilotus officinalis (L.) Lam.

Derogation for application year 2024:

Hungary makes use of the derogation provided for in Implementing Regulation (EU) 2024/587 to:

By way of derogation from the first requirement of GAEC 8 of GAEC standard 8 of the GAEC of land, Hungary decided that, for claim year 2024, farmers and other beneficiaries covered by that standard may fulfil the first requirement of that standard by dedicating at least 4 % of the arable land at farm level to:

— non-productive land and features, including land lying fallow, and/or

— nitrogen-fixing crops, and/or

— ecologically important duplicate.

Crop protection products should not be used in the cultivation of ecologically important secondary crops and nitrogen-fixing crops.

A correction coefficient of 1 is applied to ecologically important secondary crops.

Derogation from application year 2025:

Under the 2024 simplification package of Regulations (EU) 2021/2115 and (EU) 2021/2116, Hungary applies the following simplification option for GAEC 8 from claim year 2025:

The obligation to designate non-productive areas from the GAEC 8 standards system is removed by introducing such a requirement in the AÖP (eco-scheme), because any loss of income of the producer can be compensated for. The GAEC remains in 8 the obligation to preserve protected landscape features and the ban on cutting, pruning and mutilation of hedgerows and trees during the breeding and rearing period.

☒ Small ponds

Explanation

Small lake

Weighting factor: 1,5

An area with an area of at least 0.01 ha and not more than 0.5 ha, protected in GAEC, delimited in the LPIS, not used on a temporary basis, or bordered by open water surface and up to 10 metres wide coastal vegetation, or at least intermittently drained, but also permanently covered with vegetation typical of wetlands during dry periods, may be considered acceptable in terms of conditioning.

In the case of a small lake, a vegetation strip up to 10 metres wide along the coast of the small lake may be included in the eligible area.

According to GAEC requirements, ponds protected in GAEC must be preserved in accordance with the above parameters.

☒ Small wetlands

Explanation

Weighting factor: 2

Wetland recorded in the LPIS.

The demarcation of small wetlands in the LPIS is based on the farmer's drawing in the farmer's application and changes are carried out.

As it is necessary to distinguish between the 'small wetlands' eligible for GAEC 8 from the 'wetlands' under GAEC 2, the latter delimitation methodology has been designed accordingly and applied from 2025.

Irrespective of the above-mentioned methodology, wetland established under GAEC standard No 8 is eligible for non-productive investments.

☐ Stonewalls

☐ Streams

☒ Terraces

Explanation

Weighting factor: 2

Artificial terrain steps at least 1 metre high on arable land protected by the GAEC Decree and delimited in the LPIS.

GAEC conservation means that the preservation of such terraces is mandatory.

The terraces are presented in line during the application and can be counted in a conditioning list with a width of 2 metres. This means that each metre of terrace corresponds to 2 m². The minimum length of the terrace on the farmer's arable land is 10 metres.

List of features (for retention)

- **Small ponds**
- **Hedgerows individual or group of trees rows**
- **Terraces**
- **cultural features**

Ban on cutting hedges and trees during the bird breeding and rearing season (mandatory)

Grubbing-up ban: Trees, hedges and hedgerows may not be cut, engraved or otherwise mutilated during the breeding and rearing season between 1 March and 31 August.

Measures for avoiding invasive plant species

We consider soft and woody invasive plants as weeds. As described in section 4.1.1.2, we are struggling with the minimum conditions for eligible areas.

3.10.4.1.2 Territorial scope (applicable for the "minimum share" standard)

On the basis of the relevant LPIS coverage throughout the country.

3.10.4.1.3 Type of farmers concerned

☐ All farmers who have at their disposal arable land (no exemption)

☒ Exemptions that apply

☐ Non Applicable

With a size of arable land up to 10 hectares (footnote 5 of annex III, point (1)(c))

Where more than 75% of the eligible agricultural area is permanent grassland (footnote 5 of annex III, point (1)(b))

Where more than 75% of arable land is used for the production of grasses or other herbaceous forage, is used for land laying fallow, cultivation of leguminous crops, or is subject to a combination of those uses (footnote of Annex III, point(1)(a))

3.10.4.1.4 Explanation of the contribution to the main objective of the practice/standard

Non-productive landscape features and pesticide-free secondary crops for agro-ecological purposes, N-

fixing crops contribute to the protection of biodiversity, the conservation of habitats and landscapes and the protection of soils.

3.10.4.2 GAEC 9: Ban on converting or ploughing permanent grassland designated as environmentally-sensitive permanent grasslands in Natura 2000 sites

3.10.4.2.1 Summary of the on-farm practice

Conversion and ploughing of environmentally sensitive Natura 2000 grasslands is prohibited.

All Natura 2000 permanent grassland in Hungary is considered environmentally sensitive.

3.10.4.2.2 Territorial scope

Total indicative area of environmentally-sensitive permanent grasslands in Natura 2000 sites covered by the GAEC in ha: **448119.98**

3.10.4.2.3 Type of farmers concerned

All producers eligible for area payments.

3.10.4.2.4 Explanation of the contribution to achieve the main objective of the GAEC standard

Natura 2000 grasslands contribute to biodiversity protection, habitat and landscape conservation.

3.10.5 Additional GAEC (if applicable)

Code	Title	Description
-	Additional GAEC standard	Hungary does not apply additional GAEC standards.

4 Elements common to several interventions

4.1 Definition and minimum requirements

4.1.1 Agricultural activity

4.1.1.1 Definition of production

We hereby confirm that we continue to apply Article 4(1)(c)(i) of Regulation (EU) No 1307/2013 to the production of agricultural products.

4.1.1.2 Definition of maintenance of agricultural area

4.1.1.2.1 Maintenance criteria in arable land

Arable land shall be considered to be kept in good condition if there is no agricultural production during that reference year, or if there is no agricultural production during that year, excluding occasional cleaning mowing, but the presence of weeds, including hazardous weeds and reeds, and woody plants that are undesirable from the point of view of utilisation is no more than such that the arable land does not have a large, severe herbaceous or woody stalk or severe and permanent woody weeds.

Temporary grassland as arable land shall be eligible if there is no damage to temporary grassland resulting from inappropriate grazing (overgrazing) in which the grass scrub is shortly chewed and where at least 50 % of the soil surface becomes uncovered, and where there is no agricultural production in the current year, grassing species, including reeds, and forage crops are predominant on the temporary grassland and dominated by grassing grass species, including reeds, and forage crops, and there are no increases remaining from the previous growing season with propagation formulae.

The area in which agricultural production takes place, but with large-scale, severe herbaceous or woody weeds or large-scale, severe and permanent woody weeds, is not eligible for aid in the aid year under consideration. In the case of large, severe and permanent woody weeds, the area shall be reclassified as ineligible according to the Ministerial Decree on the Agricultural Parcel Identification System.

High, severe herbaceous weed: the spread of herbaceous weeds to any adjacent land, or where the field tested contains a flowering hazardous weed or a herbaceous weed of more than 50 % of the land area;

Large, severe woody weeds: the spread of woody weeds to any adjacent land, or where, in the case of the field under review, there are more than 100 woody weeds per hectare, the area under the canopy of which does not contain grazable vegetation or the removal of the ligneous weeds cannot be carried out without damage to the base crop and the area can be made suitable for agricultural cultivation during the growing season;

Severe, severe permanent woody weeds: the spread of woody weeds to any adjacent land, or where, in the case of the field under review, there are more than 100 woody weeds per hectare, the area under the canopy of which does not contain grazable vegetation or the removal of the ligneous weeds cannot be carried out without damage to the basic crop and the area cannot be made suitable for agricultural cultivation during the growing season;

Special rule for non-productive landscape features and other landscape features: On declared land objects marked as non-productive landscape features and other landscape features, the farmer shall prevent the establishment of invasive plants and dangerous weeds. The presence of invasive plants automatically corresponds to severe weeding.

Special rule for the presence of reeds and the water cover period in areas used for ecological restocking, small wetland type landscape features and paludiate areas defined under GAEC 2: After the time of the water cover or the soil's saturation with water to a degree that prevents mechanical work, maintenance rules must be complied with. The continuous presence of reeds is natural and allowed as long as it does not predominate in the area, thus not significantly hampering agricultural use.

4.1.1.2.2 Maintenance criteria in permanent crops

Permanent crops shall be considered to be in good condition if there is agricultural production during the

reference year or if there is no agricultural production in the reference year, excluding occasional cleaning mowing, but the presence of weeds, including hazardous weeds and reeds, and woody plants that are undesirable from the point of view of exploitation is limited to the extent that they do not have permanent, large-scale severe herbaceous or woody weeds or severe and permanent woody weeds.

In addition to the weed-free criterion, woody fruit and vineyards shall be considered to be kept in good condition if, based on the number of vines per hectare calculated on the basis of the plantation, the percentage of missing, dried or otherwise incapacitated plants does not exceed 30 %.

The area on which agricultural production takes place, but where large-scale, severe herbaceous or woody weeds are observed or severe and permanent woody weeds are observed, or the percentage of missing, dried or otherwise incapacitated animals per hectare, calculated on the basis of the crop rotation, is more than 30 % shall not be eligible for aid in the aid year under consideration.

In the case of large, severe and permanent woody weeds, the area shall be reclassified as ineligible according to the Ministerial Decree on the Agricultural Parcel Identification System.

Large, severe herbaceous weed: the spread of herbaceous weeds to any adjacent land, or where the field tested contains a flowering hazardous weed or a herbaceous weed of more than 50 % of the land area;

Large, severe woody weeds: the spread of woody weeds to any adjacent land, or where, in the case of the field under review, there are more than 100 woody weeds per hectare, the area under the canopy of which does not contain grazable vegetation or the removal of the ligneous weeds cannot be carried out without damage to the base crop and the area can be made suitable for agricultural cultivation during the growing season;

Large, severe permanent woody weeds: the spread of woody weeds to any adjacent land, or where, in the case of the field under review, there are more than 100 woody weeds per hectare, the area under the canopy of which does not contain grazable vegetation or the removal of the ligneous weeds cannot be carried out without damage to the basic crop and the area cannot be made suitable for agricultural cultivation during the growing season.

Special rule for the presence of reeds and the water cover period in areas used for ecological restocking, small wetland type landscape features and paludiate areas defined under GAEC 2: After the time of the water cover or the soil's saturation with water to a degree that prevents mechanical work, maintenance rules must be complied with. The continuous presence of reeds is natural and allowed as long as it does not predominate in the area, thus not significantly hampering agricultural use.

4.1.1.2.3 Maintenance criteria in permanent grassland

Permanent grassland shall be considered to be kept in good condition if it is not damaged by inappropriate grazing (overgrazing) in which the grass scrub is shortly chewed and where at least 50 % of the soil surface becomes uncovered, and where there is no agricultural production in the current year, grassing species, including reeds, and forage crops are predominant on the permanent grassland and dominated by grassing grass species, including reeds, and forage crops, and there are no growths remaining from the previous growing season whose propagating formulae have been lost.

Areas in which large-scale, severe herbaceous or woody weeds are observed or severe and permanent woody weeds are observed shall not be eligible for aid in the aid year under consideration. In the case of large, severe and permanent woody weeds, the area shall be reclassified as ineligible according to the Ministerial Decree on the Agricultural Parcel Identification System.

Large, severe herbaceous weed: the spread of herbaceous weeds to any adjacent land, or where the field tested contains a flowering hazardous weed or a herbaceous weed of more than 50 % of the land area;

Large, severe woody weeds: the spread of woody weeds to any adjacent land, or where, in the case of the field under review, there are more than 100 woody weeds per hectare, the area under the canopy of which does not contain grazable vegetation or the removal of the ligneous weeds cannot be carried out without damage to the base crop and the area can be made suitable for agricultural cultivation during the growing

season;

Large, severe permanent woody weeds: the spread of woody weeds to any adjacent land, or where, in the case of the field under review, there are more than 100 woody weeds per hectare, the area under the canopy of which does not contain grazable vegetation or the removal of the ligneous weeds cannot be carried out without damage to the basic crop and the area cannot be made suitable for agricultural cultivation during the growing season.

Special rule for the presence of reeds and the water cover period in areas used for ecological restocking, small wetland type landscape features and paludiate areas defined under GAEC 2: After the time of the water cover or the soil's saturation with water to a degree that prevents mechanical work, maintenance rules must be complied with. The continuous presence of reeds is natural and allowed as long as it does not predominate in the area, thus not significantly hampering agricultural use.

4.1.2 Agricultural area

4.1.2.1 Elements of agroforestry systems when it is established and/or maintained on the agricultural area

4.1.2.1.1 Elements of agroforestry systems in arable land

On arable land, the following uses are considered as agroforestry systems:

1. simultaneous intermediate cultivation of arable crops (including temporary grasses) and forestry or fruit tree species in the same area where the woody individuals are in parallel rows or in other regular geometrical arrangements and do not exceed 250 per hectare;
2. simultaneous intermediate cultivation of arable crops and short rotation coppice in the same area where ligneous individuals are in parallel rows or other regular geometrical arrangements and do not exceed 4000 per hectare. Detailed national rules on short rotation energy plantations must also be complied with in these agroforestry systems.

4.1.2.1.2 Elements of agroforestry systems in permanent crops

The following permanent crops are considered to be agroforestry systems if they are standalone objects and are not part of arable or grassland:

1. bars, wooden bars, groups of trees and bushes and other special tree plantations (excluding short rotation energy plantations and Christmas tree plantations) that meet the criteria for a landscape feature under GAEC 8 and are therefore eligible areas;
2. productive plantations planted with a mix of forest and fruit tree species.

4.1.2.1.3 Elements of agroforestry systems in permanent grassland

On grassland, the following uses are considered as agroforestry systems:

1. woody pastures, where the woody individuals are in parallel rows or in other regular geometrical arrangements and do not exceed 250 per hectare;
2. woody mowers, where the ligneous individuals are in parallel rows or in other regular geometrical arrangements and do not exceed 250 per hectare.

Woody individuals always mean forest tree species or fruit trees.

4.1.2.2 Arable land

4.1.2.2.1 Other comments relating to the definition of arable land

Arable land includes temporary grassland in addition to land cultivated for arable crops or available for arable crop production or land lying fallow. Temporary grassland: land used for the production, without sowing or by sowing, of grasses or other forage crops of species of the genus *Trifolium* and lucerne (*Medicago*) and their exclusive mixtures, planted less than five years from the date of planting and not due

to the obligation to restore permanent grassland.

4.1.2.3 Permanent crops

4.1.2.3.1 Definition of nurseries

Nurseries: areas of young ligneous (woody) plants grown in the open air for subsequent transplantation:

- graft nurseries and rootstocks,
- fruit nurseries,
- ornamental nurseries,
- commercial forestry nurseries, except those located within the forest area and meeting the plant's own needs,
- nurseries in which trees and shrubs (e.g. hedgerows, roses and other ornamental shrubs, ornamental conifers) intended for gardens, parks, roads and stuffing are grown, including in all cases rootstocks and seedlings.

4.1.2.3.2 Definition of Short Rotation Coppice

Short rotation coppice is defined as certain basic tree species and woody plantations for coppice with a maximum rotation of 5 years, consisting of specified basic tree species and their varieties authorised for forestry and energy purposes, with a planting density of at least 4.000 pieces per hectare, and energy cane species of the genus *Miscanthus*, Italian cane and silphium species as herbaceous energy crops.

List of authorised tree species:

1. White summer (*Populus alba*)
2. Black summer (*Populus nigra*)
3. Grey poplar (*Populus x canescens*)
4. *Populus tremula*
5. White lac (*Salix alba*)
6. Basket wafers (*Salix viminalis*)
7. *Alnus glutinosa*
8. High ash (*Fraxinus excelsior*)
9. Narrow-leaved ash (*Fraxinus angustifolia*)
10. Early maple (*Acer platanoides*)

Detailed national rules on the authorisation, planting and cultivation of short rotation energy plantations are in force.

4.1.2.3.3 Other comments relating to the definition of permanent crops

Permanent crops include, in addition to nurseries and short rotation coppice, the following crops: vineyards, orchards, other woody plantations, asparagus, woody shrub and semi-boot type, and perennial herbs, aromatics and herbs.

4.1.2.4 Permanent grassland

4.1.2.4.1 Definition of grasses and other herbaceous forage

Grass species (Graminaceae), legumes (Order Fabales) and other intestinal plants are grass crops. Stand-alone herds of species of the genus *Trifolium* and alfalfa (*Medicago*) or their exclusive mixtures shall not be considered as grassland.

List of grassroots and other forage species

1. Rye of English (*Lolium perenne*)
2. Meadow grass (*Poa pratensis*)
3. Red fescue (*Festuca rubra*)

4. Italian perry (*Lolium multiflorum*)
5. Hungarian rye rye (*Bromus inermis*)
6. Fescue (*Festuca arundinacea*),
7. Green lime grass (*Phalaris arundinacea*)
8. Purple (*Trifolium incarnatum* L.)
9. Red scrub (*Trifolium pratense* L.)
10. White clover (*Trifolium repens* L.)
11. Pershere (*Trifolium resupinatum* L.)
12. Alexandriai test (*Trifolium alexandrinum*)
13. Corn (*Trifolium hybridum*)
14. Clover of LÓDI (*Trifolium repens* L. var. *Giganteum*)
15. Clover of founs (*Trifolium resupinatum*)
16. Lucerne (*Medicago sativa* L.)
17. Hop lucerne (*Medicago lupulina*)
18. Sárkerep lucerne (*Medicago village*)
19. Alfalfa (*Medicago x. varia*)
20. Forage glucer (*Medicago sativa*)

4.1.2.4.2 Decision to use 'ploughing' criterion in relation to permanent grassland classification : **No**

4.1.2.4.3 Decision to use 'tilling' criterion in relation to permanent grassland classification : **No**

4.1.2.4.4 Decision to use 'reseeding with different types of grasses' criterion in relation to permanent grassland classification : **No**

4.1.2.4.5 Decision regarding the inclusion of other species such as trees and/or shrubs which produce animal feed, provided that grasses and other herbaceous forage remain predominant : **No**

4.1.2.4.6 Decision regarding the inclusion of other species, such as shrubs and/or trees, which could be grazed and/or which produce animal feed, where grasses and other herbaceous forage are traditionally not predominant or are absent in grazing areas

Decision regarding the inclusion of other species, such as shrubs and/or trees, which could be grazed and/or which produce animal feed, where grasses and other herbaceous forage are traditionally not predominant or are absent in grazing areas : **No**

a) In case of affirmative, applicable to all MS/region? : **No**

b) in case of negative reply to question a), applicable only to land which forms part of established local practices? : **No**

c) in case of negative reply to question a), not limited to or applicable to other areas than established local practices? : **No**

4.1.2.4.7 Other comments relating to the definition of permanent grassland

Not relevant.

4.1.2.5 Other comments relating to the definition of agricultural area in general

Not relevant.

4.1.3 Eligible hectare

4.1.3.1 Criteria how to establish the predominance of agricultural activity in case the land is also used for non-agricultural activities

In the case of areas temporarily used for non-agricultural purposes, the period of utilisation outside agricultural purposes shall be chosen in such a way as not to jeopardise the main agricultural activity and shall not exceed 60 days per year, other than land used for organic water restocking.

We confirm that this does not render the main agricultural activity impossible.

For areas temporarily used for non-agricultural purposes, the period of use outside agricultural purposes shall be chosen in such a way as not to jeopardise the main agricultural activity. In practice, this means that, after the expiry of a maximum of 60 days, the agricultural area must be suitable for carrying out the agricultural activity (production or maintenance in good condition) without substantial preparation or work.

According to the relevant national rule, the lawful land user is also obliged to notify the Paying Agency of the duration and nature of the non-agricultural activity.

A specific case of land temporarily used for non-agricultural purposes is water restocking for organic purposes. This means the temporary flooding of agricultural land for a maximum period of 180 days per year with a water permit, by means of gravity drainage from excess surface water (e.g. flooding) or free water (the quantity of water available in the area not tied to any other water rights permit) to ensure sustainable water resource management. During the remaining period of the year, the agricultural use of the land or its maintenance in a state suitable for agriculture is mandatory.

4.1.3.2 Criteria to ensure that the land is at the disposal of the farmer

The client shall be regarded as a lawful land user for the agricultural areas specified in his application until there is any doubt or if it is established, on the basis of the control procedure carried out by the agricultural and rural development support body, that the client qualifies as a lawful land user as described below.

We give producers a variety of options to prove their eligibility for land use. The details of the procedure are presented herewith:

A farmer holding a registration number with the Hungarian State Treasury may submit an application for direct aid in respect of land for which he qualifies as a lawful land user. The Treasury presumes legal land use for all producers.

The farmer must prove, in the manner laid down by law, that he is a lawful user of the land he applies for if there is any doubt in this regard (e.g. if there is a double claim or claim for the area, or if he submits an aid application for the first time as a new entrant).

Government Decree No 54/2023 on the arrangements for using agricultural subsidies from the Common Agricultural Policy and the national budget (IX. Section 61(4) of the Decree of the Minister for Agriculture sets out in detail how the producer can prove the existence of lawful land use. These are:

(4) In the following order, a beneficiary shall be deemed to be a lawful land user if, unless otherwise provided by law, for the last day of the deadline for submitting an application, in respect of the area claimed by the beneficiary:

(a) is registered as a land user in the land use register,

(b) he is registered as a representative of a primary farmer's family holding in the register of family holdings of primary producers or as a representative in the contract for the establishment of a family holding for primary producers,

(C) lease-purchase, half-lease, share-farming, favourable land use, recreational land use or sub-lease agreement, and an agreement on sharing or surplus use pursuant to Section 70 or Article 76 of Act CCXII of 2013 on certain provisions and transitional rules in connection with Act CXXII of 2013 on the circulation of agricultural and forestry land, the delegation contract referred to in Section 18(5) of Act LXXXVII of 2010 on the National Land Fund, including a contract concluded by the National Park Directorate, is entitled on the basis of a sample economic land use contract concluded with the body responsible for the management of the National Land Fund, and any person designated as the forced utilisation of land pursuant to Section 65 of Act CXXII of 2013 on the circulation of agricultural and forestry land shall be entitled, on the basis of a provisional court order, to use the land user or, in the case of areas with national defence use, or areas declared unnecessary for national defence purposes, on the basis of a contract;

(D) the legal successor of a budgetary entity registered as a trustee, usufruct or holder of a right of use under Section 5:159 of Act V of 2013 on the Civil Code, as well as a budgetary entity registered as a trustee,

(e) registered in the land register as owner or owner of cooperative land use,

(F) in the case referred to in Section 42(2)(c) of Act CXXII of 2013 on the circulation of agricultural and forestry land, the person who has a written agreement with the land user registered in the land use register;

(g) the co-owner of an area exceeding his share of ownership of land owned by an indivisible co-owner, if it has not been entered in the land-use register for reasons beyond his own fault and has a written agreement authorising the use of that portion of the land, and the use is supported by a management log which he keeps;

(H) a person who is not a co-owner of undivided co-ownership of land, if it is not entered in the land-use register for reasons beyond his or her own fault and has a written agreement authorising the use of that portion of the land, and the use is confirmed by the farming log he keeps,

a close relative of the legal land user referred to in points (a) to (h), or

(J) he holds an official certificate issued by the notary certifying that the area has been used.

In certain circumstances giving rise to doubt, the Hungarian State Treasury will automatically designate the areas/applications in question and in any case shall be designated for the examination of lawful land use:

- if a double or multiple claim is established during an on-the-spot check,
- if the information on the template provided in the application differs significantly from the situation found during the on-the-spot check,
- for parcels with unresolved over-declaration following data reconciliation.

In other circumstances of doubt, the legal land use is checked on a sample of the parcels concerned, selected on the basis of a risk analysis:

- in case of potential discrepancies detected during cross-checks with land use records,
- if non-compliance has been found by the legal land use test for a given plot in the previous year,
- if the client has not applied for aid earlier,
- if the client's request was submitted late,
- if there is a double or multiple claim on the basis of the application,
- if the table drawing overlaps with the drawing of another client.

The Paying Agency systematically, continuously and fully monitors the occurrence of the circumstances listed above for each parcel applied for and carries out, where appropriate, a legal land use inspection, following the logic described above.

The inspection is part of Decree No 54/2023 on the arrangements for the use of agricultural subsidies from the Common Agricultural Policy and the national budget for the designated parcel population. (IX. 13.) Cross-checks with the records specified in Section 61(4)(a)(b)(d) and (e) of the Decree of the Minister for Agriculture. If the legal use of the parcel has not yet been confirmed for the entire area of the parcel, the Paying Agency will be required to provide additional information from the client under Decree 54/2023 on the rules for the use of agricultural subsidies from the Common Agricultural Policy and the national budget. (IX. 13) They request the supporting documents listed in Section 61(4)(c) and (f)-(j) of the Decree of the Minister for Agriculture, on the basis of which the decision on the lawful use of land is taken.

4.1.3.3 Period during which an area has to comply with the definition of ‘eligible hectare’

For the whole grant period

4.1.3.4 Decision to include areas used for agricultural activity only every second year

: No

4.1.3.5 Decision regarding the inclusion of other landscape features (those not protected under GAEC), provided that they are not predominant and do not significantly hamper the performance of an agricultural activity due to the area they occupy

: Yes

All landscape features that can be accepted as eligible areas must be located on agricultural parcels.

Delimitation of woody-cow grasslands as special eligible areas

These special grasslands are typically cultivated in agriculture, but due to the presence of woody vegetation, they are cultivated differently from normal grassland cultivation, mostly by grazing. Due to the specific cultivation and characteristics of this type of grassland, it would be justified to be treated as a specific eligible element in the LPIS as a separate cover. Their different treatment and long-term maintenance within the eligible area can be ensured by reflecting their conservation, conditions and requirements in domestic legislation.

Sorting and review shall be carried out for areas with a maximum estimated 30 % woody vegetation. Areas estimated above 30 % should be included in the ineligible category.

Grassland areas containing woody vegetation but below the area limit of 30 % will be defined as a separate element of land cover, while grasslands currently containing more than 30 % of woody vegetation will be transferred to the ineligible category.

If the presence of woody vegetation is not affected by the presence of woody vegetation, additional areas of grassland that are contiguous with woody grassland shall be treated as a separate land cover element from grassland containing woody vegetation.

A lower area limit will also be applied in the design of special grassland land cover elements, which means that grasslands with scattered woody vegetation with a size of less than 300 square metres or 0.5 % of the surface area of the whole grassland area will not be targeted. This is because the area occupied by woody vegetation in such small areas from the grassland on the ground is typically negligible compared to the area of the whole grassland. National provisions on specific maintenance rules for agro-ecological areas should also be respected on grasslands with scattered woody vegetation.

Erosion control facility established as part of a non-productive investment:

An erosion control facility established on arable land, permanent crops or grassland as part of a non-productive investment delimited in the LPIS.

Ecological boundary:

minimum area: 0,01 ketar

Land covered by woody and/or soft vegetation, with a minimum average width of three, up to twenty metres, typically strip-like areas, which:

- (a) on the arable land or directly adjacent to the arable land, inside the physical block affected by the arable land,
- (b) situated on permanent crops or directly adjacent to permanent crops within the physical block affected by the permanent crop,
- (C) it is situated on grassland or directly adjacent to the grassland, within the physical block affected by the grassland,
- (D) an artificial element interrupted by a maximum length of two metres.

Where woody vegetation predominates in the ecological boundary zone, it must be prevented from declining significantly. A significant reduction is the reduction of at least 20 per cent of space that the Territorial Monitoring System (TMR/AMS) will be objectively able to perceive when it becomes technologically suitable.

Erosion control strip (within the agricultural parcel in question – arable land, permanent crops, grassland):

Area covered with woody or herbaceous vegetation parallel to the stratum line and specifically intended to prevent and mitigate water erosion.

Additional characteristics:

- an average width of not less than three and not more than 20 metres;
- at least thirty metres wide;
- where the sides of the plate parallel to the slope are on average less than 30 metres apart, the erosion control band shall connect the two edges of the plate.

Small wetland on grassland, arable land or permanent crops: Wetland recorded in the LPIS. Whether it is located on arable land, grassland or permanent crops, it forms part of the agricultural parcel throughout the small wetland area and may not account for more than 50 % of the parcel and must not significantly impede agricultural activity. It has permanent or temporary water cover or covers vegetation typical of wetlands. The boundary of the small wetland shall be marked within the field where the crop cultivated on the field ends.

Buffer strips on arable land, permanent crops and grassland:

The buffer strips defined in the LPIS may be recognised. Buffer strips of 5 m from the shoreline of surface watercourses and 20 m along lakes are delineated in the LPIS.

No buffer is possible between the declared arable land and the buffer strip. Agricultural production is prohibited in the buffer strips to be accounted for, except for mechanical weed control to maintain the agricultural condition. Compliance with GAEC requirements on water buffer strips is mandatory. May not be transferred in accordance with GAEC requirements

- fertiliser in a 5 m strip measured from the shoreline of surface waters graphically marked in the LPIS;
- organic manure;
- pesticides;
- plant conditioning agent;
- soil conditioning agent.
- microbiological preparation

20 m from the shoreline of standing waters above 5 000 m² graphically marked in the LPIS,

5 m from the coastline in the case of dam-locked fish ponds,

In a strip of 5 metres from the shoreline of other surface watercourses graphically marked in the LPIS, by reducing the protective distance to 3 metres if the agricultural field is less than 50 metres and less than

1 hectare.

The protection distance for organic manure shall not apply to manure that is dead by grazing animals if this occurs due to the approach to the drinking site.

4.1.3.6 Decision as regards permanent grassland with scattered ineligible features, to apply fixed reduction coefficients to determine the area considered eligible

: No

4.1.3.7 Decision to maintain the eligibility of previously eligible areas when they no longer meet the definition of ‘eligible hectare’ pursuant to paragraphs a) and b) of Article 4(4) of the SPR regulation as a result of using national schemes the conditions of which comply with the interventions covered by integrated system referred to in Art 63(2) of Regulation (EU) HzR allowing for the production of non-annex 1 products by way of paludiculture and which contribute to envi-clima related objectives of the SPR regulation

: No

4.1.4 Active farmer

4.1.4.1 Criteria to identify those who have minimum level of agricultural activity

The model for the implementation of the active farmer test in Hungary is presented below.

I. Description of the model

1. Natural persons are automatically regarded as active owners. JUSTIFICATION: If they are fully engaged in an agricultural activity, they fulfil the criterion of ‘main activity’. If this is not their main activity, i.e. they carry out agricultural activities in a secondary job, it is necessary to preserve the way of life in rural areas and to prevent rural depopulation, so that these natural persons are not excluded from receiving direct aid.
2. In the case of legal persons, those with at least 10 hectares of agricultural land are also automatically regarded as active farmers, given that it can already be considered as a major agricultural activity.
3. In the case of legal persons with less than 10 hectares of agricultural land, the active farmer would be the one registered in the Food Chain Inspection Information System (FELIR) as an organisation carrying out agricultural activities. Registered organisations have a ‘FELIR’ identifier. Such an identifier is held by all organisations whose activities include agricultural activity as their main or secondary activity. Anyone who carries out an activity as a farmer within the meaning of Article 4(2)(a) of the Strategic Plan Regulation is obliged to register with the FELIR on the basis of that national legislation.
4. In addition, four specific forms of operation would be highlighted and automatically considered as active owners: churches, municipalities, educational institutions and non-profit organisations linked to agriculture. (the “*positive list*”)
5. If, after the above steps, a legal person cannot be regarded as an active farmer, it may prove that its agricultural activity is not insignificant. It can do so by demonstrating that its agricultural turnover in the preceding year exceeds half of the annual net minimum wage in the preceding year.
ADDENDUM: Of course, area payments are included in agricultural turnover.
6. The negative list will not be used.

II. Brief description of the FELIR system

- FELIR = Food Chain Control Information System. This database contains public data in electronic form for operators in the food chain and the agricultural sector and their activities.
- FELIR is **operated by the National Food Chain Safety Office (NFCSO)**. The FELIR was established by a law (Act XLVI of 2008 on the food chain and its official supervision) and operates under Decree No 578/2020 on the operation of the food chain inspection information system. (XII. Government Decree No 14/2001.
- The FELIR contains, inter alia, data on the activity carried out by the client in respect of the client covered by the Act.
- The unique identifier of the FELIR database is the **FELIR identifier**. Actors appear in the database with their central public authenticated data, as evidenced by the FELIR identifier. The FELIR identifier therefore serves to provide electronic evidence of the State-authorized and registered activities of each actor centrally, by means of publicly authentic data. It works in the same way as TINs and tax numbers for tax law purposes, performs the same function only in the area of the agri-administration-food chain.
- **On the basis of the FELIR identifier, the authority can easily verify whether an undertaking it controls is operating lawfully and whether the product under investigation has been lawfully placed on the market.** It helps food chain operators, or even consumers, to make sure that they buy products from a registered operator.

Who is affected by FELIR registration?

The FELIR database is extensive as it covers actors in the food chain and in the agricultural sector, such as: primary producers, small farmers, animal keepers, growers, food producers, food distributors, caterers and mass caterers, winemakers, hunters, fishers, fishermen, foresters, timber dealers, veterinarians, plant doctors, feed distributors, animal medicine distributors, plant protection products distributors, seed producers, other agricultural operators.

- As a new actor, when a new activity is launched, the notification automatically generates the FELIR identifier.
- For clients who started their activities before the FELIR registration scheme, the NFCSO retroactively assigned a FELIR identifier.

A public FELIR search is available on the website of the NFCSO operating FELIR, where you can also see what activity someone has entered into the database.

FELIR Identifiable Activities

Annex 1 to the Government Decree contains inter alia (**non-exhaustive list**):

- distribution of animals kept for food production, breeding or experimental purposes;
- placing on the market of plants and plant products grown for food and feed production;
- production, storage and making available on the market of propagating material;
- activities as veterinarians, plant doctors and auxiliaries;
- production or placing on the market of products subject to authorisation under Act XCIII of 1993 and of EC fertilisers
- activity as a plant protection worker;
- plant protection services;
- aerial application of plant protection product;
- soil protection expert activities;
- application of slurry on land;
- use of non-hazardous waste on land;
- use of sewage, sewage sludge, sewage sludge compost on land;
- timber trade chain activity.

III. Justification for the positive list

- **Churches:** In the case of churches, agricultural production on owned agricultural land is not sold. The goods produced, on the one hand, cover the services of the church's staff and, on the other hand, are used for their social kitchens and other social activities operated by the church.
- **Municipalities:** Municipalities typically carry out agricultural production on their own agricultural land and are mostly not sold. The goods produced are used for their own care and for the supply of social kitchens and social services operated by the municipalities. They employ people in need as part of agricultural activity, which contributes to employment in rural areas.
- **Educational establishments:** In the case of educational establishments, direct aid is typically provided by those which provide training related to agriculture and therefore carry out production activities in their own territory, in their educational holdings, as part of practical training, for demonstration purposes.
- **Non-profit organisations linked to agriculture:** It covers specific forms of operation in which agricultural activities are also carried out by non-profit organisations (e.g. associations, foundations) which present and promote agriculture, such as traditional livestock farming, for educational, information, demonstration purposes.

Verification of FELIR data

Data on agricultural production in FELIR (i.e. the fact that the undertaking actually carries out an agricultural activity) – taking into account Act XLVI of 2008 on the food chain and its official supervision and the functioning of the food chain inspection information system 578/2020. (XII. The provisions of Government Decree No 14/2001 – the county government offices and the NFCSO, by virtue of their official powers, are subject to joint checks.

Following the audit, pursuant to Decree No 578/2020. (XII. On the basis of Sections 6 and 7 of the Government Decree, it is possible to suspend and revoke the FELIR identifier.

SECTION 6(1)

The NFCSO shall suspend the FELIR identifier if

- (a) the competent body shall record in the FELIR a measure taken by the authority to prohibit the activity, withdraw authorisation or remove it from the register, and the measure concerns all activities of the client,
- (b) on the basis of the client's notification, the determining body records the cessation of the client's activity in the FELIR and the notification concerns all activities of the client;
- (C) the client initiated the FELIR registration electronically, but did not initiate the authorisation procedure for the requested activity from the determining body within 6 months;
- (D) with regard to the client's activity, there is no data flow in the FELIR within one calendar year and, despite a request from the NFCSO, the client does not declare within 30 days the active status of its activities.

The suspension of the FELIR identifier may be lifted at the request of the client after proof of appropriate eligibility has been provided.

SECTION 7(1)

The NFCSO shall withdraw the FELIR identifier if, on the basis of a notification or data from a public register, it finds that it has a GELIR identifier.

- (a) a legal person has ceased to exist, or

(b) a natural person has died.

4.1.4.2 Decision to use a negative list of non-agricultural activities as a complementary tool

: No

4.1.4.3 Decision to set an amount of direct payments not higher than EUR 5 000 under which farmers shall in any event be considered as ‘active farmers’

: No

4.1.5 Young farmer

4.1.5.1 Maximum age limit

Maximum age limit: 40

4.1.5.2 Conditions for being ‘head of the holding’

Definition: Young farmer (natural person) or one or more legal persons under the effective and long-term control of the young farmer.

Effective and long-term control: the power of a young farmer who is a senior manager in the legal person to manage and to decide on benefits and financial risks granted to him by a majority of the voting rights;

Majority of voting rights: sum of votes in the legal person ensuring effective and long-term control of the young farmer, including

(a) the young farmer’s own vote;

(b) in addition to the vote under point (a)

(BA) the vote of a natural person or persons who are also senior officials in a legal person other than a cooperative, but who do not hold more votes each than the young farmer, and who are eligible for aid under the rules on access to the aid for farmers, or

(BB) in the case of cooperatives, the votes of members who are also senior officials and who are personally involved in agricultural production; and

(C) the vote of a natural person or persons who are also senior executives in the legal person, but who do not individually hold more votes in the young farmer and themselves exercise effective and long-term control over another legal person or persons that are eligible farmers.

4.1.5.3 Appropriate training and/or skills required

The list of relevant agricultural qualifications, vocational training and professional qualifications acceptable for young farmers, or their minimum conditions and frameworks, are laid down in the following national legislation:

- national Training Register 7/1993. (XII. Decree No 7/1993 of the Minister for Health on the National Training Register. (XII. Decree No 12/1996 of the Minister for Agriculture amending Decree No 12/1996 (XII. Decree No 29/1999 of the Minister for Agriculture

- national Training Register 7/1993. (XII. Decree No 2/2000 of 30 April 2000 of the Minister for Agriculture amending Decree No 2/2000 Regulation (I. 31.) of the OM

- 37/2003 on the National Training Register. (XII. OM Regulation (27)

- 37/2003 on the National Training Register. (XII. Decree No 28/2004 of the European Parliament and of the Council amending Decree No 28/2004 of the European Parliament and of the Council. (IX. Regulation (EC) No 30/1999 of the European Parliament and of the Council

- on the National Training Register and the procedures for enrolment and deletion in the National Training Register. (II. Decree No 17/1999 of the European Parliament and of the Council

- 150/2012 on the National Training Register and the procedures for enrolment and deletion in the National Training Register. (VII. 6th Government Decree
- on vocational training and professions in vocational secondary schools and vocational training schools, 18/1986. (VIII. Decree No 26/1999 of the Minister for Agriculture
- Decree 13/1969 on the implementation of Act VI of 1969 on vocational training of skilled workers (XII. Decree No 30/1999 of the Minister for Agriculture
- amending certain educational legislation 20/1994. (XI. Decree No 10 of the Minister for Agriculture and Rural Development
- on vocational worker training in vocational secondary schools, 14/1976. (XII. Government Decree No 24/1977 amending Joint Decree No 24/1977 of the MüM-OM (XII. Joint Decree of the MüM-OM
- 39/2012 on training and outcomes requirements for vocational education and training in higher education. (XI. Decree No 8/2013 of the Minister for Human Resources on the training and completion requirements for basic and master's degrees, as well as on the common requirements for teacher preparation and the training and output requirements for each teaching profession. Decree No 18/2016 of 30 January 2016 of the Minister for Human Resources amending Decree No 18/2016 of 30 January 2016 of the Minister for Human Resources (VIII. Decree No 139/2015 of the Minister for Human Resources on the list of qualifications and inclusion of new qualifications in higher education (VI. Government Decree No 9/1999
- Decree No 244/2020 on the rules governing the activities and records of specialised forestry staff and the management company and the further training of specialised forestry personnel. Government Decree No 273/2007 of 28 May 2013
- 12/2020 on the implementation of the Law on Vocational Education and Training (II. Government Decree No 7/2001
- 504/2013. (XII. Government Decree No 29/2001 on specific agricultural or forestry qualifications
- 65/2021. (XII. Decree of the Minister for Innovation and Technology on the list of higher education qualifications and the establishment of new courses
- 18/2016. (VIII. Decree No 8/2013 of the Minister for Human Resources on the training and completion requirements for vocational education and training in higher education, basic and master's degrees, as well as common requirements for teacher preparation and the training and output requirements for each teaching profession. (I. 30.) of the Minister for Human Resources;

In the case of VET and adult learning, the specific professions and their training output requirements and programme curricula are available at the Innovative Training Support Centre Zártkörűen Működő Részvénytársaság (IKK), at the following website: <https://akkreditalvizsgaztatas.ikk.hu/kkk-ptt>

In support of young farmers, only qualifications which are published and carried out in a manner that is verified and accredited by national legislation shall be taken into account. The relevant legislation specifies which training falls into which fields. There is legislation only on specific agricultural or forestry qualifications (504/2013. (XII. Government Decree No 29. In addition, horizontal legislation organises training by academic discipline for higher education qualifications, and by group of professions for secondary education. Thus, qualifications in the field of agriculture can be clearly identified in a pre-defined manner, as a result of the legislative process in the field of education.

The qualification requirement can be replaced by a minimum of 2 years of relevant agricultural traineeships.

4.1.5.4 Other comments relating to Young farmer definition

No further comments.

4.1.6 New farmer

4.1.6.1 Conditions for being ‘head of the holding’ for the first time

The Hungarian Strategic Plan does not contain any relevant intervention.

4.1.6.2 Appropriate training and skills required

The Hungarian Strategic Plan does not contain any relevant intervention.

4.1.7 Minimum requirements for receiving direct payments

4.1.7.1 Threshold

Threshold in ha: 1

Threshold in EUR: 100

4.1.7.2 Explanation

The minimum requirements for the use of direct aids (1 hectare or EUR 100) are designed in such a way that they do not narrow the range of potential beneficiaries to the detriment of small farms, by strengthening the targeting of the strategic plan. In line with the same principles, the minimum number of eligible animals for livestock entitlements for coupled aid has been set at 1 head, precisely in order to include the smallest operators in the aid scheme.

The limits set are designed in such a way that the implementation of the relevant aid schemes does not result in an excessive administrative burden, in line with Article 18 of Regulation (EU) 2021/2115 (*‘the management of related payments does not create an excessive administrative burden’*). The experience of the Paying Agency during the current budgetary period also shows that these limits did not lead to a disproportionate increase in area aid applications. If the thresholds were set at a lower level, the costs linked to the management of certain schemes would exceed the amount of aid paid. By definition, our aim is to avoid situations where costs outweigh the potential benefits, in order to preserve the cost-effectiveness of the EU-funded support system.

ADDITIONAL SUPPORT

1. EUR 100 threshold

The threshold of EUR 100 sets the minimum requirement for livestock farmers applying for headage-based direct payments who are unable to comply with the minimum requirement of 1 hectare. This corresponds to 3-4 ewes, 1 suckler cow or 2 foie gras in addition to the planned specific values.

However, the substantiation of the value of EUR 100 can be approached from a different perspective, namely from the cost of handling the application. This was based on the 2021 report on the estimation of Member States’ costs related to the management and control of CAP expenditure.

Calculation methodology:

Management and control costs per aid scheme/measure = (Budget of the institution/total number of persons) * Number of persons involved in the control of the aid scheme/measure

For the Paying Agency, this results in the following result for direct aids:

(EUR 172467479)/(5994 persons) x 63.6= EUR 1829985

As far as the bodies carrying out delegated tasks are concerned, this results in the following result:
 $(\text{EUR } 561189145)/(\text{50041 persons}) \times 343.8 = \text{EUR } 3855575$

Total:

$\text{EUR } 1829985 + \text{EUR } 3855575 = \text{EUR } 5685560$

By dividing this amount by the number of Single Applications for 2021 (EUR 5685560/165417), an average cost of EUR 34.37 for a Single Application is obtained.

The Paying Agency's calculations therefore indicate that a reduction of the minimum requirement of EUR 100 could already result in costs linked to the management of certain schemes exceeding the amount of aid paid. This would be contrary to the financial interests of the European Union, the principles of sound financial management.

2. Minimum area of 1 hectare

An area of 1 hectare represents the entry level of a self-sufficient farm. In a one-hectare area, a family can produce for self-sufficiency. Basic support (BISS), redistributive support (CRISS) and even young farmers may be eligible. If, for example, he is engaged in horticultural activities, he may be able to carry out a production activity to a degree which, in addition to supplying the family, allows for a minimum sale. However, in the case of arable and, in particular, grassland, self-sufficiency and traditional agricultural activity are unrealistic and economically unrealistic.

In Hungary, most of the farms compiled by the Central Statistical Office (CSO) produce for self-sufficiency and as ancillary activities, most of them do not use agricultural subsidies. Of the 241 thousand farms, 216 thousand farmland, of which 58.5 thousand have less than 1 hectare.

The experience of the Paying Agency in the current budgetary period demonstrates that the limits of 1 hectare/EUR 100 did not lead to a disproportionate increase in area aid applications. However, if the figure of 1 hectare were to be reduced, some of the above-mentioned 58.5 thousand farmers with an area of less than 1 hectare would be included in the direct payment scheme, so a significant increase in the number of applications would be expected. This would entail an additional administrative burden at the level of the Paying Agency, as a greater professional administration would be needed in the area of application management and on-the-spot checks. If the minimum size of 1 hectare were reduced by at least one application by half of the small-scale producers, the additional operating costs of at least EUR 1 million per year would have to be allocated to the Paying Agency, in addition to system development and other one-off costs, which would mean inefficient use of public resources.

4.1.8 Other definitions used in the CAP Plan

Title	Description
Endangered agricultural animal breed	decision No 188/2019 (VII. On the basis of the definition laid down in Section 2 of Government Decree No 30/2001, a non-protected native agricultural animal breed listed in a decree issued by the Minister, which has a unique genetic value and which plays a decisive role in domestic breeding at the same time; (a) which, as a result of its exclusion from production, has become necessary for the conservation of the gene pool, (b) which, as a result of a significant reduction in the number of members of staff, has become necessary for the conservation of the gene pool, (C) which is available in large numbers, but the variety's genotype and phenotype have been modified by intensive selection, changed rearing and feeding and crossings to such an extent that separate preservation and possibly reconstruction of the original type or types became necessary, or (D) which could no longer be found in the form recorded in the breeding book, making it necessary to reconstruct the variety
Protected native agricultural animal breed	decision No 188/2019 (VII. On the basis of the definition laid down in Section 2 of Government Decree No 30/2001, a type of animal listed in a decree issued by the Minister which forms part of the national heritage, the agricultural gene bank and the nature and landscape conservation; (a) which has been bred in the Carpathian Basin for at least 50 years in the natural geographical environment of Hungary, (b) which was previously bred in Hungary but the breed has ceased to be registered in the herd-book and the breed has been re-established as a result of varietal reconstruction, or (C) for which domestic breeding was resumed in the context of genetic rescue and varietal rescue
Standard output (SO)	standard value of gross production based on Commission Implementing Regulation 2020/1652. The SO is used for classifying farms according to the Union farm typology (in which the type of farming is defined by main production activities) and for determining economic farm size.
Animal keeper	Economic operator within the meaning of the Decree of the Minister for Agriculture and Rural Development on the national

	registration system for enclosures, holdings and certain data relating thereto
Breeds of agricultural animals undergoing varietal reconstruction	Breeds of agricultural livestock which have previously played a dominant role in domestic livestock production but which are no longer found in the herd-book register, or types linked to a particular breed whose use has been neglected and for which planned breeding work is currently being carried out to re-establish the breed
Forest reproductive material,	in Joined Cases 110/2003 and 110/2003 (X.21.c) FVM species and artificial hybrids thereof, seeds of varieties for the production of plants for forestry purposes, vegetative propagating material, and planting stock grown from them, which meet the certification requirements
Social cooperatives	cooperatives as defined in Sections 14-19 of Act X of 2006 on cooperatives.
Producer group (POG)	42/2015 on the recognition of producer groups (VII. 22) Section 1(1) of Decree No 150/2012 of the Minister for Agriculture on producer groups and producer organisations for fruit and vegetables. (XII. Producer groups as defined in Section 1(o) of Decree No 28/2000 of the Minister for Rural Development.
Producer organisation (PO)	organisation as defined in Article 152 of Regulation (EU) No 1308/2013 of the European Parliament and of the Council of 17 December 2013 establishing a common organisation of the markets in agricultural products and repealing Council Regulations (EEC) No 922/72, (EEC) No 234/79, (EC) No 1037/2001 and (EC) No 1234/2007 and recognised under the conditions laid down in Articles 154 and 159 of the Council Regulation
Specific rules for farmers in rural development interventions	In the case of types of intervention for rural development, a farmer is a natural or legal person or a farming organisation without legal personality which carries out an activity as a farmer in the territory of Hungary. Each intervention may establish additional eligibility criteria
Regional perspective	On the basis of regional criteria, development in the municipalities and areas listed in the following legislation may receive additional points during the selection process (the legislation may also be partially applied in accordance with the objectives of each intervention): 1. 1403/2019 on the development package to reduce economic inequality between certain areas of Hungary (VII.

	Government Decree No 5/2001 Decision 2. Government Decree No 1404/2019 on the basis of the long-term programme of ‘Catching-up municipalities’ (VII. Government Decree No 5/2001 Decision 3. Decree No 1186/2020 of 1186/2020 on further measures to be taken to continue the ‘Catch-up municipalities’ and the economic recovery programme (IV. Government Decree No 28/1999 Decision 4. No290/2014 (XI.) on the classification of beneficiary districts Government Decree No 26/1999 5. Government Decree No 105/2015 on the classification of the beneficiary municipalities and the criteria for classification (IV. Government Decree No 23/1999 6. 1362/2016 on the tasks related to the Mura national programme and their financing. (VII. Government Decision No 13/1999 7. 1321/2016 on the tasks and financing of the Ós-Drava National Programme. (VII. Government Decision No 1 8. ActLXXVII of 2011 on World Heritage 9. 429/2020 on the definition of tourist areas (IX. Government Decree No 14/2001 10. Decree No 1057/2021 of 1057/2021 on the extension of the development programme necessary to reduce economic inequality between certain areas of Hungary and the long-term programme of ‘Catching-up municipalities’ (II. Government Decision No 19/1999 Specific regional aspect of intervention (e.g.: RD40_F07_INP_73 – Investments in competitive forestry (for-profit) and RD41_F08_INN_73 – Investments for the environmental sustainability of forestry (non-profit), “Area of the total forest management activity of the forest manager”)
Areas with special needs	In the context of the CAP Strategic Plan, Article 275/2004 on areas of conservation of European Community importance. The area of Natura 2000 grassland and forest areas designated under Government Decree LIII of 8 October 1996 and delimited in the LPIS and forest stands not designated as part of the Natura 2000 network, but designated under Act LIII of 1996 on nature protection and with naturalness indexes 1 to 4.
Institutional guarantee at preferential rates	As additional national financing, an institutional guarantee of the Agricultural-Enterprise Loan Guarantee Foundation at preferential rates may be used for market-based or publicly supported loan, loan, credit line contracts, financial institution guarantees, financial leasing and factoring transactions linked to investments supported under the CAP Strategic Plan. An institutional guarantee with a preferential premium constitutes State aid if, in the case of a guarantee with a budgetary counter-guarantee, the guarantee institution grants a premium discount and/or the guarantee is accompanied by a guarantee premium subsidy. Support may be granted under a measure under the CAP Strategic Plan Regulation, taking into account the aggregation rules.

ENAR	Uniform Registration and Identification System
TIR	Farming Information System
Non-productive investment	Investment that does not lead to a significant increase in the value or profitability of the holding
Plantation	Area where the planted crops form a permanent basis for cultivation and have a contiguous area equal to or greater than one year, 1 500 m ² in the case of fruit plantations and 500 m ² in the case of berries and vegetables
Bee families	Government Decree No 70/2003 on the protection of bee flocks and the prevention and control of certain honeybee diseases (VI. Section 1(2) of the Decree of the Minister for Agriculture and Rural Development defines bee colonies as follows: ‘Bee family: mother, adult bees and brood within the bee home, living together in an airspace.’
Forest manager	owner or legal user registered in the register of forest managers kept by the forestry authority.
Collective investment	project implemented by consortia, producer groups, producer organisations, farmers’ cooperatives and social cooperatives (unless otherwise provided for in the intervention).
Konzorcium	cooperation by several members for the joint implementation of the project.
Legal land user	natural or legal person entitled to use in relation to a specific utilised agricultural area

4.2 Element related to Direct Payments

4.2.2 Reduction of direct payments

4.2.2.1 Description of the reduction and/or capping of direct payments

Do you apply the reduction of payments? : No

Do you apply capping (i.e. 100% reduction)? : No

4.2.2.2 Subtraction of labour costs

Do you apply the subtraction of labour costs? : No

4.2.2.3 Estimated product of the reduction of direct payments and capping for each year

Claim year	2023	2024	2025	2026	2027	Explanations
Financial year	2024	2025	2026	2027	2028	
Total annual estimated product (EUR)	0	0	0	0	0	Not relevant as Hungary does not apply the reduction and capping of direct payments.
- use for redistributive payment (EUR)	0	0	0	0	0	Not relevant as Hungary does not apply the reduction and capping of direct payments.
- use for other Direct Payments interventions (EUR)	0	0	0	0	0	Not relevant as Hungary does not apply the reduction and capping of direct payments.
- transfer to EAFRD (EUR)	0	0	0	0	0	Not relevant as Hungary does not apply the reduction and capping of direct payments.

4.2.3 Application at the level of members of legal persons or groups/ at the level of group of affiliated legal entities (Article 110)

☐ Application of thresholds/limits set-up in the [SPR] or [HZR] at the level of members of legal persons or groups:

Article 17(4) of [SPR] Reduction of payments

Apply threshold : No

Article 29(6) first subparagraph of [SPR] CRIS

Apply threshold : No

Article 30(4) of [SPR] CISOYF

Apply threshold : No

Article 17(1) of [SPR] Financial discipline

Apply threshold : No

☐ Where thresholds/limits set-up by the MS, application of these thresholds/limits at the level of members of legal persons/groups:

Article 28 of [SPR] Payment for small farmers

Apply threshold : No

Article 31 of [SPR] Eco-Schemes

Apply threshold : No

Article 32-34 of [SPR] CIS

Apply threshold : No

Article 70 of [SPR] Environmental, climate and other management commitments

Apply threshold : **No**

Article 71 of [SPR] Natural and other area-specific constraints

Apply threshold : **No**

Article 72 of [SPR] Area-specific disadvantages resulting from certain mandatory requirements

Apply threshold : **No**

Article 73 of [SPR] Investments

Apply threshold : **No**

Article 75 of [SPR] Installation of young farmers and rural business start-up

Apply threshold : **No**

☐ **Application of thresholds/limits set-up in the [SPR] at the level of group of affiliated legal entities:**

Article 29(6) second subparagraph of [SPR] CRIS

Apply threshold : **No**

4.2.4 Contribution to risk management tools

Do you apply the option to condition up to 3% of direct payments to the fact that this amount is used for contribution to a risk management tool? : **No**

What is the percentage?

Main elements

4.3 Technical Assistance

4.3.1 Objectives

The Technical Assistance shall finance the following key tasks:

- Tasks and measures necessary for the effective management, delivery and implementation of support in the context of the CAP Strategic Plan
- Carry out monitoring and evaluation tasks. These activities shall help to obtain continuous information on the status of the implementation of the programme, its progress and the preparation of the necessary amendments, in order to achieve the programme's objectives in the most efficient way. In addition, these activities ensure that the monitoring and evaluation reporting obligations expected by the Commission are met.
- Costs related to the tasks and functioning of the enlarged CAP Network. These include: information flow, presentation of best practices, costs of national and international cooperation events, competitions and prizes, information publications, events, multimedia and community presentations, etc. within the CAP Strategic Plan and financed by other EU financial funds.
- Central preparatory functions for the preparation of Local Development Strategies (HFS): training, counselling, mentoring.
- The acquisition of specific ad hoc external expertise required for each of the above tasks or topics.

4.3.2 Scope and indicative planning of activities

The Managing Authority of the CAP Strategic Plan intends to provide specific resources under Technical Assistance for the following tasks:

- We intend to continue to contribute 4 % of the CAP Strategic Plan envelope to finance the objectives of the Technical Assistance.
- The objectives of technical assistance and the use of funds will be implemented and financed through the Managing Authority, the Paying Agency and Intermediate Bodies as institutions.
- We intend to maintain the funding rates between these institutions over the 2014-2022 period, with the prominence of organisational changes and specific tasks that may change in the course of implementation.
- The funds allocated to the CAP Networks should reach 0.9 % of the programme envelope included in the technical assistance funds allocated to the Managing Authority.
- The resources shall finance the following tasks:
 - - Strengthening the institutional system, including the enlargement of the CAP Network, and building up the evaluation capacity
 - The cost of carrying out evaluations, evaluation activities, expert reports, statistics, studies, analysis, management, monitoring, exchange of information and implementation of the programme, measures to improve evaluation methods and exchange of information on evaluation practices, costs of expert work related to the definition, collection, transformation and transmission of data for the purpose of designing the data required for evaluations, and the cost of communicating evaluation results.
 - The cost of conducting public procurement procedures.
 - Tasks and measures relating to the control system, technical and administrative assistance;
 - Installation, operation and interconnection of IT systems for management, monitoring, control and evaluation.
 - Cost of methodological and technological improvements.
 - Cost of buying data from external data sources.
 - IT developments, the cost of the possible interconnection of IT systems between the different institutions.
 - Cost of human resources capacity.
 - Trainings, workshops.
 - Other costs related to the implementation of the CAP Strategic Plan (exit to bilateral meetings).

Indicative allocation of the TS envelope per total public expenditure (EU + domestic co-financing):

Potential beneficiaries	RDP in proportion to TS envelope	CAP ST TS planned ratio
CAP Support Network (NAK)	23.07 %	20 % – 25 %
Paying Agency (PA)	16.03 %	20 % – 25 %
Intermediate organisational delegated tasks (CA)	21.07 %	23 % – 26 %
CAP ST MA performance of tasks	39.83 %	28 % – 35 %

The contracts concluded under the 2014-2022 VP TS envelope and still in force at the start of the CAP ST ensure continuity of implementation, with a maximum expiry date of 31.12.2025.

The demarcation with the 2014-2022 Rural Development Programme will be ensured by concluding a new contract under the CAP ST TS for the performance of the tasks that must also be provided for the implementation of the CAP ST and for which we have an existing contract only after its expiry.

Financing of the certification body's tasks:

Government Decision No 1742/2020 (XI.11) on the provision of resources for the performance of the certification body's tasks in relation to the Paying Agency with regard to the European Agricultural Guarantee Fund and the European Agricultural Fund for Rural Development, as well as the resources necessary to carry out accreditation supervision and monitoring inspections as part of the competent authority's assistance, requires the provision of funds for the performance of the certification body's tasks from the central budget and authorises the Ministry performing the tasks to conclude contracts with a multiannual payment obligation.

4.3.3 Beneficiaries

- CAP ST MA – National Managing Authority
- Hungarian State Treasury – National Paying Agency
- County Government Offices – IB
- National CAP network
- organisation responsible for the operation of a public project evaluator system,
- body responsible for carrying out public tasks related to Community agricultural marketing activities (including promotion).

4.3.4 Rate

Indicate the percentage of total EAFRD contribution to the CAP Strategic Plan to be used to finance the actions of Technical Assistance. A single percentage over the period (up to 4%/up to 6% for BE, DK, EE, CY, LV, LT, LU, MT, NL, SI, SE) 4

4.4 CAP Network

4.4.1 Summary overview and objectives of the National CAP Network, including activities to support EIP and knowledge flows within the AKIS

Purpose of setting up the national CAP network

The aim of the CAP Network shall be to encourage the involvement of all stakeholders in the implementation of the CAP Strategic Plan, to assist the implementation of the CAP Strategic Plan in the transition to a performance-based delivery model and to encourage improvements in the quality of implementation of the CAP Strategic Plan. It is important that the actors of the CAP Network inform the public and potential beneficiaries about the CAP and funding opportunities. We prioritise the promotion of innovation in agriculture and rural development and the promotion of peer-to-peer learning, as well as the involvement and interaction of all stakeholders in the process of knowledge exchange and knowledge building.

The CAP Network provides specific innovation-oriented network activities that include and facilitate interaction between all stakeholders to increase knowledge flows within the AKIS and encourage the establishment of EIP Operational Groups, as well as participation in international knowledge flows, such as Horizon Europe (projects, missions and partnerships) and international EIP-AGRI activities. The CAP Network implements different activities for the whole CAP Strategic Plan (pillars I and II). It is essential that the CAP Network includes monitoring and evaluation and dissemination of the results of the CAP Strategic Plan.

Planned elements of the national CAP network

The CAP network is planned to provide support units in three complex and priority areas covering knowledge and innovation and digital competence development, rural and territorial development (including: Leader, smart village strategies, generational renewal) and to help meet climate and environmental requirements. The CAP Network as a whole is supervised by the AKIS coordination body of the Ministry of Agriculture.

AKIS Coordination Organisation

The department of the Ministry of Agriculture carries out professional and supervisory tasks, brings together not only certain elements of the national CAP network, but also the AKIS system, and ensures representation and active involvement in the professional network at home and internationally.

Innovation and Digital Support Unit

The main task of the support unit is to support the EIP and digital transformation interventions of the CAP Strategic Plan, as well as the implementation of DAS and the junction, and to facilitate the networking of R & I and digitalisation actors, maintaining the database of the Green Monitoring Network to support the implementation of the DAS.

Rural and Regional Development Support Unit

The main task of the support unit is to support the implementation of the CAP Strategic Plan LEADER and other rural development interventions, the smart village and generational renewal programme, and the networking of rural actors. Currently, the Hungarian National Rural Network.

Green Support Unit

The main task of the support unit is to support the green interventions of Pillars I and II of the CAP Strategic Plan and the implementation of related national programmes, as well as to promote the networking of green actors.

Hungary is able to put in place measures by the support unit that it can apply to eliminate the fragmented institutional structure of its domestic climate change monitoring system, including the creation of a good database, such as the standardisation of environmental knowledge bases.

Indicative funding and indicative timetable for the launch of the CAP network:

Timing and source: The above is also possible under the financial envelopes. Total financial envelope for Technical Assistance and the CAP Network: EUR 224657534 (incl. TPE+ top-up)

The AKIS Coordination Organisation will be established in the Ministry of Agriculture by 7 November 2023.

The legislative conditions of the CAP Network are created in 2022. Q4 to allow organisations to operate under the agreed CAP Strategic Plan as of 1 January 2023.

The legislation establishing the CAP network, which lists the members of the CAP network, has been completed. The CAP network consists of support units as defined in the CAP Strategic Plan, with whom discussions on their tasks started from summer 2022.

4.4.2 Structure, governance and operation of the National CAP Network

Innovation and Digitalisation Support Unit

In the future, the tasks of the Innovation and Digitalisation Support Unit will be set up by the Agricultural Economic Institute Nonprofit Kft. (Who) will be provided. As the background institution of the Ministry of Agriculture, the AKI is Hungary's knowledge centre with the most important agro-economic databases and policy experience and carrying out public and public tasks. Through its strategic research activities, the AKI has developed a wide-ranging domestic relationship, both in the form of cooperation with practical actors and contractual partnerships with the National Chamber of Agriculture, interbranch organisations, vocational schools and representatives of the banking sector. Over the past period, AKI has been involved in the implementation of a number of Horizon 2020 projects, the results of which are currently actively disseminated to domestic actors. Thanks to its participation in these projects, AKI's international relations have been significantly broadened. The AKI is a member of the winning consortium of the EU tender for the establishment of the EU CAP network, through which it has direct

and direct links with the EIP-AGRI Service Point.

The Innovation and Digitalisation Support Unit aims to familiarise the actors of the domestic agricultural economy, develop dialogue and regular knowledge transfer in order to create operational groups/cooperations, thus contributing to the development and adaptation of innovative solutions.

The role of the partnerships is to translate existing knowledge into innovative solutions and research results that can be put into practice by the various actors involved in agriculture, forestry, hunting, food, rural development, research and consultancy.

In the AKI, the Innovation and Digitalisation Support Unit enters into a seven-year framework contract with the Managing Authority. The definition of the tasks for a given year, together with the Ministry of Agriculture, AKIS coordination organisation, will be defined in the framework of annual work plans.

The Innovation and Digitalisation Support Unit plans to employ 5 innovation facilitators each year, along themes defined by the AKIS coordination organisation, who have the capacity to coordinate practitioners to set up a start-up collaboration, know the nature of interactive innovation projects and the necessary facilitation techniques. For the AKI in Horizon Europe projects (e.g.: YouCooperATE, Liaison, Sherpa project) provides the appropriate background to teach/transmit the necessary methodological background/techniques to the annually selected facilitators. AKI plans to employ a further 5 people in the developed innovation and digitalisation support unit, who will be involved in organising events, developing synergies, developing methodologies, producing content, developing a website and carrying out additional communication activities.

The Innovation and Digitalisation Support Unit of the CAP will provide an innovation support service through several activities. In line with the topics defined by the AKIS Coordination Board, based on a needs assessment among farmers, an innovation brokerage service will be developed to identify innovative bottom-up ideas. SWOT also pointed out that the success of innovation is largely influenced by the creation of an enabling environment, including an institutional system that can effectively support innovation, and an incentive scheme for innovative activities. This was confirmed by the 2021 RDP 'Innovation Impact' Thematic Evaluation, which recommended the setting up of a technical support body and the provision of an innovation service: provision of information on eligibility conditions, administrative assistance, professional support for innovation brokers, strengthening of results communication, managing and developing the website, mentoring EIP groups, assisting them in reaching out to other groups, raising awareness of good practices, taking part in projects at international level.

In addition, training materials for innovation brokers and facilitation will be developed for specialist consultants and regular training courses will be carried out to enable them to acquire the necessary competences to enable them to identify innovative bottom-up ideas. In developing the training methodology, the CAP Innovation and Digitalisation Network Support Unit, the participation of the Institute of Agricultural Economics in the ATTRACTIS project to develop the competences, tools and governance models of the Innovation Support Services (ISS) and Member States' AKIS, which will be launched in 2022, will provide significant added value.

As a result of the formal cooperation, regular information days/events are held on the themes, so that home actors and EIP Operational Groups can also be informed about Horizon Europe calls and opportunities offered by partnerships and the Soil Mission.

Formal cooperation will result in the launch of an information website and newsletter from the CAP innovation and digitalisation network, providing information on Horizon Europe's key events, project results and relevant news from the EIP Support Facility.

In addition, informal cooperation will be developed and strengthened by establishing day-to-day contacts between the Operational Groups and interested Hungarian actors, including specialist consultants and research institutes, in order to allow as many EIP Operational Groups and Hungarian AKIS actors as possible to participate in the work of the Horizon Europe consortium. The Institute of Agricultural Economics opens access to EIP Operational Groups through its own network, the BIOEAST network and

the NCP network.

Over the past period, Hungary has significantly increased its participation in Horizon Europe projects. For example, Hungary will double the number of delegates in domestic and international ecological RDI policy representations in 2022-2027, so that domestic ecological R & D interests can be effectively enforced in the European Union (e.g. BIOEAST, TP Organics, SCAR AKIS and SCAR AE). The Commission is also not unaware of the results of the BIOEAST initiative. The BIOEAST initiative, which has been operational since 2016 on the Hungarian proposal and brings together 11 countries in Central and Eastern Europe, aims to create dual, sustainability-based national strategies and to engage in strong and successful lobbying for access to EU research funds (<https://bioeast.eu/>).

The Ministry of Agriculture itself is involved in the Horizon Europe project for the purposes of AKIS, SCAR and BIOEAST, which will be the basis of the AKIS coordination unit, providing this knowledge and network in the implementation of the CAP ST.

Our EIP intervention also offers the possibility to involve up to 1 international partner in the group, but the costs incurred are eligible only on the territory of Hungary.

Furthermore, the tasks assigned to the CAP Network (Chapters 4.4 and 8) included helping to get involved in European knowledge-sharing and innovation systems, such as Horizon Europe or the European Innovation Partnership. By strengthening formal and informal domestic and international relations, our aim is to further increase the number of domestic producers, research organisations and EIP operational groups involved in the European Research Area and Horizon Europe calls. To this end, the Ministry of Agriculture's AKIS Coordination Unit and the Innovation and Digitalisation Support Unit of the CAP Network will conclude a formal agreement with the National Office for Research, Development and Innovation (NCP) of Horizon Europe, the Express Innovation Agency and the BIOEAST initiative. These contacts, which are now informal, have already been effective in helping to strengthen international research cooperation in our sector in recent years.

The task of the innovation and digitalisation support unit of the CAP Network is planned to be carried out by the Institute of Agricultural Economics Nkft. (Who) is [supplied by https://www.aki.gov.hu/en/societal-challenges-in-the-food-and-rural-economy/](https://www.aki.gov.hu/en/societal-challenges-in-the-food-and-rural-economy/).

We plan to increase the number and activity of domestic actors and EIP Operational Groups by holding regular AKIS and Horizon Europe information days/events, by launching an information website and a newsletter service to inform about Horizon Europe's key events, project results and receive relevant news from the EU EIP Support Facility.

Informal cooperation will also be developed and strengthened. The aim is to ensure day-to-day contacts between the new and established domestic and international EIP Operational Groups and other industry actors. For this purpose, AKI intends to use its own domestic and international network, the BIOEAST network and the NCP network. As it happened on 28 February 2022, TOPIC ID: Horizon-CL6-2022-FARM2FORK-02-04-two-stage, where AKI EIP Operational Group participates in the partnership together with the coordinator.

The functions of the Innovation and Digitalisation Support Unit can be understood in the following structure:

- encouraging cooperation and knowledge transfer
- contribution to the preparation of cooperation applications
- following the application, follow the progress of the Operational Groups
- communication and publication of the results of the cooperation
- achieving synergies

Other priorities of the Innovation and Digitalisation Support Unit include:

- evaluation of digitalisation efforts and DAS monitoring
- Performing NCP tasks, encouraging participation in innovation and digitalisation in the international arena, e.g. Horizon Europe, EDIH, etc.

Encouraging cooperation and transfer of knowledge across specific themes

Organise different types of online and face-to-face events for agricultural operators, including farmers, special advisers, researchers and other relevant actors in AKIS, based on a pre-established methodology, in order to achieve the coordination of practical problems and research practices and results according to pre-defined topics. Events allow actors to become familiar with each other and create further collaborations, either in the form of operational groups or in other interactive innovation cooperations.

The Support Unit shall contribute to the methodological development of the innovation content of the training courses (training of trainers) designed for special advisers registered by the NAK, so that specialist advisers can provide an innovation support service.

Contribution to the preparation of cooperation applications

The Innovation and Digitalisation Support Unit will develop an information service in relation to the EIP Operational Group grant call for proposals, which will be implemented online or through face-to-face events, in cooperation with the NAK and other units of the CAP network.

The Innovation and Digitalisation Support Unit will provide (in writing and in person) an opportunity for consultation (in writing and in person) for the operational groups set up on the call for proposals.

The Innovation and Digitalisation Support Unit, using methodological knowledge from the international project, provides training to developing operational groups to develop their own topic/ideal value offer, modelling the process and criteria for compiling interactive innovation projects.

Follow the progress of the Operational Groups following the application

The Innovation and Digitalisation Support Unit provides technical support to the MA by providing pre-qualification expertise on incoming EIP Operational Group applications. The pre-qualification procedure is developed by the National Research Development and Innovation Office (NKFIH) on the basis of novelty analysis, examination of the Intellectual Property Office (SZTNH) and analysis of the practical applicability of the innovation idea, using practical elements that can be derived from it. The Innovation and Digitalisation Support Unit will use the information that can be obtained from knowledge bases at EU level to pre-qualification (e.g.: EU FarmBook; EUREKA; The Sherpa project; EU Dashboard), to give a good image of the innovation idea.

The Innovation and Digitalisation Support Unit shall keep a record of the winning Operational Groups to ensure contact with them and further thematic knowledge transfer, either domestically or in the EU.

Another task is to display the winning Operational Groups on the website developed by the Innovation and Digitalisation Support Unit on social media platforms.

Communication and publication of the results of the cooperation

Follow the results of the winning Operational Groups, share them through an online interface/making them available to a wide range of domestic agricultural operators.

Organise/hold online or face-to-face events related to innovation outcomes along themes defined by the AKIS coordination organisation. The events will be organised in cooperation with the NAK and other units of the CAP network.

Achieving synergies

The main objective of the Innovation and Digitalisation Support Unit is to help economic operators find solutions to practical problems affecting the profession through partnerships, thus contributing to the achievement of the specific objectives of the CAP. Innovation performance can therefore be understood in a broad context, primarily domestically.

The Innovation and Digitalisation Support Unit will conclude a formal agreement with the National Agency for Research, Development and Innovation, which hosts the National Contact Point of Horizon Europe, Partnerships and Soil Mission, and Express Innovation Agency. This cooperation will be the basis for creating synergies between the CAP and Horizon Europe. And the development of synergies within the NKFIH, through the organisation of joint events and information days with the Horizon Europe Cluster 6

(NCP) unit, in order to provide operational groups with information on Horizon Europe calls linked to multi-actor and thematic networks.

The Innovation and Digitalisation Support Unit shares the main results of Horizon 2020 and Horizon Europe projects with domestic actors along the lines defined by the AKIS coordination organisation.

The Innovation and Digitalisation Support Unit will actively work with other units of the CAP network to develop an appropriate flow of knowledge between actors along defined topics, the results of the EIP Operational Groups reach relevant consultants, researchers and other practical actors. Cooperation with special advisers is also important because many practical problems can be identified through them. The development of synergies with the NAK's coordinating section of special advisers is one of the cornerstones of EIP cooperation.

The Innovation and Digitalisation Support Unit will work together:

- innovation cooperation in Hungary (e.g. the NAK TechLab incubation programme, which aims to find the most innovative solutions in Hungarian agri-food);
- the EIP-AGRI Service Point;
- with the BIOEAST initiative, which has developed an active agri-economic network based on cooperation between 11 (mostly neighbouring) Member States, including the possibility to set up cross-border operational groups.

Rural and regional development support unit

The purpose of the rural and regional development support unit is to bring together government, municipal and social organisations, professional bodies and organisations engaged in farming activities in agriculture, rural development and knowledge transfer in an information and cooperation network and to coordinate their activities in order to ensure the socio-economic development of the countryside, catch-up and the efficient use of support resources.

Functions supporting LEADER and rural networks:

- Under the LEADER measure, local action groups shall develop and implement a Local Development Strategy consistent with the objectives of the CAP Strategic Plan and the other operational programmes, in line with the local development objectives. With its role as a facilitator for LEADER and rural networks, the support unit provides support to Local Action Groups already active or in the process of being set up in the areas of the country, as well as businesses and civil society organisations in rural areas, which have a significant role in rural development activities.
- Priority tasks related to LEADER:
- Supporting the development of local development strategies (in line with smart village strategies)
- Supporting the implementation of local development strategies through competence development and mentoring
- Facilitating the networking of LAGs by ensuring appropriate channels of communication and contributing to the development of cooperation within and outside the border
- Networking of local action groups and other local development structures, exchange of best practices
- Creation and management of the LAG database
- Activities supporting the networking of local action groups under LEADER/CLLD or other local development structures, including transnational cooperation

Functionalities to help develop smart village strategies:

- Support cooperation in developing and implementing smart village strategies.
- Assistance is rural cooperation that seeks practical solutions to local economic, social and/or environmental challenges and strives to make the best possible use of digital technologies for the local population. Smart villages can also be connected to a rural centre that can bring elements of the system closer to people with a number of services.

The development of smart village strategies should be consistent with local development strategies.

Priority tasks related to smart village strategies:

- Supporting the development of smart village strategies
- Mentoring, training of trainers and special advisers
- Creating a creative, entrepreneurial-friendly, secure economic and self-governance environment, creating and operating 'smart' communication channels.
- Fostering knowledge sharing, involving the capacities of higher education institutions
- Encouraging the mapping of good practices identified in rural research

Functions supporting the implementation of small projects:

Encourage the implementation of short-term and low-budget small projects that provide quick and accessible resources for community activities in rural areas, relieving the Paying Agency's apparatus.

Priority actions for small projects

- Showcasing the diversity, identity and values of rural landscapes and regions
- Encourage workshops on a topical topic linking civil society organisations, academic workshops, especially people living in rural areas, and all stakeholders involved in rural development.
- Promotion of professional study visits and exchanges, support for scholarship programmes, traineeships and internships.
- Promote generational renewal projects.
- Entrepreneurship development, incubation programmes.
- Promotion of short supply chains.

Start-ups and generational renewal features:

- Initial screening of rural start-ups from the perspective of viability, development opportunities and entrepreneurial competences and motivation. Ensure competitive entrepreneurial knowledge and access to practical knowledge and experience for opportunity-oriented (potential) companies after screening. This could take the form of increasing entrepreneurial knowledge, developing an entrepreneurial culture, deepening the digital mindset of entrepreneurs and raising business awareness in the form of training, training and counselling.
- The creation of businesses built on a conscious basis and the development of existing businesses, which are able to use the grants directly available to them in an efficient manner on the basis of the knowledge acquired under this programme.
- Encouraging generational renewal.
- Mentoring generational renewal, facilitating farm transfers through coaching, knowledge transfer, showcasing good practices
- Encouraging intergenerational communication or improving or encouraging intergenerational communication: organisation of forums, events, training, good practices and examples of farm transfer, agricultural inheritance, business start-up
- Mentoring young farmers supported under the CAP Strategic Plan during the programming period, preparing young start-ups, nurturing talent

- Support for grassroots communities and organisations of young farmers
- Farm Traineeships Programme: pre-determined employment of young people who have recently completed agricultural training, on condition that a practical training plan is drawn up for the support period, which enhances the young farmer's practical knowledge of farming.
- Practical programmes: summer, autumn, spring exercises. Wider use of dual training. A credible and experiential presentation of modern machinery and working conditions will bring workers' needs closer to employers' expectations.
- Work experience exchanges at home and abroad: Organisation of professional study visits for farmers at home and abroad with the aim of embracing best farming practices, transferring experience and knowledge.
- Incubation and mentoring programme: young farmers are supported by the provision of vocational training, business planning, expert advice, the organisation of demonstration programmes, internships, full-scale agricultural business start-up and development services.
- Communication and career guidance programmes: Increasing the attractiveness of the sector through communication and career guidance programmes.
- Entrepreneurship programmes: Young farm managers have a higher than average share of secondary and tertiary graduates. However, due to their age characteristics, they are also characterised by a lack of market and management experience. Entrepreneurial skills development programmes can make an important contribution to the start-up and successful running of self-employed businesses.

Activities of the Hungarian National Rural Network so far:

Organisation of the MNVH

The Bureau, composed of 13 members, is responsible for the achievement of the MNVH's objectives. The Bureau, acting within its remit, draws up the MNVH Action Plan and the decisions necessary for the implementation of the Action Plan and monitors their implementation. Propose certain programmes to be financed from the budgetary resources of the HNVH. Report annually to the Head of the Managing Authority on the implementation of the Action Plan.

The Chair shall display the professionalism and unit of the Network and the Partners.

It represents the MNVH and chairs the meetings of the Presidency and the Council. Monitor the work of the Permanent Secretariat and guide the implementation of the Action Plan.

The proposing and supporting body of the MNVH is a Council composed of 20 members, which assists in setting priorities for the tasks it is required to carry out, in drawing up and monitoring the Action Plan, promoting the public and giving an opinion on the Action Plan and the report on its implementation. Provide advice to the Permanent Secretariat.

From 1 April 2020, the Permanent Secretariat (PST), as the operational body of the MNVH, has been designated by Herman Ottó Intézet Nonprofit Kft. It operates under the Directorate for Priority Programmes. In accordance with its tasks under the Decree, it prepares a proposal for an Action Plan and performs the secretarial functions of the Presidency and the Council and the related administration. Organises and participates in the development and maintenance of international relations. Its work shall be valid from 1 January 2017 in accordance with Government Decree No 11/2016 on the Hungarian National Rural Network. (IV.21) MvM Decree No 11/2020. (IV.3) Amended. According to this amendment, the tasks of the Permanent Secretariat are to be carried out through Herman Ottó Intézet Nonprofit Kft., from 1 April 2020.

The Head of the Secretariat manages the operational functioning of the Permanent Secretariat and the MNVH and its main task is to supervise the implementation of the Action Plan and Task Plan. Mediate between the Network and its Partners and provide a general replacement for the President. Establish the organisational structure and staff composition of the DPP, represent the MNVH in international relations, the European Network for Rural Development (ENRD) Coordination Committee and ensure the representation of the NRN in the LEADER sub-committee of the ECN Coordination Committee. It also represents the MNVH on the ELARD, EIP and ENRD and ERNA networks.

The area-responsible network is active and, as of 1 December 2021, there has been territorial responsibility in all counties. The provision of professional tasks and rural development information to colleagues is continuously and actively involved in the implementation of the MNVH Action Plan, both in their own county and at national level.

Due to the coronavirus emergency, the tasks of the Permanent Secretariat and the Territorial Officers had to be rescheduled. Territorial managers were able to attend fewer events in person, but were able to carry out their duties at home, as well as during online counselling and conferences. The MNVH was represented online in a number of events and promoted the open tendering opportunities and results of the Rural Development Programme.

As a result of the Rural Development Programme's applications, more and more investments have been made and good practices that can be collected and communicated in several areas of action are constantly increasing. Six good practices will be published in the ENRD collection in the near future. Our communication officer helped us to communicate the results of the RDP by transferring the news published on government websites to our own website. In addition, the territorial officials sent us articles and event reports, on the basis of which news appear on our website.

The MNVH shall endeavour to monitor the ERD's practice, to compare experiences abroad and domestic practices, and to convey the practices of the MNVH to the European networks. During the period in question, we had a partnership with the French and Georgian Rural Networks and worked with the Rural Development Network of Albania to prepare a V4 project. Between June and November 2021, our staff participated in technical study visits under the **ESPRIT** (Erasmus+) project, the main objective of which is to exchange innovative approaches and experiences in the provision of services to the rural population.

The MNVH is an active member of the European LEADER Association for Rural Development (ELARD). Cooperation with the International Association aims to improve the quality of life in rural areas and to support the quality of population maintenance through international experience and training. The MNVH's cooperation is becoming more active every year, with several training programmes taking part in several training programmes as an expert.

It is currently implementing projects related to the planned support units of the CAP in the **field of digital** competence development, with a Digital Area Development Officer with a Digital Area Development Officer and 1 expert in Digital Area Development.

The operation of the **Rural and Regional Development Support Unit** can also be based to a large extent on the current human resources of the Hungarian National Rural Network, almost all staff (rural development) agricultural engineers and more qualified practitioners among those responsible for the area. Our staff have extensive contacts at county and national level, and have close contact with the following actors:

105 Local Action Group's working organisation and membership (including local authorities, NGOs, businesses, church organisations, individuals)

Municipality and county municipalities

Civil society organisations

Farmers

Professional organisations with a county and national scope (municipal associations, parks, village care associations, etc.)

Small farmers, craftsmen, service providers

Green Support Unit

'Green' is used for environmental and climate actors and interventions aimed at protecting the environment and climate.

The purpose of the Green Support Unit is to assist farmers in the overall environmental and natural

aspects of agriculture and in particular in the measures of the green superstructure of the CAP by providing practical advice and offering support schemes tailored to the needs of the farm. To this end, it is necessary to set up a 'green advisory network' and to provide its advisors with up-to-date knowledge by building a central knowledge base and organising training courses.

The green support unit (central department of 5-10 people) will be operated by the National Chamber of Agriculture, building on existing capacities and expertise, well-designed and functioning (training) systems, bringing together green sector experts and networks, avoiding potential duplications in advance.

The Green Support Unit builds on existing network capacities, develops existing capacities through training and keeps the knowledge of professionals up to date with ongoing information and further training.

Similarly, the creation of a knowledge base (e.g. learning materials, videos, publications) and the organisation of related events and trainings will be carried out in cooperation between several organisations, exploiting existing expert capacities and using (extension and complete) existing professional materials.

Entities potentially cooperating in the operation of the Green Support Unit:

- National Chamber of Agriculture
- Forestry Sector Knowledge Centre Non-profit Kft.
- regional public nature conservation bodies (National Park Directorates)
- regional bodies in the field of game management (e.g. network of main hunters in the region, selected hunters, etc.)
- nature protection NGOs (e.g. Hungarian Association for Madartani and Nature Conservation)
- agricultural organisations (ÖHGT, MÁSZ, GOSZ, OMME, MOE, MJKSZ, etc.)
- selected territorial bodies in the field of forestry
- research institutes with expertise in environmental matters
- register consultants with expertise in environmental matters

In order to build the knowledge base and run the network, partner organisations conclude a cooperation agreement with the support unit to lay down a general framework. Specific tasks are defined in the framework of works contracts.

The work of the Green Network should be promoted through active communication. Informing producers about the contact details of the consultants, the organisation of events and publications, videos, etc., and the importance of the topic in general.

With a view to developing existing network capacities, the resulting knowledge content (including more detailed technical material) will be made available to all consultants currently active in the field of the environment, allowing them to participate in relevant training courses. Attention will also be paid to the experiences, comments and suggestions from consultants, which are shared with the intention of improving systems, and are synthesised and disseminated to policy makers and, where appropriate, research institutes.

The Green Support Unit will:

Carrying out expert activities

Technical support for the planning and implementation of the CAP Strategic Plan's domestic interventions for environmental and climate sustainability (SO4-SO6), including participation in the work of the CAP

Green sub-working group and other working groups on the subject (e.g. preparatory working groups), as well as bringing together actors involved in domestic implementation and coordinating the development of implementation systems. Preparing technical material, giving opinions, drafting proposals, conducting questionnaire surveys where necessary, in particular:

- interventions to reduce ammonia emissions from agriculture (storage, treatment, application of manure, correct nutrient management)
- carbon sequestration and greenhouse gas emission reduction practices (land use change, direct cropping, soil cover, reducing fertiliser use, increasing soil organic matter, etc.)
- development of livestock farms to reduce emissions (feeding, manure storage and treatment, flooring, insulation, air washing and other emission abatement techniques, BAT requirements, etc.)
- sustainable soil management and improvement (TCST)
- implementation of projects promoting a circular biomass economy
- renewable energy use and energy efficiency

It will also synthesise and disseminate to policy-makers the experiences, comments, suggestions and proposals from the network members, shared with the aim of improving the systems.

In addition, the implementation of the international integration of activities, thus liaising with relevant experts from other national CAP networks in the field, as well as with other foreign partners active in the field; involvement, where appropriate, in international environmental and climate sustainability projects supporting the implementation of the CAP Strategic Plan, either with own capacities or by facilitating the participation of other domestic network actors.

Participation in CAP network meetings.

Knowledge content development and related information activities

Developing knowledge content, collecting and synthesising information on:

- content of CAP Strategic Plan interventions targeting environmental and climate sustainability (including related calls), functioning of the support scheme
- content of EU directives, regulations, guides (Fit for 55, RED II, carbon farming, etc.) related to the CAP Strategic Plan, going beyond Land to Fork and Biodiversity strategies
- domestic and international (e.g. through Farmbook) environmentally sustainable farming practices, new (innovative, digital) technologies (including results from EIP-AGRI projects)

Displaying the knowledge content produced through existing channels to potential beneficiaries and experts and consultants involved in drawing on grants, adapting to the knowledge use habits of each target group. The information activity is planned in an awareness-raising and comprehensible manner, using the following tools:

- territorial, county, regional, national and international online/personal events
- publications
- videos (briefing and tutorial videos)
- other information content and activities (e.g. press release, NAKlap article, portal article, presentations)
- calculators

The overall (final) objective of information activities is to achieve farmers' awareness and to promote environmentally sustainable farming.

Transfer of knowledge to professionals

Implement knowledge transfer for specialist consultants, village administrators, trainers and other experts in order to have the right theoretical knowledge of the environment and practice of agriculture, as well as the potential of digitalisation. In doing so, they are able to provide advice that can be adapted to local farming practices and local environmental requirements to potential beneficiaries of the CAP Green superstructure (e.g. farmers, forest managers). It also aims to ensure that professionals involved in knowledge transfer are successful in raising farmers' awareness, developing environmental commitment and motivation, and encouraging environmentally sustainable farming.

Running a network of green experts and consultants

Mapping the domestic green pool of experts and consultants, making data available for contact with its members. Against this background, promoting a green pool of experts and networks, encouraging the circulation of knowledge between actors (experts, consultants, decision-makers, researchers), and starting to run the community. Develop close cooperation with the Innovation and Digitalisation Support Unit, including the networking of members of the EIP-AGRI Operational Groups relevant to the theme and channelling the results of the EIP-AGRI project.

The aim is also to promote the international integration of the network, including the development of domestic and foreign partnerships, which are relevant to the topic.

Support for monitoring of green interventions

Carry out studies to prepare green interventions of the CAP Strategic Plan (including related calls) and to assess the achievement of environmental and climate objectives. Carrying out surveys and surveys among (potentially) actors involved in green interventions.

Ultimately, define and finalise the monitoring tasks to be carried out in the context of the Strategic Plan.

The Green Support Unit shall involve relevant partner organisations in carrying out the tasks listed above and cooperate with other support units of the CAP network, thus avoiding potential duplications and facilitating possible synergies.

Common operating arrangements for support units in the CAP network

1. Management and planning

1.1: Operation of the network support facility

Support units must stop and organise their teams. The teams should be composed of experienced experts with diverse backgrounds and expertise in research and innovation, farming practice and advice in agriculture, forestry and rural areas. Teams shall include analysts, network animators, facilitators and communicators. The teams may be composed of permanent and non-permanent members.

1.2: Seven-year and annual work plan

The seven-year work plan is submitted by the support units at the beginning of the programming period and approved by the Managing Authority upon recommendation of the AKIS coordination organisation.

The support units shall submit the annual work plan by 31 December of each year preceding the reference year and shall be approved by the Managing Authority.

The work plan should cover the main and ancillary tasks.

2. Cooperation with other organisations

Support units should engage constructively with any other entity designated by the AKIS coordination organisation to provide network services.

The support units shall assist the Managing Authority in the network management of the CAP and actively contribute to the preparation and implementation of programmes related to network activities.

3. Networking activities

Support units are responsible for the preparation, provision, delivery and follow-up of face-to-face and/or online networking activities.

3.1: Knowledge building: training of trainers, training of special advisers,

3.2: Knowledge exchange: Networking events – working sessions and seminars.

4: Analytical and monitoring activities

Support units should carry out regular analysis and monitoring activities, which will be recorded in the seven-year work plan and reflected in the annual work plans. This work could focus on the analysis of the priority themes. Priority themes are defined by the AKIS coordination organisation.

4.1: Project portfolio analysis

Support units should collect, analyse and aggregate information on relevant projects in relation to milestones.

4.2: Research needs from practice

Support units collect and analyse practical needs for further research.

4.3: Identify innovation potential

(where relevant)

4.4. Monitoring tasks

Extraction and analysis of the data needed for the implementation and evaluation of the CAP Strategic Plan, e.g. reversing pollinator decline.

5: Cooperation with external experts

5.1: List of external experts

Support units draw up and maintain a list of external experts. These experts should have excellent knowledge in a specific area of activities in the priority themes.

5.2: List and network of national thematic experts

Support units shall establish and keep up-to-date a list of priority area experts.

5.3: Connect with foreign networks in specific thematic areas, bring in and encourage good practices abroad.

6: Networking with stakeholders – Information exchange activities

Support units proactively seek contacts with groups and actors carrying out work relevant to the priority areas. They shall facilitate regular consultation with relevant groups and actors and the exchange of information at EU level, including the dissemination of the results of its activities.

6.1: Mapping of stakeholders and preparation of a directory

6.2: Reply to questions, exchange of information

6.3: Participation in events

7: Communication and online network tools

Support units are responsible for the content and technical part of the communication on the priority themes. The units actively contribute to ensuring the visibility and accessibility of the CAP Network.

7.1: Provision of content for communication products

7.2: Production of monthly newsletter content

7.3: Media-related tasks, including audiovisual and social media

7.4: Providing content and animation to the CAP Network website

8: Record-keeping

Support units index and record all contract-related documents and information in their possession.

9: Participation in the work of the European CAP Network

10: Additional tasks

The AKIS coordination organisation may request the support units to carry out a number of additional tasks, which shall be specified in the annual work plan.

- Conferences (preparation, content, support)
- Organisation of cross-visits between projects
- Organising excursions, visits to innovative projects and actors in the framework of Focus Group meetings, workshops and seminars, or on its own.
- Partner search activity
- Organisation of ad-hoc expert meetings
- Mission to Member States, participation in events in different EU Member States
- Additional expert work
- Organisation of a competition and award ceremony for innovative projects/agrarian start-ups/smart village projects, etc.
- Provision of content for publications
- Green competence development
- Digital competence development

4.5 Overview of the coordination, demarcation and complementarities between the EAFRD and other Union funds active in rural areas

Below is the way in which OPs and other co-financed programmes develop rural areas in Hungary, adapt to Rural Vision 2040 action areas, link them, complement the CAP Strategic Plan measures, and how support schemes are delineated, avoiding the risk of double funding.

Two key elements of the coordination of aid policy programmes are the definition of delineations (to avoid double funding of potentially overlapping areas) and the conscious planning of possible synergies (strengthening effects) between interventions.

Demarcations can be at programme level, defined at call for proposals or project level. In particular, the CAP Strategic Plan favours calls for proposals and project-level delineations, so that inflexible conditions are not fixed at programme level and thus difficult to adapt to determine the eligibility of certain calls and projects, reducing the risk that target groups and development needs remain without funding due to inflexible rules.

In addition to delineation, the identification and conscious planning of synergies between interventions is another important development policy task. The aim of synergies is to maximise the impact of grants through coordination, i.e. to maximise the impact of a unit grant amount due to positive externalities between programmes.

KEHOP Plusz:

KEHOP Plus addresses, among others, water management and disaster risk reduction, environmental and nature protection, renewable energy economy, just transition to climate neutrality and circular economy transition.

Rural Vision 2040:

Like the other OPs, KEHOP Plus is adapting and reflecting on the areas of action identified in Rural Vision 2040. It plans major improvements and allocates nearly EUR 1.6 billion for adaptation to climate change, including investments in water management, water protection, investments based on the use of renewable energy, biodiversity conservation, nature protection and diversification of workers in rural areas.

KEHOP Plus – CAP Strategic Plan:

Based on the KEHOP Plus version officially submitted to the Committee on 22.7.2022, under SO2.4, 1. Water management and disaster risk reduction priority (planned envelope of around EUR 700 million)

and VAV interventions support several water-related developments that are directly adjacent (complementers and synergistic, expected without double funding problems) with interventions in the planned coastal water buffer zone or buffer zone (AÖP, AKG and conditionality) of the CAP Strategic Plan.

The KEHOP Plus and VAV interventions may support improvements to, inter alia, the following topics: revitalisation, restoration of areas close to water, dead branches and natural coastlines, investments in flood protection and flood drainage, channelling, extension and revitalisation of floodplains, river and floodplain connections, conversion of water banks to nature, development, conversion, dismantling, construction or replacement of existing artefacts and systems with green infrastructure elements, strengthening protection lines, building and relocating them in accordance with regulations.

Both programmes also include projects related to the use of biomass and waste water, where according to the Partnership Agreement, KEHOP Plus is an area-wide investment, while the CAP Strategic Plan provides specific waste water treatment technology for projects at municipal level. The solution of local waste water treatment can be a useful part of regional development.

For nature conservation-related investments, the CAP Strategic Plan focuses primarily on agricultural areas, while KEHOP Plus nature protection areas, where, for example, Natura 2000 sites could overlap but can be managed at project level.

In order to ensure that the interventions described above can operate from one another in terms of funding but are complementary and strengthened, it is necessary to adapt the content of future calls and projects in order to ensure a definition at call and project level and to promote complementarity.

With a focus on enhancing opportunities for synergy, it is envisaged that:

- Prioritisation of water storage-related investments and buffer areas for habitat developments in the voluntary CAP interventions supporting environmentally friendly land use, i.e. non-productive investments and in the selection criteria in the agri-environmental management (AKG) calls, considering including them as eligibility criteria for support.
- fertiliser management investments in the CAP Strategic Plan could be combined with KEHOP Plus biogas developments.
- in order to increase the effectiveness of climate change interventions, LAGs may be required to take into account the already completed in-situ climate plans in the LEADER HFS review.

Top Plus:

The programme supports the territorial development of Budapest, which is the less developed regions and developed regions of Hungary, with a particular focus on the development of the least developed and underdeveloped regions. In particular, it supports local government development and, in this context, its development includes ensuring regional and local conditions for economic recovery, job creation and expansion, population retention and family protection, such as local economic development and employment, local tourism, the development of municipal infrastructure, urban management and local public services.

Rural Vision 2040:

Rural Vision 2040 responds to the challenges of all four areas of action (stronger, connected, prosperous, resilient rural areas) by several elements of the operational programme, providing nearly EUR 4 billion in funds for the implementation of improvements. TOP Plus supports:

- integrated and inclusive local social, economic and environmental development, promoting culture, natural heritage, sustainable tourism and security;
- promote active inclusion, including by promoting equal opportunities, non-discrimination and active participation, and to improve employability, in particular for disadvantaged groups;
- development of regional and local transport infrastructure and related services linked to the local economy;
- promoting energy efficiency and reducing greenhouse gas emissions;
- improve equal access to inclusive and quality services in education and healthcare.

Top+ – CAP Strategic Plan:

The previous legislation, according to which municipalities above 10.000 inhabitants are supported by the TOP and municipalities with less than 10.000 inhabitants under the RDP, is currently not part of the regulation. Both the TOP Plus and the CAP Strategic Plan support rural areas. This provides an opportunity to co-ordinate the two sources in order to multiply each project's impact and ensure financing of developments along the entire value chain.

In order to make better use of synergies, we have a coordination mechanism between the two programmes, whereby the bodies responsible for implementing synergies at local level in the case of rural development interventions, the LEADER LFSs, must examine the Integrated Territorial Programme of the counties concerned and develop their own objectives in a complementary manner, with a view to achieving synergy.

The TOP+ specifies that the counties must be given the opportunity to consult LEADER LAGs in the county with a view to coordinating planned developments.

Delineation between the CAP Strategic Plan and the TOP Plus programme:

The demarcation between the CAP ST and the TOP is facilitated by the fact that, due to the delays in two programmes, in most cases TOP+ applications are published much earlier than the CAP calls, so it is rarely possible to open two calls at the same time or close to each other.

As a general principle of demarcation, the CAP MA requests the TOP MA to provide information on overlapping interventions (detailed below) before opening tenders to municipalities, giving priority to the identification of the municipality and the place of implementation. Furthermore, the CAP MA for municipalities in the case of overlapping interventions (detailed below) states in the call for proposals that it does not allow the same development in the same municipality. Thanks to these two measures, the CAP and TOP+ are delineated at programme level. In addition, as is currently the case, implementation in itself guarantees the avoidance of double funding, with IT and procedural safeguards.

Where overlaps are possible, demarcation between TOP+ and CAP ST is necessary:

Creation of local markets and fairs: TOP+ and the CAP also support municipal beneficiaries. In addition to the general delineation above, the applicant municipalities must declare whether they are applying only for the CAP ST or only for TOP+.

Local mass caterers: TOP+ and the CAP also support municipal beneficiaries. In addition to the general delineation above, the applicant municipalities must declare whether they are applying only for the CAP ST or only for TOP+.

Local, regional tourism attractiveness development: In the case of the CAP, the beneficiary of the intervention “RD11_B07_DVF_73 – Diversification of farmers’ activities” can only be a farmer, so the delineation from the TOP+ is clear on a beneficiary basis. In the case of CAP ST, the intervention “RD51_R11_TUC_77 – Rural development cooperation for active and eco-tourism in the region” is a pilot measure and specifically supports local tourism cooperation that develops tourism services based on local agricultural and food products and producers. In the case of the latter pilot, the CAP does not exclude municipalities wishing to participate in the cooperation, but in this case, in addition to the general definition above, the applicant authorities must declare that they will not use TOP+ funds for the same purpose and place of implementation.

Development of community spaces, sports and recreational spaces: For the development of public spaces, a functional delineation is used between the CAP and TOP+. For the CAP, the function is described in the description of intervention RD43_R02_LOC_73 – Rural infrastructure development in small municipalities, 1.2.1. for TOP+. Liveable municipalities are defined in a call for applications. Among municipal properties, the CAP supports administrative functions (e.g. cemetery, marry room) and TOP+ supports community, sport, leisure and cultural functions. In the case of sport and recreational functions, the CAP will announce in its call for proposals support for functions and activities for which the TOP+ MA undertakes to suspend the support of the activities.

Multifunctional community spaces, service centres – child protection and health function: There is no overlap, TOP+ supports the development of crèches, kindergartens, local primary health care and outpatient specialist care, as well as the development of schools in public education institutions, which are not supported by the CAP.

Energy modernisation of community facilities: Municipal beneficiaries are mainly supported by TOP+. If and when the CAP MA decides to publish this intervention, it will do so in consultation with the TOP+ MA (without jeopardising the allocation of funds and the fulfilment of the indicator commitments of the TOP+ MA) and, in addition to the general delineation above, the applicant municipalities must declare whether they are applying only for the CAP ST or only for TOP+. For this purpose, the CAP and the TOP+ MA commit to jointly assess the experience of launching the two programmes at the end of 2023 and, if necessary, amend the CAP ST accordingly.

Smart village: At the start of the CAP programme, the RD57 LEADER intervention supports the development of smart village strategies based on the ENRD (European Network for Rural Development) methodology for 54 municipalities. This activity does not overlap with the TOP+ programme. In the case of these 54 municipalities, the CAP MA shall consult the TOP+ MA on the financing of the implementation of smart village strategies and the alignment thereof in accordance with Article 1.2.1. Liveable municipalities for call for proposals. In the case of smart settlement functions, the CAP will announce in its call for proposals support for functions and activities for which the MA undertakes to suspend the support of the activities.

The Partnership Agreement also states that "Synergies will be partly driven by the alignment of the rules for calls, project selection rules to encourage inter-based projects, and common communication solutions. Develop these during the preparation of calls for proposals in joint fora between the relevant MAs and policy holders (e.g.: Call Preparatory Task Force, MB meetings) will be organised."

In addition to EAFRD interventions for rural development, the programmes under the Partnership Agreement are committed to contributing to the long-term vision for the EU's rural areas along the areas of action for 'stronger, connected, flexible and prosperous rural areas'.

EFOP Plus

The EFOP Plus priorities cover public education, health, social inclusion, social, family and youth, social innovation and support measures for the most deprived.

Rural Vision 2040

In particular, the EFOP Plus supports Rural Vision 2040 action areas under the themes 'Social Innovation, Social Resilience and Responsible Communities', with a budget of almost EUR 1.5 billion behind development.

EFOP Plus CAP Strategic Plan:

Under the social inclusion priority axis of the EFOP Plus, production workshops are planned to be supported, while funds are allocated to the development of social enterprises under the CAP Strategic Plan. Under the current plans, production workshops can be set up in any sector, including in relation to agricultural activities, and the measure includes non-profit companies and non-governmental organisations among the applicants for support, without any sector-specific limitation.

GINOP Plus

GINOP Plus, in line with relevant EU strategies, facilitates the technological change of Hungarian businesses, strengthens their digitalisation and innovation capabilities, and contributes to the training of workers in order to increase their productivity and added value.

Rural Vision 2040

EDIOP Plus invests more than EUR 3.5 billion, among others, in education training, labour market integration for people in less developed regions and the development of the SME sector, contributing to the goals of Rural Vision 2040 action areas to improve social resilience, diversify economic activities and facilitate access to services as an important part of rural development.

GINOP Plus – CAP Strategic Plan:

Under the Partnership Agreement, business development is supported by GINOP Plus. As of 2020, food businesses were excluded from traditional EDIOP business development grants, which can receive support from the VP in 2021-2022 and the CAP Strategic Plan in 2023-2027. At the same time, food businesses can continue to apply for their R & D and ESF-type grants under EDIOP Plus, as well as for

their food development activities.

DIMOP Plus

Through single service layers, DIMOP Plus contributes to digitalisation investments in specific policy tasks through a data-intensive approach and thus supports cross-cutting solutions that support the digital transformation process in a coherent way, with a sectoral objective.

Rural Vision 2040:

DIMOP Plus contributes to the delivery of sectoral policies through digitalisation investments, supporting a significant part of Rural Vision 2040's action dimensions (access to services, social innovation, digital connectivity, climate resilience, environmental resilience, social resilience) with a budget of almost EUR 1.2 billion. DIMOP Plus will significantly improve the availability of broadband networks out of more than EUR 200 million. As the accessibility problems are specific to rural areas, it is expected that most of the developments will be implemented.

DIMOP Plus – CAP Strategic Plan:

DIMOP Plus typically focuses on national-wide investments and plans to implement non-agricultural/rural development developments, yet more synergies can be identified between the two programmes.

- Government IT developments supported by DIMOP Plus also concern agricultural topics. The CAP Strategic Plan can provide agricultural and forestry data for digitalisation developments.

- Digitalisation of food and agriculture in the CAP Strategic Plan can be combined with DIMOP-funded Big Data and Artificial Intelligence developments.

- DIMOP Plus supports improvements in line with a smart village strategy financed by the CAP Strategic Plan.

- DIMOP Plus is developing broadband availability at national level, which can help to ensure access to gigabit and 5G networks for digitised farmers, which is necessary to operate more precision tools. This could be linked to the local Wi-Fi development activity of the CAP Strategic Plan.

- DIMOP Plus supports rural developments included in the CAP Strategic Plan by developing a public service application (e.g.: village, voluntary firefighting equipment development).

- Digital SME skills development under DIMOP Plus could be harnessed in combination with the digitalisation of agricultural and forestry businesses under the CAP Strategic Plan.

IKOP Plusz

IKOP Plus is responsible for improving the traffic situation in Hungary, which includes investments in railways, roads, bicycles and ports.

Rural Vision 2040

IKOP Plus's investments support the development of rural transport networks, contributing to the objective of 'transport connections and new mobility opportunities'.

IKOP Plus – CAP Strategic Plan

IKOP Plus will develop transport networks that also ensure rural accessibility, but there is no overlap in content between the two programmes in terms of investments.

VOP Plus

VOP Plus supports the effective and efficient use of cohesion funds available for Hungary. In particular, a pool of professionals with up-to-date knowledge, infrastructure conditions, IT, partnership, communication and publicity tasks contribute to the objectives of the Partnership Agreement.

VOP Plus – CAP Strategic Plan

Rural development will be examined in the programme evaluations financed under VOP Plus, as will the programme evaluations financed by Technical Assistance of the CAP Strategic Plan will look at the rural development impact of other development programmes. No other link between programmes can be identified.

Draft Recovery and Resilience Plan (HET/RRF) of Hungary – CAP Strategic Plan

The main objective of the HET Plan is to counter the economic and social impact of the coronavirus outbreak and to increase the resilience, sustainability and preparedness of the economy for the challenges

and opportunities of the green and digital transitions.

Component D of the HET plan addresses water supply in water-scarce areas, water retention, regional water transfer, protection of groundwater resources, balancing the uneven distribution of water resources in space and time. One of the objectives of the water management awareness reform in the draft WET is to encourage farmers to develop sustainable water management by raising awareness of the CAP Strategic Plan calls.

Component F of the HET Plan includes support for residential solar panel systems and the electricalisation of heating systems in combination with solar panel systems, targeting households with typically low creditworthiness and physical property suitable for the investment. The interventions supporting renewable energy included in the CAP Strategic Plan are mainly investment-oriented, so that additional support can be provided to farmers in rural areas with the help of the HET.

The HET plan, component C 1404/2019, establishing a **long-term programme for catching- up settlements**. (VII.) Government Decision No 105/2015 of 5 July 2015 on the classification of beneficiary municipalities and the criteria for classification. (IV. 23.) The Central Statistical Office decided to launch a long-term development programme, with the involvement of the municipalities in stages, selected on the basis of the lowest complex indicator drawn up by the Central Statistical Office (taking into account employment, education, housing, income, public safety and age structure) from the municipalities defined in Government Decree, in order to reduce social, economic and infrastructural disadvantages, increase local employment and increase rural population retention capacity.

There are 312 thousand people living in these municipalities under unfavourable income, housing and labour market conditions. In the years 2019-2021, part of the settlements designated for inclusion were gradually included in the implementation of needs-based, complex, integrated urban inclusion programmes based on a thorough diagnosis, aimed at improving the employability, competences, mobility, housing conditions (and the environmental status of their homes) and access to public services. Part of the so-called “reforms” is the pedagogical and professional development of community-oriented public education institutions, participation in work socialisation programmes, social work and community development based on continuous presence, the development of child protection tools, the organisation of mobilised health screenings, while investment elements include the construction and renovation of social housing and the increase of renewable energy capacities in the community. Along the lines of the municipalities affected by the interventions and the objectives set, the further expansion of activities will require RRF funds in addition to domestic funds and support from the Structural Funds for maintenance, as well as the integration of new public service elements into the domestic public service system.

The territorial focus of the Closing Municipalities programme is much narrower than the CAP interventions, since the 300 municipalities defined in the Government Decision constitute only about a tenth of the settlement network, and their need is supported by an established methodology. In these municipalities, they can effectively complement investment and activities with a strong social character in infrastructure, services and skills financed by domestic and RRF funds, and local economic and social development can be supported by rural development interventions supporting the infrastructure development of small rural municipalities (sewage, biomass-based energy, internet access, community, sport and recreational spaces, tourism, local markets and marketing aids, mass caterers, village and farm care services), social enterprises (e.g. social cooperatives, social farms) and other (e.g. short supply chain) cooperation interventions.

Connecting Europe Facility (CEF)

The Connecting Europe Facility (CEF) is a European Union financial fund set up in 2014 to invest in infrastructure for transport, energy, digital and telecommunications projects across the EU, aiming at better connectivity between EU Member States. Among the types of interventions under rural development, the instrument may typically be linked to investment-type aid.

However, it is important to underline that the CAP Strategic Plan typically involves the development of agricultural holdings, pure or mostly telecommunications infrastructure projects, such as CEF or DIMOP Plus, are not supported by Hungary here and the scale of the developments is much more focused on

farms. Among the interventions supporting infrastructure development, the instruments supporting municipal infrastructure, including the 'Okos Villa' programmes, may be linked to the CEF, but projects under the CAP Strategic Plan support in situ solutions, so that synergies can be achieved, so that local digital/telecommunication developments will be able to connect to a pan-European development.

An important objective in the CAP Strategic Plan is that small improvements are suitable for preparing beneficiaries to prepare for a higher level of development. In order to avoid double funding, the Managing Authority will pay particular attention to the design of the aid scheme.

Digital Europe Programme

The Digital Europe Programme is the European Union programme running from 2021 to 2027 and has as its main objective the uptake of digital technologies for businesses, citizens and public administrations. The programme therefore aims to bridge the gap between research on digital technologies and the market uptake of final products. It will benefit Europe's citizens and businesses, especially SMEs. Investment under the Digital Europe Programme supports the European Union's twin objectives of a green transition and digital transformation while strengthening the Union's resilience and digital sovereignty. The DEP provides project funding in five key areas, such as supercomputing, artificial intelligence, cybersecurity, advanced digital skills, ensuring widespread use of digital technologies in the economy and society.

The development of digital technologies to be funded by the CAP Strategic Plan specifically aims to develop digital competences in the agricultural and food sectors. With CAP funds, the aim is to strengthen the agro-vertic and the rural areas linked to it.

Also in rural areas, the aim is to fund projects that generally improve the quality of life of their inhabitants and help prevent depopulation, by implementing technological developments that people face similar conditions and quality of life in rural and urban settings.

The development of CAP-funded digital technologies aims to ensure access to basic agri-informatics services. Here too, CAP funds aim to trigger technological change, which can then be reinforced by other programmes such as the DEF. In applications supporting agri-digitalisation, we intend to apply as a selection principle the applicant's cooperation with the European Digital Innovation Hubs, in particular with the upcoming Agricultural EDIH. Such cooperation can further strengthen synergies and complementarities between development programmes. Potential overlaps can also be addressed at the level of calls for proposals.

Hungarian Village Programme (MFP)

The Hungarian Village Programme (MFP) supports the development of small towns and villages with a population of not more than 5000 inhabitants, accounting for more than 90 per cent of the urban network and about one third of the population, in the following areas: development of rural services and infrastructure, support for rural civic communities, improvement of housing conditions for people living in small settlements, development of a lower-ranking road network from domestic sources, and support for rural micro-enterprises with EU funds (GINOP Plusz-11.2-22).

Although in most calls of the Hungarian Village Programme an evaluation criterion linked to territorial handicaps is included (e.g. the place of implementation is located in the beneficiary district or municipality, in a disadvantaged region, in a free enterprise zone or in a municipality with less fiscal capacity), according to the payment data for the years 2019-2021, the increased support for municipalities and areas classified as rural or of lower status is not as prominent as in the allocation of funds for the 2014-2020 Rural Development Programme. Areas with a rural structure, which are lagging behind and practically unable to develop on their own, are more consciously targeted by CAP interventions. Looking at the use of funds so far, it can be concluded that the Hungarian Village Programme has mainly provided funds to municipalities that are less favoured by the VP, e.g. in more developed or less rural areas, which constitute the 'internal periphery'.

Overall, therefore, the different areas of intervention of the new CAP and the scope of activities eligible for support under the MFP are well separated and the CAP ST target system is already much more extensive and varied in nature. Overall, based on the experience of the 2014-2020 period, a weak substitute and stronger complementary, synergy effect between the two programmes can be assumed.

Programme of catching-up municipalities

The most prominent response to the fragility of rural areas in Hungary's Recovery and Resilience Plan is the 'Catching-up settlements' component, whose measures (reforms and investments) are consistent with the pillars of the EU Recovery and Resilience Facility for social and territorial cohesion, health, social, economic and institutional resilience, policies for future generations and the green transition.

Life programme

The LIFE programme is a financial instrument of the European Union dedicated to environmental, nature and climate objectives. Regulation (EU) 2021/783 on the renewed LIFE programme for the European Union financial period 2021-2027 entered into force on 17 May 2021. The total budget for the entire LIFE programme over the seven years is EUR 5.43 billion. Unlike the previous practice, the programme consists of four sub-programmes with a separate budget:

Nature and bio-diversity (EUR 2.143 billion),

Circular economy and quality of life (EUR 1,345 billion),

Climate change mitigation and adaptation (EUR 947 million);

Clean energy transition (EUR 997 million);

Applications will be evaluated by the European Climate, Infrastructure and Environment Executive Agency (CINEA).

The CAP Strategy Plan is most strongly linked to the four LIFE sub-programmes through support for adaptation to climate change, the 'Transition to organic farming (ÖKO)', the 'Agri-environmental management payment' (AKG). Unlike the Life programme, these grants, in addition to productive investments, provide farmers with additional resources to promote nature conservation, biodiversity, habitat protection, circular economy, climate change mitigation and adaptation, in particular on agricultural land. Although the Life programme and the CAP Strategic Plan may overlap between Natura 2000 areas, the two programmes have little chance of double funding in terms of their themes, focus and beneficiaries' composition. The possibility of double funding, if any, should be addressed by delineation at project level. Overall, the planned impacts in the programmes are expected to reinforce each other.

We plan to manage the linkage between the programmes in the following way

In the areas covered by this chapter, the relevant managing authorities shall establish cooperation by inviting the other party to the meetings of the Task Force for Tenders, thereby enabling the delineation to be established at project level and avoiding double funding. The calls concerned will give mutual preference to grant applicants who have also submitted a grant application for the co-call:

· Together with the second call, an information document presenting a short summary of both calls and the relationship between the two calls may be published on the application form. This document is limited to a substantive presentation of funding opportunities and links, and the detailed conditions will continue to be included in each call for proposals.

· Both calls may award extra points to a beneficiary who submits an application for the other call pending the evaluation, thus taking part in the use of synergistically matched funding opportunities.

The Managing Authorities undertake to inform each other of the co-applications submitted.

4.6 Financial instruments

4.6.1 Description of the financial instrument

Hungary does not use financial instruments for types of interventions of the type of rural development, so the financial instrument is not included in the plan.

4.7 Common elements for Rural Development types of interventions

4.7.1 List of non eligible investments

Purchase of land not built on costing more than 10 % of all the eligible expenditure on the operation concerned.

Investments in means of transport to be used for marketing or distribution by the producer organisation.

Investments in shares or capital of companies if the investment represents a financial investment.

construction of windbreaks and wind protection walls driveways and elevators

List of ineligible investments and categories of expenditure:

(a) the purchase of agricultural production rights;

(b) the purchase of payment entitlements;

(C) the purchase of land for an amount exceeding 10 % of the total eligible expenditure of the operation concerned, with the exception of the purchase of land for environmental purposes, the purchase of land to preserve soil with high carbon content and the purchase of land by young farmers using financial instruments; in the case of financial instruments, that ceiling shall apply to the eligible public expenditure paid to the final recipient, or, in case of guarantees, to the amount of the underlying loan;

(D) the purchase of animals, the purchase of annual plants and the planting of such plants for purposes other than:

restoring agricultural or forestry potential following natural disaster, adverse climatic events or catastrophic event;

(II) the protection of livestock from large carnivores and the use of animals in forestry instead of machinery;

(III) breeding of endangered breeds as defined in point (24) of Article 2 of Regulation (EU) 2016/1012 of the European Parliament and of the Council (45) under the commitments referred to in Article 70; or

(IV) the conservation of plant varieties threatened with genetic erosion under the commitments referred to in Article 70;

(e) interest on loans, except in respect of grants in the form of interest rate subsidies or guarantee fee subsidies;

(F) investment in large-scale infrastructures, as defined by Member States in their CAP Strategic Plans, which are not part of the community-led local development strategies set out in Article 32 of Regulation (EU) 2021/1060, with the exception of broadband systems and prevention measures for flood and coastal protection aimed at mitigating the consequences of likely natural disasters, adverse climatic events or catastrophic events;

(g) investments in afforestation which do not comply with environmental and climate objectives in line with the principles for sustainable forest management set out in the Pan-European Guidelines for afforestation and reforestation.

The first subparagraph, points (a), (b), (d) and (f), shall not apply where support is provided through financial instruments.

4.7.2 Definition of rural area and applicability

Definition of rural area:

A municipality in which, regardless of its administrative status (city/municipality), the population is less than 10 thousand inhabitants in the case of tanyás municipalities with a population above 10 thousand inhabitants is considered to be part of a rural area.

4.7.3 Additional elements common for Sectoral interventions, for rural development interventions, or common for both Sectoral and Rural Development interventions

— Investments in the development of existing irrigation installations or parts of existing irrigation systems shall only be eligible if the ex-ante assessment concludes that they will result in at least 10 % potential water savings for micro-irrigation based on the technical parameters of the existing installation or system, and at least 15 % for liners and reeling drums.

Where the investment concerns bodies of groundwater or surface water that have been identified as less than good in the relevant river basin management plan for reasons related to water quantity, the investment shall also comply with the following cumulative conditions:

- the project must ensure that, for irrigation installations or irrigation systems concerned by the project, actual water consumption is reduced by at least 50 % of the potential water savings identified by the ex-ante assessment of the project; and
- where the project concerns only part of the irrigated area of a holding, the total water consumption of the holding at farm level shall be reduced by at least 50 % correspondingly. The total water consumption of the holding shall include the quantities of water sold by the holding or transferred by any other means for irrigation.

None of the specified conditions shall apply to investments in existing irrigation installations which only concern energy efficiency, to investments in the creation of reservoirs or to investments in the use of visibly water which do not affect a body of groundwater or surface water.

The energy efficiency intervention is in line with the EU Directive on the promotion of the use of energy from renewable sources and its sustainability criteria.

Investments in energy efficiency implemented in a supported manner under the intervention, or new machinery, equipment and technologies procured in a subsidised manner, go beyond mandatory standards (where such standards exist) or normal practices.

4.7.4 Contribution rate(s) applicable to Rural Development interventions

National contribution rate(s)

Article	Applicable rate	Min Rate	Max Rate
155(2)(c) - Early retirement		20.00%	43.00%
91(2)(a) - Less developed regions	85.00%	20.00%	85.00%
91(2)(b) - Outermost regions and in the smaller Aegean islands		20.00%	80.00%
91(2)(c) - Transition regions within the meaning of Article 108(2), first subparagraph, point (b), of Regulation (EU) 2021/1060		20.00%	60.00%
91(2)(d) - Other regions	43.00%	20.00%	43.00%
91(3)(a) - Payments for natural or others area-specific constraints under Article 71		20.00%	65.00%
91(3)(b) - Payments under Article 70, payments under Article 72, support for non-productive investments referred to in Article 73, support for the projects of EIP operational groups under Article 77(1), point(a), and LEADER under Article 77(1), point(b)		20.00%	80.00%
91(3)(c) - Operations receiving funding from funds transferred to the EAFRD in accordance with Articles 17 and 103		20.00%	100.00%
91(3)(b) - 70 - Payments under Article 70	50.00%	20.00%	80.00%
91(3)(b) - 72 - Payments under Article 72	50.00%	20.00%	80.00%
91(3)(b) - 73 - Support for non-productive investments referred to in Article 73	50.00%	20.00%	80.00%

91(3)(b) - 77(1)(a) - Support for the European Innovation Partnership under Article 77(1), point(a)	43.00%	20.00%	80.00%
91(3)(b) - 77(1)(b) - LEADER under Article 77(1), point(b)	50.00%	20.00%	80.00%
91(3)(c) - 70 - Operations, under Article 70, receiving funding from funds transferred to the EAFRD in accordance with Articles 17 and 103		20.00%	100.00%
91(3)(c) - 71 - Operations, under Article 71, receiving funding from funds transferred to the EAFRD in accordance with Articles 17 and 103		20.00%	100.00%
91(3)(c) - 72 - Operations, under Article 72, receiving funding from funds transferred to the EAFRD in accordance with Articles 17 and 103		20.00%	100.00%
91(3)(c) - 73-74 - Operations, under Articles 73-74, receiving funding from funds transferred to the EAFRD in accordance with Articles 17 and 103		20.00%	100.00%
91(3)(c) - 75 - Operations, under Article 75, receiving funding from funds transferred to the EAFRD in accordance with Articles 17 and 103		20.00%	100.00%
91(3)(c) - 76 - Operations, under Article 76, receiving funding from funds transferred to the EAFRD in accordance with Articles 17 and 103		20.00%	100.00%
91(3)(c) - 77 - Operations, under Article 77, receiving funding from funds transferred to the EAFRD in accordance with Articles 17 and 103		20.00%	100.00%
91(3)(c) - 78 - Operations, under Article 78, receiving funding from funds transferred to the EAFRD in accordance with Articles 17 and 103		20.00%	100.00%

Regional contribution rate(s)

Region	Article	Applicable rate	Min Rate	Max Rate
HU12 - Pest	91(3)(c) - 75 - Operations, under Article 75, receiving funding from funds transferred to the EAFRD in accordance with Articles 17 and 103	85.00%	20.00%	100.00%
HU21 - Közép-Dunántúl	91(3)(c) - 75 - Operations, under Article 75, receiving funding from funds transferred to the EAFRD in accordance with Articles 17 and 103	85.00%	20.00%	100.00%
HU22 - Nyugat-Dunántúl	91(3)(c) - 75 - Operations, under Article 75, receiving funding from funds transferred to the EAFRD in accordance with Articles 17 and 103	85.00%	20.00%	100.00%
HU23 - Dél-Dunántúl	91(3)(c) - 75 - Operations, under Article 75, receiving funding from funds transferred to the EAFRD in accordance with Articles 17 and 103	85.00%	20.00%	100.00%
HU31 - Észak-Magyarország	91(3)(c) - 75 - Operations, under Article 75, receiving funding from funds transferred to the EAFRD in accordance with Articles 17 and 103	85.00%	20.00%	100.00%
HU32 - Észak-Alföld	91(3)(c) - 75 - Operations, under Article 75, receiving funding from funds transferred to the EAFRD in accordance with Articles 17 and 103	85.00%	20.00%	100.00%
HU33 - Dél-Alföld	91(3)(c) - 75 - Operations, under Article 75, receiving funding from funds transferred to the EAFRD in accordance with Articles 17 and 103	85.00%	20.00%	100.00%

5 Direct payments, sectoral and rural development interventions specified in the strategy

Fund	Form of Intervention	Type of Intervention	Intervention Code (MS) - Name	Carry-over	Common Output Indicator	Gen. Renewal	Env.	ES rebate system	LEADER
EAGF	Decoupled Direct Payments	BISS(21)	DP01_E01_BISS_16 - The basic income support for sustainability		O.4				
EAGF	Decoupled Direct Payments	CRISS(29)	DP02_E02_CRIS_16 - Complementary redistributive income support for sustainability		O.7				
EAGF	Decoupled Direct Payments	CIS-YF(30)	DP03_B01_YFS_16 - Complementary income support for young farmers		O.6				
EAGF	Decoupled Direct Payments	Eco-scheme(31) / Art. 31(7)(a) - Additional payment to BIS	DP17_G01_ECOS_16 - Agro-ecological programme		O.8				
EAGF	Coupled Direct Payments	CIS(32)	DP04_E03_CISB_16 - Aid for sugar beet cultivation		O.10				
EAGF	Coupled Direct Payments	CIS(32)	DP05_E04_CISR_16 - Aid for rice production		O.10				
EAGF	Coupled Direct Payments	CIS(32)	DP06_E05_CISV_16 - Aid for vegetable crop production		O.10				
EAGF	Coupled Direct Payments	CIS(32)	DP07_E06_CISI_16 - Aid for industrial vegetable production		O.10				
EAGF	Coupled Direct Payments	CIS(32)	DP08_E07_CISO_16 - Aid for the production of industrial oil crops		O.10				
EAGF	Coupled Direct Payments	CIS(32)	DP09_E08_CISE_16 - Aid for fruit production (Extensive)		O.10				
EAGF	Coupled Direct Payments	CIS(32)	DP10_E09_CISF_16 - Aid for fruit production (Intensive)		O.10				

EAGF	Coupled Direct Payments	CIS(32)	DP11_E10_CISS_16 - Ewe premium		O.11				
EAGF	Coupled Direct Payments	CIS(32)	DP12_E11_CISC_16 - Suckler cow premium		O.11				
EAGF	Coupled Direct Payments	CIS(32)	DP13_E12_CISM_16 - Foieched bull support		O.11				
EAGF	Coupled Direct Payments	CIS(32)	DP14_E13_CISD_16 - Aid for the rearing of dairy cows		O.11				
EAGF	Coupled Direct Payments	CIS(32)	DP15_E14_CISG_16 - Aid for the production of grain protein feed crops		O.10				
EAGF	Coupled Direct Payments	CIS(32)	DP16_E15_CISP_16 - Aid for the production of coarse protein forage		O.10				
EAGF	Sectoral - Fruit and Vegetables	INVRE(47(1)(a))	SC28_E01_FVI_47 - Investments, research and experimental and innovative production methods and other activities – fruit and vegetables		O.35				
EAGF	Sectoral - Fruit and Vegetables	ADV11(47(1)(b))	SC11_A03_FVA_47 - Advisory services and technical assistance — fruit and vegetables		O.35				
EAGF	Sectoral - Fruit and Vegetables	TRAINCO(47(1)(c))	SC12_A04_FVT_47 - training, including coaching and exchange of best practices — fruit and vegetables		O.35				
EAGF	Sectoral - Fruit and Vegetables	ORGAN(47(1)(d))	SC13_G01_FVO_47 - organic or integrated production — Vegetable fruit		O.35				
EAGF	Sectoral - Fruit and Vegetables	TRANS(47(1)(e))	SC14_B01_FVE_47 - increasing the sustainability and efficiency of transport and storage of products — fruit and vegetables		O.35				
EAGF	Sectoral - Fruit and Vegetables	PROMO(47(1)(f))	SC15_E10_FVP_47 - promotion, communication and marketing — fruit and vegetables		O.35				

EAGF	Sectoral - Fruit and Vegetables	QUAL(47(1)(g))	SC16_E11_FVQ_47 - use of EU and national quality schemes		O.35				
EAGF	Sectoral - Fruit and Vegetables	TRACE(47(1)(h))	SC17_E12_FVC_47 - application of traceability and certification schemes — fruit and vegetables		O.35				
EAGF	Sectoral - Fruit and Vegetables	CLIMA(47(1)(i))	SC18_G02_FVL_47 - climate change mitigation and adaptation measures — fruit and vegetables		O.35				
EAGF	Sectoral - Fruit and Vegetables	SETUP(47(2)(a))	SC19_I01_FVF_47 - mutual funds — fruit and vegetables		O.35				
EAGF	Sectoral - Fruit and Vegetables	INVVO(47(2)(b))	SC20_I02_FVV_47 - investments to improve the management and joint storage of quantities placed on the market — fruit and vegetables		O.35				
EAGF	Sectoral - Fruit and Vegetables	STORE(47(2)(c))	SC21_I03_FVS_47 - joint storage of products, including, where necessary, the collective processing of products — fruit and vegetables		O.35				
EAGF	Sectoral - Fruit and Vegetables	ORCHA(47(2)(d))	SC22_I04_FVR_47 - replanting of orchards — fruit and vegetables		O.35				
EAGF	Sectoral - Fruit and Vegetables	WITHD(47(2)(f))	SC23_I05_FVW_47 - withdrawals for free distribution or other destinations — fruit and vegetables		O.35				
EAGF	Sectoral - Fruit and Vegetables	GREEN(47(2)(g))	SC24_I06_FVG_47 - green harvesting — fruit and vegetables		O.35				
EAGF	Sectoral - Fruit and Vegetables	NOHAR(47(2)(h))	SC25_I07_FVN_47 - non-harvesting — fruit and vegetables		O.35				
EAGF	Sectoral - Fruit and Vegetables	HARIN(47(2)(i))	SC26_I08_FVH_47 - harvest and production insurance — fruit and vegetables		O.35				
EAGF	Sectoral - Fruit and Vegetables	COACH(47(2)(j))	SC29_I10_FVC_47 - personalised advice – fruit and vegetables		O.35				
EAGF	Sectoral - Fruit and Vegetables	COMM(47(2)(l))	SC27_I09_FVM_47 - communication activities to raise awareness and inform consumers — fruit and vegetables		O.35				
EAGF	Sectoral - Apiculture products	ADVIBES(55(1)(a))	SC02_A01_BEA_55 - Apiculture knowledge transfer and technical assistance		O.37				

EAGF	Sectoral - Apiculture products	INVAPI(55(1)(b))	SC03_E02_BEI_55 - Improving the competitiveness of the apiculture sector		O.37				
EAGF	Sectoral - Apiculture products	PROMOBEES(55(1)(f))	SC01_A02_BEM_55 - Beekeeping marketing		O.37				
EAGF	Sectoral - Wine	RESTRVINEY(58(1)(a))	SC05_E04_WIR_58 - Aid for restructuring and conversion of vineyards		O.36				
EAGF	Sectoral - Wine	INWINE(58(1)(b))	SC06_E05_WII_58 - Investments in tangible and intangible assets in the wine sector		O.36				
EAGF	Sectoral - Wine	GREENWINE(58(1)(c))	SC07_E06_WIG_58 - Support for green harvesting in the wine sector		O.36				
EAGF	Sectoral - Wine	INOVWINE(58(1)(e))	SC04_A01_WIIN_58 - INOVWINE – Innovative investments in the wine sector		O.36				
EAGF	Sectoral - Wine	ADVWINE(58(1)(f))	SC30a_A02_WIA_58 - Advisory services in the wine sector		O.36				
EAGF	Sectoral - Wine	DISTIL(58(1)(g))	SC08_E07_WID_58 - Distillation of wine by-products		O.36				
EAGF	Sectoral - Wine	INFOR(58(1)(h))	SC09_E08_WIN_58 - Promotion in the internal market in the wine sector		O.36				
EAGF	Sectoral - Wine	ACTREPUT(58(1)(i))	SC30b_E10_WIT_58 - Enhancing the reputation of EU vineyards by promoting wine tourism by recognised interbranch organisations		O.36				
EAGF	Sectoral - Wine	ACTMKTKNOW(58(1)(j))	SC30c_E11_WIM_58 - Improving market knowledge by recognised interbranch organisations in the wine sector		O.36				
EAGF	Sectoral - Wine	PROMOWINE(58(1)(k))	SC10_E09_WIP_58 - Promotion in the wine sector in third countries		O.36				
EAFRD	Rural Development	ENVCLIM(70)	RD19_G01_AEC_70 - Agricultural environmental management payments (AKG)	It does fully	O.14	No	Yes	Yes	No
EAFRD	Rural Development	ENVCLIM(70)	RD19a_G01_AEC_70 - AGRI-environmental management payments (AKG)	No inclusion	O.14	No	Yes	Yes	No

EAFRD	Rural Development	ENVCLIM(70)	RD20_G02_ORT_70 - Support to organic farming	It does fully	O.17	No	Yes	Yes	No
EAFRD	Rural Development	ENVCLIM(70)	RD20a_G02_ORT_70 - Support for organic farming	No inclusion	O.17	No	Yes	Yes	No

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.4 Share of utilised agricultural area (UAA) covered by income support and subject to conditionality

R.6 Percentage of additional direct payments per hectare for eligible farms below average farm size (compared to average)

R.7 Percentage of additional support per hectare in areas with higher needs (compared to average)

5 Specific design, requirements and eligibility conditions of the intervention

Description

Basic income support for sustainability is the primary pillar of a direct support scheme to ensure income security for farmers. An intervention in support of the SO1 specific objective, which does not include any specific targeting either from a territorial or from an activity point of view, is the status of active farmer which restricts the range of potential beneficiaries.

The intervention is announced with a single unit value, which represents the same amount per hectare for all producers. Territorial differentiation is not applied.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary, the area and, when applicable, other relevant obligations

The basic payment shall be granted to active farmers who:

- Has an eligible area of at least one hectare;
- Submitted an aid application for the eligible land;
- As a land user on the last day of the deadline for submitting aid applications in respect of the area claimed;

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Range and amounts of support

Description

The intervention is announced with a single unit value, which represents the same amount per hectare for all producers. Territorial differentiation is not applied.

8 Additional questions/information specific to the Type of Intervention

Is this BIS intervention a Payments for small farmers? (Art. 28)

☐ Yes ☒ No

Territorialisation (Art. 22(2))

☐ Yes ☒ No

9 WTO compliance

Green Box

Paragraph 5 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 5 of Annex II.

11 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Planned Unit Amount	Region(s)	Result Indicator(s)
DP01_O04_U01_HA - Specific amount of basic income support for sustainability	Uniform		R.4; R.6; R.7

Explanation and Justification (including the flexibility)

DP01_O04_U01_HA - Specific amount of basic income support for sustainability

The aim of the basic payment is to provide farmers with a minimum basic income that can contribute to improving the quality of life in rural areas through income security and strengthening the rural population's capacity to retain it. The lack of agricultural income compared to the average of the national economy was also revealed by the SWOT analysis, so the identification of the needs clearly confirms the legitimacy of this support.

Methodology for determining the BISS framework and the specific value

The BISS annual envelope is EUR 735.4 million in the plan, representing 54.7 % of the direct support envelope after the transfer. BISS is thus the largest source of direct support.

The basic payment (BISS) is an intervention that contributes to the specific objective SO1 and is the primary pillar of the direct support scheme to provide farmers with income security. It aims to provide farmers with a minimum income that can contribute to improving the quality of life in rural areas through income security and strengthening the rural population's retention capacity.

The lack of agricultural income compared to the average of the national economy was also revealed by the SWOT analysis, so the identification of the needs clearly confirms the legitimacy of this support.

Relevant weaknesses of SO1 SWOT

Gy.1. Lower than average agricultural income [SO1/1.1]

Gy.2. Strong income volatility in several agricultural sectors (e.g. certain fruit and vegetables, pig fattening, bull fattening, etc.) [SO1/1.1] [SO1/1.2] [SO1/2.3].

Gy.3. Strong dependence on direct subsidies for the profitability of agricultural enterprises, in particular small farms and certain sectors

Gy.4. High production costs and poor efficiency in the EU comparison

Figure 1: Evolution of agricultural labour income compared to average wage in Hungary

Source: AKI calculation based on Eurostat data

Figure1 shows that, in the 5-6 years following Hungary's accession to the EU, agricultural incomes have converged to average wages at the national level, but the gap has not narrowed further since 2014. This supports the need for a substantial part of the direct farmer's income support to continue to be paid to all farmers.

Figure 2 also shows the proportion of farms operating at a loss in the absence of direct subsidies per direction of production.

2.Proportion of loss of agricultural holdings in Hungary, production direction according to (2019)

Source: Calculations based on the database of a test run system

Identified needs

1.1.1	Predictable basic income for farmers
1.1.2	Provision of available loan financing
1.2.1	Tackling adverse climatic events and damage caused by climate change in agriculture
1.2.3	Offsetting and mitigating market risks

1.1.3	
Improving the profitability of small farms	

In Hungary, the objective of determining the value of the BISS support is to increase the profitability of agricultural activity to an acceptable level. Based on the calculations made in the 2020 test run (FADN) database, net value added without BISS would be less than 15 % of the gross turnover excluding direct grants in 29 % of the testing facilities. These holdings use 21 % of agricultural land, have over 36 % of livestock and employ 23 % of the agricultural labour force expressed in annual work units. In addition to ~EUR 117/ha BISS, the share of such holdings (which are also loss-making on the basis of net value added) can be reduced to 7 %, their territorial share to 5 % and their share in livestock and agricultural labour to 4 % and 3 % respectively. This clearly shows the importance of BISS in the support system and thus in ensuring food supplies, which must be given greater priority than ever because of the Russian-Ukrainian conflict.

Analysis of the risk of loss of funds through variance

For the basic payment, outputs can be planned with high certainty (see table below), given that they overlap to a large extent with SAPS areas for 2015-2022. As of 2023, the definition of eligible hectare will be expanded, which is expected to result in a minimal increase in the eligible area.

	Approved area (ha)					
<u>Measure</u>	2015	2016	2017	2018	2019	2020
SAPS	4 832 920	4 819 322	4 875 131	4 905 681	4 917 305	4 929 510
Support for small farmers	109 579	82 725	59 554	45 990	38 773	34 143
Total*	4 942 498	4 902 047	4 934 685	4 951 671	4 956 078	4 963 652

*: As of 2023, this value corresponds to the potential BISS area

Indeed, the expansion of eligible areas alone does not require a 30 % variance. It is relevant for planning with existing financial flexibility for direct aids (*Article 101 of Regulation (EU) 2021/2115*). The high variance was therefore essentially intended to maximise the use of funds by acting as a safety net among the direct aid schemes. Therefore, planning uncertainty does not appear in the BISS, but it is all the more capable of providing a solution.

A wider variance could be useful in the following potential cases:

1. Under the *neweco-schemes* scheme, which is difficult to plan, there are far fewer producers than expected. In this case, either the unit value may be above the maximum and the learning period can make use of unused funds to be transferred to BISS (*Article 101 of Regulation (EU) 2021/2115*). In order to ensure that the additional resource does not increase the specific value of BISS above the maximum (also causing a risk of loss of funds), it is

necessary to set a sufficiently high maximum.

2. Otherwise, i.e. if eco -*schemes applied* for much more farmers than expected, the unit value would fall to the minimum or even below. If the aim is to recognise environmental and climate-beneficial practices and pledges, it may be necessary to reallocate additional resources. Otherwise, farmers' motivation to participate in the scheme may be reduced in the following years.

In addition to a specific value of EUR 157,94/ha, the minimum and maximum values of $\pm 15\%$ have been determined on the basis of these considerations.

12 Planned Unit Amounts - Financial table with outputs

Planned Unit Amount	Financial Year	2024	2025	2026	2027	2028	Total 2024 - 2028
	Calendar Year	2023	2024	2025	2026	2027	Total 2023 - 2027

1.1.2	Provision of available loan financing	2	Partially
1.1.3.	Improving the profitability of small farms	2	Yes
1.2.1	Tackling adverse climatic events and damage caused by climate change in agriculture	1	Yes
1.2.3	Offsetting and mitigating the impact of market risks	2	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.4 Share of utilised agricultural area (UAA) covered by income support and subject to conditionality

R.6 Percentage of additional direct payments per hectare for eligible farms below average farm size (compared to average)

R.7 Percentage of additional support per hectare in areas with higher needs (compared to average)

5 Specific design, requirements and eligibility conditions of the intervention

Description

The aim of the redistributive aid is to provide additional support for the first hectares of small and medium-sized farms, recognising their difficulties and disadvantages due to their size and at the same time providing them with an expected level of income. This need is clearly identified among the needs arising from SWOT.

Policy decisions on the Hungarian model will result in a more targeted direct support scheme. A much stronger income shift towards small and medium-sized farms compared to 2015-2022 (14 % compared to 3 % in 2020). The reallocation of funds towards small and medium-sized farms, including a fairer distribution of direct payments from 2023, will be facilitated by applying the complementary redistributive income support for sustainability (CRISS) instead of the support for small farmers (former SFS) and degression/capping. We therefore expect the aid scheme to be simplified.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary, the area and, when applicable, other relevant obligations

An active farmer who is entitled to the basic payment (BISS) is eligible for a redistributive payment, given that the payment is based on the amount of the basic payment. Accordingly, the eligibility criteria are the same as for the basic payment:

- Has an eligible area of at least one hectare;
- Submitted an aid application for the eligible land;
- As a land user on the last day of the deadline for submitting aid applications in respect of the area claimed;

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Range and amounts of support

Description

The intervention is introduced in two steps with two uniform specific values. 14 % of the direct support envelope is allocated to the intervention. Beneficiaries of the redistributive payment may receive aid of EUR 80 for their first 10 hectares and EUR 40 for their area between 10 and 150 hectares. In order to strengthen the redistributive effect, only farmers with an area of up to 1200 hectares are eligible for the payment. In the spirit of the capping rules applied in Hungary for the period 2015-2022, noting that Hungary waives the application of degression and capping from 2023, holdings above 1200 hectares will not receive redistributive support for their first hectares.

Territorial differentiation is not applied.

8 Additional questions/information specific to the Type of Intervention

Do you apply the territorialisation for the CRISS?

☐ Yes ☒ No

Do you apply different amounts for different ranges of hectares? (Art. 29(3))

☒ Yes ☐ No

If yes, what are the ranges of hectares? (Art. 29(3))

Amounts	
40.00	10.00 ha to 150.00 ha
80.00	1.00 ha to 10.00 ha

What is the maximum number of hectares per farmer to which CRIS is paid? (Art. 29(3))

150.00

-Do you exclude farm holdings from CRIS on the basis of their physical size?

☒ Yes ☐ No

In the spirit of the capping rules applied in Hungary in 2015-2022, noting that Hungary waives the application of degression and capping from 2023, farms above 1 200 hectares do not receive any redistributive support for their first hectares either. This also improves the targeting of the intervention.

- Additional rules and/or explanations related to CRIS

9 *WTO compliance*

Green Box

Paragraph 5 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 5 of Annex II.

DP02_O07_U01_HA - Complementary redistributive income support for sustainability specific amount 1	Uniform		R.4; R.6; R.7
DP02_O07_U02_HA - Specific amount of complementary redistributive income support for sustainability 2	Uniform		R.4; R.6; R.7

Explanation and Justification (including the flexibility)

DP02_O07_U01_HA - Complementary redistributive income support for sustainability specific amount 1

Band 1: 1-10 hectares

- The average farm size of the farms receiving direct support was ~30 hectares on the basis of the single applications in 2020.
- The Hungarian farm structure shows that there are more than 104000 small farmers with an area of 10 or less, covering some 416 000 hectares together, among the farms receiving direct support. They account for 62 % of farmers applying for direct payments and more than 8 % of the eligible area.
- This farm size is very sensitive, has low bargaining power and is therefore more exposed to market disturbances (e.g. price volatility) than to medium and large farms. Due to their specific situation, their differentiated treatment is justified, even in the context of redistributive aid.
- The 10 hectares are in line with GAEC 7. (crop rotation) and 8. (non-productive features) may be granted with a size limit of exemptions, which reinforces synergies between the different elements of the plan. This also justifies the fact that the first bracket targets the higher specific amount for the first 10 hectares rather than the average holding size.
- In order to mitigate the disproportionate shift in the level of support between categories (threshold effect), holdings between 10 and 1 200 hectares would also be eligible for increased specific support for their first 10 hectares.

Substantiation of the degree of variance:

The redistributive aid has not yet been applied by Hungary. Accordingly, there is insufficient experience either on the implementation side or on the producer side. At the same time, the application data of previous years, including the size of the agricultural area for which payments are made under the Single Area Payment Scheme (SAPS), provide a relatively accurate estimate of the expected beneficiaries.

The 30 % variance is relevant for planning with existing financial flexibility for direct aids (*Article 101 of Regulation (EU) 2021/2115*). According to the Commission's view, the high variance is essentially intended to facilitate the maximum absorption of funds, given that, regardless of the number of aid beneficiaries and the additional potential effects, as detailed below, the minimum spending rate of 10 % provided for in Article 98 (14 % for Hungary) can be met without the need to reallocate funds from other interventions during the year.

For CRISS, we identified the following as a risk factor:

- Changes affecting the number of eligible holdings which do not fall under the category of artificial creation of conditions (e.g. a retiring farmer divides his area between his three sons in equal instalments, which the young people then have individually, or starting from activities with completely different profiles). This will have a downward effect on the specific value.

- Rescheduling relating to the expiry of land lease contracts. Given that land lease contracts are private-law contracts, there is no information on the proportion of contracts with maturities and, consequently, we do not know in advance how much of the land is affected per year. As evidenced by the SWOT analysis on SO1, there is a significant number of leased land managers in Hungary, although it is a fact that the share of rented land typically increases in combination with farm size. (*See table below*). However, 50.5 % in the category between 5 and 150 hectares is already very high, taking into account that a significant part of the redistributive payment (the higher unit value out of the two proposed steps) goes to these hectares.

E.g.: The land lease agreement for an area of 150 hectares expires. In the absence of a simple contract extension, it is not possible to predict whether the area will increase the size of another farm from the next period or whether additional producers will receive leased land, resulting in 8-10 smaller farms. This can be considered as a significant planning risk at national level.

Share of rented agricultural land by holding size in Hungary, 2010-2020

Size class (ha)	2010 (%)	2013 (%)	2016 (%)	2020 (%)
&=1	0,1	0,1	0,1	0,1
1 <=5	22,2	18,7	17,5	19,6

Source: Based on (2010), GSZÖ (2013, 2016) and AgricenZus (2020), AKI calculations

In addition to the two specific values indicated in the plan, the minimum and maximum values of ± 30 % have been established on the basis of such considerations. On the basis of the experience gained during the implementation of the plan, the band could be reduced, but, according to our knowledge, this guarantee is necessary for the smooth implementation of the scheme.

DP02_O07_U02_HA - Specific amount of complementary redistributive income support for sustainability 2

Band 2: 10-150 ha

- The purpose of the redistributive support is to reallocate funds to small and medium-sized farms in accordance with Article 29(2) of the Strategic Plan Regulation.
- The design of Lot 2 aims to:
 - o Mitigating the disproportionate shift in the level of aid between categories (*'threshold effect'*).
 - o The viable commodity-producing family farms are not disproportionately disadvantaged as a result of the compulsory transfer of resources and therefore this band aims to minimise losses. From 2023, the unit value of BISS, which replaces SAPS and greening, will decrease by around 30 %. This shortfall may

prove critical for a category of holdings that was not in any way affected by the achievement of the fairer resource allocation target between 2015 and 2022 (small farmers support or degression/capping).

- Hungary has made considerable efforts over the last decade to strengthen medium-sized family farms, so keeping these families in rural areas and helping them to manage them and livelihoods is our political priority. However, since the handicaps mentioned for small farms are less pronounced here, the unit premium is half the amount applied in the first stage.

Substantiation of the degree of variance:

The redistributive aid has not yet been applied by Hungary. Accordingly, there is insufficient experience either on the implementation side or on the producer side. At the same time, the application data of previous years, including the size of the agricultural area for which payments are made under the Single Area Payment Scheme (SAPS), provide a relatively accurate estimate of the expected beneficiaries.

The 30 % variance is relevant for planning with existing financial flexibility for direct aids (*Article 101 of Regulation (EU) 2021/2115*). According to the Commission's view, the high variance is essentially intended to facilitate the maximum absorption of funds, given that, regardless of the number of aid beneficiaries and the additional potential effects, as detailed below, the minimum spending rate of 10 % provided for in Article 98 (14 % for Hungary) can be met without the need to reallocate funds from other interventions during the year.

For CRISS, we identified the following as a risk factor:

- Changes affecting the number of eligible holdings which do not fall under the category of artificial creation of conditions (e.g. a retiring farmer divides his area between his three sons in equal instalments, which the young people then have individually, or starting from activities with completely different profiles). This will have a downward effect on the specific value.
- Rescheduling relating to the expiry of land lease contracts. Given that land lease contracts are private-law contracts, there is no information on the proportion of contracts with maturities and, consequently, we do not know in advance how much of the land is affected per year. As evidenced by the SWOT analysis on SO1, there is a significant number of leased land managers in Hungary, although it is a fact that the share of rented land typically increases in combination with farm size. (*See table below*). RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of

this intervention are displayed in bold
R.36 Number of young farmers benefitting from setting up with support from the CAP, including a gender breakdown
R.37 New jobs supported in CAP projects
R.4 Share of utilised agricultural area (UAA) covered by income support and subject to conditionality
R.6 Percentage of additional direct payments per hectare for eligible farms below average farm size (compared to average)
R.7 Percentage of additional support per hectare in areas with higher needs (compared to average)

5 Specific design, requirements and eligibility conditions of the intervention

Description

Pillar I support for young farmers is intended to facilitate the setting-up of young farmers, given the high costs associated with setting up and the low creditworthiness of start-up farms. By broadening eligibility criteria, the intervention will have a stronger incentive for potential beneficiaries, thus improving the EU's objective of promoting generational renewal. In Pillar I, the financial resources, the specific amount of support and the territorial ceiling are also substantially increased, reflecting Hungary's greater commitment than hitherto.

Demographic background:

- Based on the data available since 2010, it can be concluded that the number of new entrants and, consequently, the number of farmers under the age of 40 is gradually decreasing, while this number has fallen to a historical low in 2019. New entrants (4193 companies and individuals) accounted for 2.5 % of the total number of applicants, while 1528 of these were under 40 years old, or less than 1 % of the total population.
- With regard to area data, it can be seen that there has been a significant decrease in the size of new entrants, representing 1.3 % of the total eligible area in 2019, compared to 0.4 % for start-up agricultural enterprises under the age of 40.
- However, the most important finding is that the “demographic reserve” seems to be exhausted, with a substantial decrease in the number of applicants and the area declared by 2020, which may continue in the coming years.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary, the area and, when applicable, other relevant obligations

A young farmer shall be entitled to the complementary income support if he is entitled to the basic payment, given that the payment is allocated to the amount of the basic payment. Accordingly, some of the eligibility criteria are identical to the eligibility criteria for the basic payment.

Specific eligibility criteria:

- On the last day of the period for submitting the single application without penalty, the applicant is at least 18 years old and no more than 40 years old, A young farmer as defined in Chapter 2;
- The aid can be claimed for a maximum period of 5 years;
- The aid may be claimed annually by a young farmer or by one or more legal persons under the effective and long-term control of the young farmer in the context of the single application;
- A farmer submitting an application for the first time for the basic payment shall declare that he started an agricultural activity at the earliest shortly before the application was submitted;
- The support area shall not exceed 300 hectares;
- Be qualified in agriculture or forestry, as laid down in the relevant national legislation. The qualification standard may be replaced by a minimum of 2 years of relevant agricultural professional experience;
- Young farmers who entered before 2023 but have not yet completed the 5 year period (‘young transitional farmers’) can continue to apply for the remaining years, but will already be entitled to the new specific amounts;

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Range and amounts of support

Description

The intervention is announced with a single unit value, which represents the same amount per hectare for all producers. Territorial differentiation is not applied.

8 Additional questions/information specific to the Type of Intervention

The intervention gives support to young farmers for how many years? **5**

What are the conditions applied for the definition of newly setting-up?

The start of the agricultural activity shall be deemed to be the date on which the young farmer applying for the payment (in the case of a legal person at the earliest the young farmer exercising effective and long-term control in the legal person or any legal person under the effective and long-term control of the young farmer) has submitted an application for a basic payment for the first time.

First submission as the date on which the agricultural activity begins – Reason

1. The start-up of an agricultural activity which is not covered by direct aids may not be established or is subject to a high administrative burden.

According to the Hungarian plans, support for young farmers may also be granted to natural persons and legal persons. As the two groups of applicants have different legal backgrounds, the starting date of the agricultural activity can be monitored in different ways by administrative means.

·For **natural persons**, there is no need for an authorisation to carry out a minimum agricultural activity, there is no obligation to notify. Nor do you need to register with the Paying Agency until you submit an aid application. In the case of natural persons, it is therefore not possible to distinguish precisely when the applicant first carried out pet farm work in the context of ancillary or hobby activities and when this became a commercial activity. However, as soon as land use is linked to the activity, economic interests dictate the use of direct support schemes, in particular the basic payment, the redistributive payment and the young farmer's payment, in order to make his business effective. It is important that, unlike the system based on payment entitlements, the Hungarian BISS support is similar to the current SAPS system, so that all agricultural land may be eligible for aid and no entitlements are required. It is therefore legitimate to presume that those who have land at their disposal will also be eligible for the aid scheme.

·**In the case of legal persons**, business start-up can be administratively monitored and accurately documented (e.g. setting up a company), but public databases do not record when agricultural activity is carried out for the first time in the context of a commercial activity. The establishment of a firm does not, therefore, in itself mean when actual production will actually take place after its establishment, in particular if the company's objectives include both agricultural and non-agricultural activities.

2. Initial financial situation of young farmers

The main reason for joint efforts at EU level to promote generational renewal is the ageing farming community and the fact that farmers who start farming are at a significant disadvantage compared to their competitors. Young farmers start up with high start-up costs (access to land, start-up costs, purchase of machinery, buildings, heavier credit conditions). This is precisely why the Common Agricultural Policy helps them in the early stages of farming. When considered on an economic basis, it is therefore

unrealistic for a young farmer to start his activity without the basic payment (BISS), the redistributive payment (CRISS) and the young farmer's additional payment. This would simply be contrary to its economic interests and even an obligation to declare land use. According to the Hungarian plans submitted, for a small area of land up to EUR 370 per hectare can be used for these three easy-to-apply titles.

3. Arguments relating to “young farmers in transition”

We intend to make use of the possibility provided for in the second paragraph of Article 30(2) of the Strategic Plan Regulation, and producers applying for the young farmer's support before 2023 will continue to be eligible for the payment, now with the higher specific amount and up to a higher area. In order both to protect legal certainty and to reduce the administrative burden, it is logical to make the two groups of beneficiaries subject to the same conditions.

4. Amended proposal for eligibility for young farmers' start-up aid

The Paying Agency is able to verify, by means of a simple administrative check, whether or not the producer who submitted the application has made an application.

It is on the basis of the arguments and considerations presented here that it was decided to consider the first submission of the single application as the beginning of the substantive agricultural activity. However, while partially accepting the Commission's argument, we incorporate a declaration step in the application process in which the farmer is aware of his legal liability as to the starting date of his agricultural activity. This should exclude cases where a young farmer has already carried out a certain level of agricultural activity before submitting his first area-based direct aid application and, where appropriate, can no longer qualify as a start-up farm. It should be noted that, on the basis of the arguments described above, these cases are more theoretically likely.

That said, it can be assumed that young farmers who started their activity before 2023 entered the scheme at the latest in application year 2022.

It is important to note here that the requirement of ‘*newset up*’ is also included in the current system in the form of ‘*which is setup for the first time*’ (Article 50(2) of Regulation (EU) No 1307/2013), which, in our view, has a similar meaning. In this respect, the Commission has repeatedly explained that the submission of a single application should be considered as the start of the activity^[1]. It is also important to see that Article 30(3) of the Regulation envisages the granting of a five-year premium for the first submission of an application. Recital 61 states that ‘*That type of intervention should provide young farmers with additional income support after the initial setting-up. (...) Since it should only cover the initial period of the life of the business, such payment should be granted for a maximum duration after the submission of aid application and shortly after the initial setting-up.*’

In the case of Hungary, on the basis of the above, it is reasonable to assume that the ‘*initial setting up*’ and the first submission coincide, or that the time between them is in fact short. **To be confirmed, the producer shall make a legal declaration.** The legal declaration shall be accepted by the Paying Agency until the opposite fact becomes in its possession, e.g. after an administrative cross-check with existing databases has been carried out.

What form the support does take: **an annual decoupled payment per eligible hectare**

What is the amount of aid per hectare/lump-sum? **157**

Do you set a maximum in terms of number of ha? Y/N

☒ Yes ☐ No

If yes, what is the maximum number of ha? **300**

Other comments on thresholds?

Act CXXII of 2013 on the circulation of agricultural and forestry land has been in force in Hungary since 2013. Section 16(1) of Act CXXII states that *'the farmer and the person acquiring the land in the manner specified in Section 10(3) and (3a) may acquire ownership of the land up to a maximum of 300 hectares (land acquisition limit) by taking into account the size of the land already owned and in the usufruct.'*

The Hungarian legal environment therefore provided for a maximum holding of 300 hectares for all private farmers. In the period from 2015 onwards, the limit of 90 hectares, set by EU law, was below the size limit laid down in the Hungarian legislation. At the same time, Article 30(3) of Regulation (EU) 2021/2115 has resulted in substantial facilitation in the area of the establishment of a tenure border.

In the light of national considerations, during the planning preparation and the assessment of needs, it was clear that increasing the 90-hectare size limit would help young farmers. As a result, adapting to the domestic regulatory environment is an appropriate response to address needs and, as a result, young farmers can be assisted by targeted support for the maximum total land they can own.

Another argument in favour of introducing a limit of 300 hectares is that, in the absence of an area limit, planning would have become more difficult. A lower limit could have been an incentive to artificially split up holdings.

According to the preliminary calculations, an increase in the size limit could also substantially increase the size of the eligible area. The impact of the increase in the size limit can be illustrated on the basis of the latest available 2020 data. Based on the approved data, it can be seen that the eligible area (145 thousand hectares) would have increased by 13.5 % (19 500 ha), which would have benefited one in two legal persons.

When assessing the situation in the sector and identifying the needs, it was clear that a planned size of more than 90 hectares could lead to a more viable and socially and environmentally sustainable farming environment.

Do you apply a continuity with the previous scheme (Young Farmer Payment)?

Yes. Young farmers who entered before 2023 but have not yet completed the 5-year period ("young farmers in transition") may continue to apply for the aid in the remaining years, but will be eligible for the new, more favourable specific amount. The new, more favourable conditions include an increase of the area ceiling from 90 to 300 hectares. In addition, the minimum qualification requirement under the new conditions must of course also be met.

Other comments

No further comment.

9 WTO compliance

Green Box

Paragraph 5 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 5 of Annex II.

11 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Planned Unit Amount	Region(s)	Result Indicator(s)
DP03_O06_U01_HA - Specific amount of complementary income support for young farmers	Uniform		R.36; R.37; R.4; R.6; R.7

Explanation and Justification (including the flexibility)

DP03_O06_U01_HA - Specific amount of complementary income support for young farmers

The SWOT analysis, as well as the discussions with stakeholders, have made it clear that visible negative developments require a significant increase in efforts so far. Therefore, as of 2023, there will also be a substantial expansion for the dedicated resources, the specific amount or the territorial limit. The financial envelope of Pillar I is almost 1.5 times higher, the territorial limit is increased from 90 to 300 hectares and the specific amount is increased from EUR 67 to EUR 157,33.

The significant increase is justified by the high start-up costs for young farmers (access to land, start-up costs, more difficult credit conditions) when starting their agricultural activity.

The planning of the intervention is complicated by the uncertainty as to the overall demographic specificities of producers. It is possible to plan and estimate with good precision the proportion of farmers currently receiving support to participate in the measures in the coming years. At the same time, the number of entrants and the size of the area they cultivate as of 2023 is particularly difficult to estimate, taking into account the demographic effects.

While the measures listed in chapter 3.2 of the Strategic Plan offer a number of opportunities to achieve success in the context of social renewal, careful planning following reality has become necessary in order to avoid loss of resources, increase the effectiveness of the measure and achieve the CAP objectives. This makes it necessary to define a wide range for the specific aid amount.

In general, farm managers in the EU and Hungary tend to be predominantly men and relatively old. Only one in ten (9.5 %) managers were young farmers under 40 years old and they farmed 16.9 % of the area managed by individuals at EU level. The Hungarian ratios are slightly more favourable: 13.4 % of farmers were under 40 years old and they managed 23.1 % of the area cultivated by private individuals. (Eurostat, 2018^[1])

^[1] Eurostat (2018): Farmers and the agricultural labour force – statistics

Table 1: Age distribution of producers, 2016

	Under 40 years	Over 40	share of people under 40

Utilised agricultural area, hectares			
EU	3 359 320	19 853 200	16.9 %
HU	141 920	615 430	23.1 %

Source: Based on Eurostat, 2018

On the basis of an analysis of the data of all farmers submitting the single application, the data available since 2010 show a gradual reduction in the number of new entrants on the one hand, and the number of farmers under 40 years of age on the other. As a result of the trend-like process, the number of new entrants fell to a historic low in 2019. New entrants accounted for 2.5 % of the total number of applicants (4193 companies and individuals in 2019), while only 1528 were younger than 40, representing less than 1 % of the total population. (Table 2).

Table 2: Distribution of new entrants 2010-2019

Year of EC administration	New entrants (company+individual)	Less than 40 years old (individual)	Total population	New entrants	Younger than 40 years
	producers, main		producers, thousands of persons	% of total	
2010	6 845	2 467	179,88	3.8 %	1.4 %
2011	7 406	2 867	187,59	3.9 %	1.5 %
2012	9 103	3 338	188,98	4.8 %	1.8 %
2013	10 862	4 096	177,03	6.1 %	2.3 %
2014	7 833	2 688	176,89	4.4 %	1.5 %
2015	10 214	4 223	173,8	5.9 %	2.4 %
2016	8 594	4 823	173,08	5.0 %	2.8 %
2017	6 592	3 516	172,03	3.8 %	2.0 %
2018	4 411	1 761	168,96	2.6 %	1.0 %
2019	4 193	1 528	166,32	2.5 %	0.9 %

Source: Ministry of Agriculture calculation based on data from the Hungarian State Treasury 2020

If we also look at the area data, during the period since 2010 there has been a significant decrease in the area of new entrants, which accounted for 1.3 % of the total eligible area in 2019, compared to 0.4 % for newcomers younger than 40 years old. (Table 3)

Table 3: Area of new entrants 2010-2019

Year of EC administration	New entrants (company+individual) area 1 000 ha	Less than 40 years old (individual)	Total population area million ha	New entrants % of total	Younger than 40 years
2010	90,9	26,0	4,97	1.8 %	0.5 %
2011	100,2	28,2	4,96	2.0 %	0.6 %
2012	118,0	33,0	4,96	2.4 %	0.7 %
2013	109,0	34,8	4,95	2.2 %	0.7 %
2014	155,4	25,4	4,94	3.1 %	0.5 %
2015	165,8	60,7	4,94	3.4 %	1.2 %
2016	116,8	55,1	4,91	2.4 %	1.1 %
2017	85,0	31,7	4,94	1.7 %	0.6 %
2018	56,0	17,5	4,95	1.1 %	0.4 %
2019	65,3	18,3	4,93	1.3 %	0.4 %

Source: Ministry of Agriculture calculation based on data from the Hungarian State Treasury 2020

As regards demographic data in the sector, it can be seen that the number of young farmers is also decreasing and is expected to decrease further as a result of a gradually decreasing trend. During the period, it can be observed that both the number of producers and the area claimed increased gradually, before decreasing significantly in 2020. After the introduction, the number of eligible producers increased, reaching almost 12 thousand in 2019, but already dropped to 9.5 thousand in 2020. It is important that at the start of the scheme, not only farmers starting in 2015 but also the years 2011-2015 were eligible, which explains the initial high number of participants. (Table 4)

Table 4: Application data for young farmers (2015-2020)

Application year	2015	2016	2017	2018	2019	2020
Number of applicants	7 690	10 724	12 558	12 366	14 845	12 114
Area claimed at the end of application, (ha)	165 909	201 604	220 750	212 196	295 136	228 977
Approved application number (number)	6 729	9 509	11 207	10 957	12 002	9 419
Size of approved	144 145	175 216	193 203	186 015	193 561	145 154

area, (ha)

It has gradually increased since the imposition of the measure and subsequently decreased at the end of the investigation period.

In summary, producers who made use of the opportunity at the beginning of the period starting in 2015 are expected to moderately boost potential new entrants. As a result, taking into account the five-year eligibility limit, the “demographic reserve” appears to be exhausted. Following a substantial decline in 2020, this is expected to continue in the outer years. The increase of the specific aid amount and the holding limit is used to dampen this. The planning is therefore subject to uncertainty both in terms of expected outputs and the number of new entrants. In addition, minimum spending rates are set for generational renewal. Planning uncertainties, the risk of loss of funds and the fulfilment of the minimum expenditure ratio justify the ± 50 % deviation set out in the plan.

Eco-scheme(31) - Schemes for the climate, the environment and animal welfare

DP17_G01_ECOS_16 - Agro-ecological programme

Intervention Code (MS)	DP17_G01_ECOS_16
Intervention Name	Agro-ecological programme
Type of Intervention	Eco-scheme(31) - Schemes for the climate, the environment and animal welfare / Art. 31(7)(a) - Additional payment to BIS
Common Output Indicator	O.8. Number of hectares or of livestock units benefitting from eco-schemes

1 Territorial scope and, if relevant, regional dimension

Territorial scope: **National**

Code	Description
HU	Magyarország

Description of the Territorial Scope

The area under which the intervention is implemented is Hungary.

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO1 Support viable farm income and resilience of the agricultural sector across the Union in order to enhance long-term food security and agricultural diversity as well as to ensure the economic sustainability of agricultural production in the Union

SO4 Contribute to climate change mitigation and adaptation, including by reducing greenhouse gas emission and enhancing carbon sequestration, as well as promote sustainable energy

SO5 Foster sustainable development and efficient management of natural resources such as water, soil and air, including by reducing chemical dependency

SO6 Contribute to halting and reversing biodiversity loss, enhance ecosystem services and preserve habitats and landscapes

CAP AREAS OF ACTION Code + Description

AOA-A climate change mitigation, including reduction of GHG emissions from agricultural practices, as well as maintenance of existing carbon stores and enhancement of carbon sequestration

AOA-D prevention of soil degradation, soil restoration, improvement of soil fertility and of nutrient management [and soil biota]

AOA-E protection of biodiversity, conservation or restoration of habitats or species, including maintenance and creation of landscape features or non-productive areas

AOA-F actions for a sustainable and reduced use of pesticides, particularly pesticides that present a risk for human health or environment

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
1.1.1	Predictable basic income for farmers	2	Yes
4.1.1	Improving the carbon sequestration capacity of soils and ecosystems	1	Yes
4.4.2	Review of the use of arable land at the boundary of economics	2	Yes
4.4.3	Improving the water retention capacity of soils and ecosystems by encouraging land-use change	1	Yes
5.1.2	Reducing nutrient losses,	1	Yes

	preventing nutrient leaching		
5.1.3	Restoring degraded soils and improving their water management	1	Yes
5.2.1	Sustainable use of surface and groundwater	1.	Yes
5.3.1	Promoting water retention in soil and landscape	1	Yes
5.4.1	Reducing emissions of air pollutants and particulate matter of agricultural origin	3	Yes
5.4.2	Reducing ammonia emissions from agriculture	2	Yes
5.5.2	Integrated environmentally friendly pest management	1	Yes
6.1.3	Maintenance and development of grasslands in good ecological status and species richness	2	Yes
6.2.3	Ensuring ecological interoperability and biodiversity between cultivated areas by means of intermediate zones	1	Yes
6.4.1	Developing up-to-date data collection and monitoring systems for measuring biodiversity	1	Partially

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.12 Share of utilised agricultural area (UAA) under supported commitments to improve climate adaptation

R.14 Share of utilised agricultural area (UAA) under supported commitments to reduce emissions or to maintain or enhance carbon storage (including permanent grassland, permanent crops with permanent green cover, agricultural land in wetland and peatland)

R.19 Share of utilised agricultural area (UAA) under supported commitments beneficial for soil management to improve soil quality and biota (such as reducing tillage, soil cover with crops, crop rotation included with leguminous crops)

R.20 Share of utilised agricultural area (UAA) under supported commitments to reduce ammonia emission

R.21 Share of utilised agricultural area (UAA) under supported commitments for the quality of water bodies

R.22 Share of utilised agricultural area (UAA) under supported commitments related to improved nutrient management

R.23 Share of utilised agricultural area (UAA) under supported commitments to improve water balance

R.24 Share of Utilised Agricultural Area (UAA) under supported specific commitments which lead to a sustainable use of pesticides in order to reduce risks and impacts of pesticides, such as pesticides leakage

R.31 Share of utilised agricultural area (UAA) under supported commitments for supporting biodiversity conservation or restoration including high-nature-value farming practices

R.34 Share of utilised agricultural area (UAA) under supported commitments for managing landscape features, including hedgerows and trees

R.4 Share of utilised agricultural area (UAA) covered by income support and subject to conditionality

R.6 Percentage of additional direct payments per hectare for eligible farms below average farm size (compared to average)

R.7 Percentage of additional support per hectare in areas with higher needs (compared to average)

5 Specific design, requirements and eligibility conditions of the intervention

Description

Description of the intervention:

Under the basic agro-ecological scheme, farmers may receive a lump sum per hectare payment per year as a complementary payment to the basic income support pursuant to Article 31(7)(a) of Regulation (EU)

2021/2115 of the European Parliament and of the Council for voluntary good practices for climate and environmental purposes.

One of the reasons for the choice of the additional form of payment is that, because of its simplicity, a more transparent and comprehensible and predictable system, which is one of our priorities, can also be seen from the point of view of producers. In addition, the top-up approach, combined with a scoring system, can distinguish between the level of ambition of the pledges, while still being paid with a single unit value to producers.

Based on the positive experience of the so-called greening payment in the period 2014-2021 and the payment for agri-environmental management under the Rural Development Programme, we set out optional requirements that are already known, understandable and environmentally beneficial for farmers. The aim of this well-targeted intervention is to ensure that a relatively large number of farmers can benefit from an environmentally efficient support programme on a relatively large part of agricultural land. In order to ensure that the majority of farmers find the most favourable standard for them, we have formulated optional requirements as a method of exploitation. These standards can be considered as agricultural practices focusing on soil and water protection, biodiversity protection and climate change mitigation, in particular:

- soil protection against erosion;
- protection and improvement of soil structure;
- preserving and improving soil potential;
- protecting and improving soil biodiversity;
- increasing the water retention capacity of soils;
- protecting water quality by reducing alluvial and polluting loads from soil erosion and/or surface runoff;
- protecting water quality by reducing pesticide pollution from agricultural sources;
- sustainable use of water;
- maintaining and increasing the diversity of habitats linked to agricultural land, in particular with regard to habitats, thereby improving the situation of species in unfavourable conservation status and improving the landscape structure;
- reducing fertiliser use, thereby reducing ammonia emissions;
- increasing carbon sequestration of agricultural land;
- sustainable use of pesticides, integrated pest management.

In order to ensure that practices of good weight are implemented, the optional practices have been scored and indicated as a requirement that farmers have to score at least two points per method of exploitation. When selecting scoring values, we have taken into account the fact that possible combinations of individual specifications also have a sufficiently strong environmental benefit.

The support shall be granted on a per hectare basis as a complementary payment to the basic income support, provided that the conditions and best practices chosen are respected.

Description of commitments for eco-scheme

Requirements:

The management of agronomic operations and the provision of data to that effect from all farmers benefiting from support are the basic principles.

For all actual uses within the holding (arable, grassland, special permanent crops, other permanent crops, non-Natura 200 grasslands, Natura 2000 grasslands), a minimum of 2 points must be chosen from among

the agricultural good practices identified.

Where the arable land or non-Natura 2000 grassland of the holding is less than 5 ha or 1 ha in the case of other permanent crops, there is no obligation to make provision for a given type of use, but payment for the area concerned shall not be granted only if the farmer also opts for these areas below the threshold.*

There is no obligation to choose a practice for Natura 2000 sites and special permanent crops, but payment is only granted for the land use category if the farmer also commits to these areas.

Method of exploitation	Optional good practices	Point	Contribution to environmental objectives
Arable land	After summer or autumn-harvest crops, where crops other than autumn sown are followed, provide mulching with cover crops or by leaving the stubble in a cultural state until the start of preparatory work for the following year's spring culture, but at least by 28 February.	1	The practice increases the carbon sequestration capacity of soils by ensuring that the soil surface is covered for as long as possible, while soil cover protects soils from the adverse effects of erosion and helps to preserve soil moisture. Soil cover throughout the winter contributes to ensuring that active substances from plant protection products and nutrients are not drained into water bodies from agricultural land. This is particularly true for areas with varied terrain. As a result, the quality of water bodies is improved. Related specific objective: SO4 and SO5 Related R indicators: R12, R14, R19, R21, R23
	Crop diversification requirements for arable crops: (a) farmers on arable land of 10 hectares or less shall produce at least two different crops on arable land in a given year and, in the case of two crops, the crops grown on the largest area shall not cover more than 80 % of the arable land; (b) at least three half of those with more than 10 hectares of arable land shall be cultivated, in the case of three crops, the crops grown on the largest area shall not cover more than 65 % of the arable land and the crops grown on the two largest areas taken together shall not exceed 80 % of the arable land; (C) where there are more than 30 hectares of arable land, at least four half of the arable land shall be cultivated and, in the case of four crops, the crops grown on	1	The practice contributes to reducing extortion, improving the agricultural area's gross nutrient balance and reducing pesticide use by developing a crop structure with well-diversified crops with different needs. As the number of plant species grown on arable land increases, crop diversification contributes to a more mosaic landscape and thus also to its habitats. In addition to mosaic, crop diversification helps to increase the number and length of field margins. This has a positive impact on the population dynamics of wild species linked to agricultural habitats. Related specific objective: SO5 and SO6 Related R indicators: R 19, R 22, R 24 and R 31

	the largest area shall not cover more than 65 % of the arable land and the crops grown on the two largest areas taken together shall not exceed 80 % of the arable land, provided that the area under the smallest crop shall be 1 ha. (D) At least half of those with more than 300 ha of arable land shall be cultivated and, in the case of five crops, the crops grown on the largest area shall not cover more than 65 % of the arable land and the crops grown on the two largest areas taken together shall not exceed 80 % of the arable land, provided that the area under the smallest crop shall be equal to 1 ha. (e) At least six half of those with more than 1 000 hectares of arable land shall be cultivated and, in the case of six crops, the crops grown on the largest area shall not cover more than 65 % of the arable land and the crops grown on the two largest areas taken together shall not exceed 80 % of the arable land, provided that the area under the smallest crop shall be equal to 1 ha.		
	Maintaining an area of 10 % of arable land, non-productive landscape features and areas, or a combination thereof.(Possible overlap with the AEM requirements is avoided by allowing the same element to be accounted for under only one item.) Under this commitment, the combined share of ecological focus secondary crops and nitrogen-fixing crops grown without the use of plant protection products shall not exceed 5 % of arable land. Commitment basis is the arable land used by the farmer, excluding temporary grassland.	2	The practice contributes to maintaining and increasing the diversity of habitats, landscape features and areas associated with agricultural land, thereby helping to improve the situation of species in unfavourable conservation status. Furthermore, land lying fallow, small wetlands facilitates carbon sequestration, while ecological boundary strips and erosion buffer strips serve to protect soils against erosion. Landscape features that provide permanent plant cover on the edges of the plots or provide continuous soil cover contribute to ensuring that active substances derived from plant protection products and nutrients are not discharged from agricultural land into water bodies. As a result, the quality of water bodies is improved.

	Derogation for application year 2024: Hungary makes use of the derogation in Implementing Regulation (EU) 2024/587 to adapt the baseline requirement to the GAEC 8 derogation in the Agro-ecological Programme. Accordingly, to meet the 10 percentage points of the pledge, the combined share of ecological focus secondary crops and nitrogen fixing crops grown without the use of the plant protection product should not exceed 9 % of the arable land.		Related specific objectives: SO4, SO5 and SO6 Related R indicators: R 14, R 19, R 21, R 31, R 34
	Maintaining an area of 10 % of arable land, non-productive landscape features and areas, or a combination thereof.(Possible overlap with the AEM requirements is avoided by allowing the same element to be accounted for under only one item.) In order to meet 10 percentage points of this commitment, the combined share of ecological focus secondary crops and nitrogen-fixing crops grown without the use of plant protection products shall not exceed 9 % of the arable land under which the farmer uses arable land, excluding temporary grassland.	1	The practice contributes to maintaining and increasing the diversity of habitats, landscape features and areas associated with agricultural land, thereby helping to improve the situation of species in unfavourable conservation status. Furthermore, land lying fallow, small wetlands facilitates carbon sequestration, while ecological boundary strips and erosion buffer strips serve to protect soils against erosion. Landscape features that provide permanent plant cover on the edges of the plots or provide continuous soil cover contribute to ensuring that active substances derived from plant protection products and nutrients are not discharged from agricultural land into water bodies. As a result, the quality of water bodies is improved. Related specific objectives: SO4, SO5 and SO6 Related R indicators: R 14, R 19, R 21, R 31, R 34
	Where the total area of arable land on the holding exceeds 50 ha, the maximum size of arable land shall not exceed 30 hectares. Any overlap with the AKG ‘voluntary plate size limitation’ is avoided by preventing a customer who has opted for this specification in the AKG from choosing it in the AÖP.	1	The practice contributes to the development of a mosaic landscape, which has a positive impact on the biodiversity of agricultural habitats and the diversity of landscape structures. Related specific objectives: SO5 and SO6 Related R indicators: R 19, R 21, R 31
	In plant protection, the use of plant protection products	1	The practice has a positive impact on pollinating

	classified as either moderately hazardous or hazardous to bees is prohibited on the basis of the authorisation document. A regularly updated list of non-use agents is published by the MA for information purposes.		insects. Related specific objectives: SO5 and SO6 Related R indicators: R 24, R 31
	Immediate incorporation of urea fertiliser or application of an inhibitor during application.	1	In the case of urea, a significant reduction in emissions can be achieved by immediate incorporation or the application of inhibitor fertiliser, which contributes to the reduction of ammonia emissions. Related specific objectives: SO5 Related R indicator: R12; R 20
	The use of microbiological preparations on at least 50 % of arable land before sowing or by sowing, applied to the soil and added to the soil and then mixed into the soil.	2	The practice helps restore soil organic matter and improve soil potential and soil biodiversity, thereby contributing to reducing nutrient losses and improving the water retention capacity of soils. Healthier soils, in turn, contribute to the reduction of fertiliser and increased use of protective agents. Related specific objectives: SO5 Related R indicator: R 19, R 20, R 21, R 24
	Use of soil conditioning, plant conditioning, N-fixing or compost products on at least 50 % of arable land.	1	The practice helps restore soil organic matter and improve soil potential and soil biodiversity, thereby contributing to reducing nutrient losses and improving the water retention capacity of soils. Healthier soils, in turn, contribute to the reduction of fertiliser and increased use of protective agents. In particular, soil conditioners help to develop favourable soil conditions, adequate humus content and aeration. N fixation aids contribute to reducing ammonia emissions. Compost preparations consisting of organic, inorganic and mineral materials provide a rich source of nutrients that promote the healthy development and growth of plants. They also improve soil structure, increasing its water retention capacity and aeration, creating a more sustainable and healthy environment for plants in the long term. Related specific objectives: SO5 Related R indicator: R 19, R 20, R 21, R 24
	The use of a non-rotational cultivation method (minimum	2	The practice contributes to preserving the carbon stock of soils, thereby reducing greenhouse gas

	cultivation, zero-till, direct sowing) on at least 50 % of the arable land under cultivation, using a plant protection product restricted to at least 50 % of the arable land under cultivation, where the use of glyphosate-containing pesticides is permitted at most once a year only for weed control or, where it is not otherwise feasible due to weather and soil conditions, for the terminaling of crops grown as cover crops. A regularly updated list of prohibited pesticides is published by the MA.		emissions from arable land and halting or reversing the degradation of the soil structure, as well as improving humus content and water retention. Taking into account chemical control alternatives, there is no other active substance having an all-effect effect in Hungary. Only selective active substances, combined with at least 2 active substances, can produce at most a similar result at a much higher cost level and with a very high risk of development of resistance. The deliberate use once a year of glyphosate products with selective mode of action in soil-friendly cultivation allows for the effective and targeted removal of cover crops with minimal soil disturbance and loss of soil moisture. This is without prejudice to the ecological usefulness of the practice. A detailed justification is attached to the Plan among the other Member States' documents. Related specific objectives: SO4 and SO5 Related R indicators: R 12, R 14, R 19, R 21, R 23
Turf	Conservation of grasslands at farm level compared to previous year grasslands, with permanent grasslands to be maintained at parcel level, while the location of temporary grasslands may vary. Hacking or ploughing of grasslands is prohibited. Only optional on non-Natura 2000 grasslands	1	The conservation of grasslands at farm level increases both carbon sequestration on agricultural land and contributes to the preservation of biodiversity, given that a significant part of Hungary's grasslands are extensively cultivated. Furthermore, conserving the size of temporary grasslands is a step forward in sustainability. Related specific objectives: SO4 SO5 and SO6 Related R indicators: R 12, R 14, R 31
	The continuation of pastoral or intermittent grazing on at least 50 % of the grassland. The grazing of a section does not exceed 12 days. — Optional on all grasslands.	2	Pastoralism or batch grazing greatly influences the area's nutrient flows by altering the use of different pasture areas, thereby contributing to the composition of the vegetation making up the grass and the annual grass yield, thus contributing to the development and protection of biodiversity appropriate to the type of grassland. Regulated grazing can also contribute to the protection of certain species of flora and fauna that are important for nature conservation and to the reduction of certain unwanted species. Related specific objectives: SO6 Related R indicators: R12; R14; R19; R 31

	Mowing of extensive grasslands at least once a year. Optional only 1 on non-Natura 2000 grasslands.		The use of grasslands by mowing contributes to the development of an appropriate species mix and to the reduction of unwanted species. Related specific objectives: SO6 Related R indicators: R 31
	Using only alternating hake or rear-suspension or towed mowers without shanks when mowing grasslands. — Optional on all grasslands.	2	When using the alternating mower, the grass is simply inclined during mowing, the plants are not damaged above the mowing plane, but the cutting quality is good and the grass has a quicker shoot. When using suitably used rear-suspension or towed pads without stalk breakers, wildlife is also not damaged and can therefore be used as an alternative to an alternative to an alternating cake. Related specific objectives: SO6 Related R indicators: R 31
	On grasslands, a stubble height of at least 10 cm is mandatory after mowing. Optional for all types of grassland.	1	Mowing above 10 cm in grasslands significantly contributes to the protection of fauna. Related specific objectives: SO6 Related R indicators: R 31
	Grazing of at least 50 % of grasslands with native livestock breeds. The livestock density must be at least 0.2 livestock units per hectare. Optional for all types of grassland	1	The proposed practice has beneficial habitat effects due to the non-selective grazing practices of native breeds. Adapting local animal breeds to local environmental conditions is scientifically proven. Their adaptation to local environmental conditions has a mutual impact: these varieties are best suited to manage pasture areas properly. Habitat management and habitat restoration practices in Natura 2000 sites in Hungary (partially funded by several LIFE Natura projects) have shown that grazing with local animal breeds has yielded better biodiversity results, mainly due to:- The grazing of local breeds is less selective and is therefore more suitable to reduce weed species in pastures. — With appropriate grazing practices, native livestock breeds can usefully help to reduce invasive plant species (<i>Solidago canadensis</i>, <i>Amorpha fruticosa</i>). — Their adaptation to local environmental conditions makes them more resilient to extreme weather conditions caused by climate change (durable drought, high UV radiation, periodic flooding). In addition, due to the greater resistance of local breeds to diseases and pathogens, it can be assumed that the pressure on grasslands for

			antibiotics and other residues will be reduced. The use of these veterinary medicinal products causes widely documented environmental problems. The proposed practice does not fall under the current agri-environmental management (AKG) scheme, so there is no risk of double funding. Related specific objectives: SO6 Related R indicators: R12; R14; R19; R 31
	Grazing of at least 70 % of grasslands with native livestock breeds. The livestock density must be at least 0.2 livestock units per hectare. Optional for all types of grassland	2	The proposed practice has beneficial habitat effects due to the non-selective grazing practices of native breeds. Adapting local animal breeds to local environmental conditions is scientifically proven. Their adaptation to local environmental conditions has a mutual impact: these varieties are best suited to manage pasture areas properly. Habitat management and habitat restoration practices in Natura 2000 sites in Hungary (partially funded by several LIFE Natura projects) have shown that grazing with local animal breeds has yielded better biodiversity results, mainly due to: — The grazing of local breeds is less selective and is therefore more suitable for reducing weed species in pastures. — With appropriate grazing practices, native livestock breeds can usefully help to reduce invasive plant species (<i>Solidago canadensis</i>, <i>Amorpha fruticosa</i>). — Their adaptation to local environmental conditions makes them more resilient to extreme weather conditions caused by climate change (durable drought, high UV radiation, periodic flooding). In addition, due to the greater resistance of local breeds to diseases and pathogens, it can be assumed that the pressure on grasslands for antibiotics and other residues will be reduced. The use of these veterinary medicinal products causes widely documented environmental problems. The proposed practice does not fall under the current agri-environmental management (AKG) scheme, so there is no risk of double funding. Related specific objectives: SO6 Related R indicators: R12; R14; R19; R 31

Permanent crops	Use of micro-irrigation technologies in at least 50 % of the other permanent culture area	2	The practice contributes to the sustainable use of water resources. Related specific objectives: SO5 Related R indicators: R 23
	In plant protection, according to the authorisation document, the use of plant protection products classified as hazardous or hazardous to bees is prohibited. A regularly updated list of non-use agents is published by the MA for information purposes. Practice that can be used in both special and other permanent crops.	1	The practice has a positive impact on pollinating insects. Related specific objectives: SO5 and SO6 Related R indicators: R 24, R 31
	Use of authorised biological agents or pheromonic airspace saturation on at least 50 % of the other permanent crop area.	2	The practice also helps to reduce the use of chemical pesticides in permanent non-organic crops. Related specific objectives: SO5 and SO6 Related R indicators: R 21, R 24, R 31
	Use of microbiological preparations as soil grafting or flock treatment on at least 50 % of the other permanent crop area	2	The practice helps restore soil organic matter and improve soil potential and soil biodiversity, thereby contributing to reducing nutrient losses and improving the water retention capacity of soils. Healthier soils, in turn, contribute to the reduction of fertiliser and increased use of protective agents. Related specific objectives: SO5 Related R indicator: R 19, R 20, R 21, R 24
	Use of soil conditioning or plant conditioning or compost products on at least 50 % of the other permanent crop area.	1	The practice helps restore soil organic matter and improve soil potential and soil biodiversity, thereby contributing to reducing nutrient losses and improving the water retention capacity of soils. Healthier soils, in turn, contribute to the reduction of fertiliser and increased use of protective agents. In particular, soil conditioners help to develop favourable soil conditions, adequate humus content and aeration. N fixation aids contribute to reducing ammonia emissions. Compost preparations consisting of organic, inorganic and mineral materials provide a rich source of nutrients that promote the healthy development and growth of plants. They also improve soil structure, increasing

			its water retention capacity and aeration, creating a more sustainable and healthy environment for plants in the long term. Related specific objectives: SO5 Related R indicator: R 19, R 20, R 21, R 24
	Mulching of permanent crops in areas with a slope of less than 12 %, with the cultivation of one-year spacing crops. An optional practice in both special and other permanent crops.	1	Soil cover protects soils from the adverse effects of erosion and helps to preserve soil moisture. Related specific objective: SO4 and SO5 Related R indicators: R12, R14, R19
	Mulching of permanent crops by maintaining perennial crops or by grassing. An optional practice in both special and other permanent crops.	2	The practice increases the carbon sequestration capacity of soils by ensuring that the soil surface is covered for as long as possible, while soil cover protects soils from the adverse effects of erosion and helps to preserve soil moisture. Related specific objective: SO4 and SO5 Related R indicators: R12, R14, R19, R23
	Immediate incorporation of urea fertiliser or application of an inhibitor during application in other permanent crops.	1	In the case of urea, a significant reduction in emissions can be achieved by immediate incorporation or the application of inhibitor fertiliser, which contributes to the reduction of ammonia emissions. Related specific objectives: SO5 Related R indicators: R12; R 20

Where the arable land or non-Natura 2000 grassland of the holding is less than 5 ha or 1 ha in the case of other permanent crops, there is no obligation to make provision for a given type of use, but payment for the area concerned shall not be granted only if the farmer also opts for these areas below the threshold.*

*In the case of Natura 2000 grasslands, the Land Use Rules for the Maintenance of Natura 2000 grasslands are laid down in Government Decree 269/2007. Government Decree (X. 18.) lays down mandatory requirements for which compensatory aid may be claimed under Article 72 of the SPR. Given that the requirements set out therein may also be desirable for non-Natura 2000 grasslands, we would like to make them available among the optional good practices of the AÖP, with the proviso that these standards are not optional in Natura 2000 sites. Due to their mandatory use requirements, Natura 2000 grasslands are not reported in the overall economic concept of the AÖP, as is the case for areas with a size limit of 5 ha and 1 ha respectively, but payments for the affected areas are only granted if, despite the derogation, they choose the best practices available to them.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary, the area and, when applicable, other relevant obligations

An active farmer who is entitled to a basic payment is eligible for aid under the agro-ecological scheme, since the payment is based on the amount of the basic payment pursuant to Article 31(7)(a) of the STR Regulation. Accordingly, some of the eligibility criteria are identical to the eligibility conditions for the basic payment, i.e.

- has at least one hectare of eligible area;
- has submitted an aid application for the eligible land;
- prove the status of land user in respect of the area applied for on the last day of the deadline for the submission of the aid application;

Specific eligibility criteria:

- For each actual use on the holding (arable, other grasslands, other permanent crops), a minimum of 2 points shall be chosen from among the agricultural good practices identified.
- Where the arable land or grassland of the holding is less than 5 ha or, in the case of permanent crops, 1 ha, for a given type of use, there is no obligation to make payments for the area concerned only if the farmer opts for these areas below the threshold.
- In the context of the Agro-ecological Programme, a category of ‘special’ permanent culture is defined in part different from the definition of permanent culture in the basic act. In particular, in the case of short rotation coppice or tree plantations established on agricultural land under EAGGF or EAFRD to provide raw material for industrial purposes consisting of fast-growing species, it is not mandatory to choose a practice. Special permanent crops are not included in the overall economic concept of the AÖP, as is the case for areas with a size of 5 ha and 1 ha respectively, but only if, despite the derogation, they choose the best practices available to them.

Link to agri-environmental management (AKG) payments:

The provisions of the agro-ecological scheme and agri-environmental payments are clearly designed in such a way that they differ from one standard to another. In the case of specifications where, due to their nature, the individual specifications are nevertheless linked, any overlap is avoided by preventing the customer who has chosen the standard in the AKG from choosing the corresponding good practice in the AÖP.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

List of relevant GAEC and SMR

Code	Description
GAEC01	Maintenance of permanent grassland based on a ratio of permanent grassland in relation to agricultural area at national, regional, sub-regional, group-of-holdings or holding level in comparison to the reference year 2018. Maximum decrease of 5% compared to the reference year.
GAEC05	Tillage management, reducing the risk of soil degradation and erosion, including consideration of the slope gradient
GAEC06	Minimum soil cover to avoid bare soil in periods that are most sensitive
GAEC07	Crop rotation in arable land, except for crops growing under water
GAEC08	Retention of landscape features. Ban on cutting hedges and trees during the bird breeding and rearing season. As an option, measures for avoiding invasive plant species

GAEC09	Ban on converting or ploughing permanent grassland designated as environmentally-sensitive permanent grasslands in Natura 2000 sites
SMR01	Directive 2000/60/EC of 23 October 2000 of the European Parliament and of the Council establishing a framework for Community action in the field of water policy: Article 11(3), point (e), and point (h), as regards mandatory requirements to control diffuse sources of pollution by phosphates
SMR02	Council Directive 91/676/EEC of 12 December 1991 concerning the protection of waters against pollution caused by nitrates from agricultural sources: Articles 4 and 5
SMR03	Directive 2009/147/EC of the European Parliament and of the Council of 30 November 2009 on the conservation of wild birds: Article 3(1), Article 3(2), point (b), Article 4(1), (2) and (4)
SMR04	Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild flora and fauna: Article 6(1) and (2)
SMR08	Directive 2009/128/EC of the European Parliament and of the Council of 21 October 2009 establishing a framework for Community action to achieve the sustainable use of pesticides: Article 5(2) and Article 8(1) to (5); Article 12 with regard to restrictions on the use of pesticides in protected areas defined on the basis of Directive 2000/60/EC and Natura 2000 legislation; Article 13(1) and (3) on handling and storage of pesticides and disposal of remnants

List of relevant mandatory national standards

NJSZ - Section 35-42 of Act CXXIX of 2007 on the protection of agricultural land

The land user shall carry out soil conservation farming or activities adapted to the ecological conditions of the production area, as follows:

On arable land at risk of erosion, the user shall, in order to prevent water and wind erosion, grow crops for soil cover and use a cultivation method which facilitates the drainage of rainwaters into the soil by preserving soil structure, preventing and eliminating soil compaction and/or maintaining contoured cultivation;

The land user shall ensure that the soil organic matter is preserved by means of a crop change.

The land user shall ensure that the soil organic matter is preserved through the application of organic matter

The land user shall carry out soil conservation farming or activities adapted to the ecological conditions of the production area, as follows:

NJSZ - Sections 6(2), 7(1) and 8(1) 16(1), (4) 17(1) and (3) of Act LIII of 1996 on nature protection

The conservation of wild organisms, their populations and communities must be ensured in conjunction with the conservation of their habitats and that all activities must be carried out with the welfare of natural assets and areas in order to protect the habitats of wild organisms and their biodiversity, as well as sustainable use, including sustainability, the use of environmentally sound methods and the protection of biodiversity. It is also necessary to preserve the natural and semi-natural state of the landscapes and to ensure the preservation of the natural values, natural systems and unique landscape values that determine the aesthetic features and nature of the landscapes, taking into account historically developed environmentally friendly uses.

Link between GAEC, SMR and national standards with the eco-scheme (explain how the eco-scheme goes beyond the baseline, notably for SMR and national standards)

Method of exploitation	Optional good practices	Related reference legislation (SMR – statutory economic operator requirements and other binding requirements laid down in national legislation and GAEC requirements)	Relationship between the reference regulation and the AÖP requirements
Arable land	After summer or autumn-harvest crops, where crops other than autumn sown are followed, provide mulching with cover crops or by leaving the stubble in a cultural state until the start of preparatory work for the following year's spring culture, but at least by 28 February.	NJSZ – Act CXXIX of 2007 on the protection of agricultural land, Sections 35-42	None of the elements of the reference regulation requires soil cover during the winter season. GAEC 6 requires the most sensitive coverage in Hungary, covering the summer and early autumn periods.
		The land user shall carry out soil conservation farming or activities adapted to the ecological conditions of the production area, as follows:	
		On arable land at risk of erosion, the user shall, in order to prevent water and wind erosion, grow crops for soil cover and use a cultivation method which facilitates the drainage of rainwaters into the soil by preserving soil structure, preventing and eliminating soil compaction and/or maintaining contoured cultivation;	
		SMR 1 – b) mandatory requirements for the control of diffuse sources of pollution of phosphates	
		SMR 2 – protection of waters against pollution caused by nitrates from agricultural sources – Nitrate GHP	
		GAEC 5 – requirements for site-specific minimum land management for soil protection and limiting erosion	
		GAEC 6 – Minimum soil cover during sensitive periods	
Arable land	Crop diversification requirements for arable crops: (a) farmers on arable land of 10 hectares or	NJSZ – Act CXXIX of 2007 on the protection of agricultural land, Sections 35-42.	The reference regulation lays down rules for crop conversion or crop diversification in the framework of GAEC 7, which is complemented by the optional crop diversification practice of the AÖP. The latter is a much more ambitious crop diversification than under GAEC 7.
		The land user shall carry out soil conservation farming or activities adapted to the ecological conditions of the	

	less shall produce at least two different crops on arable land in a given year; in the case of two crops, the crops grown on the largest area shall not cover more than 80 % of the arable land;(b) those with more than 10 hectares of arable land shall be cultivated with at least three half of the arable land and, in the case of three crops, the crops grown on the largest area shall not cover more than 65 % of the arable land; and the crops grown on the two largest areas taken together shall not exceed 80 % of the arable land;(c) where there are more than 30 hectares of arable land, at least four half of the arable land shall be cultivated and, in the case of four	production area, as follows:	
		The land user shall ensure that the soil organic matter is preserved by means of a crop change. GAEC 7 – Sown-change rules	

	crops, the crops grown on the largest area shall not cover more than 65 % of the arable land and the crops grown on the two largest areas taken together shall not exceed 80 % of the arable land, provided that the area under the smallest crop shall be at least five half of those with more than 300 ha of arable land, and in the case of five crops, the crops grown on the largest area shall not cover more than 65 % of the arable land and the crops grown on the two largest areas taken together shall not exceed 80 % of the arable land, provided that the area under the smallest crop shall be equal to or greater than 1 ha of arable land.(e) In the case of five crops, the crop grown on the largest		

	area shall not cover more than 65 % of the arable land and, in the case of five crops, the crop grown on the two largest areas shall not exceed 80 % of the arable land, provided that the area of the smallest crop shall be equal to or greater than 1 ha.		
Arable land	Covering 10 % of arable land, maintaining non-productive landscape features and areas, or a combination thereof. (A possible overlap with the AKG requirements is avoided by allowing the same element to be accounted for under only one item.) Under this commitment, the combined share of ecologically important secondary crops and nitrogen-fixing crops grown without the	NJSZ – Sections 6(2), 7(1), 8(1) 16(1), (4) 17(1), 17(1) and (3) of Act LIII of 1996 on nature protection	GAEC 8 requires the maintenance of non-productive areas and landscape features to be 7 % of arable land, of which the land features and fallow areas must reach 3 %, which are exceeded in both cases by the AÖP standard. It is also optional for areas below 10 ha. As of 2025, GAEC8 no longer contains a non-production element or area obligation.
		The conservation of wild organisms, their populations and communities must be ensured in conjunction with the conservation of their habitats and that all activities must be carried out with the welfare of natural assets and areas in order to protect the habitats of wild organisms and their biodiversity, as well as sustainable use, including sustainability, the use of environmentally sound methods and the protection of biodiversity. It is also necessary to preserve the natural and semi-natural state of the landscapes and to ensure the preservation of the natural values, natural systems and unique landscape values that determine the aesthetic features and nature of the landscapes, taking into account historically developed environmentally friendly uses.	
		GAEC 2 – protection of wetlands	
		GAEC 8 – Protection of	

	use of plant protection products may not exceed 5 % of arable land. Commitment basis is the arable land used by the farmer, excluding temporary grassland. Derogation for application year 2024: Hungary makes use of the derogation in Implementing Regulation (EU) 2024/587 to adapt the baseline requirement to the GAEC 8 derogation in the Agro-ecological Programme. Accordingly, the 10 percentage points of the pledge should not exceed 9 % of arable land combined with secondary ecological focus crops and nitrogen-fixing crops grown without the use of plant protection	biodiversity: Maintenance of non-productive areas and landscape features	

	products.		
	In an area of 10 % of arable land, the maintenance of non-productive landscape features and areas, or a combination thereof.(Possible overlap with AEM requirements is avoided by allowing the same element to be accounted for under only one item.) In order to meet 10 percentage points of this commitment, the combined share of ecological focus secondary crops and nitrogen-fixing crops grown without the use of plant protection products shall not exceed 9 % of arable land used by a farmer under a commitment fund, excluding temporary grassland	NJSZ – Sections 6(2), 7(1), 8(1) 16(1), (4) 17(1), 17(1) and (3) of Act LIII of 1996 on nature protection The conservation of wild organisms, their populations and communities must be ensured in conjunction with the conservation of their habitats and that all activities must be carried out with the welfare of natural assets and areas in order to protect the habitats of wild organisms and their biodiversity, as well as sustainable use, including sustainability, the use of environmentally sound methods and the protection of biodiversity. It is also necessary to preserve the natural and semi-natural state of the landscapes and to ensure the preservation of the natural values, natural systems and unique landscape values that determine the aesthetic features and nature of the landscapes, taking into account historically developed environmentally friendly uses. GAEC 2 – protection of wetlands. GAEC 8 – Protection of biodiversity: Maintenance of non-productive areas and landscape features.	From the GAEC 8 standard, the rule on the maintenance of non-productive areas and landscape features will be deleted from 2025. Therefore, this AÖP practice will be introduced for 1 point from 2025. It is also optional for areas below 10 ha.
Arable land	Where the total area of arable land on	NJSZ – Section 6(2), Article 7(1), Section 8(1), Section 17(1), Section 17(1), Section	The reference rules do not provide for a limit on the size of the plate, and there are typically larger plots on arable land.

	the holding exceeds 50 ha, the maximum size of arable land shall not exceed 30 hectares. Any overlap with the AKG 'voluntary plate size limitation' is avoided by preventing a customer who has opted for this specification in the AKG from choosing it in the AÖP.	17(1) of Act LIII of 1996 on the conservation of nature conservation shall ensure the conservation of wild organisms and their populations and communities together with the protection of their habitats, and that all activities must be carried out with respect to the conservation of the habitats of wild organisms and their biodiversity, as well as sustainable use, including sustainability, the use of nature-friendly methods and the protection of biodiversity. It is also necessary to preserve the natural and semi-natural state of the landscapes and to ensure the preservation of the natural values, natural systems and unique landscape values that determine the aesthetic features and nature of the landscapes, taking into account historically developed environmentally friendly uses.	
Arable land	In plant protection, the use of plant protection products classified as either moderately hazardous or hazardous to bees is prohibited on the basis of the authorisation document. A regularly updated list of non-use agents is published by the MA for information purposes.	SMR 8 – National legislation on the sustainable use of plant protection products Minimum requirements for the maintenance of the agricultural area under Article 4(2) of the SPR Regulation	The reference rules allow the use of authorised plant protection products without further restrictions.
Arable land	Immediate incorporation	SMR 2 – protection of waters against pollution caused by	The reference rules only require applied fertilisers to be rotated in nitrate vulnerable

	of urea fertiliser or application of an inhibitor during application	nitrates from agricultural sources – Nitrate GHP: Fertiliser applied to the soil of an area with a slope of more than 12 % shall be applied to the soil within 4 hours of application, except for the operation of head fertilisation.	zones with a slope of more than 12 %, leaving a 4-hour time window. The AÖP standard covers all arable land and requires immediate incorporation and the use of inhibitors.
Arable land	The use of microbiological preparations on at least 50 % of arable land before sowing or by sowing, applied to the soil and added to the soil and then mixed into the soil.	NJSZ – Act CXXIX of 2007 on the protection of agricultural land, Sections 35-42. The land user shall carry out soil conservation farming or activities adapted to the ecological conditions of the production area, as follows: The land user shall ensure that the soil organic matter is preserved through the application of organic matter	The reference rules do not prescribe the use of these products anywhere, and the use of these products is not typical of general economic practice. Fertiliser use is typical.
Arable land	Use of soil conditioning, plant conditioning, N-fixing or compost products on at least 50 % of arable land.	NJSZ – Act CXXIX of 2007 on the protection of agricultural land, Sections 35-42. The land user shall carry out soil conservation farming or activities adapted to the ecological conditions of the production area, as follows: The land user shall ensure that the soil organic matter is preserved by applying organic matter.	The reference rules do not prescribe the use of these products anywhere, and the use of these products is not typical of general economic practice. Fertiliser use is typical.
Arable land	The use of a non-rotational cultivation method (minimum cultivation, zero-till, direct sowing) on at least 50 % of the arable land under cultivation, using a plant protection product restricted to at least 50 % of the arable land under	NJSZ – Act CXXIX of 2007 on the protection of agricultural land, Sections 35-42. The land user shall maintain soil conservation farming or activities adapted to the ecological conditions of the production area, as follows: The user shall ensure the maintenance of soil organic matter by using environmentally sound tillage methods. In arable land at risk of erosion, the land user shall cultivate crops for soil cover in order to prevent water and wind erosion and use a cultivation method which facilitates the introduction of rainwaters into the soil by	The reference rules do not prescribe any non-rotational cultivation method, and common farming practices are characterised by the use of rotational tillage methods.

	cultivation, where the use of glyphosate-containing pesticides is permitted at most once a year only for weed control or, where it is not otherwise feasible due to weather and soil conditions, for the terminaling of crops grown as cover crops. A regularly updated list of prohibited pesticides is published by the MA.	preserving soil structure, preventing and eliminating soil compaction and/or running contiguous cultivation; GAEC 5 – requirements for site-specific minimum land management for soil protection and limiting erosion	
Grasslands	Conservation of extensive grasslands at farm level compared to previous year grasslands, with permanent grasslands to be maintained at parcel level, while the location of temporary grasslands may vary. Hacking or ploughing of grasslands is prohibited. Can only be selected on non-Natura 2000 grasslands.	NJSZ – Section 6(2), Article 7(1), Section 8(1), Section 17(1), Section 17(1) of Act LIII of 1996 on the conservation of nature conservation shall ensure the conservation of wild organisms and their populations and communities together with the protection of their habitats, and that all activities must be carried out with respect to the conservation of the habitats of wild organisms and their biodiversity, as well as sustainable use, including sustainability, the use of nature-friendly methods and the protection of biodiversity. It is also necessary to preserve the natural and semi-natural state of the landscapes and to ensure the preservation of the natural values, natural systems and unique landscape values that determine the aesthetic	The reference rules do not require the conservation of permanent grassland at economic or field level, but only for Natura 2000 sites are prohibited from breaking them. However, in these areas this requirement is not optional.

		features and nature of the landscapes, taking into account historically developed environmentally friendly uses.	
		GAEC 1 – Conservation of permanent grassland at Member State level	
		GAEC 9 – Natura 2000 grassland classified as sensitive grassland designated as permanent grassland is prohibited	In the absence of a reference rule, the preservation of temporary grasslands is an essential step forward in terms of sustainability.
		SMRs 3 and 4 – 275/2004 on nature protection areas of European Community importance. Government Decree No 269/2007 of 8 October 2007 on land use rules for the maintenance of NATURA 2000 grasslands. The legal requirements cover the general protection of Natura 2000 sites (e.g. activities subject to authorisation) and, in the case of grasslands, the minimum land use requirements for their conservation.	
		Minimum requirements for the maintenance of the agricultural area under Article 4(2) of the SPR Regulation.	
		There is no reference rule for temporary grasslands.	
Grasslands	The continuation of pastoral or intermittent grazing on at least 50 % of the grassland. The grazing of a section does not exceed 12 days. Optional on all grasslands.	NJSZ – Section 6(2), Article 7(1), Section 8(1), Section 17(1), Section 17(1), Section 17(1) of Act LIII of 1996 on the conservation of nature conservation shall ensure the conservation of wild organisms and their populations and communities together with the protection of their habitats, and that all activities must be carried out with respect to the conservation of the habitats of wild organisms and their biodiversity, as well as sustainable use, including sustainability, the use of nature-friendly methods and	The reference regulation does not provide for the continuation of pastoral or batch grazing, but is less common.

		the protection of biodiversity. It is also necessary to preserve the natural and semi-natural state of the landscapes and to ensure the preservation of the natural values, natural systems and unique landscape values that determine the aesthetic features and nature of the landscapes, taking into account historically developed environmentally friendly uses. SMRs 3 and 4 – 275/2004 on nature protection areas of European Community importance. Government Decree No 269/2007 of 8 October 2007 on land use rules for the maintenance of NATURA 2000 grasslands. The legal requirements cover the general protection of Natura 2000 sites (e.g. activities subject to authorisation) and, in the case of grasslands, the minimum land use requirements for their conservation.	
Grasslands	Mowing of grasslands at least once a year. Can only be selected on non-Natura 2000 grasslands.	NJSZ – Section 6(2), Article 7(1), Section 8(1), Section 17(1), Section 17(1), Section 17(1) of Act LIII of 1996 on the conservation of nature conservation shall ensure the conservation of wild organisms and their populations and communities together with the protection of their habitats, and that all activities must be carried out with respect to the conservation of the habitats of wild organisms and their biodiversity, as well as sustainable use, including sustainability, the use of nature-friendly methods and the protection of biodiversity. It is also necessary to preserve the natural and semi-natural state of the landscapes and to ensure the preservation of the natural values, natural systems and unique landscape values	Only in the case of Natura 2000 grasslands the reference regulation provides for the use of grasslands by mowing or grazing. Some grasslands are negligent and not utilised.

		that determine the aesthetic features and nature of the landscapes, taking into account historically developed environmentally friendly uses. SMRs 3 and 4 – 275/2004 on nature protection areas of European Community importance. Government Decree No 269/2007 of 8 October 2007 on land use rules for the maintenance of NATURA 2000 grasslands. The legal requirements cover the general protection of Natura 2000 sites (e.g. activities subject to authorisation) and, in the case of grasslands, the minimum land use requirements for their conservation. Minimum requirements for the maintenance of the agricultural area under Article 4(2) of the SPR Regulation:	
Grasslands	Using only alternating hake or rear-suspension or towed mowers without shanks when mowing grasslands. Optional on all grasslands.	NJSZ – Section 6(2), Article 7(1), Section 8(1), Section 17(1), Section 17(1), Section 17(1) of Act LIII of 1996 on nature conservation shall ensure the conservation of wild organisms and their populations and communities together with the protection of their habitats, and that all activities must be carried out with respect to the conservation of the habitats of wild organisms and their biodiversity, as well as sustainable use, including sustainability, the use of nature-friendly methods and the protection of biodiversity. It is also necessary to preserve the natural and semi-natural state of the landscapes and to ensure the preservation of the natural values, natural systems and unique landscape values that determine the aesthetic features and nature of the landscapes, taking into account historically developed	The reference regulation does not specify the type of pad to be used during mowing. In practice, drums that are harmful to grassland biota are used

		environmentally friendly uses. SMRs 3 and 4 – 275/2004 on nature protection areas of European Community importance. Government Decree No 269/2007 of 8 October 2007 on land use rules for the maintenance of NATURA 2000 grasslands. The legal requirements cover the general protection of Natura 2000 sites (e.g. activities subject to authorisation) and, in the case of grasslands, the minimum land use requirements for their conservation.	
	On grasslands, a stubble height of at least 10 cm is mandatory after mowing Optional for all types of grassland.	NJSZ – Section 6(2), Article 7(1), Section 8(1), Section 17(1), Section 17(1), Section 17(1) of Act LIII of 1996 on nature conservation shall ensure the conservation of wild organisms and their populations and communities together with the protection of their habitats, and that all activities must be carried out with respect to the conservation of the habitats of wild organisms and their biodiversity, as well as sustainable use, including sustainability, the use of nature-friendly methods and the protection of biodiversity. It is also necessary to preserve the natural and semi-natural state of the landscapes and to ensure the preservation of the natural values, natural systems and unique landscape values that determine the aesthetic features and nature of the landscapes, taking into account historically developed environmentally friendly uses. SMRs 3 and 4 – 275/2004 on nature protection areas of European Community importance. Government Decree No 269/2007 of 8 October 2007 on land use rules for the maintenance of	The reference regulation does not contain any requirement for the stubble height to be left during mowing. Keeping a stubble of at least 10 cm is a significant improvement in nature conservation.

		NATURA 2000 grasslands. The legal requirements cover the general protection of Natura 2000 sites (e.g. activities subject to authorisation) and, in the case of grasslands, the minimum land use requirements for their conservation.	
	Grazing of at least 50 % of grasslands with native livestock breeds. The livestock density must be at least 0.2 livestock units per hectare. Optional for all types of grassland.	NJSZ – Section 6(2), Article 7(1), Section 8(1), Section 17(1), Section 17(1), Section 17(1) of Act LIII of 1996 on nature conservation shall ensure the conservation of wild organisms and their populations and communities together with the protection of their habitats, and that all activities must be carried out with respect to the conservation of the habitats of wild organisms and their biodiversity, as well as sustainable use, including sustainability, the use of nature-friendly methods and the protection of biodiversity. It is also necessary to preserve the natural and semi-natural state of the landscapes and to ensure the preservation of the natural values, natural systems and unique landscape values that determine the aesthetic features and nature of the landscapes, taking into account historically developed environmentally friendly uses. 7 Range and amounts of support

Description

The support is granted on a per hectare basis for the entire area of the holding, subject to compliance with the conditions and the best practices chosen.

The indicative specific aid amount is EUR 80.85 per hectare, determined on the basis of the financial envelope of the EYP (15 % of the total amount of direct aids after Member State transfers) and the expected estimated area of support (2.5 million ha), after assessing the following for each optional practice:

- the magnitude of additional costs and/or loss of profit in farming;
- the environmental benefits of choosing a given practice.

As an axiom, we noted that the expected environmental benefit and the additional costs and/or loss of profit involved are almost straight.

Based on literature data, practices with higher expected environmental benefits (2 points) are given a lower score (1 point). And as 2 points have to be collected for the farmer in all fields (arable, grassland, permanent crops), a similar effort or environmental benefit can be expected for the same uniform amount of aid.

The issue is explained in more detail in point 11.

8 Additional questions/information specific to the Type of Intervention

N/A

9 WTO compliance

Green Box

Paragraph 5 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The basic agro-ecological programme will be introduced as a top-up payment to the basic income support pursuant to Article 31(7)(a), so that the payment is fully decoupled from production.

In addition, compliance with the green box requirements is ensured by the fact that the aid applicant has to choose a standard for all types of use of the farm (arable, grassland, permanent crops).

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 5 of Annex II.

11 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Planned Unit Amount	Region(s)	Result Indicator(s)
DP17_O08_U01_HA - Basic Agro-ecological programme	Uniform		R.12; R.14; R.19; R.20; R.21; R.22; R.23; R.24; R.31; R.34; R.4; R.6; R.7

Explanation and Justification (including the flexibility)

DP17_O08_U01_HA - Basic Agro-ecological programme

Mathematical approach:

The financial envelope of the AÖP, 15 % of the total Member State transfer, divided by an estimated area of 2.5 million hectares. The indicative specific amount thus calculated shall be EUR 80,85 per hectare.

The minimum specific amount (EUR 40.43/ha) can be obtained from an AÖP area of 5 million hectares. The maximum unit value (EUR 202,13/ha) is obtained if only 1 million hectares are claimed.

Proportionality:

It is important to record: Hungary intends to grant *eco-scheme* support in the form of a bonus under Article 31(7)(a) of the basic act for the entire farm area of the participating farmer (the so-called *whole farm approach*). On the basis of that provision, this is a payment which we grant as a supplement to the BISS basic payment, as **an incentive**. As in all previous programming cycles, a clear distinction must be made **between incentive** payments and **compensatory** subsidies.

In the light of the above, the following **principles** have been laid down when establishing the unit amount of *eco scheme* aid:

- 1.Incentivising support is intended to be of a non-compensatory type.
- 2.Incentivising aid, it is not possible to compensate for all costs and/or benefits incurred by each practice.
- 3.Any ‘overcompensation’ should be avoided.
- 4.We intend to pay the aid for the entire area (*whole farm*). Therefore, the optional practices necessary for all types of cultivation are announced. Practices will have different legal costs and benefits, which are further nuanced by different geographical and operational conditions.
- 5.For reasons of transparency and ease of implementation, a uniform unit amount will be applied.
- 6.The apparent contradiction between the uniform unit amount and the varying level of ambition of different practices is resolved by adding a score to the optional practices. Compliance with *the eco-scheme* will therefore depend not on the number of practices chosen, but on their total score for each cultivation method.
- 7.Statistical and literary data show that there is a growing interest in all the practices planned to be advertised in Hungary, regardless of past subsidies. It can therefore be concluded that *eco-scheme* support is sufficient if it covers between 30 % and 50 % of the presumed costs/benefits of the practices selected in the example. In other words: *eco-scheme* is not **intended to implement** the practice, but only the ‘last drop in the cup’, which ‘bills down’ in the desired direction of the producers who are currently still cumbersome. Those who already do so should be recognised and confirmed. But not reimbursement!

The indicative specific size of the aid amount is EUR 80.85 per hectare, determined on the basis of the financial envelope of the AÖP (15 % of the total amount of direct aids after transfer by the Member States) and the estimated estimated size of the area to be supported (2.5 million ha), after assessing the following for each optional practice:

- the magnitude of the additional costs and/or forgone profits incurred in farming;
- the environmental benefit of choosing a particular practice.

As an axiom, we have recorded that the expected environmental benefit and the additional and/or forgone benefits incurred are close to a straight line.

Based on literature data, practices with higher expected environmental benefits are higher (2 points), while practices with a more modest benefit are given a lower score (1 point). And given the need to collect between 2 points for each crop (arable, grass, permanent crop), a similar effort or environmental benefit can be expected for the same uniform amount of aid.

It is currently very difficult to estimate the effective cost levels of the practices chosen several years in advance. Soaring energy and input prices present as much uncertainty as ever more volatile and extreme crop prices.

The objective justification for the proportionality of the unit amount is based on the costs of each operation. The data was provided by the Institute for Agricultural Machinery in 2020. The publication is available at: [winerichagi_gepi_workk_koltsege_2020_ban_20_04.pdf\(gmgi.hu\)](http://winerichagi_gepi_workk_koltsege_2020_ban_20_04.pdf(gmgi.hu))

The optional practices may be grouped as follows in terms of additional costs incurred:

A.) A higher number of operations than the optimum calculated on the basis of microeconomic methods, multiple exits into the area. E.g.: crop diversification on ploughs; voluntary plaque size on intended use; use of cover crops or green manure crops between main crops; application and incorporation of microbiological preparations or soil conditioners; mowing of grasslands at least once. Additional costs incurred due to the higher operational number, assuming that a 100 kW power machine is used: EUR 100-310 on average.

(B.) The use of a substance, machine or technology that is more sophisticated than is widely used. For example, the use of an alternating pad instead of a rotary pad; material costs for microbiological preparations or soil conditioners; use of micro-irrigation in a permanent culture; application of a non-rotational tillage system on arable land. The additional costs incurred (either purchase or operating costs) range from EUR 150 to EUR 280 per hectare.

(C.) Self-limitation efficiency, crop volume or quality losses. Such as bee-friendly plant protection; the maintenance of permanent grasslands at parcel level; interlining of permanent crops. They can be calculated in a useful indirect way, which is missing. We can see extreme values per year, but in any case we must be based on an average value above EUR 150.

Practices that degrade the microeconomic optimal for other reasons. The values per hectare calculated by analogy with the three categories above exceed EUR 150 for each practice.

Flexibility:

The -15 % and + 25 % approaches for traditional direct support interventions (BISS, CIS, CIS-YF) do not provide sufficient certainty to the Member State for eco-scheme. The introduction of eco-scheme would also pose a serious implementation risk at a time when global commodity markets are fundamentally calm and predictable. It is impossible, objectively, to predict with what kind and success farmers will participate in an entirely new intervention, linked to a pillar II agri-environmental management programme.

At present, however, there is also a “concurrence” of all forms of aid of a voluntary nature of agri-environmental management, whereby they will enter less

(or even fluctuate between years) due to steeply rising crop prices.

For this reason, we want to apply -25 % and + 50 % flexibility to eco-scheme. If there is a lasting shift in the number of hectares of eco-scheme, the range of the unit amount of the eco-scheme may also be modified as part of the plan amendment.

1.1.1	Predictable basic income for farmers	2	Yes
1.1.2	Provision of available loan financing	2	Partially
1.1.3.	Improving the profitability of small farms	2	Yes
1.2.1	Tackling adverse climatic events and damage caused by climate change in agriculture	1	Yes
1.2.3	Offsetting and mitigating the impact of market risks	2	Yes
2.1.1	Increasing operational and business efficiency of production	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.4 Share of utilised agricultural area (UAA) covered by income support and subject to conditionality

R.6 Percentage of additional direct payments per hectare for eligible farms below average farm size (compared to average)

R.7 Percentage of additional support per hectare in areas with higher needs (compared to average)

R.8 Share of farms benefitting from coupled income support for improving competitiveness, sustainability or quality

5 Specific design, requirements and eligibility conditions of the intervention

Description

It is of utmost importance for sugar beet growers and their families that coupled coupled payments, which

specifically support genuine production, together with the basic payment, form a real safety net that ensures an expected level of resilience in the event of income fluctuations due to weather and market risks.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary, the area and, when applicable, other relevant obligations

Sugar beet production aid shall be granted to a farmer who is entitled to direct aid under the relevant national legislation.

Specific eligibility criteria:

- The aid for sugar beet production shall be granted to an active farmer who produces sugar beet, and
- use at least the minimum quantity of certified propagating material per hectare set out in the table in respect of the total area declared by it for the purpose of applying for coupled direct aid and certifies that the material has been acquired, and
- submit a copy of the beet delivery contract concluded with the sugar beet processor, either directly or through a sugar beet integrator, for the production of sugar beet during the reference year. This will address the uncertainty for producers resulting from the small number of sugar beet processors. Thus, Community funds will only be paid for the cultivation of sugar beet for which further processing is ensured.

The sugar beet processor is not expected to be a Hungarian processor, so this condition does not lead to discrimination.

Hungarian name	Latin name	Min. seed
		DB/ha*
Sugar beet	Beta vulgaris	100 000

*: The values in the table are mean values from which a tolerance of $\pm 20\%$ is allowed. This flexibility is the possibility to adjust the mean values where necessary, and not a possibility for beneficiaries to deviate from the fixed standard values.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Range and amounts of support

Description

The intervention is announced with a single unit value representing the same amount per hectare for all sugar beet growers and applicants. Territorial differentiation is not applied.

8 Additional questions/information specific to the Type of Intervention

Justification of the difficulty(ies) that the targeted sector(s)/production(s) or type(s) of farming therein undergo.

Targeted support for sugar beet cultivation in Hungary is justified by the fact that the income available to producers in the sector is low and the level of income available is unpredictable year-on-year.

This difficulty is caused by low and volatile yields, drastic increases in input prices, fluctuations in market prices and a low proportion of irrigated areas (**secondary arguments**).

In the absence of coupled aid, the sector would be at risk of shrinking or even disappearing.

What is the aim of the intervention with regard to the targeted sector(s)/production(s) or type(s) of farming therein?

- ☐ to improve competitiveness
- ☒ to improve quality
- ☒ to improve sustainability

How will the intervention address the identified difficulty(ies) by this aim (i.e. explanation about the targeting)?

According to the consultation of the sectors and the needs assessment compiled on the basis of **the SWOT analysis, our aim is to stabilise the sector's profitability and improve its resilience** in order to maintain income in spite of fluctuations, contributing to increasing Hungary's sugar self-sufficiency and food security. In addition, the positive effects of, for example, the preservation of biodiversity or the reduction of energy dependency are maintained.

In order to maintain **the long-term improvement of the situation in the sector**, the eligibility conditions include a supply contract for live sugar beet with the processor for sugar beet production (ensuring predictability). In addition, certified seed is being introduced to promote sustainable production. The aim is therefore to address the difficulties caused by fluctuations in yields and low yields. In addition to stabilising income, direct aid plays an important role in farmers' farming, as they generate the necessary own resources and cover for the necessary improvements. In addition, stabilising farmers' incomes promotes modernisation, digitalisation and thus improved production efficiency.

What is (are) the sector(s) concerned?

Sugar beet

Justification of the importance of the targeted sector(s)/production(s) or type(s) of farming therein

In the absence of coupled aid, the sector would be at risk of shrinking or even disappearing. It is necessary to avoid this because of the wide variety of **environmental and social importance** of the sector.

- The sector supplies the only Hungarian sugar factory with raw material and by-products are used as feed, soil improvers and nutrients.
- Its role in preserving biodiversity is underlined by the positive effects of soya cultivation in crop rotation, also in terms of protein dependency, through its mutually beneficial effects.
- Magyar Cukor Zrt., through its biogas plant, covers part of the energy demand for sugar production using its by-product and self-generated renewable energy. Biogas produced and unused is purified and fed into the natural gas network in return for a green premium, thus contributing to a sustainable energy supply for the city of Kaposvár (such as the city's public transport) and to reducing dependence on energy imports.

Explanation how the intervention is consistent with the Water Framework Directive (i.e. 2000/60/EC).

Compliance with the Water Framework Directive is considered to be ensured horizontally through the adequacy of the legislative environment. The licensing system described in detail in section 3.3 provides sufficient safeguards for the start of new activities. For farms already in operation, it is important to clarify: The water use licensing system presented is not an offer that Hungary undertakes from 2023 onwards. This is a description of a system that has been in place for many years and has evolved and strengthened since the entry into force of the Directive for water use for agricultural purposes.

In addition, it can be concluded from the eligibility criteria and the amount of aid for sugar beet cultivation that the unit payment is uniform for all producers, without any incentive to achieve higher yields and thus does not encourage higher water use. Stable output planning also proves that Hungary does not aim at intensification of agricultural production.

Among the elements of conditionality applicable from 2023, the SMR 1 contains a specific basic requirement for the implementation of the Directive, which can thus be held accountable to producers through the system of checks and penalties for conditionality. Proper national implementation and control of the standard thus establishes a link between the authorisation procedures for water abstraction for irrigation and the payment of payments under the CAP.

This point of the Directive is also one of the mandatory basic measures of any river basin management

plan.

As additional information, it can be noted that Section II. Through Pillar-funded investment facilities, we are planning to devote significant resources to the widest possible uptake of precision farming, promoting a more rational and sustainable use of natural resources (including water).

Given the relevance of irrigated farming in this item, the additional control described in section 3.3 will be introduced.

This ensures that the scheme does not jeopardise the achievement of the objectives laid down in Hungary's river basin management plan.

Is the intervention financed, partly or completely, from the protein crop top up (maximum 2% in total) in accordance with Art. 96(3) of SPR?

☐ Yes ☒ No

If the intervention targets a mix between legumes and grasses: please indicate the minimum percentage of legumes in the mix.

N/A

Coupled income support granted to silkworms is an animal based support, where the use of 'head' as the support's basic unit requires prior clarification of the followings:

please clarify the conversion rate between this unit and 'head' (i.e. how many of this unit corresponds to '1 head'?) for the purpose of e.g. indicators.

N/A

It is possible to give further clarification in comment (e.g. the weight of eggs that a box must contain)

9 WTO compliance

Amber Box

Explanation of whether and, if so, how the intervention respects relevant provisions of Article 6.5 or Annex 2 to the WTO Agreement on Agriculture (Blue Box)

The CIS interventions are amber box support and are therefore not relevant.

11 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Planned Unit Amount	Region(s)	Result Indicator(s)
DP04_O10_U01_HA - Specific amount of aid for sugar beet production	Uniform		R.4; R.6; R.7; R.8

Explanation and Justification (including the flexibility)

DP04_O10_U01_HA - Specific amount of aid for sugar beet production

Brief description of the determination of the specific value

The determination of the unit value has been supported by the experience gained in 2015-2022 and relative stability among the supported sectors. This provided adequate basic data on the role of coupled aid in sugar beet cultivation revenues and what its absence would cause for operational success.

The findings of the SWOT analysis showed that coupled aid is a key element for sugar beet cultivation. Therefore, based on the needs identified in the needs assessment and addressing the difficulties indicated, Hungary opted for targeted support for the sensitive sectors identified in the submitted plan, such as sugar beet cultivation.

For the calculation of the unit value, we relied on data from sector situation analyses. The multi-annual statistical data sets have been used to determine the amount that is typically sufficient to minimise or, where appropriate, raise the profitability of a given activity to an expected level. Our aim is to prevent the cessation of activities or conversion to other crops (e.g. wheat with higher incomes, maize, oil crops). This is particularly important in ensuring that Hungary's food supply is guaranteed for sugar (even if part of the supply is covered by imports). The suitability of the specific value may, of course, be changed from year to year due to external factors, which is why there is a need for a solid band to manage the swings.

Support for **the use of** yield categories is provided in the detailed background document. The proportion of farms with stable production in high yield categories is so low that it does not jeopardise targeting and does not mean massive support for producers who thrive without support. The purpose of using the categories of yields is to demonstrate that the difficulty is largely justified, but it is not possible to distinguish between categories of beneficiaries because of the variability in the classification per year.

In general, the planning of **stable outputs** clearly shows our intentions. This is to keep sugar beet production at levels and to prevent further shrinking. This also means that it does not provide incentives for irrigation. This in turn contributes to responsible treatment of natural resources (including water and soil).

Minimum and maximum value of the specific value

For the sugar beet aid, a minimum and a maximum value are fixed at a unit value of EUR 653,11/ha.

Variance of the specific value: $\pm 35\%$

When setting the minimum and maximum amounts of the unit payment, the following methodology was followed:

- We examined the extremes recorded during the period 2015-2021 for approved areas.
- The data for the submission of applications for 2022 are now available to help predict the expected evolution of trends.
- The effect of changes in product areas has been filtered out using the detailed tables for comparability (*not relevant for sugar beet*).
- Where we found extreme values at the beginning of the period, they were removed from the series.
- The envelope sizes valid from 2023 onwards have been assigned to the fixed extremes to obtain the theoretical specific values for the extremes.

—The deviations of these extremes from the planned specific values are reflected in the specific bands (minimum and maximum values) modelled from the previous period.

—These calculations were adjusted to reflect the risks identified, forecasts from the industry and expected market trends.

—The calculations show that a further reduction in the bands would already lead to a significant increase in financial risks.

Specific explanation: It is necessary to maintain a sufficiently secure net to manage the risk of single-channel sales. The production area of sugar beet in Hungary is very low, with the result that the loss of a few thousand hectares can trigger a significant increase in the unit value. The 2022 application shows the lowest area so far, which is likely to have an impact on high incomes for benchmark products (mainly maize) in the context of a drop in external sales.

(Information supporting each finding, more detailed reasoning can be found in the analysis of the situation in the sector.)

1 Territorial scope and, if relevant, regional dimension

Territorial scope: **National**

Code	Description
HU	Magyarország

Description of the Territorial Scope

The whole territory of Hungary.

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO1 Support viable farm income and resilience of the agricultural sector across the Union in order to enhance long-term food security and agricultural diversity as well as to ensure the economic sustainability of agricultural production in the Union

SO2 Enhance market orientation and increase farm competitiveness, both in the short and long term, including greater focus on research, technology and digitalisation

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
1.1.1	Predictable basic income for farmers	2	Yes
1.1.2	Provision of available loan financing	2	Partially
1.1.3.	Improving the profitability of small farms	2	Yes
1.2.1	Tackling adverse climatic events and damage caused by climate change in agriculture	1	Yes
1.2.3	Offsetting and mitigating the impact of market risks	2	Yes
2.1.1	Increasing operational and business efficiency of production	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.4 Share of utilised agricultural area (UAA) covered by income support and subject to conditionality

R.6 Percentage of additional direct payments per hectare for eligible farms below average farm size (compared to average)

R.7 Percentage of additional support per hectare in areas with higher needs (compared to average)

R.8 Share of farms benefitting from coupled income support for improving competitiveness, sustainability or quality

5 Specific design, requirements and eligibility conditions of the intervention

Description

For rice growers and their families, it is of the utmost importance that coupled payments, which specifically support genuine production, together with the basic payment, form a real safety net that ensures an expected level of resilience in the event of income fluctuations due to weather and market

risks.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary, the area and, when applicable, other relevant obligations

Rice production aid shall be granted to an active farmer who is entitled to direct payments under the relevant national legislation.

Specific eligibility criteria:

- Cultivates rice falling within CN code 1006 10;
- Use at least the minimum quantity of certified propagating material per hectare set out in the table for the entire area declared by it for the purpose of applying for coupled direct aid, certifies that the propagating material has been purchased or is insured against damage relevant to the cultivation of the rice in respect of the area claimed;
- Discard rice by 31 May at the latest;
- A minimum yield of 2.5 t/ha is demonstrated to be achieved.

English title	Latin description	Min. plate count/ha*
Rice	Oryza sativa	270 000

*: The values in the table are mean values from which a tolerance of $\pm 20\%$ is allowed. This flexibility is the possibility to adjust the mean values where necessary, and not a possibility for beneficiaries to deviate from the fixed standard values.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Range and amounts of support

Description

The intervention is announced with a single unit value, which represents the same amount per hectare for each rice grower and applicant. Territorial differentiation is not applied.

8 Additional questions/information specific to the Type of Intervention

Justification of the difficulty(ies) that the targeted sector(s)/production(s) or type(s) of farming therein undergo.

The specific support for rice production in Hungary **is justified by** the fact that the income that can be realised for producers in the sector is negative without coupled aid and, even with subsidies, it falls short of the income generated by the cultivation of the main arable crops.

This difficulty is caused by low yields, drastic increases in input prices, low buying-in prices, import dependency or the need for specific technology to grow it, resulting in higher inputs than cereals (**secondary arguments**).

In the absence of coupled aid, the sector of in-situ settlements is likely to disappear.

What is the aim of the intervention with regard to the targeted sector(s)/production(s) or type(s) of farming therein?

- ☐ to improve competitiveness
☒ to improve quality
☒ to improve sustainability

How will the intervention address the identified difficulty(ies) by this aim (i.e. explanation about the targeting)?

According to the consultation of the sectors and the needs assessment compiled on the basis of **the SWOT analysis, our aim is to stabilise the sector's profitability and improve its resilience** in order to maintain it despite its low income-generating capacity, contributing to increasing Hungary's rice self-sufficiency and food security. In addition, the ecosystem services provided by the sector are maintained. In order to maintain **the long-term improvement of the sector's situation**, the eligibility criteria include a minimum expected return. In addition, in order to promote sustainable production, the use of certified seed is foreseen as a new standard, with the option of using crop-relevant insurance as an alternative. Our aim is thus to address the difficulties arising from low yields. In addition to stabilising income, direct aid plays an important role in farmers' farming, as they generate the necessary own resources and cover for the necessary improvements. In addition, stabilising farmers' incomes promotes modernisation, digitalisation and thus improved production efficiency.

What is (are) the sector(s) concerned?

Rice

Justification of the importance of the targeted sector(s)/production(s) or type(s) of farming therein

In the absence of coupled aid, the sector of in-situ settlements is likely to disappear. It is necessary to avoid this because the **environmental importance of the sector** is very diverse.

- It is important for security of supply to partially cover domestic needs.
- Rice production helps to preserve biodiversity and the landscape and preserves the natural environment, and is of particular importance for the protection of the Hungarian population of *Glareola pratincola* (*Glareola pratincola*).
- It uses areas of weakness that are less suited to other arable crops.
- The drainage network of rice yards is an important tool for the internal decontamination of the areas along the main drainage channel.
- High-quality rice research is carried out in the south-east of Hungary (Szarvas).
- In Jász-Nagykun-Szolnok County, in the northern part of the Nagykunság, the EU protected geographical indication (PGI) 'Nagykun rizs' is grown from varieties adapted to the region's soil and climate conditions.

Explanation how the intervention is consistent with the Water Framework Directive (i.e. 2000/60/EC).

Compliance with the Water Framework Directive is considered to be ensured horizontally through the adequacy of the legislative environment. The licensing system described in detail in section 3.3 provides sufficient safeguards for the start of new activities. For farms already in operation, it is important to clarify: The water use licensing system presented is not an offer that Hungary undertakes from 2023 onwards. This is a description of a system that has been in place for many years and has evolved and strengthened since the entry into force of the Directive for water use for agricultural purposes.

In addition, it can be concluded from the eligibility criteria and the amount of aid for rice production that the unit payment is uniform for all producers, without any incentive to achieve higher yields and thus does not encourage higher water use. Stable output planning also proves that Hungary does not aim at intensification of agricultural production.

Under domestic climatic conditions, rice can only be grown using flooding technology, which is mainly possible in the district of the irrigation systems of the Tisza valley and the Körös valley. At the same time, after the flooding period, the water is discharged in a practically cleaner form.

The drainage network of the demolished rice yards already installed is an important tool for the internal decontamination of the areas along the main drainage channel.

Among the elements of conditionality applicable from 2023, the SMR 1 contains a specific basic requirement for the implementation of the Directive, which can thus be held accountable to producers through the system of checks and penalties for conditionality. Proper national implementation and control

of the standard thus establishes a link between the authorisation procedures for water abstraction for irrigation and the payment of payments under the CAP.

This point of the Directive is also one of the mandatory basic measures of any river basin management plan.

As additional information, it can be noted that Section II. Through Pillar-funded investment facilities, we are planning to devote significant resources to the widest possible uptake of precision farming, promoting a more rational and sustainable use of natural resources (including water).

Given the relevance of irrigated farming in this item, the additional control described in section 3.3 will be introduced.

This ensures that the scheme does not jeopardise the achievement of the objectives laid down in Hungary's river basin management plan.

Overall, the ecosystem services provided by the sector, including the utilisation of weak areas or the cleanliness of water flowing back from the land, have overall greater environmental added value than the loss caused by evaporation during the flooding period of rice cultivation.

Is the intervention financed, partly or completely, from the protein crop top up (maximum 2% in total) in accordance with Art. 96(3) of SPR?

☐ Yes ☒ No

If the intervention targets a mix between legumes and grasses: please indicate the minimum percentage of legumes in the mix.

N/A

Coupled income support granted to silkworms is an animal based support, where the use of 'head' as the support's basic unit requires prior clarification of the followings:

please clarify the conversion rate between this unit and 'head' (i.e. how many of this unit corresponds to '1 head'?) for the purpose of e.g. indicators.

It is possible to give further clarification in comment (e.g. the weight of eggs that a box must contain)

9 WTO compliance

Amber Box

Explanation of whether and, if so, how the intervention respects relevant provisions of Article 6.5 or Annex 2 to the WTO Agreement on Agriculture (Blue Box)

The CIS interventions are amber box support and are therefore not relevant.

11 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Planned Unit Amount	Region(s)	Result Indicator(s)
DP05_O10_U01_HA - Specific amount of aid for rice production	Uniform		R.4; R.6; R.7; R.8

Explanation and Justification (including the flexibility)

DP05_O10_U01_HA - Specific amount of aid for rice production

Brief description of the determination of the specific value

The determination of unit values has been supported by the experience gained in 2015-2022 and relative stability among the supported sectors. This provided sufficient basic data on the role played by coupled aid in the income of rice cultivation and what its absence would make for operational success.

The findings of the SWOT analysis showed that coupled aid is a key element for rice cultivation. Therefore, based on the needs identified in the needs assessment and addressing the difficulties indicated, Hungary opted for targeted support for the sensitive sectors identified in the submitted plan, including rice cultivation.

For the calculation of the unit value, we relied on data from sector situation analyses. The multi-annual statistical data sets have been used to determine the amount that is typically sufficient to minimise or, where appropriate, raise the profitability of a given activity to an expected level. Our aim is to prevent the cessation of a given activity or the transition to other crops (e.g. Indian rice at a lower input). This is particularly important in ensuring that Hungary's food supply is guaranteed for rice (even if part of the supply is covered by imports). The suitability of the specific value may, of course, be changed from year to year due to external factors, which is why there is a need for a solid band to manage the swings.

In general, the planning of **stable outputs** clearly shows our intentions. This is to keep the output of rice cultivation at levels and to prevent further shrinking. This also means that it does not provide incentives for irrigation. This in turn contributes to responsible treatment of natural resources (including water and soil).

Minimum and maximum value of the specific value

For rice aid, *a minimum and a maximum value are fixed at a unit value of EUR 728,44/ha.*

Variance of the specific value: $\pm 20\%$

When setting the minimum and maximum amounts of the unit payment, the following methodology was followed:

- We examined the extremes recorded during the period 2015-2021 for approved areas.
- The data for the submission of applications for 2022 are now available to help predict the expected evolution of trends.
- The effect of changes in product areas has been filtered out using the detailed tables for comparability (*not relevant for sugar beet*).
- Where we found extreme values at the beginning of the period, they were removed from the series.
- The envelope sizes valid from 2023 onwards have been assigned to the fixed extremes to obtain the theoretical specific values for the extremes.
- The deviations of these extremes from the planned specific values are reflected in the specific bands (minimum and maximum values) modelled from the

previous period.

—These calculations were adjusted to reflect the risks identified, forecasts from the industry and expected market trends.

—The calculations show that a further reduction in the bands would already lead to a significant increase in financial risks.

Specific explanation: The width of the band may be justified in the light of historical data. It is also a question of the impact that certified seed use or insurance will have as a new expectation. The production area of the rice in Hungary is very small, so the loss of a few hundred hectares can trigger a significant increase in the unit value.

(Information supporting each finding, more detailed reasoning can be found in the analysis of the situation in the sector.)

R.7 Percentage of additional support per hectare in areas with higher needs (compared to average)

R.8 Share of farms benefitting from coupled income support for improving competitiveness, sustainability or quality

5 Specific design, requirements and eligibility conditions of the intervention

Description

It is of the utmost importance for producers and their families to grow vegetable and herbs that coupled with a production-linked payment that specifically supports genuine production, together with the basic payment, there is a genuine safety net that ensures the required level of resilience in the event of income

fluctuations arising from these weather and market risks.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary, the area and, when applicable, other relevant obligations

An active farmer who is entitled to a direct payment under the relevant national legislation shall be entitled to the aid for the production of vegetable crops.

Specific eligibility criteria:

- cultivate a vegetable plant as defined in the table below using field, greenhouse or film-rearing technology:

- until flowering begins, retain each of the vegetable plants specified in the Annex to be preserved until flowering begins, or

- the vegetable plants referred to in the Annex which are not to be preserved until the start of flowering shall be kept on the area for at least a further two weeks after the submission of the aid application or, in the case of an amendment of the eligible crop, the amendment of the aid application.

- in the case of planting or sowing in respect of the application for the current year, use at least the minimum quantity of propagating material per hectare specified in the table for the entire area declared by it for the purpose of applying for coupled direct aid and certify the purchase of the propagating material, or

- in the case of horseradish, asparagus, peppermint, tarpaulin, rosemary, vegetative propagation from its own stock, declare the use of the minimum cuttings or cubes per hectare set out in the table for the total area declared for coupled direct aid, and record the actual quantity used on the relevant entries in the farm log.

By requiring the use of certified material, coupled aid can contribute to the EU's environmental and climate objectives. The aim of the standard is to ensure that farmers grow resistant varieties that can cope with the negative effects of climate change, thereby promoting the climate-adaptation of agriculture.

*: The values in the table are mean values from which a tolerance of $\pm 20\%$ is allowed. This flexibility is an option to adjust the mean values as necessary and not a derogation for beneficiaries from the set standard values.

**: Depending on which part of the vegetable plant is consumed, it is necessary to separate the vegetable plants. The aim is to ensure genuine production of goods in the case of crops subject to coupled aid. For some vegetables, a 2-week period is sufficient, as once they have been grown, the leaves of the plant are

consumed. (E.g.: spinach, salt) In contrast, in the case of the other group of vegetables, actual production can be ensured if preservation until flowering starts is the minimum condition, as the fruit is formed after flowering. (E.g. tomatoes, cucumbers)

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Range and amounts of support

Description

The intervention is announced with a single unit value, which represents the same amount per hectare for all vegetable growers and applicants. Territorial differentiation is not applied.

8 Additional questions/information specific to the Type of Intervention

Justification of the difficulty(ies) that the targeted sector(s)/production(s) or type(s) of farming therein undergo.

The main reason for targeted support for the cultivation of vegetable crops in **Hungary** is the fact that the production area is on a downward trend. In addition, the level of income available to producers in the sector varies significantly from year to year, sometimes unpredictable.

This difficulty is caused by volatile and low yields due to extreme weather conditions, drastic increases in input prices, fluctuations in producer prices, lack of homogeneous commodity bases, high entry barriers for herbs and higher production costs per hectare compared to benchmark crops for arable crops (maize, wheat, sunflower) (**secondary arguments**).

What is the aim of the intervention with regard to the targeted sector(s)/production(s) or type(s) of farming therein?

☐ to improve competitiveness

☒ to improve quality

☒ to improve sustainability

How will the intervention address the identified difficulty(ies) by this aim (i.e. explanation about the targeting)?

According to the consultation of the sectors and the needs assessment compiled on the basis of **the SWOT analysis, our aim is to stabilise the sector's profitability and improve its resilience** in order to maintain income in spite of fluctuations, contributing to the supply of healthy food to the population, including food security. In addition, the positive effects on, for example, the preservation of biodiversity or the rural workforce are maintained. Coupled aid also helps to bridge the period during which the positive effects of further interventions in the sector start to work (e.g.: measures to improve the bargaining power of producers).

In order to promote sustainable production, in order to maintain **the long-term improvement of the situation in the sector**, the eligibility conditions include certified seed use and minimum numbers of seed (and thousands of seed weight), seedlings, onions, teats and cuttings per hectare for arable vegetable plants, herbs and, in the case of precipitation, seedling numbers. The aim is therefore to address the difficulties caused by fluctuations in yields and low yields. In addition to stabilising income, direct aid plays an important role in farmers' farming, as they generate the necessary own resources and cover for the necessary improvements. In addition, stabilising farmers' incomes promotes modernisation, digitalisation and thus improved production efficiency.

What is (are) the sector(s) concerned?

Fruit and vegetables

Justification of the importance of the targeted sector(s)/production(s) or type(s) of farming therein

In the absence of coupled subsidies, the sector would be at risk of shrinking. It is necessary to avoid this because the **importance of the sector** is very diverse.

- Vegetables are a basic food that should be delivered to consumers or processors through the shortest possible supply chain (minimising the environmental burden), so local production is essential.
- It plays a key role in food security and health promotion.
- Farms applying for coupled support for vegetable crops tend to grow on less than 5 hectares. The diversity of cultivated species and the maintenance of smaller-scale species in production are important for the conservation of biodiversity.
- Due to its high annual labour consumption per hectare, the sector contributes to the employment and retention of the rural population.

Explanation how the intervention is consistent with the Water Framework Directive (i.e. 2000/60/EC).

Compliance with the Water Framework Directive is considered to be ensured horizontally through the adequacy of the legislative environment. The licensing system described in detail in section 3.3 provides sufficient safeguards for the start of new activities. For farms already in operation, it is important to clarify: The water use licensing system presented is not an offer that Hungary undertakes from 2023 onwards. This is a description of a system that has been in place for many years and has evolved and strengthened since the entry into force of the Directive for water use for agricultural purposes.

In addition, it can be concluded from the eligibility criteria and the amount of aid for the aid for the production of vegetable crops that the unit payment is uniform for all producers, without any incentive to achieve higher yields and thus does not encourage higher water use. Stable output planning also proves that Hungary does not aim at intensification of agricultural production.

Among the elements of conditionality applicable from 2023, the SMR 1 contains a specific basic requirement for the implementation of the Directive, which can thus be held accountable to producers through the system of checks and penalties for conditionality. Proper national implementation and control of the standard thus establishes a link between the authorisation procedures for water abstraction for irrigation and the payment of payments under the CAP.

This point of the Directive is also one of the mandatory basic measures of any river basin management plan.

As additional information, it can be noted that Section II. Through Pillar-funded investment facilities, we are planning to devote significant resources to the widest possible uptake of precision farming, promoting a more rational and sustainable use of natural resources (including water).

Given the relevance of irrigated farming in this item, the additional control described in section 3.3 will be introduced.

This ensures that the scheme does not jeopardise the achievement of the objectives laid down in Hungary's river basin management plan.

Is the intervention financed, partly or completely, from the protein crop top up (maximum 2% in total) in accordance with Art. 96(3) of SPR?

☐ Yes ☒ No

If the intervention targets a mix between legumes and grasses: please indicate the minimum percentage of legumes in the mix.

N/A

Coupled income support granted to silkworms is an animal based support, where the use of 'head' as the support's basic unit requires prior clarification of the followings:

11 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Planned Unit Amount	Region(s)	Result Indicator(s)
DP06_O10_U01_HA - Specific amount of aid for vegetable crops	Uniform		R.4; R.6; R.7; R.8

Explanation and Justification (including the flexibility)

DP06_O10_U01_HA - Specific amount of aid for vegetable crops

Brief description of the determination of the specific value

The determination of the unit value has been supported by experience gained in 2015-2022 and relative stability among supported cultures. This provided adequate basic data on the role of coupled aid in vegetable crop production income and what its absence would cause for operational success.

The findings of the SWOT analysis showed that coupled aid is a key element for vegetable production. Therefore, based on the needs identified in the needs assessment and addressing the difficulties indicated, Hungary opted for targeted support for the sensitive sectors identified in the submitted plan, including vegetable crop production.

For the calculation of the unit value, we relied on data from sector situation analyses. The multi-annual statistical data sets have been used to determine the amount that is typically sufficient to minimise or, where appropriate, raise the profitability of a given activity to an expected level. Our aim is to prevent the cessation of activities or conversion to other crops (e.g. wheat with higher incomes, maize, oil crops). This is particularly important in ensuring that Hungary's food supply for fresh vegetables is guaranteed. The suitability of the specific value may, of course, be changed from year to year due to external factors, which is why there is a need for a solid band to manage the swings.

Support for the **use of yield** categories is provided in the background document. The proportion of farms with stable production in high yield categories is so low that it does not jeopardise targeting and does not mean massive support for producers who thrive without support. The purpose of using the categories of yields is to demonstrate that the difficulty is largely justified, but it is not possible to distinguish between categories of beneficiaries because of the variability in the classification per year.

In general, the planning of **stable outputs** clearly shows our intentions. This is to maintain the production of vegetable crops at levels and to prevent further shrinkage. This also means that it does not provide incentives for irrigation. This in turn contributes to responsible treatment of natural resources (including water and soil).

Minimum and maximum value of the specific value

For the aid for the production of vegetable crops, a minimum and a maximum value of EUR 292,80 per hectare are fixed.

Variance of the specific value: + 20 %/-25 %

When setting the minimum and maximum amounts of unit aid, the following methodology was followed:

- We examined the extremes recorded during the period 2015-2021 for approved areas.
- The data for the submission of applications for 2022 are now available to help predict the expected evolution of trends.
- The impact of changes in product areas (e.g. loss of potatoes, reclassification of some crops from industrial vegetable envelopes (spine, brine, beans, pot

corn)) has been filtered out for the sake of comparability.

—Where we found extreme values at the beginning of the period, they were removed from the series.

—The envelope sizes valid from 2023 onwards have been assigned to the fixed extremes to obtain the theoretical specific values for the extremes.

—The deviations of these extremes from the planned specific values are reflected in the specific bands (minimum and maximum values) modelled from the previous period.

—These calculations were adjusted to reflect the risks identified, forecasts from the industry and expected market trends.

—The calculations show that a further reduction in the bands would already lead to a significant increase in financial risks.

Specific explanation: Historical data, market swings and extreme weather conditions make it necessary to leave a sufficient margin of manoeuvre. The vegetable envelope has been supplemented by some crops previously included in the industrial vegetable envelope (salt, spinach, beans, potting maize), which also justifies some caution in the financial planning of the envelope. The maximum tolerance level for deviation has been reduced, with confidence to stop the decline in the area.

(Information supporting each finding, more detailed reasoning can be found in the analysis of the situation in the sector.)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.4 Share of utilised agricultural area (UAA) covered by income support and subject to conditionality

R.6 Percentage of additional direct payments per hectare for eligible farms below average farm size (compared to average)

R.7 Percentage of additional support per hectare in areas with higher needs (compared to average)

R.8 Share of farms benefitting from coupled income support for improving competitiveness, sustainability or quality

5 Specific design, requirements and eligibility conditions of the intervention

Description

For producers of industrial vegetable crops and their families, it is of the utmost importance that coupled payments, which specifically support genuine production, together with the basic payment, form a real safety net that ensures an expected level of resilience in the event of income fluctuations resulting from

these weather and market risks.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary, the area and, when applicable, other relevant obligations

An active farmer who is entitled to a direct payment under the relevant national legislation shall be eligible for aid for industrial vegetable production.

Specific eligibility criteria:

- cultivate a plant as shown in the table below,
- use at least the minimum quantity of propagating material per hectare set out in the table for the entire area declared by it for the purposes of applying for coupled direct aid and certify the purchase of the propagating material, and
- the plant shall be kept under normal growth conditions until at least the beginning of flowering.

By requiring the use of certified material, coupled aid can contribute to the EU's environmental and climate objectives. The aim of the standard is to ensure that farmers grow resistant varieties that can cope with the negative effects of climate change, thereby promoting the climate-adaptation of agriculture.

English title	Latin denomination	Min. seed pieces/hectare*
Green peas (spring, autumn)	Pisum sativum	900 000
Sugar pea	P. sativum L. ssp. sativum convar. saccharatum	900 000
Sweetcorn	Zea mays convar. saccharata	55 000

*: The values in the table are mean values from which a tolerance of $\pm 20\%$ is allowed. This flexibility is an option to adjust the mean values as necessary and not a derogation for beneficiaries from the set standard values.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Range and amounts of support

Description

The intervention is announced with a single unit value, which represents the same amount per hectare for each producer and applicant producing vegetable crops for industrial processing. Territorial differentiation is not applied.

8 Additional questions/information specific to the Type of Intervention

Justification of the difficulty(ies) that the targeted sector(s)/production(s) or type(s) of farming therein undergo.

The specific support for industrial vegetable production in Hungary is **justified by the fact** that the income that can be realised for producers in the sector is low and the level of income available varies significantly from year to year, and sometimes unpredictable.

This difficulty is caused by volatile yields due to extreme weather conditions, drastic increases in input prices, fluctuations in producer prices, lack of homogeneous commodity bases, higher production costs per hectare and higher production risk compared to benchmark crops in arable crops (maize, wheat, sunflower) (**secondary arguments**).

In the absence of coupled subsidies, the sector would be at risk of shrinking.

What is the aim of the intervention with regard to the targeted sector(s)/production(s) or type(s) of farming therein?

- ☐ to improve competitiveness
- ☒ to improve quality
- ☒ to improve sustainability

How will the intervention address the identified difficulty(ies) by this aim (i.e. explanation about the targeting)?

According to the consultation of the sectors and the needs assessment compiled on the basis of **the SWOT analysis, our aim is to stabilise the sector's profitability and improve its resilience** in order to maintain income in spite of fluctuations, contributing to the supply of healthy food to the population, including food security. In addition, the positive effects on, for example, biodiversity, the supply of raw materials to the processing industry and the preservation of the rural workforce are maintained. Coupled aid also helps to bridge the period during which the positive effects of further interventions in the sector start to work (e.g.: measures to improve the bargaining power of producers). Coupled aid also helps to bridge the period during which the positive effects of further interventions in the sector start to work (e.g.: measures to improve the bargaining power of producers).

In order to promote sustainable production, in order to maintain **the long-term improvement of the situation in the sector**, the eligibility conditions include certified seed use and a minimum number of pieces of seed (and 1000 seed weight) per hectare. The aim is therefore to address the difficulties arising from fluctuations in yields. In addition to stabilising income, direct aid plays an important role in farmers' farming, as they generate the necessary own resources and cover for the necessary improvements. In addition, stabilising farmers' incomes promotes modernisation, digitalisation and thus improved production efficiency.

What is (are) the sector(s) concerned?

Fruit and vegetables

Justification of the importance of the targeted sector(s)/production(s) or type(s) of farming therein

In the absence of coupled subsidies, the sector would be at risk of shrinking. It is necessary to avoid this because the **importance of the sector is** very diverse.

- Green peas and sweet corn represent a significant share of the acquisition of *the processing industry (70-80 % of output and purchases of raw materials by the refrigeration and canning industry in Hungary)*. Supplying these businesses with feedstock increases food security. This should be delivered to processors through the shortest possible supply chain (minimising the environmental burden), so local product production is essential.
- It plays a key role in food security and health promotion.
- Almost half of the applicant holdings have an area of less than 5 hectares. Keeping smaller-scale species in production is important for the conservation of biodiversity.
- Due to its high annual labour consumption per hectare, the sector contributes to the employment and retention of the rural population.

Explanation how the intervention is consistent with the Water Framework Directive (i.e. 2000/60/EC).

Compliance with the Water Framework Directive is considered to be ensured horizontally through the adequacy of the legislative environment. The licensing system described in detail in section 3.3 provides sufficient safeguards for the start of new activities. For farms already in operation, it is important to clarify: The water use licensing system presented is not an offer that Hungary undertakes from 2023 onwards. This is a description of a system that has been in place for many years and has evolved and strengthened since the entry into force of the Directive for water use for agricultural purposes.

In addition, it can be concluded from the eligibility criteria and the amount of aid for industrial vegetable crop production that the unit payment is uniform for all producers, without any incentive to achieve higher yields and thus does not encourage higher water use. Stable output planning also proves that Hungary

does not aim at intensification of agricultural production.

Among the elements of conditionality applicable from 2023, the SMR 1 contains a specific basic requirement for the implementation of the Directive, which can thus be held accountable to producers through the system of checks and penalties for conditionality. Proper national implementation and control of the standard thus establishes a link between the authorisation procedures for water abstraction for irrigation and the payment of payments under the CAP.

This point of the Directive is also one of the mandatory basic measures of any river basin management plan.

As additional information, it can be noted that Section II. Through Pillar-funded investment facilities, we are planning to devote significant resources to the widest possible uptake of precision farming, promoting a more rational and sustainable use of natural resources (including water).

Given the relevance of irrigated farming in this item, the additional control described in section 3.3 will be introduced.

This ensures that the scheme does not jeopardise the achievement of the objectives laid down in Hungary's river basin management plan.

DP07_O10_U01_HA - Specific amount of aid for industrial vegetable production	Uniform		R.4; R.6; R.7; R.8

Explanation and Justification (including the flexibility)

DP07_O10_U01_HA - Specific amount of aid for industrial vegetable production

Brief description of the determination of the specific value

The determination of the unit value has been supported by experience gained in 2015-2022 and relative stability among supported cultures. This has provided sufficient basic data on the role of coupled aid in the income of industrial vegetable crops and what its absence would cause for operational success.

The findings of the SWOT analysis showed that coupled aid is a key element for industrial vegetable production. Therefore, based on the needs identified in the needs assessment and addressing the difficulties indicated, Hungary opted for targeted support for the sensitive sectors identified in the submitted plan, such as industrial vegetable production.

For the calculation of the unit value, we relied on data from sector situation analyses. The multi-annual statistical data sets have been used to determine the amount that is typically sufficient to minimise or, where appropriate, raise the profitability of a given activity to an expected level. Our aim is to prevent the cessation of activities or conversion to other crops (e.g. wheat with higher incomes, maize, oil crops). This is particularly important in ensuring that Hungary's food supply for these products is guaranteed. The suitability of the specific value may, of course, be changed from year to year due to external factors, which is why there is a need for a solid band to manage the swings.

Support for the **use of yield** categories is provided in the background document. The proportion of farms with stable production in high yield categories is so low that it does not jeopardise targeting and does not mean massive support for producers who thrive without support. The purpose of using the categories of yields is to demonstrate that the difficulty is largely justified, but it is not possible to distinguish between categories of beneficiaries because of the variability in the classification per year.

In general, it should also be pointed out that the design of **stable outputs** clearly shows our intentions. This is to maintain the production of industrial vegetable crops at levels and prevent their shrinkage. This also means that it does not provide incentives for irrigation. This in turn contributes to responsible treatment of natural resources (including water and soil).

Minimum and maximum value of the specific value

For the aid for vegetable crops for industrial processing, **a minimum and a maximum value of EUR 376,14 per hectare are fixed.**

Variance of the specific value: $\pm 20\%$

When setting the minimum and maximum amounts of unit aid, the following methodology was followed:

- We examined the extremes recorded during the period 2015-2021 for approved areas.
- The data for the submission of applications for 2022 are now available to help predict the expected evolution of trends.
- For the sake of comparability, the impact of changes in product areas has been filtered out using detailed data tables (the reclassification of certain crops

into the vegetable envelope (peno, brine, beans, potting maize)).

—Where we found extreme values at the beginning of the period, they were removed from the series.

—The envelope sizes valid from 2023 onwards have been assigned to the fixed extremes to obtain the theoretical specific values for the extremes.

—The deviations of these extremes from the planned specific values are reflected in the specific bands (minimum and maximum values) modelled from the previous period.

—These calculations were adjusted to reflect the risks identified, forecasts from the industry and expected market trends.

—The calculations show that a further reduction in the bands would already lead to a significant increase in financial risks.

Specific explanation: The width of the band is justified in the light of historical data. Strong demand from the manufacturing industry and disciplined contractual relations allow for a relatively narrow range.

(Information supporting each finding, more detailed reasoning can be found in the analysis of the situation in the sector.)

7 Range and amounts of support

Description

The intervention is announced with a single unit value, which represents the same amount per hectare for all producers and applicants of oil crops grown for industrial processing. No territorial differentiation is applied.

8 Additional questions/information specific to the Type of Intervention

Justification of the difficulty(ies) that the targeted sector(s)/production(s) or type(s) of farming therein undergo.

The specific support for the cultivation of industrial oil crops in Hungary is justified by the fact that the income available to producers in the sector is low and the level of income available fluctuates significantly from year to year.

This difficulty is caused by volatile yields due to extreme weather conditions, drastic increases in input prices, the need for special instruments that cannot be used in other crops, and higher production costs per hectare compared to benchmark crops for arable crops (maize, wheat, sunflower) (**secondary arguments**).

In the absence of coupled aid, due to the strong import pressure at the processing level, the sector would be at risk of shrinking or even disappearing.

What is the aim of the intervention with regard to the targeted sector(s)/production(s) or type(s) of farming therein?

- ☐ to improve competitiveness
- ☒ to improve quality
- ☒ to improve sustainability

How will the intervention address the identified difficulty(ies) by this aim (i.e. explanation about the targeting)?

According to the needs assessment drawn up on the basis of the consultation of the sectors **and the SWOT analysis, we aim to stabilise the sector's profitability and improve its resilience** in order to maintain income despite fluctuations, contributing to the survival of the liveable countryside, preserving biodiversity and supplying the processing industry with raw materials. Coupled support will also help bridge the period during which the positive effects of further interventions in the sector start to work (e.g.: measures to improve the bargaining power of producers). Coupled support will also help bridge the period during which the positive effects of further interventions in the sector start to work (e.g.: measures to improve the bargaining power of producers).

In order to promote sustainable production in order to maintain **the improvement of the sector's situation in the long term**, the eligibility criteria include the use of certified seed and minimum numbers of seedlings. By doing so, our aim is to help ensure the high quality and a more stable yield required by processors. In addition to stabilising income, direct aids play an important role in farmers' farming, as they create the necessary own resources and cover for the necessary improvements. The stabilisation of producer incomes also promotes modernisation and digitalisation, thus improving the efficiency of production.

What is (are) the sector(s) concerned?

Fruit and vegetables

Justification of the importance of the targeted sector(s)/production(s) or type(s) of farming therein

In the absence of coupled aid, due to the strong import pressure at the processing level, the sector would be at risk of shrinking or even disappearing. It is necessary to avoid this because the **importance of the sector is very diverse**.

- The sustainability of the functioning of the product chain will not be possible without stable supply to the manufacturing industry. The oil pumpkins must be delivered to processors through the shortest possible supply chain (minimising the environmental impact), so local production of products is essential.
- Almost half of the applicant holdings have an area of less than 5 hectares. Keeping smaller-scale species in production is important for the conservation of biodiversity.
- In addition to food and food supplements, oil pumpkin seeds are also used as a raw material for pharmaceutical products. This also means that the seeds to be processed must meet strict quality requirements.
- In practice, the processing of oil pumpkin seeds takes place in Hungary only on small scales, so it also plays a role in preserving the quality of life in the countryside and maintaining the population retention capacity of the countryside.

Explanation how the intervention is consistent with the Water Framework Directive (i.e. 2000/60/EC).

Compliance with the Water Framework Directive is considered to be ensured horizontally through the adequacy of the legislative environment. The licensing system described in detail in section 3.3 provides sufficient safeguards for the start of new activities. For farms already in operation, it is important to clarify: The water use licensing system presented is not an offer that Hungary undertakes from 2023 onwards. This is a description of a system that has been in place for many years and has evolved and strengthened since the entry into force of the Directive for water use for agricultural purposes.

In addition, it can be concluded from the eligibility criteria and the amount of aid for industrial oil crop

production that the unit payment is uniform for all producers, without any incentive to achieve higher yields and thus does not encourage higher water use. Stable output planning also proves that Hungary does not aim at intensification of agricultural production.

Among the elements of conditionality applicable from 2023, the SMR 1 contains a specific basic requirement for the implementation of the Directive, which can thus be held accountable to producers through the system of checks and penalties for conditionality. Proper national implementation and control of the standard thus establishes a link between the authorisation procedures for water abstraction for irrigation and the payment of payments under the CAP.

This point of the Directive is also one of the mandatory basic measures of any river basin management plan.

As additional information, it can be noted that Section II. Through Pillar-funded investment facilities, we are planning to devote significant resources to the widest possible uptake of precision farming, promoting a more rational and sustainable use of natural resources (including water).

The surplus check presented in chapter 3.3 does not apply to this item.

This ensures that the scheme does not jeopardise the achievement of the objectives laid down in Hungary's river basin management plan.

Is the intervention financed, partly or completely, from the protein crop top up (maximum 2% in total) in accordance with Art. 96(3) of SPR?

☐ Yes ☒ No

If the intervention targets a mix between legumes and grasses: please indicate the minimum percentage of legumes in the mix.

N/A

Coupled income support granted to silkworms is an animal based support, where the use of 'head' as the support's basic unit requires prior clarification of the followings:

please clarify the conversion rate between this unit and 'head' (i.e. how many of this unit corresponds to '1 head'?) for the purpose of e.g. indicators.

N/A

It is possible to give further clarification in comment (e.g. the weight of eggs that a box must contain)

9 WTO compliance

Amber Box

Explanation of whether and, if so, how the intervention respects relevant provisions of Article 6.5 or Annex 2 to the WTO Agreement on Agriculture (Blue Box)

The CIS interventions are amber box support and are therefore not relevant.

11 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Planned Unit Amount	Region(s)	Result Indicator(s)
DP08_O10_U01_HA - Specific amount of aid for vegetables for oil processing	Uniform		R.4; R.6; R.7; R.8

Explanation and Justification (including the flexibility)

DP08_O10_U01_HA - Specific amount of aid for vegetables for oil processing

Brief description of the determination of the specific value

The determination of the unit value has been supported by the experience gained in 2015-2022 and relative stability among the supported sectors. This has provided sufficient basic data on the role of coupled aid in the income of special vegetable crops and what its absence would cause for operational success.

The findings of the SWOT analysis showed that coupled aid is a key element for industrial oil crop production. Therefore, based on the needs identified in the needs assessment and addressing the difficulties indicated, Hungary opted for targeted support for the sensitive sectors identified in the submitted plan, such as industrial oil crop production.

For the calculation of the unit values, we relied on data from industry situation analyses. The multi-annual statistical data sets have been used to determine the amount that is typically sufficient to minimise or, where appropriate, raise the profitability of a given activity to an expected level. Our aim is to prevent the cessation of activities or conversion to other crops (e.g. wheat with higher incomes, maize, oil crops). This is particularly important to ensure that Hungary's food supply is also ensured for this product. The suitability of the specific value may, of course, be changed from year to year due to external factors, which is why there is a need for a solid band to manage the swings.

Support for the **use of yield** categories is provided in the background document. The proportion of farms with stable production in high yield categories is so low that it does not jeopardise targeting and does not mean massive support for producers who thrive without support. The purpose of using the categories of yields is to demonstrate that the difficulty is largely justified, but it is not possible to distinguish between categories of beneficiaries because of the variability in the classification per year.

In general, the planning of **stable outputs** clearly shows our intentions. This is to keep the output of industrial oil crops at levels and to prevent them from shrinking. This also means that it does not provide incentives for irrigation. This in turn contributes to responsible treatment of natural resources (including water and soil).

Minimum and maximum value of the specific value

For industrial oilseeds aid, **a minimum and a maximum value of EUR 109,59 per hectare are fixed.**

Variance of the specific value: $\pm 30\%$

When setting the minimum and maximum amounts of unit aid, the following methodology was followed:

—We examined the extremes recorded during the period 2015-2021 for approved areas.

—The data for the submission of applications for 2022 are now available to help predict the expected evolution of trends.

—For the sake of comparability, the impact of changes in product areas has been filtered out using *the detailed data tables (not relevant for industrial oil crop cultivation)*.

—Where we found extreme values at the beginning of the period, they were removed from the series.

- The envelope sizes valid from 2023 onwards have been assigned to the fixed extremes to obtain the theoretical specific values for the extremes.
- The deviations of these extremes from the planned specific values are reflected in the specific bands (minimum and maximum values) modelled from the previous period.
- These calculations were adjusted to reflect the risks identified, forecasts from sectors and expected market trends.
- The calculations show that a further reduction in the bands would already lead to a significant increase in financial risks.

Specific explanation: Historical data showed serious swings. In addition, the financial resources of the envelope are significantly reduced, which also justifies some caution in its planning.

(Information supporting each finding, more detailed reasoning can be found in the analysis of the situation in the sector.)

R.6 Percentage of additional direct payments per hectare for eligible farms below average farm size (compared to average)

R.7 Percentage of additional support per hectare in areas with higher needs (compared to average)

R.8 Share of farms benefitting from coupled income support for improving competitiveness, sustainability or quality

5 Specific design, requirements and eligibility conditions of the intervention

Description

For extensive fruit producers and their families, it is of the utmost importance that coupled payments, which specifically support genuine production, together with the basic payment, form a real safety net that ensures an expected level of resilience in the event of income fluctuations due to these weather and market

risks.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary, the area and, when applicable, other relevant obligations

An active farmer who is entitled to direct payments under the relevant national legislation shall be eligible for aid for extensive fruit production.

Specific eligibility criteria:

who cultivates plants planted as shown in the table below,

whose homogeneous plantation for which aid is applied for is at least the minimum number per hectare at the time of planting as set out in the table,

on the last day of the deadline for the submission of the single application without penalty, it fulfils any two of the following conditions:

the plantation does not exceed the age specified in the table,

b. the existence of fixed, installed irrigation,

C. In the case of a plantation, at least 85 %, and

declare that the conditions set out in points (b) to (c) are met.

English title	Latin name	Min. vine/ha*	Max. age

*: The values in the table are mean values from which a tolerance of $\pm 20\%$ is allowed. This flexibility is the possibility to adjust the mean values where necessary, and not a possibility for beneficiaries to deviate from the fixed standard values.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Range and amounts of support

Description

The intervention is announced with a single unit value, which represents the same amount per hectare for all extensively producing and applying for fruit. Territorial differentiation is not applied.

8 Additional questions/information specific to the Type of Intervention

Justification of the difficulty(ies) that the targeted sector(s)/production(s) or type(s) of farming therein undergo.

The main reason for targeted support for fruit production in Hungary **is** the fact that the production area is on a downward trend. The decrease is particularly striking for the most important key product (apples) and has been ongoing since 2015. In addition to apples, the area of fruit with significant production areas or traditions, such as plums, pears, peaches, nectarines, currants or raspberries, is on a declining trend. The number of fruit growers is also decreasing. In addition, the level of income that can be realised for producers in the sector varies significantly from year to year, sometimes unpredictable.

This difficulty is caused by volatile and low yields due to extreme weather conditions, drastic increases in input prices, fluctuations in producer prices, lack of homogeneous commodity bases, fluctuating quality and higher production costs per hectare compared to benchmark crops for arable crops (maize, wheat, sunflower) (**secondary arguments**).

In the absence of coupled aid, the sector would be at risk of shrinking, which would also have a negative impact on processing.

What is the aim of the intervention with regard to the targeted sector(s)/production(s) or type(s) of farming therein?

☐ to improve competitiveness

☒ to improve quality

☒ to improve sustainability

How will the intervention address the identified difficulty(ies) by this aim (i.e. explanation about the targeting)?

According to the consultation of the sectors and the needs assessment compiled on the basis of **the SWOT analysis, our aim is to stabilise the sector's profitability and improve its resilience** in order to maintain income in spite of fluctuations, contributing to the supply of healthy food to the population, including food security. In addition, the positive effects on, for example, the preservation of biodiversity or the rural workforce are maintained. Coupled aid also helps to bridge the period during which the positive effects of further interventions in the sector start to work (e.g.: measures to improve the bargaining power of producers).

In order to promote sustainable production in order to maintain **the long-term improvement of the situation in the sector**, the eligibility conditions include a minimum number of vines per hectare, the existence of a fixed irrigation system and a condition relating to the age of the plantation. The aim is

therefore to address the difficulties caused by fluctuations in yields and low yields. In addition to stabilising income, direct aid plays an important role in farmers' farming, as they generate the necessary own resources and cover for the necessary improvements. In addition, stabilising farmers' incomes promotes modernisation, digitalisation and thus improved production efficiency.

Intensive orchards play a major role in the production of fruit intended for fresh consumption, whereas the output of extensive and more mechanised plantations is primarily a source of raw material for the processing industry, from short transport distances. This is precisely what justifies extensive and intensive fruit-growing envelopes with two separate unit costs, which makes it possible to increase the targeting of the aid.

What is (are) the sector(s) concerned?

Fruit and vegetables

Justification of the importance of the targeted sector(s)/production(s) or type(s) of farming therein

In the absence of coupled aid, the sector would be at risk of shrinking, which would also have a negative impact on processing. It is necessary to avoid this because the **importance of the sector is** very diverse.

- Fruit is a basic food that should be delivered to consumers or processors through the shortest possible supply chain (minimising the environmental impact), so local production is essential.
- It plays a key role in food security and health promotion.
- Extensive plantations are mostly used for the production of raw materials in the manufacturing sector. The sustainability of the functioning of the product chain will not be possible without stable supply to the manufacturing industry.
- Farms applying for coupled support tend to farm less than 5 hectares. The diversity of cultivated species and the maintenance of smaller-scale species in production are important for the conservation of biodiversity.
- Due to the technological characteristics of fruit-growing, the sector also needs manual labour alongside mechanical work. Due to its high annual labour consumption per hectare, the sector thus contributes to the employment and retention of the rural population.

Explanation how the intervention is consistent with the Water Framework Directive (i.e. 2000/60/EC).

Compliance with the Water Framework Directive is considered to be ensured horizontally through the adequacy of the legislative environment. The licensing system described in detail in section 3.3 provides sufficient safeguards for the start of new activities. For farms already in operation, it is important to clarify: The water use licensing system presented is not an offer that Hungary undertakes from 2023 onwards. This is a description of a system that has been in place for many years and has evolved and strengthened since the entry into force of the Directive for water use for agricultural purposes.

In addition, it can be concluded from the eligibility criteria and the amount of aid for extensive fruit production that the unit payment is uniform for all producers, without any incentive to achieve higher yields and thus does not encourage higher water use. Stable output planning also proves that Hungary does not aim at intensification of agricultural production.

Among the elements of conditionality applicable from 2023, the SMR 1 contains a specific basic requirement for the implementation of the Directive, which can thus be held accountable to producers through the system of checks and penalties for conditionality. Proper national implementation and control of the standard thus establishes a link between the authorisation procedures for water abstraction for irrigation and the payment of payments under the CAP.

This point of the Directive is also one of the mandatory basic measures of any river basin management plan.

As additional information, it can be noted that Section II. Through Pillar-funded investment facilities, we are planning to devote significant resources to the widest possible uptake of precision farming, promoting a more rational and sustainable use of natural resources (including water).

Given the relevance of irrigated farming in this item, the additional control described in section 3.3 will be introduced.

This ensures that the scheme does not jeopardise the achievement of the objectives laid down in Hungary's river basin management plan.

Is the intervention financed, partly or completely, from the protein crop top up (maximum 2% in total) in accordance with Art. 96(3) of SPR?

☐ Yes ☒ No

If the intervention targets a mix between legumes and grasses: please indicate the minimum percentage of legumes in the mix.

11 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Planned Unit Amount	Region(s)	Result Indicator(s)
DP09_O10_U01_HA - Specific amount of aid for extensive fruit production	Uniform		R.4; R.6; R.7; R.8

Explanation and Justification (including the flexibility)

DP09_O10_U01_HA - Specific amount of aid for extensive fruit production

Brief description of the determination of the specific value

The determination of the unit value has been supported by the experience gained in 2015-2022 and relative stability among the supported sectors. This provided adequate basic data on the role played by coupled aid in the income of extensive fruit production and what its absence would make for operational success.

The findings of the SWOT analysis showed that coupled aid is a key element for extensive fruit production. Therefore, based on the needs identified in the needs assessment and addressing the difficulties indicated, Hungary opted for targeted support for the sensitive sectors identified in the submitted plan, including extensive fruit cultivation.

For the calculation of the unit values, we relied on data from industry situation analyses. The multi-annual statistical data sets have been used to determine the amount that is typically sufficient to minimise or, where appropriate, raise the profitability of a given activity to an expected level. Our aim is to prevent the cessation of activities or conversion to other crops. This is of particular importance in ensuring that Hungary's food supply for fruit is guaranteed. The suitability of the specific value may, of course, be changed from year to year due to external factors, which is why there is a need for a solid band to manage the swings.

Support for the **use of yield** categories is provided in the background document. The proportion of farms with stable production in high yield categories is so low that it does not jeopardise targeting and does not mean massive support for producers who thrive without support. The purpose of using the categories of yields is to demonstrate that the difficulty is largely justified, but it is not possible to distinguish between categories of beneficiaries because of the variability in the classification per year.

In general, the planning of **stable outputs** clearly shows our intentions. This is to maintain emissions from extensive fruit production or prevent it from shrinking. This also means that it does not provide incentives for irrigation. This in turn contributes to responsible treatment of natural resources (including water and soil).

Minimum and maximum value of the specific value

In the case of aid for extensive fruit production, a minimum and a maximum value of EUR 159,49 per hectare are fixed.

Variance of the specific value: + 20 %/-10 %

When setting the minimum and maximum amounts of unit aid, the following methodology was followed:

—We examined the extremes recorded during the period 2015-2021 for approved areas.

—The data for the submission of applications for 2022 are now available to help predict the expected evolution of trends.

- The impact of changes in product areas has been filtered out using the detailed tables for comparability (*not relevant for fruit production*).
- Where we found extreme values at the beginning of the period, they were removed from the series.
- The envelope sizes valid from 2023 onwards have been assigned to the fixed extremes to obtain the theoretical specific values for the extremes.
- The deviations of these extremes from the planned specific values are reflected in the specific bands (minimum and maximum values) modelled from the previous period.
- These calculations were adjusted to reflect the risks identified, forecasts from the industry and expected market trends.
- The calculations show that a further reduction in the bands would already lead to a significant increase in financial risks.

Specific explanation: According to the calculations, the risk of the envelope fluctuating is relatively low. At the same time, the bands have been differentiated. With the expectation of halting the reduction in the area, the maximum tolerance level for deviations is lower. At the same time, we see a need for more room for manoeuvre in the case of a minimum value, as the inclusion of new areas is unlikely.

(Information supporting each finding, more detailed reasoning can be found in the analysis of the situation in the sector.)

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
1.1.1	Predictable basic income for farmers	2	Yes
1.1.2	Provision of available loan financing	2	Partially
1.1.3.	Improving the profitability of small farms	2	Yes
1.2.1	Tackling adverse climatic events and damage caused by climate change in agriculture	1	Yes
1.2.3	Offsetting and mitigating the impact of market risks	2	Yes
2.1.1	Increasing operational and business efficiency of production	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.4 Share of utilised agricultural area (UAA) covered by income support and subject to conditionality

R.6 Percentage of additional direct payments per hectare for eligible farms below average farm size (compared to average)

R.7 Percentage of additional support per hectare in areas with higher needs (compared to average)

R.8 Share of farms benefitting from coupled income support for improving competitiveness, sustainability or quality

5 Specific design, requirements and eligibility conditions of the intervention

Description

For intensive fruit growers and their families, it is of the utmost importance that coupled payments, which specifically support genuine production, together with the basic payment, form a real safety net that ensures an expected level of resilience in the event of income fluctuations due to these weather and market

risks.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary, the area and, when applicable, other relevant obligations

An active farmer who is entitled to direct payments under the relevant national legislation shall be eligible for intensive fruit production aid.

Specific eligibility criteria:

- who cultivates plants planted according to the table below,
- whose homogeneous plantation for which aid is applied for is at least the minimum number per hectare at the time of planting, as set out in the table,
- on the last day of the deadline for submitting the single application without penalty any two of the following conditions:
 - o the plantation does not exceed the age specified in the table,
 - o the presence of fixed, planted irrigation,
 - o at least 85 % in the case of vineyards, and
- (d) declare that the conditions set out in points (b) to (c) are fulfilled.

English title	Latin name	Min. vine/ha*	Max. age
Strawberries	<i>Fragaria × ananassa</i>	40 000	2 years
Currants	<i>Ribes rubrum</i>	4700	10 years
Other currants	<i>Ribes nigrum</i>	4700	10 years

Piszke, Piske regular graft	<i>Ribes uva-crispa</i>	4700	10 years
Blackberries	<i>Rubus idaeus</i>	—	10 years
Spiked blackberries	<i>Rubus rusticanus</i> var. <i>inermis</i>	—	10 years
Buckthorn	<i>Hippophae</i> (<i>Elaeagnus</i>) <i>rhamnoides</i>	990	15 years
Black elder	<i>Sambucus nigra</i>	600	15 years
Apples	<i>Malus domestica</i>	1300	20 years
Pears	<i>Pyrus communis</i>	1000	25 years
Quince	<i>Cydonia oblonga</i>	500	20 years
Peaches, Nektarine	<i>Prunus persica</i>	660	20 years
Apricots (apricots)	<i>Prunus armeniaca</i>	400	20 years
Sour cherries	<i>Prunus cerasus</i>	660	20 years
Cherry	<i>Prunus</i> subg. <i>Cerasus</i>	660	20 years
Plums	<i>Prunus</i> subgenus <i>Prunus</i>	660	20 years
Naplesa	<i>Mespilus germanica</i>	—	20 years
Walnuts	<i>Juglans regia</i>	200	50 years
Hazel	<i>Corylus avellana</i>	410	20 years
Almonds	<i>Prunus amygdalus</i>	410	20 years
Chestnuts	<i>Castanea sativa</i>	200	50 years
Blueberries	<i>Vaccinium corymbosum</i>	2000	10 years
Blackberry	<i>Aronia melanocarpa</i>	—	10 years
Rosehips	<i>Rosa canina</i>	—	15 years
Kiwifruit	<i>Actinidia deliciosa</i>	400	25 years
Persimmon	<i>Diospyros kaki</i>	660	20 years
Common figs	<i>Ficus carica</i>	625	25 years
Meaty som	<i>Cornus mas</i>	800	25 years

*: The values in the table are mean values from which a tolerance of $\pm 20\%$ is allowed. This flexibility is the possibility to adjust the mean values where necessary, and not a possibility for beneficiaries to deviate from the fixed standard values.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Range and amounts of support

Description

The intervention is announced with a single unit value, which represents the same amount per hectare for all intensively producing and applying for fruit. Territorial differentiation is not applied.

8 Additional questions/information specific to the Type of Intervention

Justification of the difficulty(ies) that the targeted sector(s)/production(s) or type(s) of farming therein undergo.

The main reason for targeted support for fruit production in Hungary **is** the fact that the production area is on a downward trend. The decrease is particularly striking for the most important key product (apples) and has been ongoing since 2015. In addition to apples, the area of fruit with significant production areas or traditions, such as plums, pears, peaches, nectarines, currants or raspberries, is on a declining trend. The number of fruit growers is also decreasing. In addition, the level of income that can be realised for producers in the sector varies significantly from year to year, sometimes unpredictable.

This difficulty is caused by volatile and low yields due to extreme weather conditions, drastic increases in input prices, fluctuations in producer prices, lack of homogeneous commodity bases, fluctuating quality, high barriers to entry and higher production costs per hectare compared to benchmark crops for arable crops (maize, wheat, sunflower) (**secondary arguments**).

In the absence of coupled subsidies, the sector would be at risk of shrinking.

What is the aim of the intervention with regard to the targeted sector(s)/production(s) or type(s) of farming therein?

☐ to improve competitiveness

☒ to improve quality

☒ to improve sustainability

How will the intervention address the identified difficulty(ies) by this aim (i.e. explanation about the targeting)?

According to the consultation of the sectors and the needs assessment compiled on the basis of **the SWOT analysis, our aim is to stabilise the sector's profitability and improve its resilience** in order to maintain income in spite of fluctuations, contributing to the supply of healthy food to the population, including food security. In addition, the positive effects on, for example, the preservation of biodiversity or the rural workforce are maintained. Coupled aid also helps to bridge the period during which the positive effects of further interventions in the sector start to work (e.g.: measures to improve the bargaining power of producers). Coupled aid also helps to bridge the period during which the positive effects of further interventions in the sector start to work (e.g.: measures to improve the bargaining power of producers).

In order to promote sustainable production in order to maintain **the long-term improvement of the situation in the sector**, the eligibility conditions include a minimum number of vines per hectare, the existence of a fixed irrigation system and a condition relating to the age of the plantation. The aim is

therefore to address the difficulties caused by fluctuations in yields and low yields. In addition to stabilising income, direct aid plays an important role in farmers' farming, as they generate the necessary own resources and cover for the necessary improvements. In addition, stabilising farmers' incomes promotes modernisation, digitalisation and thus improved production efficiency.

Intensive orchards play a major role in the production of fruit intended for fresh consumption, whereas the output of extensive and more mechanised plantations is primarily a source of raw material for the processing industry, from short transport distances. This is precisely what justifies extensive and intensive fruit-growing envelopes with two separate unit costs, which makes it possible to increase the targeting of the aid.

What is (are) the sector(s) concerned?

Fruit and vegetables

Justification of the importance of the targeted sector(s)/production(s) or type(s) of farming therein

In the absence of coupled subsidies, the sector would be at risk of shrinking. It is necessary to avoid this because the **importance of the sector** is very diverse.

- Fruit is a basic food that should be delivered to consumers or processors through the shortest possible supply chain (minimising the environmental impact), so local production is essential.
- It plays a key role in food security and health promotion.
- Intensive plantations play a major role mainly in the production of fruit intended for fresh consumption.
- Farms applying for coupled support tend to farm less than 5 hectares. The diversity of cultivated species and the maintenance of smaller-scale species in production are important for the conservation of biodiversity.
- Due to the technological characteristics of fruit-growing, the sector also needs manual labour alongside mechanical work. Due to its high annual labour consumption per hectare, the sector thus contributes to the employment and retention of the rural population.

Explanation how the intervention is consistent with the Water Framework Directive (i.e. 2000/60/EC).

Compliance with the Water Framework Directive is considered to be ensured horizontally through the adequacy of the legislative environment. The licensing system described in detail in section 3.3 provides sufficient safeguards for the start of new activities. For farms already in operation, it is important to clarify: The water use licensing system presented is not an offer that Hungary undertakes from 2023 onwards. This is a description of a system that has been in place for many years and has evolved and strengthened since the entry into force of the Directive for water use for agricultural purposes.

In addition, it can be concluded from the eligibility criteria and the amount of aid for intensive fruit production that the unit payment is uniform for all producers, without any incentive to achieve higher yields and thus does not encourage higher water use. Stable output planning also proves that Hungary does not aim at intensification of agricultural production.

Among the elements of conditionality applicable from 2023, the SMR 1 contains a specific basic requirement for the implementation of the Directive, which can thus be held accountable to producers through the system of checks and penalties for conditionality. Proper national implementation and control of the standard thus establishes a link between the authorisation procedures for water abstraction for irrigation and the payment of payments under the CAP.

This point of the Directive is also one of the mandatory basic measures of any river basin management plan.

As additional information, it can be noted that Section II. Through Pillar-funded investment facilities, we are planning to devote significant resources to the widest possible uptake of precision farming, promoting a more rational and sustainable use of natural resources (including water).

Given the relevance of irrigated farming in this item, the additional control described in section 3.3 will be introduced.

This ensures that the scheme does not jeopardise the achievement of the objectives laid down in Hungary's river basin management plan.

Is the intervention financed, partly or completely, from the protein crop top up (maximum 2% in total) in accordance with Art. 96(3) of SPR?

☐ Yes ☒ No

If the intervention targets a mix between legumes and grasses: please indicate the minimum percentage of legumes in the mix.

N/A

Coupled income support granted to silkworms is an animal based support, where the use of 'head' as the support's basic unit requires prior clarification of the followings:

please clarify the conversion rate between this unit and 'head' (i.e. how many of this unit corresponds to '1 head'?) for the purpose of e.g. indicators.

11 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Planned Unit Amount	Region(s)	Result Indicator(s)
DP10_O10_U01_HA - Specific amount of aid for intensive fruit production	Uniform		R.4; R.6; R.7; R.8

Explanation and Justification (including the flexibility)

DP10_O10_U01_HA - Specific amount of aid for intensive fruit production

Brief description of the determination of the specific value

The determination of the unit value has been supported by the experience gained in 2015-2022 and relative stability among the supported sectors. This provided adequate basic data on the role played by coupled aid in the income of intensive fruit production and what its absence would make for operational success.

The findings of the SWOT analysis showed that coupled aid is a key element for intensive fruit production. Therefore, based on the needs identified in the needs assessment and addressing the difficulties indicated, Hungary opted for targeted support for the sensitive sectors identified in the submitted plan, including intensive fruit production.

For the calculation of the unit value, we relied on data from sector situation analyses. The multi-annual statistical data sets have been used to determine the amount that is typically sufficient to minimise or, where appropriate, raise the profitability of a given activity to an expected level. Our aim is to prevent the cessation of activities or conversion to other crops. This is of particular importance in ensuring that Hungary's food supply for fruit is guaranteed. The suitability of the specific value may, of course, be changed from year to year due to external factors, which is why there is a need for a solid band to manage the swings.

Support for the **use of yield** categories is provided in the background document. The proportion of farms with stable production in high yield categories is so low that it does not jeopardise targeting and does not mean massive support for producers who thrive without support. The purpose of using the categories of yields is to demonstrate that the difficulty is largely justified, but it is not possible to distinguish between categories of beneficiaries because of the variability in the classification per year.

In general, the planning of **stable outputs** clearly shows our intentions. This is to keep the output of intensive fruit production at levels and to prevent it from shrinking. This also means that it does not provide incentives for irrigation. This in turn contributes to responsible treatment of natural resources (including water and soil).

Minimum and maximum values of the specific value

In the case of aid for intensive fruit production, a minimum and a maximum value are fixed at a unit value of EUR373,48/ha.

Variance of the specific value: + 15 %/-25 %

When setting the minimum and maximum amounts of unit aid, the following methodology was followed:

—We examined the extremes recorded during the period 2015-2021 for approved areas.

—The data for the submission of applications for 2022 are now available to help predict the expected evolution of trends.

- The impact of changes in product areas has been filtered out using the detailed tables for comparability (*not relevant for fruit production*).
- Where we found extreme values at the beginning of the period, they were removed from the series.
- The envelope sizes valid from 2023 onwards have been assigned to the fixed extremes to obtain the theoretical specific values for the extremes.
- The deviations of these extremes from the planned specific values are reflected in the specific bands (minimum and maximum values) modelled from the previous period.
- These calculations were adjusted to reflect the risks identified, forecasts from the industry and expected market trends.
- The calculations show that a further reduction in the bands would already lead to a significant increase in financial risks.

Specific explanation: Historical data, as well as market swings and extreme weather conditions, make it necessary to define a sufficient margin of manoeuvre. However, this has been introduced in a differentiated manner. With the expectation of halting the reduction in the area, we have reduced the maximum tolerance level for deviations, while at the same time we see the need for greater room for manoeuvre for the minimum value.

(Information supporting each finding, more detailed reasoning can be found in the analysis of the situation in the sector.)

R.6 Percentage of additional direct payments per hectare for eligible farms below average farm size (compared to average)

R.7 Percentage of additional support per hectare in areas with higher needs (compared to average)

R.8 Share of farms benefitting from coupled income support for improving competitiveness, sustainability or quality

5 Specific design, requirements and eligibility conditions of the intervention

Description

The aim of the aid is to promote the economic and environmental sustainability of the sector and to ensure a quality commodity base by requiring the use of registered fathers.

It is of the utmost importance for ewe farmers and their families that coupled payments and transitional national support to support genuine production together form a real safety net that ensures an expected level of resilience in the event of income fluctuations due to weather and market risks.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary, the area and, when applicable, other relevant obligations

The ewe premium shall be granted to an active farmer who is entitled to direct payments under the relevant national legislation.

Specific eligibility criteria:

- All females of the ovine species which are at least one year on the last day of the retention period shall be eligible;
- Ensure the use of fathers in accordance with the provisions of the Government Decree on animal husbandry and use only a flock with a herd-book certificate or a certificate of origin to serve the female herd, thus providing the necessary funds for quality production.
- Ensure that livestock kept in his holding is permanently marked, continuously recorded and reported in accordance with the Juh ENAR Decree, and
- undertakes to keep the animals declared in the aid application for one hundred consecutive days starting on 1 April of the reference year. The transport of the requested animal to an exhibition shall not be considered as a breach of the retention obligation.
- Ensure compliance with the requirements and time limits laid down in Community law.
- Minimum number of eligible individuals: one. This is for two reasons. On the one hand, the minimum number of animals is consistently 1 animal in the case of animal-based schemes. On the other hand, by involving the smallest producers, the environmental added value can be increased by complying with conditionality. Thirdly, the exclusion of small producers would run counter to the spirit of the reform, given the aim of treating small farms differently.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Range and amounts of support

Description

The intervention shall be announced with a single unit value representing the same amount per animal for each producer and applicant keeping ewes. Territorial differentiation is not applied.

8 Additional questions/information specific to the Type of Intervention

Justification of the difficulty(ies) that the targeted sector(s)/production(s) or type(s) of farming therein undergo.

The specific support for ewe rearing in Hungary is justified **by** the fact that the income available to producers in the sector is low, resulting in a gradual decline in the herd. The decline in the herd between 2015 and 2020 was much higher than in other European countries with a significant sheep population. This difficulty is caused by the additional costs of complying with EU animal health and environmental standards, the lack of own pasture areas, the heterogeneous herd in terms of breeds, the low consumption per capita and the fact that the current unfavourable profitability conditions make the sector unattractive for the next generation. The sharp increase in input prices will only further reinforce this process. **(subsidiary arguments).**

In the absence of coupled aid, the sector would risk further shrinking or even disappearing.

What is the aim of the intervention with regard to the targeted sector(s)/production(s) or type(s) of farming therein?

- ☐ to improve competitiveness
- ☒ to improve quality
- ☒ to improve sustainability

How will the intervention address the identified difficulty(ies) by this aim (i.e. explanation about the targeting)?

According to the consultation of the sectors and the needs assessment drawn up on the basis of the SWOT analysis, **our aim is to stabilise the sector's profitability and improve its resilience** in order to maintain it in spite of the difficulties indicated, to prevent population decline, to make it more attractive to young farmers if profitability improves, and to contribute to the survival of the liveable countryside, to maintaining the ecological balance and to maintaining the landscape.

In order to promote sustainable production, in order to maintain **the long-term improvement of the situation in the sector**, the eligibility conditions include the requirement to use professional farmers. In doing so, our aim is to improve animal health and welfare, food safety and the production of a quality commodity base, thereby improving the market situation and the ability of producers to generate income. In addition to stabilising income, direct aid plays an important role in farmers' farming, as they generate the necessary own resources and cover for the necessary improvements. A more stable income can also help modernise, increase digitalisation and thus improve the efficiency of production.

What is (are) the sector(s) concerned?

Sheepmeat and goatmeat

Justification of the importance of the targeted sector(s)/production(s) or type(s) of farming therein

In the absence of coupled aid, the sector would risk further shrinking or even disappearing. It is necessary to avoid this because the sector's **environmental importance is paramount**.

- Most of the areas with sheep-farming traditions are economically underdeveloped, disadvantaged areas where unemployment is above average.
- Sheep and goat farming is a key factor in the use of fragmented pasture areas, in particular in the use of permanent pasture areas, in maintaining the ecological balance, in the preservation of the landscape, and in the sector's role in terms of landscape and environmental protection.
- Pasture-based sheep farming is essential to maintain some 1 million hectares of pastureland in a cultural state, to preserve the species richness of grassland farmers, to prevent the spread of undesired plants, which often also cause allergic grievances, and to prevent scrubbing.

Explanation how the intervention is consistent with the Water Framework Directive (i.e. 2000/60/EC).

Compliance with the Water Framework Directive is considered to be ensured horizontally through the adequacy of the legislative environment. The licensing system described in detail in section 3.3 provides sufficient safeguards for the start of new activities. For farms already in operation, it is important to clarify: The water use licensing system presented is not an offer that Hungary would undertake from 2023 onwards. This is a description of a system that has been in place for many years and has evolved and strengthened since the entry into force of the Directive for water use for agricultural purposes.

The same applies to animal husbandry rules, since national legislation on the prevention of pollution from nitrates has been in force since 2006 and 2008 respectively. One of the basic measures of Directive 91/676/EEC is the construction of manure storage facilities. In Hungary, in accordance with Government Decree No 27/2006. (II. According to the Government Decree, the deadline for the implementation of manure storage sites in livestock farms in or qualifying as nitrate vulnerable zones expired on 31 December 2014. Similarly, the deadline for the establishment of slurry stores for livestock farms other than nitrate vulnerable zones or non-nitrate vulnerable zones expired on 31 December 2014, while the deadline for the establishment of livestock manure storage facilities expired on 22 December 2015. At present, therefore, only livestock farms with adequate manure storage capacity can operate in Hungary. Insulated manure suitable for the storage of at least 6 months of manure, complying with the technical requirements laid down, must be equipped with a storage facility for leak-proof manure. As regards

manure management (storage and installation), it can therefore also be stated that livestock farms currently active have been authorised to operate on the basis of strict manure management standards ensuring the preservation of water quality.

In addition, it can be concluded from the eligibility criteria and the amount of aid for sheep farming that the unit payment is uniform for all producers, without any incentive to achieve higher yields and thus does not encourage higher water use. Stable output planning also proves that Hungary does not aim at intensification of agricultural production.

Among the elements of conditionality applicable from 2023, the SMR 1 contains a specific basic requirement for the implementation of the Directive, which can thus be held accountable to producers through the system of checks and penalties for conditionality. Proper national implementation and control of the standard thus establishes a link between the authorisation procedures for water abstraction for irrigation and the payment of payments under the CAP.

This point of the Directive is also one of the mandatory basic measures of any river basin management plan.

In Hungary, significant sources of tender were available for the modernisation of livestock holdings, including sheep farms, during the 2015-2022 cycle. Protecting water from a quality point of view is a priority objective, so manure storage and deposition are also carried out in accordance with the requirements of the Nitrates Directive. As additional information, it can be noted that Section II. Through Pillar-funded investment facilities, we are planning to devote significant resources to the widest possible uptake of precision farming, promoting a more rational and sustainable use of natural resources (including water).

This ensures that the scheme does not jeopardise the achievement of the objectives laid down in Hungary's river basin management plan.

Sheep farming is typically carried out in extensive form in Hungary, which requires a more moderate use of water. In the case of extensive rearing, livestock density standards prior to over-grazing of grasslands ensure that livestock farming does not cause deterioration in the quality of water bodies. The additional control presented in chapter 3.3 will not be introduced.

Is the intervention financed, partly or completely, from the protein crop top up (maximum 2% in total) in accordance with Art. 96(3) of SPR?

☐ Yes ☒ No

11 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Planned Unit Amount	Region(s)	Result Indicator(s)
DP11_O11_U01_HD - Specific amount of ewe premium	Uniform		R.4; R.6; R.7; R.8

Explanation and Justification (including the flexibility)

DP11_O11_U01_HD - Specific amount of ewe premium

Brief description of the determination of the specific value

The determination of the unit value has been supported by the experience gained in 2015-2022 and relative stability among the supported sectors. This provided sufficient basic data on the role played by coupled aid in the income from ewe rearing and what would be caused by its absence in production efficiency.

The findings of the SWOT analysis showed that coupled aid is a key element for ewe rearing. Therefore, based on the needs identified in the needs assessment and addressing the difficulties indicated, Hungary opted for targeted support for the sensitive sectors identified in the submitted plan, including ewe rearing.

For the calculation of the unit values, we relied on data from industry situation analyses. The multi-annual statistical data sets have been used to determine the amount that is typically sufficient to minimise or, where appropriate, raise the profitability of a given activity to an expected level. Our aim is to prevent the cessation of a given activity. This is particularly important in ensuring that Hungary's food supply for sheepmeat and sheep's milk is ensured. The suitability of the specific value may, of course, be changed from year to year due to external factors, which is why there is a need for a solid band to manage the swings.

In general, the planning of **stable outputs** clearly shows our intentions. This is to keep the ewe rearing at a level and to prevent further shrinking. This also means that it does not encourage more intensive rearing of animals. This in turn contributes to responsible treatment of natural resources (including water and soil).

Minimum and maximum value of the specific value

For the ewe premium, *a minimum and a maximum value of EUR 35,26 per animal are fixed.*

Variance of the specific value: + 25 %/-15 %

When setting the minimum and maximum amounts of unit aid, the following methodology was followed:

—We examined the extremes recorded during the period 2015-2021 for approved animals.

—Data of the animals approved on the basis of the 2023 application submission, using which we updated the value of the excavation indicator following the observed trends.

—For the sake of comparability, the impact of changes in product areas has been filtered out using *the detailed data tables (not relevant for ewe rearing)*.

—Where we found extreme values at the beginning of the period, they were removed from the series.

—The envelope sizes valid from 2023 onwards have been assigned to the fixed extremes to obtain the theoretical specific values for the extremes.

—The deviations of these extremes from the planned specific values are reflected in the specific bands (minimum and maximum values) modelled from the previous period.

—These calculations were adjusted to reflect the risks identified, forecasts from the industry and expected market trends.

—The calculations show that a further reduction in the bands would already lead to a significant increase in financial risks.

Specific explanation: The gradual decline in the stock justifies a differentiated approach for minimum and maximum levels. Therefore, a greater margin has been set for the maximum value.

(Information supporting each finding, more detailed reasoning can be found in the analysis of the situation in the sector.)

Presentation of potential market distorting effects in the EU single market

The balance of the EU single market is not negatively affected by live sheep exports. Domestic sheep meat consumption is low (ewes, goats, rabbits and other meat together account for only 0.2 kg/capita) and is significantly below the EU average. The sector's output is therefore mainly exported as live lambs, typically within the EU, but the sheep population is quite heterogeneous in terms of breed, which is detrimental to possible expansion of export links, as it makes it difficult to serve larger markets requiring homogeneous commodity bases. In addition, the slow, gradually decreasing trend of livestock is an important factor in estimating the impact of the single market. Finally, it should be pointed out that the aid is aimed at income stability and therefore, **in the case of export markets, coupled subsidies are unlikely to have a market-distorting effect.**

R.7 Percentage of additional support per hectare in areas with higher needs (compared to average)

R.8 Share of farms benefitting from coupled income support for improving competitiveness, sustainability or quality

5 Specific design, requirements and eligibility conditions of the intervention

Description

For coupled suckler cow farmers and their families, it is of the utmost importance that coupled coupled payments and transitional national support provide a real safety net that ensures an expected level of

resilience in the event of income fluctuations due to weather and market risks.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary, the area and, when applicable, other relevant obligations

The suckler cow premium shall be granted to an active farmer who is entitled to direct payments under the relevant national legislation.

Specific eligibility criteria:

• Suckler cow:

cows belonging to a meat breed or born from a cross with a meat breed, belonging to a herd intended for rearing calves for meat production, or

female bovine animals or buffaloes over eight months of age, belonging to a meat breed or born from a cross with a meat breed;

as from the application year 2015, the claimed animal received only the suckler cow premium and only the suckler cow premium.

• On the day of submission of the aid application, suckler cows on the holding which do not belong to the breeds listed below and belong to a breed declared under code 99 as 'other dairy production' under code 88, Brown Swiss under code 03 or Borzderes under code 15, or Kostromai breed under code 15.

• Ensure that livestock in her holding is marked, continuously recorded and reported in accordance with the ENAR Regulation. Comply with the requirements and time limits laid down in Community law.

• Keep the livestock applied for from the date of submission of the aid application in a culture free from tuberculosis, brucellosis and leukosis.

• Ensure the use of fathers in accordance with the provisions of the Government Decree on animal husbandry and use in herd animals declared for aid, breeding bulls or deep-frozen semen, ova or embryos with a central registration number and eligible according to the table, and ensure that inseminations (coverings), free and three-like matings and embryo transplants corresponding to calvings between 1 January of the reference year and the end of the retention period are recorded in the central database.

• At least 30 % of the animals applied for have calving during the reference year and keep the calves born from the requested animal during the holding for at least one month from the date of birth on the same holding as their mother, and

• undertakes to keep the animals declared in the aid application on a continuous basis for a period of six months from the day following the date on which the aid application was submitted.

• The proportion of heifers in the farmer's holding for which the aid is granted may not exceed 40 % for the entire duration of the holding.

A calving rate of 30 % and a heifer rate of 40 % on the holding of a farmer for which the premium is based need not be respected in the case of eligible animals of less than three animals.

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Range and amounts of support

Description

The intervention shall be announced with a single unit value representing the same amount per animal for each suckler cow producer and applicant. Territorial differentiation is not applied.

8 Additional questions/information specific to the Type of Intervention

Justification of the difficulty(ies) that the targeted sector(s)/production(s) or type(s) of farming therein undergo.

Targeted support for suckler cow farming in Hungary is justified by the **difficulty** that despite targeted support, the sector has been loss-making on average over recent years.

This difficulty is caused by drastic increases in input prices, additional costs of compliance with EU animal health and environmental standards, low purchase prices, a lack of own pasture areas, heterogeneity in terms of variety use and farm size, genetic bases that need to be improved, cost sensitivity due to lower and intermittent production value, and low per capita consumption. (**subsidiary arguments**).

In the absence of coupled aid, the sector would be at risk of shrinking due to the loss of predictability.

What is the aim of the intervention with regard to the targeted sector(s)/production(s) or type(s) of farming therein?

- ☐ to improve competitiveness
- ☒ to improve quality
- ☒ to improve sustainability

How will the intervention address the identified difficulty(ies) by this aim (i.e. explanation about the targeting)?

According to the consultation of the sectors and the needs assessment drawn up on the basis of the SWOT analysis, **our aim is to stabilise the sector's profitability and improve its resilience** in order to maintain it in spite of the difficulties indicated, to improve the quality of the population, to continue to attract young farmers and to contribute to the survival of the liveable countryside, the ecological balance and the preservation of the landscape.

In order to promote sustainable production, in order to maintain **the long-term improvement of the situation in the sector**, the eligibility conditions include the requirement for proper use of fathers and the restriction to beef breeds. The proper use of father animals and the restriction to meat breeds improve targeting, facilitate the production of a quality commodity base through the development of genetic funds, thereby improving the market situation and the ability of producers to generate income. In addition to stabilising income, direct aid plays an important role in farmers' farming, as they generate the necessary own resources and cover for the necessary improvements. In addition, stabilising farmers' incomes promotes modernisation, digitalisation and thus improved production efficiency.

What is (are) the sector(s) concerned?

Beef and veal

Justification of the importance of the targeted sector(s)/production(s) or type(s) of farming therein

In the absence of coupled aid, the sector would be at risk of shrinking due to the loss of predictability. It is necessary to avoid this because of the wide-ranging **importance of** the sector.

- Most of the rural areas with tradition of rearing cattle are economically underdeveloped, disadvantaged areas where unemployment is above average.
- Beef fattening is based on the rearing of suckler cows for meat production, which is the simplest extensive rearing activity within the family business.
- Farms benefiting from coupled support for meat-producing suckler cows tend to be small farms with a maximum of 20 animals.
- Cattle rearing for meat production is a key factor in the use of fragmented pasture areas, in particular in the use of permanent pasture areas, in maintaining the ecological balance, in preserving the landscape, and in the sector's role in protecting the landscape and the environment.
- Pasture-based cattle farming is essential to maintain some 1 million hectares of grassland in the cultural state, to preserve the species richness of grassland founders, to prevent the spread of unwanted plants, which often also cause allergic grievances, and to prevent scrubbing.
- Cattle rearing also plays a role in generational renewal, as many young people start their activities as beef keepers.
- Although beef is not the predominant source of domestic consumption, it is a basic food, so support is also important for food security.

Explanation how the intervention is consistent with the Water Framework Directive (i.e. 2000/60/EC).

Compliance with the Water Framework Directive is considered to be ensured horizontally through the adequacy of the legislative environment. The licensing system described in detail in section 3.3 provides sufficient safeguards for the start of new activities. For farms already in operation, it is important to clarify: The water use licensing system presented is not an offer that Hungary would undertake from 2023 onwards. This is a description of a system that has been in place for many years and has evolved and strengthened since the entry into force of the Directive for water use for agricultural purposes.

The same applies to animal husbandry rules, since national legislation on the prevention of pollution from nitrates has been in force since 2006 and 2008 respectively. One of the basic measures of Directive 91/676/EEC is the construction of manure storage facilities. In Hungary, in accordance with Government Decree No 27/2006. (II. According to the Government Decree, the deadline for the implementation of manure storage sites in livestock farms in or qualifying as nitrate vulnerable zones expired on 31 December 2014. Similarly, the deadline for the establishment of slurry stores for livestock farms other than nitrate vulnerable zones or non-nitrate vulnerable zones expired on 31 December 2014, while the deadline for the establishment of livestock manure storage facilities expired on 22 December 2015. At present, therefore, only livestock farms with adequate manure storage capacity can operate in Hungary. Insulated manure suitable for the storage of at least 6 months of manure, complying with the technical requirements laid down, must be equipped with a storage facility for leak-proof manure. As regards manure management (storage and installation), it can therefore also be stated that livestock farms currently active have been authorised to operate on the basis of strict manure management standards ensuring the preservation of water quality.

In addition, it can be concluded from the eligibility criteria and the amount of aid for suckler cow premiums that the unit payment is uniform for all producers, without any incentive to achieve higher yields and thus does not encourage higher water use. Stable output planning also proves that Hungary does not aim at intensification of agricultural production.

Among the elements of conditionality applicable from 2023, the SMR 1 contains a specific basic requirement for the implementation of the Directive, which can thus be held accountable to producers through the system of checks and penalties for conditionality. Proper national implementation and control of the standard thus establishes a link between the authorisation procedures for water abstraction for irrigation and the payment of payments under the CAP.

This point of the Directive is also one of the mandatory basic measures of any river basin management plan.

In Hungary, significant sources of tender were available for the modernisation of livestock holdings, including cattle farms, during the 2015-2022 cycle. Protecting water from a quality point of view is a priority objective, so manure storage and deposition are also carried out in accordance with the requirements of the Nitrates Directive. As additional information, it can be noted that Section II. Through Pillar-funded investment facilities, we are planning to devote significant resources to the widest possible uptake of precision farming, promoting a more rational and sustainable use of natural resources (including water).

This ensures that the scheme does not jeopardise the achievement of the objectives laid down in Hungary's river basin management plan.

Beefcattle tend to be in extensive form in Hungary, which requires a more moderate use of water. In the case of extensive rearing, livestock density standards prior to over-grazing of grasslands ensure that livestock farming does not cause deterioration in the quality of water bodies. The additional control presented in chapter 3.3 will not be introduced.

Is the intervention financed, partly or completely, from the protein crop top up (maximum 2% in total) in accordance with Art. 96(3) of SPR?

☐ Yes ☒ No

If the intervention targets a mix between legumes and grasses: please indicate the minimum percentage of legumes in the mix.

N/A

Coupled income support granted to silkworms is an animal based support, where the use of 'head' as the support's basic unit requires prior clarification of the followings:

please clarify the conversion rate between this unit and ‘head’ (i.e. how many of this unit corresponds to ‘1 head’?) for the purpose of e.g. indicators.

It is possible to give further clarification in comment (e.g. the weight of eggs that a box must contain)

9 WTO compliance

Amber Box

Explanation of whether and, if so, how the intervention respects relevant provisions of Article 6.5 or Annex 2 to the WTO Agreement on Agriculture (Blue Box)

The CIS interventions are amber box support and are therefore not relevant.

11 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Planned Unit Amount	Region(s)	Result Indicator(s)
DP12_O11_U01_HD - Specific amount of suckler cow premium	Uniform		R.4; R.6; R.7; R.8

Explanation and Justification (including the flexibility)

DP12_O11_U01_HD - Specific amount of suckler cow premium

Brief description of the determination of the specific value

The determination of the unit value has been supported by the experience gained in 2015-2022 and relative stability among the supported sectors. This provided adequate basic data on the role of coupled subsidies in the income of suckler cow farming and what its absence would cause for operational success. The findings of the SWOT analysis showed that coupled aid is a key element for suckler cow farming. Therefore, based on addressing the needs identified in the needs assessment and addressing the difficulties indicated, Hungary opted for targeted support for the sensitive sectors identified in the submitted plan, including suckler cow farming.

For the calculation of the unit values, we relied on data from industry situation analyses. The multi-annual statistical data sets have been used to determine the amount that is typically sufficient to minimise or, where appropriate, raise the profitability of a given activity to an expected level. Our aim is to prevent the cessation of a given activity. This is of particular importance in ensuring that Hungary's food supply for beef is guaranteed. The suitability of the specific value may, of course, be changed from year to year due to external factors, which is why there is a need for a solid band to manage the swings.

In general, the planning of **stable outputs** clearly shows our intentions. This is to keep suckler cow rearing at a level or to prevent shrinking of suckler cows. This also means that it does not encourage more intensive rearing of animals. This in turn contributes to responsible treatment of natural resources (including water and soil).

Minimum and maximum value of the specific value

For the suckler cow premium, *a minimum and a maximum value of EUR 139,95 per animal are fixed.*

Variance of the specific value: + 25 %/-20 %

When setting the minimum and maximum amounts of unit aid, the following methodology was followed:

- We examined the extremes recorded during the period 2015-2021 for approved animals.
- The data for the submission of applications for 2022 are now available to help predict the expected evolution of trends.
- For the sake of comparability, the impact of changes in product areas has been filtered out using *the detailed data tables (not relevant for suckler cow rearing)*.
- Where we found extreme values at the beginning of the period, they were removed from the series.
- The envelope sizes valid from 2023 onwards have been assigned to the fixed extremes to obtain the theoretical specific values for the extremes.
- The deviations of these extremes from the planned specific values are reflected in the specific bands (minimum and maximum values) modelled from the

previous period.

—These calculations were adjusted to reflect the risks identified, forecasts from the industry and expected market trends.

—The calculations show that a further reduction in the bands would already lead to a significant increase in financial risks.

Specific explanation: The minimum value is set at 20 %, which is justified on the basis of historical data. The differentiated approach is justified by the fact that stock growth is less likely than a decline. Therefore, a greater margin of manoeuvre has been established for the 50 % derogation.

(Information supporting each finding, more detailed reasoning can be found in the analysis of the situation in the sector.)

R.8 Share of farms benefitting from coupled income support for improving competitiveness, sustainability or quality

5 Specific design, requirements and eligibility conditions of the intervention

Description

It is of the utmost importance for bull fattening farmers and their families that coupled coupled payments and transitional national support to support genuine production together form a real safety net that ensures

an expected level of resilience in the event of income fluctuations due to weather and market risks.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary, the area and, when applicable, other relevant obligations

An active farmer who is entitled to a direct payment under the relevant national legislation shall be eligible for a foie bull payment.

Specific eligibility criteria:

(1) The aid for fattening shall be eligible for male bovine animals or buffaloes aged nine months or more on the day of export under point (a), with the exception of separate slaughter due to clinical signs, as referred to in point (b), between 1 April of the previous year and 31 March of the current year have been slaughtered in a slaughterhouse, or live animals exported to a third country outside the European Union or transported to another Member State of the European Union from a holding, artificial insemination station, loading or collection centre type.

(2) An active farmer shall be entitled to the foie-farming premium if:

- on the basis of the national register laid down in the ENAR Decree, the bovine animal kept the male bovine animal from the holding for at least two months immediately before leaving the holding in accordance with paragraph (1),
- Ensure the use of fathers in accordance with the Book Decree and in the case of the conception of animals declared for the foie-farming premium
 - the use of dourage bulls or deep-frozen semen, ova or embryos with a central registration number (KPLSZ) or an equivalent foreign identifier can be demonstrated, or
 - in the case of free and three-style matings, the keeping in the holding of a father bearing a KPLSZ or an equivalent foreign identifier for the date of conception of the animals declared for the foie-keeping premium may be certified, and
 - ensure that inseminations, free and three-like matings and embryo transplants of livestock are registered in the national livestock database by 31 August of the reference year at the latest.
- ensure that bovine herds on their holding are marked and registered in accordance with the ENAR Regulation, and
- bovine animals are certified as having been slaughtered or exported in the slaughterhouse in accordance with the reporting obligation laid down in the ENAR Decree, and
- comply with the requirements and time limits laid down in Community law.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Range and amounts of support

Description

The intervention shall be announced with a single unit value representing the same amount per animal for each producer and applicant holding foieged bulls. Territorial differentiation is not applied.

8 Additional questions/information specific to the Type of Intervention

Justification of the difficulty(ies) that the targeted sector(s)/production(s) or type(s) of farming therein undergo.

Targeted support for foie gras in Hungary is justified by the **difficulty** that the sector would be loss-making in the absence of targeted support.

This difficulty is caused by drastic increases in input prices, additional costs of compliance with EU

animal health and environmental standards, low purchase prices, a lack of own pasture areas, heterogeneity in terms of variety use and farm size, genetic bases that need to be improved, cost sensitivity due to lower and intermittent production value, and low per capita consumption. (**subsidiary arguments**).

In the absence of coupled aid, the sector would be at risk of shrinking due to the loss of predictability.

What is the aim of the intervention with regard to the targeted sector(s)/production(s) or type(s) of farming therein?

☐ to improve competitiveness

☒ to improve quality

☒ to improve sustainability'

How will the intervention address the identified difficulty(ies) by this aim (i.e. explanation about the targeting)?

According to the consultation of the sectors and the needs assessment drawn up on the basis of the SWOT analysis, **our aim is to stabilise the sector's profitability and improve its resilience** in order to maintain it in spite of the difficulties indicated, to improve the quality of the population, to continue to attract young farmers and to contribute to the survival of the liveable countryside, the ecological balance and the preservation of the landscape.

In order to promote sustainable production in order to maintain **the long-term improvement of the sector's situation**, maintaining and increasing support will bring long-term benefits to the landscape and the environment (e.g.: biodiversity), it can improve rural employment in the long term, the retaining power of rural areas, the preservation of traditional, local and regional production, as well as the inclusion of younger generations in the meat sector with an ageing age. In order to maintain long-term effects, the eligibility criteria include the use of an appropriate father animal. **In addition, appropriate use of father animals is introduced in the eligibility conditions. This improves targeting, facilitating the production of quality commodity funds through the development of genetic funds, thereby improving the market position of producers and their ability to generate income.**

In addition to stabilising income, direct aid plays an important role in farmers' farming, as they generate the necessary own resources and cover for the necessary improvements. In addition, stabilising farmers' incomes promotes modernisation, digitalisation and thus improved production efficiency.

What is (are) the sector(s) concerned?

Beef and veal

Justification of the importance of the targeted sector(s)/production(s) or type(s) of farming therein

In the absence of coupled aid, the sector would be at risk of shrinking due to the loss of predictability. It is necessary to avoid this because of the wide-ranging **importance of the sector**.

- Most of the rural areas with tradition of rearing cattle are economically underdeveloped, disadvantaged areas where unemployment is above average.
- Farms benefiting from coupled support for foie bulls tend to be small farms with a maximum of 10 animals.
- Cattle rearing for meat production is a key factor in the use of fragmented pasture areas, in particular in the use of permanent pasture areas, in maintaining the ecological balance, in preserving the landscape, and in the sector's role in protecting the landscape and the environment.
- Pasture-based cattle farming is essential to maintain some 1 million hectares of grassland in the cultural state, to preserve the species richness of grassland founders, to prevent the spread of unwanted plants, which often also cause allergic grievances, and to prevent scrubbing.
- Cattle rearing also plays a role in generational renewal, as many young people start their activities as beef keepers.
- Although beef is not the predominant source of domestic consumption, it is a basic food, so

support is also important for food security.

Explanation how the intervention is consistent with the Water Framework Directive (i.e. 2000/60/EC).

Compliance with the Water Framework Directive is considered to be ensured horizontally through the adequacy of the legislative environment. The licensing system described in detail in section 3.3 provides sufficient safeguards for the start of new activities. For farms already in operation, it is important to clarify: The water use licensing system presented is not an offer that Hungary would undertake from 2023 onwards. This is a description of a system that has been in place for many years and has evolved and strengthened since the entry into force of the Directive for water use for agricultural purposes.

The same applies to animal husbandry rules, since national legislation on the prevention of pollution from nitrates has been in force since 2006 and 2008 respectively. One of the basic measures of Directive 91/676/EEC is the construction of manure storage facilities. In Hungary, in accordance with Government Decree No 27/2006. (II. According to the Government Decree, the deadline for the implementation of manure storage sites in livestock farms in or qualifying as nitrate vulnerable zones expired on 31 December 2014. Similarly, the deadline for the establishment of slurry stores for livestock farms other than nitrate vulnerable zones or non-nitrate vulnerable zones expired on 31 December 2014, while the deadline for the establishment of livestock manure storage facilities expired on 22 December 2015. At present, therefore, only livestock farms with adequate manure storage capacity can operate in Hungary. Insulated manure suitable for the storage of at least 6 months of manure, complying with the technical requirements laid down, must be equipped with a storage facility for leak-proof manure. As regards manure management (storage and installation), it can therefore also be stated that livestock farms currently active have been authorised to operate on the basis of strict manure management standards ensuring the preservation of water quality.

In addition, it can be concluded from the eligibility criteria and the amount of aid for the aid for foie gras that the unit payment is uniform for all producers and does not contain an incentive to achieve higher yields and thus does not encourage higher water use. Stable output planning also proves that Hungary does not aim at intensification of agricultural production.

Among the elements of conditionality applicable from 2023, the SMR 1 contains a specific basic requirement for the implementation of the Directive, which can thus be held accountable to producers through the system of checks and penalties for conditionality. Proper national implementation and control of the standard thus establishes a link between the authorisation procedures for water abstraction for irrigation and the payment of payments under the CAP.

This point of the Directive is also one of the mandatory basic measures of any river basin management plan.

In Hungary, significant sources of tender were available for the modernisation of livestock holdings, including cattle farms, during the 2015-2022 cycle. Protecting water from a quality point of view is a priority objective, so manure storage and deposition are also carried out in accordance with the requirements of the Nitrates Directive. As additional information, it can be noted that Section II. Through Pillar-funded investment facilities, we are planning to devote significant resources to the widest possible uptake of precision farming, promoting a more rational and sustainable use of natural resources (including water).

This ensures that the scheme does not jeopardise the achievement of the objectives laid down in Hungary's river basin management plan.

Beefcattle tend to be in extensive form in Hungary, which requires a more moderate use of water. In the case of extensive rearing, livestock density standards prior to over-grazing of grasslands ensure that livestock farming does not cause deterioration in the quality of water bodies. The additional control presented in chapter 3.3 will not be introduced.

Is the intervention financed, partly or completely, from the protein crop top up (maximum 2% in total) in accordance with Art. 96(3) of SPR?

☐ Yes ☒ No

If the intervention targets a mix between legumes and grasses: please indicate the minimum percentage of legumes in the mix.

N/A

Coupled income support granted to silkworms is an animal based support, where the use of 'head' as the support's basic unit requires prior clarification of the followings:

please clarify the conversion rate between this unit and 'head' (i.e. how many of this unit corresponds to '1 head'?) for the purpose of e.g. indicators.

11 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Planned Unit Amount	Region(s)	Result Indicator(s)
DP13_O11_U01_HD - Specific amount of fattened bull support	Uniform		R.4; R.6; R.7; R.8

Explanation and Justification (including the flexibility)

DP13_O11_U01_HD - Specific amount of fattened bull support

Brief description of the determination of the specific value

The determination of the unit value has been supported by the experience gained in 2015-2022 and relative stability among the supported sectors. This provided adequate basic data on the role played by coupled subsidies in the income of foie gras and what its absence would make for operational success.

The findings of the SWOT analysis showed that coupled aid is a key element for foie gras. Therefore, based on addressing the needs identified in the needs assessment and addressing the difficulties indicated, Hungary opted for targeted support for the sensitive sectors identified in the submitted plan, including foie gras.

For the calculation of the unit value, we relied on data from sector situation analyses. The multi-annual statistical data sets have been used to determine the amount that is typically sufficient to minimise or, where appropriate, raise the profitability of a given activity to an expected level. Our aim is to prevent the cessation of a given activity. This is of particular importance in ensuring that Hungary's food supply for beef is guaranteed. The suitability of the specific value may, of course, be changed from year to year due to external factors, which is why there is a need for a solid band to manage the swings.

In general, the planning of **stable outputs** clearly shows our intentions. This is to maintain the emissions of foie gras or prevent the shrinking of foie gras. This also means that it does not encourage more intensive rearing of animals. This in turn contributes to responsible treatment of natural resources (including water and soil).

Minimum and maximum value of the specific value

*In the case of foie gras, a minimum value and a maximum value of **EUR 76,20 per animal** are fixed.*

Variance of the specific value: + 40 %/-25 %

When setting the minimum and maximum amounts of unit aid, the following methodology was followed:

- We examined the extremes recorded during the period 2015-2021 for approved animals.
- The data for the submission of applications for 2022 are now available to help predict the expected evolution of trends.
- For the sake of comparability, we have filtered out the effect of changes in product areas using *the detailed data tables (not relevant for foie gras keeping)*.
- Where we found extreme values at the beginning of the period, they were removed from the series.
- The envelope sizes valid from 2023 onwards have been assigned to the fixed extremes to obtain the theoretical specific values for the extremes.
- The deviations of these extremes from the planned specific values are reflected in the specific bands (minimum and maximum values) modelled from the previous period.
- These calculations were adjusted to reflect the risks identified, forecasts from the industry and expected market trends.

—The calculations show that a further reduction in the bands would already lead to a significant increase in financial risks.

Specific explanation:

The maximum deviation is set at 40 %, which is justified on the basis of historical data. In addition, the potential of the sector that typically sells to the external market (outside the EU) is determined by current market developments (e.g. the situation of Turkish deliveries), which, based on the experience of the past period, may have a significant turnaround within a year. The differentiated approach is justified by the fact that stock growth is less likely than a decline.

(Information supporting each finding, more detailed reasoning can be found in the analysis of the situation in the sector.)

Presentation of potential market distorting effects in the EU single market

Domestic consumption of beef per capita is very low (0.9 kg/person) and significantly below the EU average. The Hungarian beef sector has significant exports of live animals. The table below, which lists the main partners, shows that, in terms of weight, the largest trading partners are EU Member States, but the total volume of exports is fragmented between the partners. **As a result, the EU internal market does not end up in a quantity of livestock capable of undermining the balance of the internal market.** It is also important to see that we have significant partners outside the EU, which also does not jeopardise the balance of the internal market.

DP14_E13_CISD_16 - Aid for the rearing of dairy cows

Intervention Code (MS)	DP14_E13_CISD_16
Intervention Name	Aid for the rearing of dairy cows
Type of Intervention	CIS(32) - Coupled income support
Common Output Indicator	O.11. Number of heads benefitting from coupled income support

1 Territorial scope and, if relevant, regional dimension

Territorial scope: **National**

Code	Description
HU	Magyarország

Description of the Territorial Scope

The whole territory of Hungary.

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO1 Support viable farm income and resilience of the agricultural sector across the Union in order to enhance long-term food security and agricultural diversity as well as to ensure the economic sustainability of agricultural production in the Union

SO2 Enhance market orientation and increase farm competitiveness, both in the short and long term, including greater focus on research, technology and digitalisation

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
1.1.1	Predictable basic income for farmers	2	Yes
1.1.2	Provision of available loan financing	2	Partially
1.1.3.	Improving the profitability of small farms	2	Yes
1.2.1	Tackling adverse climatic events and damage caused by climate change in agriculture	1	Yes
1.2.3	Offsetting and mitigating the impact of market risks	2	Yes
2.1.1	Increasing operational and business efficiency of production	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.4 Share of utilised agricultural area (UAA) covered by income support and subject to conditionality

R.6 Percentage of additional direct payments per hectare for eligible farms below average farm size (compared to average)

R.7 Percentage of additional support per hectare in areas with higher needs (compared to average)

R.8 Share of farms benefitting from coupled income support for improving competitiveness, sustainability or quality

5 Specific design, requirements and eligibility conditions of the intervention

Description

It is of utmost importance for dairy farmers and their families that coupled coupled payments to support genuine production combined with transitional national support provide a real safety net that ensures the

expected level of resilience in the event of income fluctuations due to weather and market risks.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary, the area and, when applicable, other relevant obligations

The dairy cow premium shall be granted to an active farmer who is entitled to direct payments under the relevant national legislation.

Specific eligibility criteria:

(1) The dairy cow premium shall be granted to a farmer who:

rearing female bovine animals at least once, the age of which is not less than twenty-three months on 31 March of the year in which the aid application is submitted;

ensure that the livestock on his holding is marked and registered in accordance with the ENAR Regulation for bovine animals, and

keep the livestock applied for at the time of submission of the aid application in a culture free from tuberculosis, brucellosis and leukosis.

(2) Aid may be claimed in respect of dairy cows in accordance with point (a) of paragraph (1) which were found in the farmer's holding on 31 March of the reference year, but were not placed on the farmer's holding on 31 March of the reference year, and

- under official control of milk production, or
- dairy cows registered in the ENAR register using milk and dual-use breed codes, or
- Animals eligible for the dairy cow premium are eligible for the dairy cow premium as of the 2015 application year only and exclusively for dairy cows.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Range and amounts of support

Description

The intervention is announced with a single unit value, which represents the same amount per animal for all producers of dairy cows and applicants. Territorial differentiation is not applied.

8 Additional questions/information specific to the Type of Intervention

Justification of the difficulty(ies) that the targeted sector(s)/production(s) or type(s) of farming therein undergo.

The specific support for dairy cows in Hungary is justified by **the** fact that, in the absence of targeted support, the sector is characterised by low income-generating capacity and income volatility.

This difficulty is caused by drastic increases in input prices, additional costs to comply with environmental, animal health and animal welfare standards, very low purchase prices in the EU, high cost, import pressure from processed products and the resulting strong competition, poor content of raw milk and high feed cost ratios in production costs. (**subsidiary arguments**).

In the absence of coupled subsidies, the sector would risk shrinking, self-sufficiency and thus reduced food security.

What is the aim of the intervention with regard to the targeted sector(s)/production(s) or type(s) of farming therein?

- ☐ to improve competitiveness
- ☒ to improve quality
- ☒ to improve sustainability

How will the intervention address the identified difficulty(ies) by this aim (i.e. explanation about the targeting)?

Our aim is to stabilise the sector's profitability and improve its resilience, based on the consultation of the sectors and the SWOT analysis, in order to maintain it in spite of the difficulties indicated, to improve quality, to contribute to food security and to reduce the environmental impact by alleviating import pressures. *The planning of stable outputs also confirms that we are not waiting for an increase in production and that intensification is not encouraged by the aid.*

In order to promote sustainable production in order to maintain **the long-term improvement of the situation in the sector**, participation in official production control is one of the eligibility conditions. This ensures good quality of raw milk (food safety) and provides feedback to farmers on feed. In turn, the limitation to dairy breeds improves targeting, the production of a quality commodity base, thereby improving the market position of producers and their ability to generate income. It also ensures that EU funds are used to keep the animals most suitable for milk production.

In addition to stabilising income, direct aid plays an important role in farmers' farming, as they generate the necessary own resources and cover for the necessary improvements. In addition, stabilising farmers' incomes promotes modernisation, digitalisation and thus improved production efficiency.

What is (are) the sector(s) concerned?

Milk and milk products

Justification of the importance of the targeted sector(s)/production(s) or type(s) of farming therein

In the absence of coupled subsidies, the sector would risk shrinking, self-sufficiency and thus reduced food security.

It is necessary to avoid this because of the wide-ranging **importance of** the sector.

- Milk is a basic food and therefore, in the long term, milk production contributes to maintaining food security through the supply of raw materials to the domestic dairy sector.
- It plays an important role in maintaining the triple-free status of bovine herds in Hungary (free status of tuberculosis, brucellosis and leukosis), thereby maintaining a favourable animal health, animal welfare and food safety situation.
- The role of milk in employment is significant, but has fallen drastically since EU accession. The decline in milk production would put at risk the livelihoods of almost 14 thousand people employed in the production of raw materials and in the dairy sector, causing serious social and social problems, especially in rural areas. Dairy cows can ensure long-term employment in rural areas, retaining the rural area and preserving the production of traditional, local and regional dairy products.
- Cattle rearing performs important ecological functions: maintaining grassland in a cultural state, contributing to maintaining the ecological balance, preserving the species richness of grassland founders, preventing the spread of unwanted crops, mostly causing allergic grievances, or scrubbing. Grazing also contributes to reducing high feed costs in international comparisons.
- An important by-product of milk production is valuable organic livestock manure, which is an important input for environmentally sound, sustainable crop production, but is barely recognised on the market, unlike fertilisers, it improves not only the fertility but also the structure of soils, so that greenhouse gas emissions can be reduced by professional storage and transfer to the soil.
- Strengthening domestic production and reducing supply chains is also important in order to reduce environmental pressures, and the aim is to cover as much of the consumption as possible with domestic products with a much lower ecological footprint.

Explanation how the intervention is consistent with the Water Framework Directive (i.e. 2000/60/EC).

Compliance with the Water Framework Directive is considered to be ensured horizontally through the adequacy of the legislative environment. The licensing system described in detail in section 3.3 provides sufficient safeguards for the start of new activities. For farms already in operation, it is important to clarify: The water use licensing system presented is not an offer that Hungary would undertake from 2023

onwards. This is a description of a system that has been in place for many years and has evolved and strengthened since the entry into force of the Directive for water use for agricultural purposes.

The same applies to animal husbandry rules, since national legislation on the prevention of pollution from nitrates has been in force since 2006 and 2008 respectively. One of the basic measures of Directive 91/676/EEC is the construction of manure storage facilities. In Hungary, in accordance with Government Decree No 27/2006. (II. According to the Government Decree, the deadline for the implementation of manure storage sites in livestock farms in or qualifying as nitrate vulnerable zones expired on 31 December 2014. Similarly, the deadline for the establishment of slurry stores for livestock farms other than nitrate vulnerable zones or non-nitrate vulnerable zones expired on 31 December 2014, while the deadline for the establishment of livestock manure storage facilities expired on 22 December 2015. At present, therefore, only livestock farms with adequate manure storage capacity can operate in Hungary. Insulated manure suitable for the storage of at least 6 months of manure, complying with the technical requirements laid down, must be equipped with a storage facility for leak-proof manure. As regards manure management (storage and installation), it can therefore also be stated that livestock farms currently active have been authorised to operate on the basis of strict manure management standards ensuring the preservation of water quality.

In addition, it can be concluded from the eligibility criteria and the amount of aid for dairy cows that the unit payment is uniform for all producers, without any incentive to achieve higher yields and thus does not encourage higher water use. Stable output planning also proves that Hungary does not aim at intensification of agricultural production.

Among the elements of conditionality applicable from 2023, the SMR 1 contains a specific basic requirement for the implementation of the Directive, which can thus be held accountable to producers through the system of checks and penalties for conditionality. Proper national implementation and control of the standard thus establishes a link between the authorisation procedures for water abstraction for irrigation and the payment of payments under the CAP.

This point of the Directive is also one of the mandatory basic measures of any river basin management plan.

In Hungary, significant sources of tender were available for the modernisation of livestock holdings, including dairy cattle, during the 2015-2022 cycle. Protecting water from a quality point of view is a priority objective, so manure storage and deposition are also carried out in accordance with the requirements of the Nitrates Directive. As additional information, it can be noted that Section II. Through Pillar-funded investment facilities, we are planning to devote significant resources to the widest possible uptake of precision farming, promoting a more rational and sustainable use of natural resources (including water).

In view of the relevance and priority of this item for the protection of water quality, the additional control described in section 3.3 will be introduced.

This ensures that the scheme does not jeopardise the achievement of the objectives laid down in Hungary's river basin management plan.

Is the intervention financed, partly or completely, from the protein crop top up (maximum 2% in total) in accordance with Art. 96(3) of SPR?

☐ Yes ☒ No

If the intervention targets a mix between legumes and grasses: please indicate the minimum percentage of legumes in the mix.

N/A

Coupled income support granted to silkworms is an animal based support, where the use of 'head' as the support's basic unit requires prior clarification of the followings:

please clarify the conversion rate between this unit and ‘head’ (i.e. how many of this unit corresponds to ‘1 head’?) for the purpose of e.g. indicators.

9 WTO compliance

Amber Box

Explanation of whether and, if so, how the intervention respects relevant provisions of Article 6.5 or Annex 2 to the WTO Agreement on Agriculture (Blue Box)

The CIS interventions are amber box support and are therefore not relevant.

11 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Planned Unit Amount	Region(s)	Result Indicator(s)
DP14_O11_U01_HD - Specific amount of dairy cow premium	Uniform		R.4; R.6; R.7; R.8

Explanation and Justification (including the flexibility)

DP14_O11_U01_HD - Specific amount of dairy cow premium

Brief description of the determination of the specific value

The determination of the unit value has been supported by the experience gained in 2015-2022 and relative stability among the supported sectors. This provided sufficient basic data on the role played by coupled aid in the dairy cows' income and what its absence would cause for farm success.

The findings of the SWOT analysis showed that coupled aid is a key element for dairy cows rearing. Therefore, based on the needs identified in the needs assessment and addressing the difficulties indicated, Hungary opted for targeted support for the sensitive sectors identified in the submitted plan, including dairy cows.

For the calculation of the unit value, we relied on data from sector situation analyses. The multi-annual statistical data sets have been used to determine the amount that is typically sufficient to minimise or, where appropriate, raise the profitability of a given activity to an expected level. Our aim is to prevent the cessation of a given activity. This is particularly important in ensuring that Hungary's food supply for milk and milk products is guaranteed. The suitability of the specific value may, of course, be changed from year to year due to external factors, which is why there is a need for a solid band to manage the swings.

In general, the planning of **stable outputs** clearly shows our intentions. This is to maintain the emissions of dairy cows or prevent them from shrinking. This also means that it does not encourage more intensive rearing of animals. This in turn contributes to responsible treatment of natural resources (including water and soil).

Minimum and maximum value of the specific value

*In the case of the dairy cow premium, a minimum and a maximum value of **EUR 316,99 per animal** are fixed.*

Variance of the specific value: ± 25 %

When setting the minimum and maximum amounts of unit aid, the following methodology was followed:

- We examined the extremes recorded during the period 2015-2021 for approved animals.
- The data for the submission of applications for 2022 are now available to help predict the expected evolution of trends.
- For the sake of comparability, the impact of changes in product areas has been filtered out using *the detailed data tables (not relevant for dairy cows)*.
- Where we found extreme values at the beginning of the period, they were removed from the series.
- The envelope sizes valid from 2023 onwards have been assigned to the fixed extremes to obtain the theoretical specific values for the extremes.
- The deviations of these extremes from the planned specific values are reflected in the specific bands (minimum and maximum values) modelled from the previous period.

- These calculations were adjusted to reflect the risks identified, forecasts from the industry and expected market trends.
- The calculations show that a further reduction in the bands would already lead to a significant increase in financial risks.

Specific explanation: The band is set at 25 %, which is justified on the basis of historical data.

(Information supporting each finding, more detailed reasoning can be found in the analysis of the situation in the sector.)

Presentation of potential market distorting effects in the EU single market

The Hungarian milk and milk products sector has a rather mixed picture. In addition to producing close to the level of national self-sufficiency, it generates significant external trade flows, mainly within the EU. Regrettably, there is still a contradiction whereby part of the milk produced in Hungary leaves the country in the form of raw milk, while the market for processed products (cheese, yoghurt, dairy spreads) is a major source of imports from EU Member States.

The table below shows the main destination countries for raw milk exports. This shows that raw milk typically enters the internal market. In particular, Romania accounted for 47 % of raw milk in 2021. This may in itself raise the issue of the potential negative impact on the market balance, but at the same time Hungarian exports of raw milk do not distort the functioning of the internal market. Hungarian milk production accounts for between 1 % and 1.5 % of EU milk production. This alone is a very small proportion. Around 10-15 % of the raw milk delivered, representing about half of domestic production in terms of liquid milk production, is exported, which is virtually negligible for EU production. In addition, Romanian milk production is unable to supply raw materials to its processing industry and therefore needs to be imported. Accordingly, Hungarian exports in this case rather contribute to the security of food supply.

The pattern of exports is fragmented between partners and therefore does not represent a real threat to the balance of the internal market. The cheese is still worth mentioning in Hungarian exports, but it is typically not the EU but the markets in the Middle East.

Destination country	Volume of exports of raw milk (kg)	Breakdown
Total	277 621 423	100

DP15_E14_CISG_16 - Aid for the production of grain protein feed crops

Intervention Code (MS)	DP15_E14_CISG_16
Intervention Name	Aid for the production of grain protein feed crops
Type of Intervention	CIS(32) - Coupled income support
Common Output Indicator	O.10. Number of hectares benefitting from coupled income support

1 Territorial scope and, if relevant, regional dimension

Territorial scope: **National**

Code	Description
HU	Magyarország

Description of the Territorial Scope

The whole territory of Hungary.

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO1 Support viable farm income and resilience of the agricultural sector across the Union in order to enhance long-term food security and agricultural diversity as well as to ensure the economic sustainability of agricultural production in the Union

SO2 Enhance market orientation and increase farm competitiveness, both in the short and long term, including greater focus on research, technology and digitalisation

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
1.1.1	Predictable basic income for farmers	2	Yes
1.1.2	Provision of available loan financing	2	Partially
1.1.3.	Improving the profitability of small farms	2	Yes
1.2.1	Tackling adverse climatic events and damage caused by climate change in agriculture	1	Yes
1.2.3	Offsetting and mitigating the impact of market risks	2	Yes
2.1.1	Increasing operational and business efficiency of production	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.4 Share of utilised agricultural area (UAA) covered by income support and subject to conditionality

R.6 Percentage of additional direct payments per hectare for eligible farms below average farm size (compared to average)

R.7 Percentage of additional support per hectare in areas with higher needs (compared to average)

R.8 Share of farms benefitting from coupled income support for improving competitiveness, sustainability or quality

5 Specific design, requirements and eligibility conditions of the intervention

Description

For producers of protein feed grains and their families, it is of the utmost importance that coupled payments, which specifically support genuine production, together with the basic payment, form a real safety net that ensures an expected level of resilience in the event of income fluctuations due to weather

and market risks.

The intervention also aims to reduce protein dependency, thereby helping to partially meet the feed needs of livestock farmers.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary, the area and, when applicable, other relevant obligations

The protein forage grain premium shall be granted to an active farmer who is entitled to direct payments under the relevant national legislation.

Specific eligibility criteria:

- cultivate a crop as shown in the table below,
- a minimum yield of 2 tonnes/ha for soya, field beans, sweet lupins, dry peas, chickpeas, field peas, field peas, and
- use at least the minimum quantity of propagating material per hectare specified in the table in respect of the total area declared by it for the purpose of applying for coupled direct aid, certifying that the propagating material has been acquired, or
- for the production of field peas, for the total area declared for coupled direct aid, the table declares the use of the minimum quantity of propagating material per hectare specified in the table and recorded on the relevant voucher of the farming logbook.

By requiring the use of certified material, coupled support can contribute to the EU's environmental and climate objectives. The purpose of the standard is to enable farmers to grow resistant varieties that can cope with the negative effects of climate change, thereby helping agriculture to adapt its climate.

Name in Hungarian	Name in Latin	Minimum seed (kg/hectare)*
Soybean	Glycine max	70
Field beans (Disa beans)	Vicia faba	170
Sweet white lupins (for fodder)	Lupinus subbus	100
Sweet yellow lupins (for fodder)	Lupinus luteus	100
Sweet blue lupins (for forage)	Lupinus angustifolius	100
Sweet white lupins	Lupinus subbus	100
Blue-flower sweet lupins	Lupinus angustifolius	100
Yellow-flowing sweet lupin	Lupinus luteus	100
Dry peas (yellow peas)	Pisum sativum ssp. sativum convar. sativum	100
Chickpeas	Cicer arietinum	80
Spring field peas	Pisum sativum	170
Winter pea	Pisum sativum	100
Field peas	Pisum arvense	100

*: The values in the table are mean values from which a tolerance of $\pm 20\%$ is allowed. This flexibility is the possibility to adjust the mean values where necessary, and not a possibility for beneficiaries to deviate from the fixed standard values.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Range and amounts of support

Description

The intervention is announced with a single unit value, which represents the same amount per hectare for each applicant and grower of protein feed grain. Territorial differentiation is not applied.

8 Additional questions/information specific to the Type of Intervention

Justification of the difficulty(ies) that the targeted sector(s)/production(s) or type(s) of farming therein undergo.

Targeted support for the production of protein grain crops in Hungary **is justified by** the fact that the income-generating capacity of soya and forage peas, without coupled aid, is well below benchmark crops (wheat, maize, sunflower, rapeseed). Profitability is rather volatile year-on-year.

This difficulty is caused by volatile yields due to extreme weather conditions, a drastic increase in input prices, a lack of a suitable machinery pool, and the lack of specialised knowledge to grow successfully by a significant number of farmers, an incomplete knowledge base and an inefficient transfer of knowledge (**secondary arguments**).

In the absence of coupled aid, the sector would be at risk of shrinking, which would further aggravate Hungary's and the EU's protein dependency.

What is the aim of the intervention with regard to the targeted sector(s)/production(s) or type(s) of farming therein?

- ☐ to improve competitiveness
- ☒ to improve quality
- ☒ to improve sustainability

How will the intervention address the identified difficulty(ies) by this aim (i.e. explanation about the targeting)?

Our aim is to stabilise the sector's profitability and improve its resilience, based on the consultation of the sectors and the SWOT analysis, in order to maintain income in spite of fluctuations, contributing to alleviating the country's and the EU's import dependency and to food security through animal feed. In addition, positive effects on, for example, biodiversity or nitrogen resources in soils are maintained.

In order to promote sustainable production in order to maintain **the long-term improvement of the situation in the sector**, the eligibility conditions include certified seed use and minimum seed use and yields per hectare. The aim is therefore to address the difficulties arising from fluctuations in yields. In addition to stabilising income, direct aid plays an important role in farmers' farming, as they generate the necessary own resources and cover for the necessary improvements. In addition, stabilising farmers' incomes promotes modernisation, digitalisation and thus improved production efficiency.

What is (are) the sector(s) concerned?

Protein crops

Mix between legumes and grasses

Justification of the importance of the targeted sector(s)/production(s) or type(s) of farming therein

In the absence of coupled aid, the sector would be at risk of shrinking, which would further aggravate Hungary's and the EU's protein dependency. It is necessary to avoid this because the **importance of the sector is** very diverse.

- It reduces Hungary's and the EU's dependence on protein imports, thereby also allowing partly to replace the protein needs of the livestock sectors.
- It increases nitrogen in the soil, thereby directly contributing to the reduction of fertiliser use and nutrient losses.
- They are particularly important in crop diversification, increasing biodiversity, and their pre-plant value is high.

- Small livestock farms seeking self-sufficiency are one of the main sources of protein, and their production contributes to the viability of these farms in an environmentally sound manner by reducing feed costs.

Explanation how the intervention is consistent with the Water Framework Directive (i.e. 2000/60/EC).

Compliance with the Water Framework Directive is considered to be ensured horizontally through the adequacy of the legislative environment. The licensing system described in detail in section 3.3 provides sufficient safeguards for the start of new activities. For farms already in operation, it is important to clarify: The water use licensing system presented is not an offer that Hungary undertakes from 2023 onwards. This is a description of a system that has been in place for many years and has evolved and strengthened since the entry into force of the Directive for water use for agricultural purposes.

In addition, it can be concluded from the eligibility criteria and the amount of aid for the aid for the production of protein fodder grain that the unit payment is uniform for all producers, without any incentive to achieve higher yields and thus does not encourage higher water use. Stable output planning also proves that Hungary does not aim at intensification of agricultural production.

Among the elements of conditionality applicable from 2023, the SMR 1 contains a specific basic requirement for the implementation of the Directive, which can thus be held accountable to producers through the system of checks and penalties for conditionality. Proper national implementation and control of the standard thus establishes a link between the authorisation procedures for water abstraction for irrigation and the payment of payments under the CAP.

This point of the Directive is also one of the mandatory basic measures of any river basin management plan.

As additional information, it can be noted that Section II. Through Pillar-funded investment facilities, we are planning to devote significant resources to the widest possible uptake of precision farming, promoting a more rational and sustainable use of natural resources (including water).

The surplus check presented in chapter 3.3 does not apply to this item.

This ensures that the scheme does not jeopardise the achievement of the objectives laid down in Hungary's river basin management plan.

EU WTO schedule limits on oilseeds (Blair

House Agreement): Does the intervention target any of the crop(s) covered by the agreement (i.e. soybean, rapeseed, sunflower seed)?

☒ Yes ☐ No

	Claim Year				
	2023	2024	2025	2026	2027
rapeseed/colza	0	0	0	0	0
sunflower (excluding confectionary sunflower seed)	0	0	0	0	0
soya beans	56,406	56,406	56,406	56,406	56,406

Is the intervention financed, partly or completely, from the protein crop top up (maximum 2% in total) in accordance with Art. 96(3) of SPR?

☒ Yes ☐ No

If the intervention targets a mix between legumes and grasses: please indicate the minimum percentage of legumes in the mix.

50 %

Coupled income support granted to silkworms is an animal based support, where the use of 'head' as the support's basic unit requires prior clarification of the followings:

please clarify the conversion rate between this unit and ‘head’ (i.e. how many of this unit corresponds to ‘1 head’?) for the purpose of e.g. indicators.

N/A

It is possible to give further clarification in comment (e.g. the weight of eggs that a box must contain)

9 WTO compliance

Amber Box

Explanation of whether and, if so, how the intervention respects relevant provisions of Article 6.5 or Annex 2 to the WTO Agreement on Agriculture (Blue Box)

CIS interventions are amber box support and are therefore not relevant.

11 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Planned Unit Amount	Region(s)	Result Indicator(s)
DP15_O10_U01_HA - Specific amount of aid for the production of protein fodder grain	Uniform		R.4; R.6; R.7; R.8

Explanation and Justification (including the flexibility)

DP15_O10_U01_HA - Specific amount of aid for the production of protein fodder grain

Brief description of the determination of the specific value

The determination of the unit value has been supported by the experience gained in 2015-2022 and relative stability among the supported sectors. This has provided sufficient basic data on the role of coupled aid in the income of protein grain crops and what its absence would cause for operational success.

The findings of the SWOT analysis showed that coupled support is a key element for protein grain production. Therefore, based on the needs identified in the needs assessment and addressing the difficulties indicated, Hungary opted for targeted support for the sensitive sectors identified in the submitted plan, such as protein grain production.

For the calculation of the unit value, we relied on data from sector situation analyses. The multi-annual statistical data sets have been used to determine the amount that is typically sufficient to minimise or, where appropriate, raise the profitability of a given activity to an expected level. Our aim is to prevent the cessation of activities or conversion to other crops (e.g. wheat with higher incomes, maize, oil crops). This is of particular importance in ensuring the supply of food and feed to Hungary. The suitability of the specific value may, of course, be changed from year to year due to external factors, which is why there is a need for a solid band to manage the swings.

In general, the planning of **stable outputs** clearly shows our intentions. This is to keep the production of grain protein crops at levels and prevent their shrinkage. This also means that it does not provide incentives for irrigation. This in turn contributes to responsible treatment of natural resources (including water and soil).

Minimum and maximum value of the specific value

In the case of aid for the production of protein fodder grains, a minimum and a maximum value of EUR 232,87 per hectare are fixed.

Variance of the specific value: $\pm 30\%$

When setting the minimum and maximum amounts of unit aid, the following methodology was followed:

—We examined the extremes recorded during the period 2015-2021 for approved areas.

—The data for the submission of applications for 2022 are now available to help predict the expected evolution of trends.

—The impact of changes in product areas has been filtered out using detailed data tables for comparability purposes (not relevant for protein grain production).

—Where we found extreme values at the beginning of the period, they were removed from the series.

—The envelope sizes valid from 2023 onwards have been assigned to the fixed extremes to obtain the theoretical specific values for the extremes.

—The deviations of these extremes from the planned specific values are reflected in the specific bands (minimum and maximum values) modelled from the

previous period.

—These calculations were adjusted to reflect the risks identified, forecasts from the industry and expected market trends.

—The calculations show that a further reduction in the bands would already lead to a significant increase in financial risks.

Specific explanation: The band is justified by historical data and serious swings in the soya market. However, the size of the financial envelope is slightly increasing and the combined effect of these two factors is still difficult to estimate.

(Information supporting each finding, more detailed reasoning can be found in the analysis of the situation in the sector.)

R.4 Share of utilised agricultural area (UAA) covered by income support and subject to conditionality

R.6 Percentage of additional direct payments per hectare for eligible farms below average farm size (compared to average)

R.7 Percentage of additional support per hectare in areas with higher needs (compared to average)

R.8 Share of farms benefitting from coupled income support for improving competitiveness, sustainability or quality

5 Specific design, requirements and eligibility conditions of the intervention

Description

For producers of coarse protein feed crops and their families, it is of the utmost importance that coupled payments, which specifically support genuine production, together with the basic payment, form a real safety net that ensures an expected level of resilience in the event of income fluctuations due to these

weather and market risks.

The intervention also aims to reduce protein dependency, thereby helping to partially meet the feed needs of ruminants.

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary, the area and, when applicable, other relevant obligations

The aid for the production of coarse protein forage shall be an active farmer who is eligible for direct aid under the relevant national legislation.

Specific eligibility criteria:

- grow a plant according to the table below,
- use the minimum propagating material per hectare of the weight set out in the table below or, in the case of planting or overseeding in the autumn of the year preceding the year of the claim, or a quantity of propagating material providing a minimum number of sprouts, in respect of the total area declared by it for the purposes of applying for coupled direct aid, and provides evidence of the purchase of the propagating material,
- the crop suitable for multi-annual cultivation is present in at least 80 % of the field declared in the aid application as a coherent herd, and
- it shall also be ensured that the protein crop component does not fall below 50 % in the case of uses other than the minimum values laid down in the table for the cultivation of the female mixture, peas' sun-rising bird, peas maize and rye-spined vetch.

By requiring the use of certified material, coupled support can contribute to the EU's environmental and climate objectives. The aim of the standard is to ensure that farmers grow resistant varieties that can cope with the negative effects of climate change, thereby promoting the climate adaptation of agriculture.

6 Identification of relevant baseline elements

(relevant GAEC, statutory management requirements (SMR) and other mandatory requirements established by national and Union law), where applicable, description of the specific relevant obligations under the SMR, and explanation as to how the commitment goes beyond the mandatory requirements (as referred to in Art. 28 (5) and Art. 70 (3) and in Art. 72 (5))

N/A

7 Range and amounts of support

Description

The intervention is announced with a single unit value, which represents the same amount per hectare for all producers and applicants of coarse protein fodder. Territorial differentiation is not applied.

8 Additional questions/information specific to the Type of Intervention

Justification of the difficulty(ies) that the targeted sector(s)/production(s) or type(s) of farming therein undergo.

Targeted support for the production of fibre protein crops in Hungary **is justified by** the fact that the income-generating capacity of forage crops in Hungary, without coupled aid, is far below the benchmark crops (wheat, maize, sunflower, rapeseed). Profitability is rather volatile year-on-year.

This difficulty is caused by volatile and low yields due to extreme weather conditions, a drastic increase in input prices, the lack of a suitable machinery fleet and the fact that the positive externalities of leguminous coarse fodder production are not recognised by the market. (**subsidiary arguments**).

In the absence of coupled aid, the sector would be at risk of shrinking, which would further aggravate Hungary's and the EU's protein dependency. In addition, a decline in the area and its possible withdrawal from crop rotation would cause both economic and ecological losses.

What is the aim of the intervention with regard to the targeted sector(s)/production(s) or type(s) of farming therein?

- ☐ to improve competitiveness
- ☒ to improve quality
- ☒ to improve sustainability'

How will the intervention address the identified difficulty(ies) by this aim (i.e. explanation about the targeting)?

Our aim is to stabilise the sector's profitability and improve its resilience, based on the consultation of the sectors and the SWOT analysis, in order to maintain income in spite of fluctuations, contributing to alleviating the country's and the EU's import dependency and to food security through animal feed. In addition, positive effects on, for example, biodiversity or nitrogen resources in soils are maintained.

In order to promote sustainable production, in order to maintain **the long-term improvement of the situation in the sector**, the eligibility conditions include certified seed use and the requirement of a minimum number of propagating material per hectare or a minimum number of germinal products. The aim is thus to address the difficulties arising from fluctuations in yields and low yields. In addition to stabilising income, direct aid plays an important role in farmers' farming, as they generate the necessary own resources and cover for the necessary improvements. In addition, stabilising farmers' incomes promotes modernisation, digitalisation and thus improved production efficiency.

What is (are) the sector(s) concerned?

Protein crops

Mix between legumes and grasses

Justification of the importance of the targeted sector(s)/production(s) or type(s) of farming therein

In the absence of coupled aid, the sector would be at risk of shrinking, which would further aggravate Hungary's and the EU's protein dependency. In addition, a decline in the area and its possible withdrawal from crop rotation would cause both economic and ecological losses. It is necessary to avoid this because **the importance of the sector is** very diverse.

- It reduces Hungary's and the EU's dependence on protein imports, thereby also allowing partly to

replace the protein needs of the livestock sectors.

- Leguminous coarse fodder crops play a significant role in the use of land with weak income-producing potential, in crop diversification and in increasing biodiversity.
- Leguminous coarse fodder crops increase the soil's nitrogen stock, thereby contributing directly to the reduction of fertiliser use and nutrient losses, their deep, branched roots improve soil structure, and soil conservation effects on soils exposed to erosion.
- The cultivation of leguminous coarse fodder crops is the most environmentally friendly solution for the self-protein supply of protein to small cattle farms.

Explanation how the intervention is consistent with the Water Framework Directive (i.e. 2000/60/EC).

Compliance with the Water Framework Directive is considered to be ensured horizontally through the adequacy of the legislative environment. The licensing system described in detail in section 3.3 provides sufficient safeguards for the start of new activities. For farms already in operation, it is important to clarify: The water use licensing system presented is not an offer that Hungary undertakes from 2023 onwards. This is a description of a system that has been in place for many years and has evolved and strengthened since the entry into force of the Directive for water use for agricultural purposes.

In addition, it can be concluded from the eligibility criteria and the amount of aid for the aid for the production of rough protein fodder that the unit payment is uniform for all producers, without any incentive to achieve higher yields and thus does not encourage higher water use. Stable output planning also proves that Hungary does not aim at intensification of agricultural production.

Among the elements of conditionality applicable from 2023, the SMR 1 contains a specific basic requirement for the implementation of the Directive, which can thus be held accountable to producers through the system of checks and penalties for conditionality. Proper national implementation and control of the standard thus establishes a link between the authorisation procedures for water abstraction for irrigation and the payment of payments under the CAP.

This point of the Directive is also one of the mandatory basic measures of any river basin management plan.

As additional information, it can be noted that Section II. Through Pillar-funded investment facilities, we are planning to devote significant resources to the widest possible uptake of precision farming, promoting a more rational and sustainable use of natural resources (including water).

The surplus check presented in chapter 3.3 does not apply to this item.

This ensures that the scheme does not jeopardise the achievement of the objectives laid down in Hungary's river basin management plan.

9 WTO compliance

Amber Box

Explanation of whether and, if so, how the intervention respects relevant provisions of Article 6.5 or Annex 2 to the WTO Agreement on Agriculture (Blue Box)

The CIS interventions are amber box support and are therefore not relevant.

11 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Planned Unit Amount	Region(s)	Result Indicator(s)
DP16_O10_U01_HA - Specific amount of aid for the production of coarse protein crops	Uniform		R.4; R.6; R.7; R.8

Explanation and Justification (including the flexibility)

DP16_O10_U01_HA - Specific amount of aid for the production of coarse protein crops

Brief description of the determination of the specific value

The determination of the unit value has been supported by the experience gained in 2015-2022 and relative stability among the supported sectors. This has provided sufficient basic data on the role of coupled aid in the income of protein grain crops and what its absence would cause for operational success.

The findings of the SWOT analysis showed that coupled support is a key element for protein grain production. Therefore, based on the needs identified in the needs assessment and addressing the difficulties indicated, Hungary opted for targeted support for the sensitive sectors identified in the submitted plan, such as protein grain production.

For the calculation of the unit value, we relied on data from sector situation analyses. The multi-annual statistical data sets have been used to determine the amount that is typically sufficient to minimise or, where appropriate, raise the profitability of a given activity to an expected level. Our aim is to prevent the cessation of activities or conversion to other crops (e.g. wheat with higher incomes, maize, oil crops). This is of particular importance in ensuring the supply of food and feed to Hungary. The suitability of the specific value may, of course, be changed from year to year due to external factors, which is why there is a need for a solid band to manage the swings.

In general, the planning of **stable outputs** clearly shows our intentions. This is to keep the production of grain protein crops at levels and prevent their shrinkage. This also means that it does not provide incentives for irrigation. This in turn contributes to responsible treatment of natural resources (including water and soil).

Minimum and maximum value of the specific value

For the aid for the production of coarse protein fodder, a minimum and a maximum value of EUR 64,17 per hectare are fixed.

Variance of the specific value: + 20 %/-30 %

When setting the minimum and maximum amounts of unit aid, the following methodology was followed:

- We examined the extremes recorded during the 2015-2021 period for approved areas and animals.
- The data for the submission of applications for 2022 are now available to help predict the expected evolution of trends.
- The impact of changes in product areas has been filtered out for comparability purposes using detailed data tables (*not relevant for fibre protein crops*).
- Where we found extreme values at the beginning of the period, they were removed from the series.
- The envelope sizes valid from 2023 onwards have been assigned to the fixed extremes to obtain the theoretical specific values for the extremes.
- The deviations of these extremes from the planned specific values are reflected in the specific bands (minimum and maximum values) modelled from the

previous period.

—These calculations were adjusted to reflect the risks identified, forecasts from the industry and expected market trends.

—The calculations show that a further reduction in the bands would already lead to a significant increase in financial risks.

Specific explanation: Historical data showed an increase in the area and therefore the maximum tolerance level for deviation has been reduced. At the same time, the financial envelope and the unit value are decreasing and the impact of these factors is still difficult to estimate.

(Information supporting each finding, more detailed reasoning can be found in the analysis of the situation in the sector.)

Fruit and Vegetables

Planned Unit Amounts - Definition

Planned Unit Amount	Type of Planned Unit Amount	Region(s)	Result Indicator(s)
SC11_SC29_O35_A01_OP - Support to operational funds	Average		R.10; R.11

Description

SC11_SC29_O35_A01_OP - Support to operational funds

The Union financial assistance shall be equal to the amount of the financial contributions referred to in Article 51(1), point (a), actually paid and limited to 50 % of the actual expenditure incurred.

The Union financial assistance shall be limited to: 4.1 % of the value of the marketed production of each producer organisation; 4.5 % of the value of marketed production of each association of producer organisations; 5 % of the value of marketed production of each transnational producer organisation or transnational association of producer organisations.

Those limits may be increased by 0,5 percentage points provided that the amount in excess of the relevant percentage set out in the first subparagraph is used solely for one or more interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (h), (i) and (j). In the case of associations of producer organisations, including transnational associations of producer organisations, those interventions may be implemented by the association on behalf of its members.

At the request of a producer organisation or of an association of producer organisations, the 50 % limit provided for in paragraph 1 shall be increased to 60 % for an operational programme or part of an operational programme if at least one of the following applies:

transnational producer organisations implement in two or more Member States interventions linked to the objectives referred to in Article 46, points (b), (e) and (f);

one or more producer organisations or associations of producer organisations are engaged in interventions operated on an interbranch basis;

the operational programme concerns only specific aid for the production of organic products within the scope of Regulation (EU) 2018/848;

the producer organisation or the association of producer organisations recognised under Regulation (EU) No 1308/2013 implements for the first time an operational programme;

producer organisations market less than 20 % of fruit and vegetable production in a Member State;

the producer organisation operates in one of the outermost regions;

the operational programme comprises the interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (i) and (j);

the operational programme is for the first time implemented by a recognised producer organisation which is the result of a merger between two or more recognised producer organisations.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objective referred to in Article 46, point (d), if that expenditure covers at least 5 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objectives referred to in Article 46, points (e) and (f), if that expenditure covers at least 20 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 100 % in the following cases:

market withdrawals of fruit and vegetables which do not exceed 5 % of the volume of marketed production of each producer organisation and which are

disposed of by way of:

free distribution to charitable organisations and foundations approved to that effect by the Member States, for use in their activities to assist persons whose right to public assistance is recognised in national law, in particular because they lack the necessary means of subsistence;

free distribution to penal institutions, schools, public education institutions, establishments referred to in Article 22 of Regulation (EU) No 1308/2013 and children's holiday camps, hospitals and old people's homes designated by the Member States; Member States shall take all necessary steps to ensure that the quantities thus allocated are only additional to the quantities normally purchased by such establishments;

In regions of the Member States in which the degree of organisation of producers in the fruit and vegetables sector is significantly below the Union average, Member States may grant producer organisations recognised under Regulation (EU) No 1308/2013 national financial assistance equal to a maximum of 80 % of the financial contributions referred to in Article 51(1), point (a), of this Regulation and up to 10 % of the value of the marketed production of any such producer organisation. The national financial assistance shall be additional to the operational fund.

Planned Unit Amounts - financial table with output

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	Total 2023 - 2027

BOOST(46(g)) boosting products' commercial value and quality, including improving product quality and developing products with a protected designation of origin or with a protected geographical indication or covered by Union or national quality schemes recognised by Member States
CLIMA(46(f)) contributing to climate change mitigation and adaptation
COMP(46(c)) improvement of medium- and long-term-competitiveness, in particular through modernisation
CONC(46(b)) concentration of supply and placing on the market of the products, including through direct marketing
EMPL(46(k)) improving the conditions of employment and ensuring compliance with the employer obligations as well as occupational health and safety requirements in accordance with Directives 89/391/EEC, 2009/104/EC and (EU) 2019/1152
PROD(46(a)) planning and organisation of production, adjusting production to demand, in particular with regard to quality and quantity, optimisation of production costs and returns on investments, stabilising producer prices
PROMO(46(e)) promoting, developing and implementing: (i) production methods and techniques that are respectful of the environment; (ii) pest and disease resilient production practices; (iii) animal health and welfare standards going beyond minimum requirements established under Union and national law; (iv) reduction of waste and environmentally sound use and management of by-products, including their re-usage and valorisation; (v) protection and enhancement of biodiversity and sustainable use of natural resources, in particular protection of water, soil and air.
REDE(46(d)) research into, and development of, sustainable production methods, including pest resilience, animal disease resistance and climate change resilience and mitigation, innovative practices and production techniques boosting economic competitiveness and bolstering market developments

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold
SO2 Enhance market orientation and increase farm competitiveness, both in the short and long term, including greater focus on research, technology and digitalisation
SO3 Improve the farmer' position in the value chain
SO4 Contribute to climate change mitigation and adaptation, including by reducing greenhouse gas emission and enhancing carbon sequestration, as well as promote sustainable energy
SO5 Foster sustainable development and efficient management of natural resources such as water, soil and air, including by reducing chemical dependency
SO6 Contribute to halting and reversing biodiversity loss, enhance ecosystem services and preserve habitats and landscapes
SO9 Improve the response of Union agriculture to societal demands on food and health, including high quality, safe, and

nutritious food produced in a sustainable way, the reduction of food waste, as well as improving animal welfare and combatting antimicrobial resistances

XCO Cross-cutting objective of modernising the sector by fostering and sharing of knowledge, innovation and digitalisation in agriculture and rural areas, and encouraging their uptake

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
2.1.1	Increasing operational and business efficiency of production	1	Yes
2.1.11	Creation of new plantations, refurbishment and modernisation of plantations	2	Yes
2.1.2	Creation of modern generation capacities	2	Yes
2.1.3	Increasing the level of processing of agricultural raw materials	1	Yes
2.1.7	Technological transition taking into account stricter phytosanitary requirements	1	Yes
2.1.8	Improvement of cultivation technology	1	Yes
2.2.1	Development of post harvest technology	2	Yes
2.2.2	Construction/refurbishment of crop storages, cold stores	2	Yes
2.3.1	Uptake of innovative technologies and sustainable approaches in agriculture	2	Yes
2.4.1	Market research	3	Yes
3.1.1	Promoting horizontal and vertical integration, coordination and cooperation	1	Yes
3.1.2	Increase the number and market efficiency of sectoral cooperation (including PO, PG)	1	Yes
3.1.3	Development of short supply chains (database, tool, infrastructure and competence development)	1	Yes
4.4.1	Development of solutions and tools to protect against adverse weather effects	1	Yes
5.1.2	Reducing nutrient losses, preventing nutrient leaching	1	Yes
5.2.1	Sustainable use of surface and groundwater	1.	Yes
6.4.1	Developing up-to-date data collection and monitoring systems for measuring biodiversity	1	Partially
6.5.1	Support for cooperation between agriculture, forestry, hunting and nature conservation	1	Partially
9.3.1	Product development and packaging development that	3	Yes

	meet consumers' expectations		
9.3.2	Use of innovative technological solutions in food production – packaging	2	Partially
9.3.3	Promoting compliance with the Packaging and Waste Framework Directive	2	Yes
CCO.1.2	Raising farmers' knowledge	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description	Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold
R.1	Number of persons benefitting from advice, training, knowledge exchange, or participating in European Innovation Partnership (EIP) operational groups supported by the CAP in order to enhance sustainable economic, social, environmental, climate and resource efficiency performance
R.10	Share of farms participating in producer groups, producer organisations, local markets, short supply chain circuits and quality schemes supported by the CAP
R.11/Fruit and Vegetables	Share of value of marketed production by producer organisations or producer groups with operational programmes in certain sectors
R.12	Share of utilised agricultural area (UAA) under supported commitments to improve climate adaptation
R.15	Supported investments in renewable energy production capacity, including bio-based (in MW)
R.16	Share of farms benefitting from CAP investment support contributing to climate change mitigation and adaptation, and to the production of renewable energy or biomaterials
R.19	Share of utilised agricultural area (UAA) under supported commitments beneficial for soil management to improve soil quality and biota (such as reducing tillage, soil cover with crops, crop rotation included with leguminous crops)
R.23	Share of utilised agricultural area (UAA) under supported commitments to improve water balance
R.24	Share of Utilised Agricultural Area (UAA) under supported specific commitments which lead to a sustainable use of pesticides in order to reduce risks and impacts of pesticides, such as pesticides leakage
R.26	Share of farms benefitting from CAP productive and non-productive investment support related to care for the natural resource
R.27	Number of operations contributing to environmental sustainability and the achievement of climate mitigation and adaptation goals in rural areas
R.31	Share of utilised agricultural area (UAA) under supported commitments for supporting biodiversity conservation or restoration including high-nature-value farming practices
R.32	Share of farms benefitting from CAP investment support contributing to biodiversity
R.39	Number of rural businesses including bio-economy businesses developed with CAP support
R.9	Share of farmers receiving investment support to restructure and modernise, including to improve resource efficiency

5 Specific design, requirements and eligibility conditions of the intervention

Description

The implementation of investments, research and experimental and innovative production methods and other types of activities for sectoral objectives included in the operational programmes submitted by recognised producer organisations and adopted by the responsible authority.

Responsibilities

Implementation and maintenance of the implemented activities in accordance with the objectives set out in the operational programmes

Preparation and submission of the report on the implementation of operational programmes

Participation in compulsory training relating to the fulfilment of the conditions for recognition and the implementation of operational programmes.

Eligibility criteria

Compliance with the conditions for recognition as a producer organisation laid down by the European Union and national legislation

Submission and implementation of operational programmes

15 % of the aid must be allocated to climate and environmental measures comprising at least three activities and 2 % to research development.

Specific Conditions

The type of intervention referred to in Article 47(a) may be implemented in addition to those listed in points (i) to (xiii) in the following areas:

- concentration of supply and placing on the market of products
- planning and organisation of production
- improving competitiveness in the medium and long term
- increasing the commercial value and quality of products

The maintenance period for investments under the OP is 5 years. Where the accounting depreciation period of the investment is shorter than five years, the maintenance period for small and medium-sized enterprises shall be 3 years.

Investments shall be made on the premises of the beneficiary or, where applicable, on the premises of producer members or subsidiaries of the beneficiary organisation that comply with the 90 % requirement referred to in Article 31(7) of this Regulation EU/126/2022.

Grants for investments, including leasing, may be granted in a single instalment or in annual instalments approved in the operational programme.

In the case of investments in tangible assets consisting of energy generation systems, the amount of energy produced does not exceed the amount of energy that can be used annually for the usual activities of the beneficiary.

For types of investment and other activities, the condition for the calculation of expenditure under Article 50(7)(b) of Regulation (EU)/2115/2021

Investments referred to in Article 11 of Regulation (EU)/126/2022 shall be taken into account if they result in a reduction of at least 15 % during the accounting depreciation period of the investment compared to the previous situation in respect of any of the points (a) to (d) and (f) of Article 12(1):

result in a reduction of at least 7 % over the accounting depreciation period of the investment compared to the previous situation, where those investments bring more of the environmental benefits listed above.

Productive or non-productive investments in or outside the production area that contribute to climate change mitigation and adaptation may be taken into account.

Investments in the improvement of existing irrigation installations or parts of irrigation systems shall be eligible only if an ex ante assessment concludes that they will result in potential water savings of at least 10 % in terms of microirrigation and 15 % in terms of linear and reeling drum installations, based on the technical parameters of the existing installation or system.

Where the investment concerns bodies of groundwater or surface waters which have been classified as less than good in the relevant river basin management plan for reasons related to water quantity, the investment shall also comply with the following cumulative conditions:

- the project must ensure a reduction in actual water consumption of at least 50 % of the potential water savings identified by the ex-ante assessment of the project for the irrigation installations or irrigation systems concerned by the project; and
- where the project concerns only part of the irrigated area of the holding, the total water consumption of the holding at farm level shall be reduced accordingly by at least 50 %. The total water consumption of the holding shall be added to the quantity of water sold by the holding or otherwise transferred for irrigation

purposes.

None of the conditions set shall apply to investments in existing irrigation installations which only concern energy efficiency, nor to investments in the construction of reservoirs or to investments in the use of reclaimed water which do not affect a body of groundwater or surface water.

Investments related to points (e) (g) to (i) of Article 12(1) of Regulation (EU)/126/2022 and other interventions related to the objective listed in points (a) to (i) of Article 50 of Regulation (EU)/2115/2021 shall be eligible for expenditure under points (a) and (b) of Article 50(7) of Regulation (EU)/2115/2021 if they demonstrate to the satisfaction of the beneficiaries when submitting the operational programmes or amendments thereto, that the activities included in the operational programme contribute positively to the achievement of the objectives, even if their impact, where applicable, cannot be quantified.

Eligible for support shall include additional costs and income foregone resulting from interventions targeting agri-environment-climate objectives. Interventions targeting agri-environment-climate objectives shall be reviewed when relevant mandatory standards, requirements or obligations are amended.

A product which has been damaged for phytosanitary reasons shall not be considered waste from the production process if the use of integrated pest management technology is not justified, unless there is no approved product for use within the framework of the integrated technology in that crop.

For types of research activities, condition for calculation for expenditure under Article 50(7)(c) of Regulation (EU) No 2115/2021

Applied research

proven cooperation with a research organisation

mandatory scientific publication, research report and certified dissemination to members of the Producer Organisation

Research for technological development/technological experiment/type experiment

mandatory research report and certified dissemination to members of the Producer Organisation

Market/marketing research:

Product and process developments for market diversification, market expansion

Market research to assess existing and potential market needs, development opportunities for current distribution channels, possibilities to develop new distribution channels

Market research affecting production structures

Consumer behaviour research

In addition to the costs listed in Annex III,

1. rental and open-end leasing of transport vehicles used for sales and distribution activities.
2. the fees for the services used, which are included in the operational programme, are implemented in the context of activities aimed at achieving the objectives of the operational programme (for example, but not exhaustive: consultancy services, consultancy services, expert activities, research and experimentation, marketing communication, promotion, quality assurance systems development, auditing, preparation, etc.
3. costs of meetings and training programmes where they are related to the operational programme, including daily allowances, transport and accommodation costs, where applicable, on a standard flat-rate or scales of unit costs basis.
4. flat rate for staff and administrative costs linked to the management of the operational fund or to

the preparation, implementation and monitoring of the operational programme, up to a maximum of 2 % of the approved operational fund

6 Form and rate of support/amounts/calculation methods

Support may take any of the following forms:

reimbursement of eligible costs actually incurred by a beneficiary; Article 44(1)(a)

unit costs; Article 44(1)(b)(2)(c)

Institution guarantee at preferential rates

The Union financial assistance shall be equal to the amount of the financial contributions referred to in Article 51(1), point (a), actually paid and limited to 50 % of the actual expenditure incurred.

The Union financial assistance shall be limited to: 4.1 % of the value of the marketed production of each producer organisation; 4.5 % of the value of marketed production of each association of producer organisations; 5 % of the value of marketed production of each transnational producer organisation or transnational association of producer organisations.

Those limits may be increased by 0,5 percentage points provided that the amount in excess of the relevant percentage set out in the first subparagraph is used solely for one or more interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (h), (i) and (j). In the case of associations of producer organisations, including transnational associations of producer organisations, those interventions may be implemented by the association on behalf of its members.

At the request of a producer organisation or of an association of producer organisations, the 50 % limit provided for in paragraph 1 shall be increased to 60 % for an operational programme or part of an operational programme if at least one of the following applies:

transnational producer organisations implement in two or more Member States interventions linked to the objectives referred to in Article 46, points (b), (e) and (f);

one or more producer organisations or associations of producer organisations are engaged in interventions operated on an interbranch basis;

the operational programme concerns only specific aid for the production of organic products within the scope of Regulation (EU) 2018/848;

the producer organisation or the association of producer organisations recognised under Regulation (EU) No 1308/2013 implements for the first time an operational programme;

producer organisations market less than 20 % of fruit and vegetable production in a Member State;

the producer organisation operates in one of the outermost regions;

the operational programme comprises the interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (i) and (j);

the operational programme is for the first time implemented by a recognised producer organisation which is the result of a merger between two or more recognised producer organisations.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objective referred to in Article 46, point (d), if that expenditure covers at least 5 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objectives referred to in Article 46, points (e) and (f), if that expenditure covers at least 20 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 100 % in the following cases:

market withdrawals of fruit and vegetables which do not exceed 5 % of the volume of marketed production of each producer organisation and which are disposed of by way of:

free distribution to charitable organisations and foundations approved to that effect by the Member States, for use in their activities to assist persons whose right to public assistance is recognised in national law, in particular because they lack the necessary means of subsistence;

free distribution to penal institutions, schools, public education institutions, establishments referred to in Article 22 of Regulation (EU) No 1308/2013 and children's holiday camps, hospitals and old people's homes designated by the Member States; Member States shall take all necessary steps to ensure that the

quantities thus allocated are only additional to the quantities normally purchased by such establishments; In regions of the Member States in which the degree of organisation of producers in the fruit and vegetables sector is significantly below the Union average, Member States may grant producer organisations recognised under Regulation (EU) No 1308/2013 national financial assistance equal to a maximum of 80 % of the financial contributions referred to in Article 51(1), point (a), of this Regulation and up to 10 % of the value of the marketed production of any such producer organisation. The national financial assistance shall be additional to the operational fund.

7 Additional information specific to the Type of Intervention

Investments can be made through purchase, construction, rental and leasing. In the case of rent, the grant will be calculated on the basis of unit costs or, for other cases, on the basis of the costs incurred.

Environmental actions on soil protection and nutrient management related to water and waste management, climate change mitigation, integrated pest management and maintenance of natural habitats and biodiversity

The expected reductions and, where applicable, the expected additional environmental benefits shall be demonstrated in advance through project descriptions or other technical documents; those project descriptions or other technical documents shall be presented by the producer organisation or association of producer organisations at the time of the application for approval of the proposed operational programme or amendment to that programme, indicating the technical documents or the results certified by an independent body or expert appointed by the Member State which could be achieved through the implementation of the investment.

In order to avoid double funding, farmers participating in an activity having the same content as agri-environment-climate payments implemented with support under the operational programme shall not be entitled to receive support for the same activity on the same parcel under agri-environment-climate payments.

For environmental measures that coincide with agri-environment-climate or organic farming commitments under rural development interventions, the support ceiling shall be set at the maximum amounts established for agri-environment-climate payments or organic farming payments. However, this does not apply to environmental protection activities which are not directly or indirectly linked to a particular parcel.

8 WTO compliance

Green Box

Paragraph 2 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 2 of Annex II. Producers shall establish services under their operational programmes for farmers who are members of the producer organisation.

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.1 Number of persons benefitting from advice, training, knowledge exchange, or participating in European Innovation Partnership (EIP) operational groups supported by the CAP in order to enhance sustainable economic, social, environmental, climate and resource efficiency performance

R.10 Share of farms participating in producer groups, producer organisations, local markets, short supply chain circuits and quality schemes supported by the CAP

R.11/Fruit and Vegetables Share of value of marketed production by producer organisations or producer groups with operational programmes in certain sectors

R.28 Number of persons benefitting from advice, training, knowledge exchange, or participating in European Innovation Partnership (EIP) operational groups supported by the CAP related to environmental or climate-related performance

5 Specific design, requirements and eligibility conditions of the intervention

Description

Implementation of advisory services and technical assistance for sectoral objectives included in operational programmes submitted by recognised producer organisations and adopted by the responsible

authority

Obligations

Implementation and maintenance of the activities implemented in accordance with the objectives set out in the operational programmes

Preparation and submission of the report on the implementation of operational programmes

Participation in compulsory training related to the fulfilment of the recognition criteria and the implementation of the operational programmes.

Eligibility criteria

Compliance with the conditions for recognition as a producer organisation laid down by European Union and national legislation

Submission and implementation of an operational programme

15 % of the aid must be spent on climate and environmental measures with a minimum of three activities and 2 % for research development.

Detailed description of the rationale of the advisory plan, the methods and instruments chosen in relation to the objectives pursued

Summary of the content of the expert advice, justification of the action's contribution to the objectives of the operational programme

Number of participants in expert advice, number of occasions, duration of sessions

Other interventions related to the objective listed in points (a) to (i) of Article 12(1) of Regulation (EU)/126/2022 may count towards expenditure under Article 50(7)(a) and (b) of Regulation (EU)/2115/2021 if the beneficiaries credibly demonstrate, at the time of submission of the operational programmes or their amendments, that the activities included in the operational programme contribute positively to the achievement of the objectives, even if their impact cannot be quantified.

In addition to the costs listed in Annex III, are also eligible:

- the fees for the services used, which are carried out in the operational programme, are carried out within the framework of activities intended to achieve the objectives of the operational programme (for example, but not exhaustively: consultancy services, consultancy services, expert activities, research and experimentation, marketing communication, promotion, quality assurance systems development, audit, preparation, etc.
- Flat rate for staff and administrative costs linked to the management of the operational fund or the preparation, implementation and follow-up of the operational programme, up to a maximum of 2 % of the approved operational fund

6 Form and rate of support/amounts/calculation methods

Support may take any of the following forms:

reimbursement of eligible costs actually incurred by a beneficiary; Article 44(1)(a)

unit costs; Article 44(1)(b)(2)(a)(i), (c)

The Union financial assistance shall be equal to the amount of the financial contributions referred to in Article 51(1), point (a), actually paid and limited to 50 % of the actual expenditure incurred.

The Union financial assistance shall be limited to: 4.1 % of the value of the marketed production of each producer organisation; 4.5 % of the value of marketed production of each association of producer organisations; 5 % of the value of marketed production of each transnational producer organisation or transnational association of producer organisations.

Those limits may be increased by 0,5 percentage points provided that the amount in excess of the relevant percentage set out in the first subparagraph is used solely for one or more interventions linked to the

objectives referred to in Article 46, points (d), (e), (f), (h), (i) and (j). In the case of associations of producer organisations, including transnational associations of producer organisations, those interventions may be implemented by the association on behalf of its members.

At the request of a producer organisation or of an association of producer organisations, the 50 % limit provided for in paragraph 1 shall be increased to 60 % for an operational programme or part of an operational programme if at least one of the following applies:

transnational producer organisations implement in two or more Member States interventions linked to the objectives referred to in Article 46, points (b), (e) and (f);

one or more producer organisations or associations of producer organisations are engaged in interventions operated on an interbranch basis;

the operational programme concerns only specific aid for the production of organic products within the scope of Regulation (EU) 2018/848;

the producer organisation or the association of producer organisations recognised under Regulation (EU) No 1308/2013 implements for the first time an operational programme;

producer organisations market less than 20 % of fruit and vegetable production in a Member State;

the producer organisation operates in one of the outermost regions;

the operational programme comprises the interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (i) and (j);

the operational programme is for the first time implemented by a recognised producer organisation which is the result of a merger between two or more recognised producer organisations.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objective referred to in Article 46, point (d), if that expenditure covers at least 5 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objectives referred to in Article 46, points (e) and (f), if that expenditure covers at least 20 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 100 % in the following cases:

market withdrawals of fruit and vegetables which do not exceed 5 % of the volume of marketed production of each producer organisation and which are disposed of by way of:

free distribution to charitable organisations and foundations approved to that effect by the Member States, for use in their activities to assist persons whose right to public assistance is recognised in national law, in particular because they lack the necessary means of subsistence;

free distribution to penal institutions, schools, public education institutions, establishments referred to in Article 22 of Regulation (EU) No 1308/2013 and children's holiday camps, hospitals and old people's homes designated by the Member States; Member States shall take all necessary steps to ensure that the quantities thus allocated are only additional to the quantities normally purchased by such establishments;

In regions of the Member States in which the degree of organisation of producers in the fruit and vegetables sector is significantly below the Union average, Member States may grant producer organisations recognised under Regulation (EU) No 1308/2013 national financial assistance equal to a maximum of 80 % of the financial contributions referred to in Article 51(1), point (a), of this Regulation and up to 10 % of the value of the marketed production of any such producer organisation. The national financial assistance shall be additional to the operational fund.

7 Additional information specific to the Type of Intervention

support for technology, technology development and farm management consultancy types on the basis of unit costs

8 WTO compliance

Green Box

Paragraph 2 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 2 of Annex II. Producers shall establish services under their operational programmes for farmers who are members of the producer organisation.

TRAINCO(47(1)(c)) - - training including coaching and exchange of best practices, in particular concerning sustainable pest and disease control techniques, sustainable use of plant protection and animal health products, and climate change adaptation and mitigation, as well as the use of organised trading platforms and commodity exchanges on the spot and futures market

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.1 Number of persons benefitting from advice, training, knowledge exchange, or participating in European Innovation Partnership (EIP) operational groups supported by the CAP in order to enhance sustainable economic, social, environmental, climate and resource efficiency performance

R.10 Share of farms participating in producer groups, producer organisations, local markets, short supply chain circuits and quality schemes supported by the CAP

R.11/Fruit and Vegetables Share of value of marketed production by producer organisations or producer groups with operational programmes in certain sectors

R.28 Number of persons benefitting from advice, training, knowledge exchange, or participating in European Innovation Partnership (EIP) operational groups supported by the CAP related to environmental or climate-related performance

5 Specific design, requirements and eligibility conditions of the intervention

Description

Implementation of actions pursuing sectoral objectives included in the operational programmes submitted by recognised producer organisations and adopted by the responsible authority

Obligations

Implementation and maintenance of the activities implemented in accordance with the objectives set out in

the operational programmes

Preparation and submission of the report on the implementation of operational programmes

Participation in compulsory training related to the fulfilment of the recognition criteria and the implementation of the operational programmes.

Eligibility criteria

Compliance with the conditions for recognition as a producer organisation laid down by European Union and national legislation

Submission and implementation of an operational programme

15 % of the aid must be spent on climate and environmental measures with a minimum of three activities and 2 % for research development.

Specific requirements for intervention

Detailed description of the justification of the training plan, the methods and instruments chosen in relation to the objectives pursued

Summary of the content of the training, justification of the action's contribution to the objectives of the operational programme

Number of participants in training, number of occasions, duration of sessions

For each producer organisation, association of producer organisation, producer group or individual producer participating in personalised advice under the operational programme, a preliminary needs assessment shall be carried out in respect of the content, duration, expected results and documentation of the personalised advice.

The purpose of the personalised advice is to:

- facilitating the creation of new producer organisations, merging existing organisations or allowing individual producers to join an existing producer organisation, as well as advising producer groups that are about to be recognised as producer organisations in accordance with Regulation (EU) No 1308/2013;
- create networking opportunities for providers and recipients of advisory services.

Individualised advice to several producer organisations, associations of producer organisations, producer groups or individual producers may be provided at the same time only if justified on the basis of the results of the preliminary assessment of needs.

In the case of personalised advice, the operational programme shall describe the number of participating producer organisations, associations of producer organisations, producer groups or individual producers, the number of occasions, the total duration, the aggregate cost per type of costs and the methodology, planned content and sample of the preliminary assessment of needs.

In addition to the costs listed in Annex III, are also eligible:

- fees for the services used, which are carried out in the operational programme, shall be carried out within the framework of the activities intended to achieve the objectives of the operational programme
- costs of meetings and training programmes where they are related to the operational programme, including daily allowances, transport and accommodation costs, where applicable, on a standard flat-rate or scales of unit costs basis.
- Flat rate for staff and administrative costs linked to the management of the operational fund or the preparation, implementation and follow-up of the operational programme, up to a maximum of 2 % of the approved operational fund

6 Form and rate of support/amounts/calculation methods

Support may take any of the following forms:

reimbursement of eligible costs actually incurred by a beneficiary; Article 44(1)(a) unit costs; Article 44(1)(b)(2)(a)(i), (c)

The Union financial assistance shall be equal to the amount of the financial contributions referred to in Article 51(1), point (a), actually paid and limited to 50 % of the actual expenditure incurred.

The Union financial assistance shall be limited to: 4.1 % of the value of the marketed production of each producer organisation; 4.5 % of the value of marketed production of each association of producer organisations; 5 % of the value of marketed production of each transnational producer organisation or transnational association of producer organisations.

Those limits may be increased by 0,5 percentage points provided that the amount in excess of the relevant percentage set out in the first subparagraph is used solely for one or more interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (h), (i) and (j). In the case of associations of producer organisations, including transnational associations of producer organisations, those interventions may be implemented by the association on behalf of its members.

At the request of a producer organisation or of an association of producer organisations, the 50 % limit provided for in paragraph 1 shall be increased to 60 % for an operational programme or part of an operational programme if at least one of the following applies:

transnational producer organisations implement in two or more Member States interventions linked to the objectives referred to in Article 46, points (b), (e) and (f);

one or more producer organisations or associations of producer organisations are engaged in interventions operated on an interbranch basis;

the operational programme concerns only specific aid for the production of organic products within the scope of Regulation (EU) 2018/848;

the producer organisation or the association of producer organisations recognised under Regulation (EU) No 1308/2013 implements for the first time an operational programme;

producer organisations market less than 20 % of fruit and vegetable production in a Member State;

the producer organisation operates in one of the outermost regions;

the operational programme comprises the interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (i) and (j);

the operational programme is for the first time implemented by a recognised producer organisation which is the result of a merger between two or more recognised producer organisations.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objective referred to in Article 46, point (d), if that expenditure covers at least 5 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objectives referred to in Article 46, points (e) and (f), if that expenditure covers at least 20 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 100 % in the following cases:

market withdrawals of fruit and vegetables which do not exceed 5 % of the volume of marketed production of each producer organisation and which are disposed of by way of:

free distribution to charitable organisations and foundations approved to that effect by the Member States, for use in their activities to assist persons whose right to public assistance is recognised in national law, in particular because they lack the necessary means of subsistence;

free distribution to penal institutions, schools, public education institutions, establishments referred to in Article 22 of Regulation (EU) No 1308/2013 and children's holiday camps, hospitals and old people's homes designated by the Member States; Member States shall take all necessary steps to ensure that the quantities thus allocated are only additional to the quantities normally purchased by such establishments;

In regions of the Member States in which the degree of organisation of producers in the fruit and vegetables sector is significantly below the Union average, Member States may grant producer organisations recognised under Regulation (EU) No 1308/2013 national financial assistance equal to a

maximum of 80 % of the financial contributions referred to in Article 51(1), point (a), of this Regulation and up to 10 % of the value of the marketed production of any such producer organisation. The national financial assistance shall be additional to the operational fund.

7 Additional information specific to the Type of Intervention

- Professional and vocational training courses with a longer average duration of 280 hours.
- Other training courses, training courses, 24-hour duration.
- Training courses of an administrative nature, 80 hours long.
- Training to implement targets, 8 hours

8 WTO compliance

Green Box

Paragraph 2 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 2 of Annex II. Producers shall establish services under their operational programmes for farmers who are members of the producer organisation.

4.1.1	Improving the carbon sequestration capacity of soils and ecosystems	1	Yes
6.4.1	Developing up-to-date data	1	Partially

	collection and monitoring systems for measuring biodiversity		
9.4.1	Increase the share of organic products in the internal market and related processing capacities	2	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.10 Share of farms participating in producer groups, producer organisations, local markets, short supply chain circuits and quality schemes supported by the CAP

R.11/Fruit and Vegetables Share of value of marketed production by producer organisations or producer groups with operational programmes in certain sectors

R.29 Share of utilised agricultural area (UAA) supported by the CAP for organic farming with a split between maintenance and conversion

5 Specific design, requirements and eligibility conditions of the intervention

Description

Implementation of organic or integrated production actions pursuing sectoral objectives included in the operational programmes submitted by recognised producer organisations and adopted by the responsible authority

Obligations

Implementation and maintenance of the activities implemented in accordance with the objectives set out in the operational programmes

Preparation and submission of the report on the implementation of operational programmes

Participation in compulsory training related to the fulfilment of the recognition criteria and the implementation of the operational programmes.

Eligibility criteria

Compliance with the conditions for recognition as a producer organisation laid down by European Union and national legislation

Submission and implementation of an operational programme

15 % of the aid must be spent on climate and environmental measures with a minimum of three activities and 2 % for research development.

Condition for the calculation of expenditure under Article 50(7)(b) of Regulation (EU)/2115/2021

Other interventions related to an objective listed in points (a) to (i) of Article 12(1) of Regulation (EU)/126/2022 may count towards expenditure under Article 50(7)(b) of Regulation (EU)/2115/2021 if the beneficiaries credibly demonstrate, at the time of submission of the operational programmes or their amendments, that the activities included in the operational programme contribute positively to the achievement of the objectives, even if their impact cannot be quantified.

Eligible costs shall include additional costs and income foregone resulting from interventions targeting agri-environment-climate objectives.

Interventions targeting agri-environment-climate objectives shall be reviewed when the relevant mandatory standards, requirements or obligations are amended.

In addition to the costs listed in Annex III, are also eligible:

- the fees for the services used, which are carried out in the operational programme, are carried out within the framework of activities intended to achieve the objectives of the operational programme (for example, but not exhaustively: consultancy services, consultancy services, expert activities, research and experimentation, marketing communication, promotion, quality assurance systems development, audit, preparation, etc.
- costs of meetings and training programmes in so far as they relate to the operational programme, including daily allowances, travel and accommodation costs, where appropriate, on a flat-rate or unit cost basis.
- Flat rate for staff and administrative costs linked to the management of the operational fund or the preparation, implementation and follow-up of the operational programme, up to a maximum of 2 % of the approved operational fund

6 Form and rate of support/amounts/calculation methods

Support may take any of the following forms:

reimbursement of eligible costs actually incurred by a beneficiary; Article 44(1)(a)

unit costs; Article 44(1)(b)(2)(a)(i), (c)

lump sums; Article 44(1)(c)(2)(a)(i c)

Aid under the Agro-ecological Programme shall be eligible for aid for a given year under the Agro-ecological Programme on the basis of practices eligible for aid in respect of the area of fruit and vegetables concerned on its own.

The Union financial assistance shall be equal to the amount of the financial contributions referred to in Article 51(1), point (a), actually paid and limited to 50 % of the actual expenditure incurred.

The Union financial assistance shall be limited to: 4.1 % of the value of the marketed production of each producer organisation; 4.5 % of the value of marketed production of each association of producer organisations; 5 % of the value of marketed production of each transnational producer organisation or transnational association of producer organisations.

Those limits may be increased by 0,5 percentage points provided that the amount in excess of the relevant percentage set out in the first subparagraph is used solely for one or more interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (h), (i) and (j). In the case of associations of producer organisations, including transnational associations of producer organisations, those interventions may be implemented by the association on behalf of its members.

At the request of a producer organisation or of an association of producer organisations, the 50 % limit provided for in paragraph 1 shall be increased to 60 % for an operational programme or part of an operational programme if at least one of the following applies:

transnational producer organisations implement in two or more Member States interventions linked to the objectives referred to in Article 46, points (b), (e) and (f);

one or more producer organisations or associations of producer organisations are engaged in interventions operated on an interbranch basis;

the operational programme concerns only specific aid for the production of organic products within the scope of Regulation (EU) 2018/848;

the producer organisation or the association of producer organisations recognised under Regulation (EU) No 1308/2013 implements for the first time an operational programme;

producer organisations market less than 20 % of fruit and vegetable production in a Member State;

the producer organisation operates in one of the outermost regions;

the operational programme comprises the interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (i) and (j);

the operational programme is for the first time implemented by a recognised producer organisation which is the result of a merger between two or more recognised producer organisations.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objective referred to in Article 46, point (d), if that expenditure covers at least 5 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objectives referred to in Article 46, points (e) and (f), if that expenditure covers at least 20 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 100 % in the following cases:

market withdrawals of fruit and vegetables which do not exceed 5 % of the volume of marketed production of each producer organisation and which are disposed of by way of:

free distribution to charitable organisations and foundations approved to that effect by the Member States, for use in their activities to assist persons whose right to public assistance is recognised in national law, in particular because they lack the necessary means of subsistence;

free distribution to penal institutions, schools, public education institutions, establishments referred to in Article 22 of Regulation (EU) No 1308/2013 and children's holiday camps, hospitals and old people's homes designated by the Member States; Member States shall take all necessary steps to ensure that the quantities thus allocated are only additional to the quantities normally purchased by such establishments;

In regions of the Member States in which the degree of organisation of producers in the fruit and vegetables sector is significantly below the Union average, Member States may grant producer organisations recognised under Regulation (EU) No 1308/2013 national financial assistance equal to a maximum of 80 % of the financial contributions referred to in Article 51(1), point (a), of this Regulation and up to 10 % of the value of the marketed production of any such producer organisation. The national financial assistance shall be additional to the operational fund.

7 Additional information specific to the Type of Intervention

Support for the use of techniques to reduce or avoid the use of plant protection products used in organic or integrated production, on the basis of unit costs and costs, in the field of vegetable and fruit production.

Subject to compliance with the conditions laid down in the Agro-ecological Programme, practices under which a farmer is eligible for aid on his own for the land used for the production of fruit and vegetables, but the performance of which has not been taken into account for the holding of the farmer in question under the Agro-ecological Programme, shall be eligible for aid.

8 WTO compliance

Green Box

Paragraph 12 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 12 of Annex II.

When determining the expenditure to be covered, the additional costs incurred and income foregone resulting from the implemented interventions related to agri-environment-climate objectives, shall be taken into account. Point 1 of Annex III of the regulation 126/2022 shall be applied.

CAP SECTORAL OBJECTIVE Code + Description
BOOST(46(g)) boosting products' commercial value and quality, including improving product quality and developing products with a protected designation of origin or with a protected geographical indication or covered by Union or national quality schemes recognised by Member States
COMP(46(c)) improvement of medium- and long-term-competitiveness, in particular through modernisation
CONC(46(b)) concentration of supply and placing on the market of the products, including through direct marketing
PROMO(46(e)) promoting, developing and implementing: (i) production methods and techniques that are respectful of the environment; (ii) pest and disease resilient production practices; (iii) animal health and welfare standards going beyond minimum requirements established under Union and national law; (iv) reduction of waste and environmentally sound use and management of by-products, including their re-usage and valorisation; (v) protection and enhancement of biodiversity and sustainable use of natural resources, in particular protection of water, soil and air.

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO2 Enhance market orientation and increase farm competitiveness, both in the short and long term, including greater focus on research, technology and digitalisation

SO3 Improve the farmer' position in the value chain

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
2.1.2	Creation of modern generation capacities	2	Yes
2.2.1	Development of post harvest technology	2	Yes
2.2.2	Construction/refurbishment of crop storages, cold stores	2	Yes
3.1.1	Promoting horizontal and vertical integration, coordination and cooperation	1	Yes
3.1.2	Increase the number and market efficiency of sectoral cooperation (including PO,	1	Yes

	PG)		

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.10 Share of farms participating in producer groups, producer organisations, local markets, short supply chain circuits and quality schemes supported by the CAP

R.11/Fruit and Vegetables Share of value of marketed production by producer organisations or producer groups with operational programmes in certain sectors

5 Specific design, requirements and eligibility conditions of the intervention

Description

Implementation of activities of the type of sustainability and efficiency of transport and storage of products for sectoral objectives submitted by recognised producer organisations and included in operational programmes adopted by the responsible authority

Responsibilities

Implementation and maintenance of the implemented activities in accordance with the objectives set out in the operational programmes

Preparation and submission of the report on the implementation of operational programmes

Participation in compulsory training relating to the fulfilment of the conditions for recognition and the implementation of operational programmes.

Eligibility criteria

Compliance with the conditions for recognition as a producer organisation laid down by the European Union and national legislation

Submission and implementation of operational programmes

15 % of the aid must be allocated to climate and environmental measures comprising at least three activities and 2 % to research development.

Other interventions related to the objective listed in points (a) to (i) of Article 12(1) of Regulation (EU)/126/2022 shall be eligible for expenditure under Article 50(7)(b) of Regulation (EU)/2115/2021 if they demonstrate to the satisfaction of the beneficiaries at the time of submission of the operational programmes or amendments thereto that the activities included in the operational programme contribute positively to the achievement of the objectives, even if their impact, where applicable, cannot be quantified.

Eligible costs shall include additional costs and income foregone resulting from interventions targeting agri-environment-climate objectives.

Interventions targeting agri-environment-climate objectives shall be reviewed when relevant mandatory standards, requirements or obligations are amended.

In addition to the costs listed in Annex III, eligible

- the fees for the services used, which are included in the operational programme, are implemented in the context of activities aimed at achieving the objectives of the operational programme (for example, but not exhaustive: consultancy services, consultancy services, expert activities, research and experimentation, marketing communication, promotion, quality assurance systems development, auditing, preparation, etc.
- costs of meetings and training programmes where they are related to the operational programme, including daily allowances, transport and accommodation costs, where applicable, on a standard

flat-rate or scales of unit costs basis.

- Flat rate for staff and administrative costs linked to the management of the operational fund or to the preparation, implementation and monitoring of the operational programme, up to a maximum of 2 % of the approved operational fund

6 Form and rate of support/amounts/calculation methods

Support may take any of the following forms:

reimbursement of eligible costs actually incurred by a beneficiary; Article 44(1)(a)

unit costs; Article 44(1)(b)(2)(a)(i), (c)

The Union financial assistance shall be equal to the amount of the financial contributions referred to in Article 51(1), point (a), actually paid and limited to 50 % of the actual expenditure incurred.

The Union financial assistance shall be limited to: 4.1 % of the value of the marketed production of each producer organisation; 4.5 % of the value of marketed production of each association of producer organisations; 5 % of the value of marketed production of each transnational producer organisation or transnational association of producer organisations.

Those limits may be increased by 0,5 percentage points provided that the amount in excess of the relevant percentage set out in the first subparagraph is used solely for one or more interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (h), (i) and (j). In the case of associations of producer organisations, including transnational associations of producer organisations, those interventions may be implemented by the association on behalf of its members.

At the request of a producer organisation or of an association of producer organisations, the 50 % limit provided for in paragraph 1 shall be increased to 60 % for an operational programme or part of an operational programme if at least one of the following applies:

transnational producer organisations implement in two or more Member States interventions linked to the objectives referred to in Article 46, points (b), (e) and (f);

one or more producer organisations or associations of producer organisations are engaged in interventions operated on an interbranch basis;

the operational programme concerns only specific aid for the production of organic products within the scope of Regulation (EU) 2018/848;

the producer organisation or the association of producer organisations recognised under Regulation (EU) No 1308/2013 implements for the first time an operational programme;

producer organisations market less than 20 % of fruit and vegetable production in a Member State;

the producer organisation operates in one of the outermost regions;

the operational programme comprises the interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (i) and (j);

the operational programme is for the first time implemented by a recognised producer organisation which is the result of a merger between two or more recognised producer organisations.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objective referred to in Article 46, point (d), if that expenditure covers at least 5 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objectives referred to in Article 46, points (e) and (f), if that expenditure covers at least 20 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 100 % in the following cases:

market withdrawals of fruit and vegetables which do not exceed 5 % of the volume of marketed production of each producer organisation and which are disposed of by way of:

free distribution to charitable organisations and foundations approved to that effect by the Member States, for use in their activities to assist persons whose right to public assistance is recognised in national law, in particular because they lack the necessary means of subsistence;

free distribution to penal institutions, schools, public education institutions, establishments referred to in

Article 22 of Regulation (EU) No 1308/2013 and children's holiday camps, hospitals and old people's homes designated by the Member States; Member States shall take all necessary steps to ensure that the quantities thus allocated are only additional to the quantities normally purchased by such establishments; In regions of the Member States in which the degree of organisation of producers in the fruit and vegetables sector is significantly below the Union average, Member States may grant producer organisations recognised under Regulation (EU) No 1308/2013 national financial assistance equal to a maximum of 80 % of the financial contributions referred to in Article 51(1), point (a), of this Regulation and up to 10 % of the value of the marketed production of any such producer organisation. The national financial assistance shall be additional to the operational fund.

7 Additional information specific to the Type of Intervention

Support for materials intended to reduce energy use in storage and increase the storage period of products on the basis of unit cost and cost reimbursement

Support for the additional costs arising from the application of logistics systems for transport leading to increased sustainability

No investment is eligible under the type of intervention

8 WTO compliance

Green Box

Paragraph 2 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 2 of Annex II. Producers shall establish services under their operational programmes for farmers who are members of the producer organisation.

PROMO(47(1)(f)) - - promotion, communication and marketing including actions and activities aimed in particular at raising consumer awareness about the Union quality schemes and the importance of healthy diets, and at diversification and consolidation of markets

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.10 Share of farms participating in producer groups, producer organisations, local markets, short supply chain circuits and quality schemes supported by the CAP

R.11/Fruit and Vegetables Share of value of marketed production by producer organisations or producer groups with operational programmes in certain sectors

5 Specific design, requirements and eligibility conditions of the intervention

Description

Implementation of actions addressing sectoral objectives submitted by recognised producer organisations and included in operational programmes adopted by the responsible authority

Responsibilities

Implementation and maintenance of the implemented activities in accordance with the objectives set out in the operational programmes

Preparation and submission of the report on the implementation of operational programmes

Participation in compulsory training relating to the fulfilment of the conditions for recognition and the implementation of operational programmes.

Eligibility criteria

Compliance with the conditions for recognition as a producer organisation laid down by the European Union and national legislation

Submission and implementation of operational programmes

15 % of the aid must be allocated to climate and environmental measures comprising at least three activities and 2 % to research development.

Promotional communication and marketing activities shall pursue one of the following objectives:

1. increasing awareness of the merits of Union agricultural products and of the high standards applicable to their production methods in the Union;
2. increasing the competitiveness and consumption of Union agricultural products and certain processed products produced in the Union and raising their profile both inside and outside the Union for sectors other than wine;
3. increasing awareness about Union quality schemes both inside and outside the Union;
4. increasing the market share of Union agricultural products and certain processed products produced in the Union, specifically focusing on the markets in third countries that have the highest growth potential;
5. contributing, where relevant, to restore the normal market conditions in the Union market in the event of serious market disturbance, loss of consumer confidence or other specific problems;
6. increasing awareness of sustainable production;
7. increase consumer awareness of brands/trade marks in the fruit and vegetables sector marketed by producer organisations, associations of producer organisations, transnational producer

organisations and transnational associations of producer organisations

In addition to the costs listed in Annex III, eligible

- the fees for the services used, which are included in the operational programme, are implemented in the context of activities aimed at achieving the objectives of the operational programme (for example, but not exhaustive: consultancy services, consultancy services, expert activities, research and experimentation, marketing communication, promotion, quality assurance systems development, auditing, preparation, etc.
- costs of meetings and training programmes where they are related to the operational programme, including daily allowances, transport and accommodation costs, where applicable, on a standard flat-rate or scales of unit costs basis.
- flat rate for staff and administrative costs linked to the management of the operational fund or to the preparation, implementation and monitoring of the operational programme, up to a maximum of 2 % of the approved operational fund

6 Form and rate of support/amounts/calculation methods

Support may take any of the following forms:

reimbursement of eligible costs actually incurred by a beneficiary; Article 44(1)(a)

unit costs; Article 44(1)(b)(2)(a)(i), (c)

The Union financial assistance shall be equal to the amount of the financial contributions referred to in Article 51(1), point (a), actually paid and limited to 50 % of the actual expenditure incurred.

The Union financial assistance shall be limited to: 4.1 % of the value of the marketed production of each producer organisation; 4.5 % of the value of marketed production of each association of producer organisations; 5 % of the value of marketed production of each transnational producer organisation or transnational association of producer organisations.

Those limits may be increased by 0,5 percentage points provided that the amount in excess of the relevant percentage set out in the first subparagraph is used solely for one or more interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (h), (i) and (j). In the case of associations of producer organisations, including transnational associations of producer organisations, those interventions may be implemented by the association on behalf of its members.

At the request of a producer organisation or of an association of producer organisations, the 50 % limit provided for in paragraph 1 shall be increased to 60 % for an operational programme or part of an operational programme if at least one of the following applies:

transnational producer organisations implement in two or more Member States interventions linked to the objectives referred to in Article 46, points (b), (e) and (f);

one or more producer organisations or associations of producer organisations are engaged in interventions operated on an interbranch basis;

the operational programme concerns only specific aid for the production of organic products within the scope of Regulation (EU) 2018/848;

the producer organisation or the association of producer organisations recognised under Regulation (EU) No 1308/2013 implements for the first time an operational programme;

producer organisations market less than 20 % of fruit and vegetable production in a Member State;

the producer organisation operates in one of the outermost regions;

the operational programme comprises the interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (i) and (j);

the operational programme is for the first time implemented by a recognised producer organisation which is the result of a merger between two or more recognised producer organisations.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objective referred to in Article 46, point (d), if that expenditure covers at least 5 % of the expenditure

under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objectives referred to in Article 46, points (e) and (f), if that expenditure covers at least 20 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 100 % in the following cases:

market withdrawals of fruit and vegetables which do not exceed 5 % of the volume of marketed production of each producer organisation and which are disposed of by way of:

free distribution to charitable organisations and foundations approved to that effect by the Member States, for use in their activities to assist persons whose right to public assistance is recognised in national law, in particular because they lack the necessary means of subsistence;

free distribution to penal institutions, schools, public education institutions, establishments referred to in Article 22 of Regulation (EU) No 1308/2013 and children's holiday camps, hospitals and old people's homes designated by the Member States; Member States shall take all necessary steps to ensure that the quantities thus allocated are only additional to the quantities normally purchased by such establishments;

In regions of the Member States in which the degree of organisation of producers in the fruit and vegetables sector is significantly below the Union average, Member States may grant producer organisations recognised under Regulation (EU) No 1308/2013 national financial assistance equal to a maximum of 80 % of the financial contributions referred to in Article 51(1), point (a), of this Regulation and up to 10 % of the value of the marketed production of any such producer organisation. The national financial assistance shall be additional to the operational fund.

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.10 Share of farms participating in producer groups, producer organisations, local markets, short supply chain circuits and quality schemes supported by the CAP

R.11/Fruit and Vegetables Share of value of marketed production by producer organisations or producer groups with operational programmes in certain sectors

5 Specific design, requirements and eligibility conditions of the intervention

Description

Implementation of actions addressing sectoral objectives submitted by recognised producer organisations and included in operational programmes adopted by the responsible authority

Responsibilities

Implementation and maintenance of the implemented activities in accordance with the objectives set out in the operational programmes

Preparation and submission of the report on the implementation of operational programmes

Participation in compulsory training relating to the fulfilment of the conditions for recognition and the implementation of operational programmes.

Eligibility criteria

Compliance with the conditions for recognition as a producer organisation laid down by the European Union and national legislation

Submission and implementation of operational programmes

15 % of the aid must be allocated to climate and environmental measures comprising at least three activities and 2 % to research development.

Other interventions related to the objective listed in points (a) to (i) of Article 12(1) of Regulation (EU)/126/2022 shall be eligible for expenditure under Article 50(7)(b) of Regulation (EU)/2115/2021 if the beneficiaries demonstrate to the satisfaction of the beneficiary when submitting the operational programmes or amendments thereto that the activities included in the operational programme contribute positively to the achievement of the objectives, even where their impact cannot be quantified.

Interventions targeting agri-environment-climate objectives shall be reviewed when relevant mandatory standards, requirements or obligations are amended.

In addition to the costs listed in Annex III

- the fees for the services used, which are included in the operational programme, are implemented in the context of activities aimed at achieving the objectives of the operational programme (for example, but not exhaustive: consultancy services, consultancy services, expert activities, research and experimentation, marketing communication, promotion, quality assurance systems development, auditing, preparation, etc.

- costs of meetings and training programmes where they are related to the operational programme, including daily allowances, transport and accommodation costs, where applicable, on a standard flat-rate or scales of unit costs basis.
- flat rate for staff and administrative costs linked to the management of the operational fund or to the preparation, implementation and monitoring of the operational programme, up to a maximum of 2 % of the approved operational fund

6 Form and rate of support/amounts/calculation methods

Support may take any of the following forms:

reimbursement of eligible costs actually incurred by a beneficiary; Article 44(1)(a)
unit costs; Article 44(1)(b)(2)(a)(i), (c)

The Union financial assistance shall be equal to the amount of the financial contributions referred to in Article 51(1), point (a), actually paid and limited to 50 % of the actual expenditure incurred.

The Union financial assistance shall be limited to: 4.1 % of the value of the marketed production of each producer organisation; 4.5 % of the value of marketed production of each association of producer organisations; 5 % of the value of marketed production of each transnational producer organisation or transnational association of producer organisations.

Those limits may be increased by 0,5 percentage points provided that the amount in excess of the relevant percentage set out in the first subparagraph is used solely for one or more interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (h), (i) and (j). In the case of associations of producer organisations, including transnational associations of producer organisations, those interventions may be implemented by the association on behalf of its members.

At the request of a producer organisation or of an association of producer organisations, the 50 % limit provided for in paragraph 1 shall be increased to 60 % for an operational programme or part of an operational programme if at least one of the following applies:

transnational producer organisations implement in two or more Member States interventions linked to the objectives referred to in Article 46, points (b), (e) and (f);

one or more producer organisations or associations of producer organisations are engaged in interventions operated on an interbranch basis;

the operational programme concerns only specific aid for the production of organic products within the scope of Regulation (EU) 2018/848;

the producer organisation or the association of producer organisations recognised under Regulation (EU) No 1308/2013 implements for the first time an operational programme;

producer organisations market less than 20 % of fruit and vegetable production in a Member State;

the producer organisation operates in one of the outermost regions;

the operational programme comprises the interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (i) and (j);

the operational programme is for the first time implemented by a recognised producer organisation which is the result of a merger between two or more recognised producer organisations.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objective referred to in Article 46, point (d), if that expenditure covers at least 5 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objectives referred to in Article 46, points (e) and (f), if that expenditure covers at least 20 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 100 % in the following cases:

market withdrawals of fruit and vegetables which do not exceed 5 % of the volume of marketed production of each producer organisation and which are disposed of by way of:

free distribution to charitable organisations and foundations approved to that effect by the Member States, for use in their activities to assist persons whose right to public assistance is recognised in national law, in

particular because they lack the necessary means of subsistence;
free distribution to penal institutions, schools, public education institutions, establishments referred to in Article 22 of Regulation (EU) No 1308/2013 and children's holiday camps, hospitals and old people's homes designated by the Member States; Member States shall take all necessary steps to ensure that the quantities thus allocated are only additional to the quantities normally purchased by such establishments;
In regions of the Member States in which the degree of organisation of producers in the fruit and vegetables sector is significantly below the Union average, Member States may grant producer organisations recognised under Regulation (EU) No 1308/2013 national financial assistance equal to a maximum of 80 % of the financial contributions referred to in Article 51(1), point (a), of this Regulation and up to 10 % of the value of the marketed production of any such producer organisation. The national financial assistance shall be additional to the operational fund.

7 Additional information specific to the Type of Intervention

Not relevant

8 WTO compliance

Green Box

Paragraph 2 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 2 of Annex II. Producers shall establish services under their operational programmes for farmers who are members of the producer organisation.

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.10 Share of farms participating in producer groups, producer organisations, local markets, short supply chain circuits and quality schemes supported by the CAP

R.11/Fruit and Vegetables Share of value of marketed production by producer organisations or producer groups with operational programmes in certain sectors

5 Specific design, requirements and eligibility conditions of the intervention

Description

Implementation of advisory services and technical assistance type activities for sectoral objectives submitted by recognised producer organisations and included in operational programmes adopted by the responsible authority

Responsibilities

Implementation and maintenance of the implemented activities in accordance with the objectives set out in the operational programmes

Preparation and submission of the report on the implementation of operational programmes

Participation in compulsory training relating to the fulfilment of the conditions for recognition and the implementation of operational programmes.

Eligibility criteria

Compliance with the conditions for recognition as a producer organisation laid down by the European Union and national legislation

Submission and implementation of operational programmes

15 % of the aid must be allocated to climate and environmental measures comprising at least three activities and 2 % to research development.

Other interventions related to the objective listed in points (a) to (i) of Article 12(1) of Regulation (EU)/126/2022 shall be eligible for expenditure under Article 50(7)(b) of Regulation (EU)/2115/2021 if they demonstrate to the satisfaction of the beneficiaries at the time of submission of the operational programmes or amendments thereto that the activities included in the operational programme contribute positively to the achievement of the objectives, even if their impact, where applicable, cannot be quantified.

Eligible costs shall include additional costs and income foregone resulting from interventions targeting agri-environment-climate objectives.

Interventions targeting agri-environment-climate objectives shall be reviewed when relevant mandatory

standards, requirements or obligations are amended.

In addition to the costs listed in Annex III

- the fees for the services used, which are included in the operational programme, are implemented in the context of activities aimed at achieving the objectives of the operational programme (for example, but not exhaustive: consultancy services, consultancy services, expert activities, research and experimentation, marketing communication, promotion, quality assurance systems development, auditing, preparation, etc.
- costs of meetings and training programmes where they are related to the operational programme, including daily allowances, transport and accommodation costs, where applicable, on a standard flat-rate or scales of unit costs basis.
- Flat rate for staff and administrative costs linked to the management of the operational fund or to the preparation, implementation and monitoring of the operational programme, up to a maximum of 2 % of the approved operational fund

6 Form and rate of support/amounts/calculation methods

Support may take any of the following forms:

reimbursement of eligible costs actually incurred by a beneficiary; Article 44(1)(a)

unit costs; Article 44(1)(b)(2)(a)(i), (c)

The Union financial assistance shall be equal to the amount of the financial contributions referred to in Article 51(1), point (a), actually paid and limited to 50 % of the actual expenditure incurred.

The Union financial assistance shall be limited to: 4.1 % of the value of the marketed production of each producer organisation; 4.5 % of the value of marketed production of each association of producer organisations; 5 % of the value of marketed production of each transnational producer organisation or transnational association of producer organisations.

Those limits may be increased by 0,5 percentage points provided that the amount in excess of the relevant percentage set out in the first subparagraph is used solely for one or more interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (h), (i) and (j). In the case of associations of producer organisations, including transnational associations of producer organisations, those interventions may be implemented by the association on behalf of its members.

At the request of a producer organisation or of an association of producer organisations, the 50 % limit provided for in paragraph 1 shall be increased to 60 % for an operational programme or part of an operational programme if at least one of the following applies:

transnational producer organisations implement in two or more Member States interventions linked to the objectives referred to in Article 46, points (b), (e) and (f);

one or more producer organisations or associations of producer organisations are engaged in interventions operated on an interbranch basis;

the operational programme concerns only specific aid for the production of organic products within the scope of Regulation (EU) 2018/848;

the producer organisation or the association of producer organisations recognised under Regulation (EU) No 1308/2013 implements for the first time an operational programme;

producer organisations market less than 20 % of fruit and vegetable production in a Member State;

the producer organisation operates in one of the outermost regions;

the operational programme comprises the interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (i) and (j);

the operational programme is for the first time implemented by a recognised producer organisation which is the result of a merger between two or more recognised producer organisations.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objective referred to in Article 46, point (d), if that expenditure covers at least 5 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objectives referred to in Article 46, points (e) and (f), if that expenditure covers at least 20 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 100 % in the following cases:

market withdrawals of fruit and vegetables which do not exceed 5 % of the volume of marketed production of each producer organisation and which are disposed of by way of:

free distribution to charitable organisations and foundations approved to that effect by the Member States, for use in their activities to assist persons whose right to public assistance is recognised in national law, in particular because they lack the necessary means of subsistence;

free distribution to penal institutions, schools, public education institutions, establishments referred to in Article 22 of Regulation (EU) No 1308/2013 and children's holiday camps, hospitals and old people's homes designated by the Member States; Member States shall take all necessary steps to ensure that the quantities thus allocated are only additional to the quantities normally purchased by such establishments;

In regions of the Member States in which the degree of organisation of producers in the fruit and vegetables sector is significantly below the Union average, Member States may grant producer organisations recognised under Regulation (EU) No 1308/2013 national financial assistance equal to a maximum of 80 % of the financial contributions referred to in Article 51(1), point (a), of this Regulation and up to 10 % of the value of the marketed production of any such producer organisation. The national financial assistance shall be additional to the operational fund.

7 Additional information specific to the Type of Intervention

Costs of preparation, development and certification of environmental and human resources certification schemes for quality certification

8 WTO compliance

Green Box

Paragraph 2 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 2 of Annex II. Producers shall establish services under their operational programmes for farmers who are members of the producer organisation.

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.10 Share of farms participating in producer groups, producer organisations, local markets, short supply chain circuits and quality schemes supported by the CAP

R.11/Fruit and Vegetables Share of value of marketed production by producer organisations or producer groups with operational programmes in certain sectors

R.12 Share of utilised agricultural area (UAA) under supported commitments to improve climate adaptation

5 Specific design, requirements and eligibility conditions of the intervention

Description

Implementation of climate change mitigation and adaptation activities for sectoral objectives submitted by recognised producer organisations and included in operational programmes adopted by the responsible authority

Responsibilities

Implementation and maintenance of the implemented activities in accordance with the objectives set out in the operational programmes

Preparation and submission of the report on the implementation of operational programmes

Participation in compulsory training related to the fulfilment of recognition criteria and the implementation of operational programmes.

Eligibility criteria

Compliance with the conditions for recognition as a producer organisation laid down by the European Union and national legislation

Submission and implementation of operational programmes

15 % of the aid must be allocated to climate and environmental measures comprising at least three activities and 2 % to research development.

Other interventions related to the objective listed in points (a) to (i) of Article 12(1) of Regulation (EU)/126/2022 shall be eligible for expenditure under Article 50(7)(b) of Regulation (EU)/2115/2021 if they demonstrate to the satisfaction of the beneficiaries at the time of submission of the operational programmes or amendments thereto that the activities included in the operational programme contribute positively to the achievement of the objectives, even if their impact, where applicable, cannot be quantified.

Eligible costs shall include additional costs and income foregone resulting from interventions targeting agri-environment-climate objectives.

Interventions targeting agri-environment-climate objectives shall be reviewed when relevant mandatory standards, requirements or obligations are amended.

In addition to the costs listed in Annex III, eligible

- the fees for the services used, which are included in the operational programme, are implemented in the context of activities aimed at achieving the objectives of the operational programme (for

example, but not exhaustive: consultancy services, consultancy services, expert activities, research and experimentation, marketing communication, promotion, quality assurance systems development, auditing, preparation, etc.

- costs of meetings and training programmes where they are related to the operational programme, including daily allowances, transport and accommodation costs, where applicable, on a standard flat-rate or scales of unit costs basis.
- flat rate for staff and administrative costs linked to the management of the operational fund or to the preparation, implementation and monitoring of the operational programme, up to a maximum of 2 % of the approved operational fund

6 Form and rate of support/amounts/calculation methods

Support may take any of the following forms:

reimbursement of eligible costs actually incurred by a beneficiary; Article 44(1)(a)
unit costs; Article 44(1)(b)(2)(a)(i), (c)

The Union financial assistance shall be equal to the amount of the financial contributions referred to in Article 51(1), point (a), actually paid and limited to 50 % of the actual expenditure incurred.

The Union financial assistance shall be limited to: 4.1 % of the value of the marketed production of each producer organisation; 4.5 % of the value of marketed production of each association of producer organisations; 5 % of the value of marketed production of each transnational producer organisation or transnational association of producer organisations.

Those limits may be increased by 0,5 percentage points provided that the amount in excess of the relevant percentage set out in the first subparagraph is used solely for one or more interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (h), (i) and (j). In the case of associations of producer organisations, including transnational associations of producer organisations, those interventions may be implemented by the association on behalf of its members.

At the request of a producer organisation or of an association of producer organisations, the 50 % limit provided for in paragraph 1 shall be increased to 60 % for an operational programme or part of an operational programme if at least one of the following applies:

transnational producer organisations implement in two or more Member States interventions linked to the objectives referred to in Article 46, points (b), (e) and (f);

one or more producer organisations or associations of producer organisations are engaged in interventions operated on an interbranch basis;

the operational programme concerns only specific aid for the production of organic products within the scope of Regulation (EU) 2018/848;

the producer organisation or the association of producer organisations recognised under Regulation (EU) No 1308/2013 implements for the first time an operational programme;

producer organisations market less than 20 % of fruit and vegetable production in a Member State;

the producer organisation operates in one of the outermost regions;

the operational programme comprises the interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (i) and (j);

the operational programme is for the first time implemented by a recognised producer organisation which is the result of a merger between two or more recognised producer organisations.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objective referred to in Article 46, point (d), if that expenditure covers at least 5 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objectives referred to in Article 46, points (e) and (f), if that expenditure covers at least 20 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 100 % in the following cases:
market withdrawals of fruit and vegetables which do not exceed 5 % of the volume of marketed production of each producer organisation and which are disposed of by way of:

free distribution to charitable organisations and foundations approved to that effect by the Member States, for use in their activities to assist persons whose right to public assistance is recognised in national law, in particular because they lack the necessary means of subsistence;

free distribution to penal institutions, schools, public education institutions, establishments referred to in Article 22 of Regulation (EU) No 1308/2013 and children's holiday camps, hospitals and old people's homes designated by the Member States; Member States shall take all necessary steps to ensure that the quantities thus allocated are only additional to the quantities normally purchased by such establishments;

In regions of the Member States in which the degree of organisation of producers in the fruit and vegetables sector is significantly below the Union average, Member States may grant producer organisations recognised under Regulation (EU) No 1308/2013 national financial assistance equal to a maximum of 80 % of the financial contributions referred to in Article 51(1), point (a), of this Regulation and up to 10 % of the value of the marketed production of any such producer organisation. The national financial assistance shall be additional to the operational fund.

5 Specific design, requirements and eligibility conditions of the intervention

Description

Implementation of actions pursuing sectoral objectives included in the operational programmes submitted

by recognised producer organisations and adopted by the responsible authority

Obligations

Implementation and maintenance of the activities implemented in accordance with the objectives set out in the operational programmes

Preparation and submission of the report on the implementation of operational programmes

Participation in compulsory training related to the fulfilment of recognition criteria and the implementation of operational programmes.

Eligibility criteria

Compliance with the conditions for recognition as a producer organisation laid down by European Union and national legislation

Submission and implementation of an operational programme

15 % of the aid must be spent on climate and environmental measures with a minimum of three activities and 2 % for research development.

a flat rate for staff and administrative costs linked to the management of the operational fund or the preparation, implementation and follow-up of an operational programme may be granted up to a maximum of 2 % of the approved operational fund.

In order to be eligible for Union financial assistance, it is recommended that the mutual fund concerned: the mutual fund has a transparent policy with regard to payments to and financial compensation from the fund;

has clear rules for determining liability for any debt arising;

Mutual fund is a scheme in place to insure affiliated farmers whereby compensation payments are made to affiliated farmers who have suffered economic losses as a result of adverse climatic events, animal or plant diseases, pest infestations or environmental incidents or for a severe drop in income.

Instead of a significant drop in income, the value of marketed production of the producer organisation or association of producer organisations concerned may be used as a basis for a significant drop in the income of all producer members or members of the association of producer organisations or part of the membership. To this end, the value of marketed production may be calculated on the basis of the sales prices of the producer organisation for each product. However, the drop in producers' incomes still needs to be taken into account.

Payments from mutual funds to members who do not suffer a significant drop in income due to adverse market conditions shall not be eligible for financial support.

Aid may be granted for the replenishment of mutual funds where the decline in the value of marketed production of the producer organisation exceeds 30 % on the basis of a three-year average based on the preceding five-year period excluding the highest and lowest entry;

‘Adverse market conditions’ – this should refer to an objectively existing situation in the market for a given product that leads to a drop of income of producer members.

Payments from the mutual fund to a producer member may be made if the drop in income for that producer exceeds 30 per cent of its average annual income calculated on the basis of a three-year average based on the preceding 3 years or the preceding five-year period excluding the highest and lowest entry. For the purposes of this paragraph, income shall mean the amount of receipts received by the producer member on the fruit and vegetables market, including any public support for fruit and vegetable products, less input costs. Payments made by the mutual fund to the producer member may compensate for less than 70 % of the loss of income in the year in which the producer member acquires the right to such support.

Types of expenditure covered by the mutual funds measure:

the administrative costs of setting up the mutual fund include, inter alia, management costs, registration

fees, staff costs and overheads; and
the financial contributions referred to in Article 51(1)(a) of the CAP Strategy Plan Regulation for the replenishment of mutual funds following compensation paid to producer members whose net income has fallen significantly as a result of adverse market conditions. The replenishment should be done through the operational fund. The financial contributions to replenish the mutual fund would become a dedicated part of the operational fund.

Re-insurance of mutual funds is not eligible for support under the European Agricultural Guarantee Fund.

Financial contributions to replenish mutual funds would cover the following items:

the amounts paid out from the mutual fund as financial compensation to producer members who experience a severe drop in their income as a result of adverse market conditions.

interest on commercial loans taken out under market conditions by the mutual fund for the purpose of providing financial compensation to farmers from the mutual fund, where the resources available in the mutual fund are insufficient to meet the compensation claims.

The loss of income compensated by the mutual fund shall not be taken into account in the application of the agricultural crisis insurance instrument and the income loss compensated by the agricultural crisis insurance instrument shall not be compensated by the mutual fund. The producer organisation or association of producer organisations shall not compensate their producer members for the withdrawal from the market of products for which it has already paid compensation for a significant drop in income. The products benefitting from mutual fund compensations may however be sold on the market or processed.

Where the mutual fund performs other functions, only the amounts specifically intended to compensate for a significant drop in income due to adverse market conditions should be ring-fenced and used as a basis for the calculation of the aid intensity.

Member States may allow producer members of producer organisations or members of associations of producer organisations to claim partial reimbursement of their contribution to the mutual fund after five years if the mutual fund has not been used to pay the compensation and the amounts collected have not been used

6 Form and rate of support/amounts/calculation methods

Support may take any of the following forms:

reimbursement of eligible costs actually incurred by a beneficiary;

The Union financial assistance shall be equal to the amount of the financial contributions referred to in Article 51(1), point (a), actually paid and limited to 50 % of the actual expenditure incurred.

The Union financial assistance shall be limited to: 4.1 % of the value of the marketed production of each producer organisation; 4.5 % of the value of marketed production of each association of producer organisations; 5 % of the value of marketed production of each transnational producer organisation or transnational association of producer organisations.

Those limits may be increased by 0,5 percentage points provided that the amount in excess of the relevant percentage set out in the first subparagraph is used solely for one or more interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (h), (i) and (j). In the case of associations of producer organisations, including transnational associations of producer organisations, those interventions may be implemented by the association on behalf of its members.

At the request of a producer organisation or of an association of producer organisations, the 50 % limit provided for in paragraph 1 shall be increased to 60 % for an operational programme or part of an operational programme if at least one of the following applies:

transnational producer organisations implement in two or more Member States interventions linked to the objectives referred to in Article 46, points (b), (e) and (f);

one or more producer organisations or associations of producer organisations are engaged in interventions operated on an interbranch basis;

the operational programme concerns only specific aid for the production of organic products within the

scope of Regulation (EU) 2018/848;

the producer organisation or the association of producer organisations recognised under Regulation (EU) No 1308/2013 implements for the first time an operational programme;

producer organisations market less than 20 % of fruit and vegetable production in a Member State;

the producer organisation operates in one of the outermost regions;

the operational programme comprises the interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (i) and (j);

the operational programme is for the first time implemented by a recognised producer organisation which is the result of a merger between two or more recognised producer organisations.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objective referred to in Article 46, point (d), if that expenditure covers at least 5 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objectives referred to in Article 46, points (e) and (f), if that expenditure covers at least 20 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 100 % in the following cases:

market withdrawals of fruit and vegetables which do not exceed 5 % of the volume of marketed production of each producer organisation and which are disposed of by way of:

free distribution to charitable organisations and foundations approved to that effect by the Member States, for use in their activities to assist persons whose right to public assistance is recognised in national law, in particular because they lack the necessary means of subsistence;

free distribution to penal institutions, schools, public education institutions, establishments referred to in Article 22 of Regulation (EU) No 1308/2013 and children's holiday camps, hospitals and old people's homes designated by the Member States; Member States shall take all necessary steps to ensure that the quantities thus allocated are only additional to the quantities normally purchased by such establishments;

In regions of the Member States in which the degree of organisation of producers in the fruit and vegetables sector is significantly below the Union average, Member States may grant producer organisations recognised under Regulation (EU) No 1308/2013 national financial assistance equal to a maximum of 80 % of the financial contributions referred to in Article 51(1), point (a), of this Regulation and up to 10 % of the value of the marketed production of any such producer organisation. The national financial assistance shall be additional to the operational fund.

7 Additional information specific to the Type of Intervention

Mutual fund is a scheme in place to insure affiliated farmers whereby compensation payments are made to affiliated farmers who have suffered economic losses as a result of adverse climatic events, animal or plant diseases, pest infestations or environmental incidents or for a severe drop in income.

Instead of a significant drop in income, the value of marketed production of the producer organisation or association of producer organisations concerned may be used as a basis for a significant drop in the income of all producer members or members of the association of producer organisations or part of the membership. To this end, the value of marketed production may be calculated on the basis of the sales prices of the producer organisation for each product. However, the drop in producers' incomes still needs to be taken into account.

Payments from mutual funds to members who do not suffer a significant drop in income due to adverse market conditions shall not be eligible for financial support.

Aid may be granted for the replenishment of mutual funds where the decline in the value of marketed production of the producer organisation exceeds 30 % on the basis of a three-year average based on the preceding five-year period excluding the highest and lowest entry;

'Adverse market conditions' – this should refer to an objectively existing situation in the market for a given product that leads to a drop of income of producer members.

Payments from the mutual fund to a producer member may be made if the drop in income for that producer exceeds 30 per cent of its average annual income calculated on the basis of a three-year average based on the preceding 3 years or the preceding five-year period excluding the highest and lowest entry. For the purposes of this paragraph, income shall mean the amount of receipts received by the producer

member on the fruit and vegetables market, including any public support for fruit and vegetable products, less input costs. Payments made by the mutual fund to the producer member may compensate for less than 70 % of the loss of income in the year in which the producer member acquires the right to such support.

Types of expenditure covered by the mutual funds measure:

the administrative costs of setting up the mutual fund include, inter alia, management costs, registration fees, staff costs and overheads; and

the financial contributions referred to in Article 51(1)(a) of the CAP Strategy Plan Regulation for the replenishment of mutual funds following compensation paid to producer members whose net income has fallen significantly as a result of adverse market conditions. The replenishment should be done through the operational fund. The financial contributions to replenish the mutual fund would become a dedicated part of the operational fund.

Re-insurance of mutual funds is not eligible for support under the European Agricultural Guarantee Fund.

Financial contributions to replenish mutual funds would cover the following items:

the amounts paid out from the mutual fund as financial compensation to producer members who experience a severe drop in their income as a result of adverse market conditions.

interest on commercial loans taken out under market conditions by the mutual fund for the purpose of providing financial compensation to farmers from the mutual fund, where the resources available in the mutual fund are insufficient to meet the compensation claims.

The loss of income compensated by the mutual fund shall not be taken into account in the application of the agricultural crisis insurance instrument and the income loss compensated by the agricultural crisis insurance instrument shall not be compensated by the mutual fund. The producer organisation or association of producer organisations shall not compensate their producer members for the withdrawal from the market of products for which it has already paid compensation for a significant drop in income. The products benefitting from mutual fund compensations may however be sold on the market or processed.

Where the mutual fund performs other functions, only the amounts specifically intended to compensate for a significant drop in income due to adverse market conditions should be ring-fenced and used as a basis for the calculation of the aid intensity.

Member States may allow producer members of producer organisations or members of associations of producer organisations to claim partial reimbursement of their contribution to the mutual fund after five years if the mutual fund has not been used to pay the compensation and the amounts collected have not been used

8 WTO compliance

Green Box

Paragraph 7 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The subsidy scheme complies with the conditions of the WTO Green Box as it fully follows the criteria referred to in point 7 of Annex II.

1.2.3	Offsetting and mitigating the impact of market risks	2	Yes
2.1.1	Increasing operational and business efficiency of production	1	Yes
2.2.1	Development of post harvest technology	2	Yes
2.2.2	Construction/refurbishment of crop storages, cold stores	2	Yes
2.3.3	Increasing the market share of high added value products	1	Yes
2.4.2	Promotion of agri-food products	2	Yes
3.1.1	Promoting horizontal and vertical integration, coordination and cooperation	1	Yes
3.1.2	Increase the number and market efficiency of sectoral cooperation (including PO, PG)	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.10 Share of farms participating in producer groups, producer organisations, local markets, short supply chain circuits and quality schemes supported by the CAP

R.11/Fruit and Vegetables Share of value of marketed production by producer organisations or producer groups with operational programmes in certain sectors

R.5 Share of farms with supported CAP risk management tools

5 Specific design, requirements and eligibility conditions of the intervention

Description

Implementation of the type of actions pursuing sectoral objectives included in the operational programmes submitted by recognised producer organisations and adopted by the responsible authority

Obligations

Implementation and maintenance of the activities implemented in accordance with the objectives set out in the operational programmes

Preparation and submission of the report on the implementation of operational programmes

Participation in compulsory training related to the fulfilment of the recognition criteria and the implementation of the operational programmes.

Eligibility criteria

Compliance with the conditions for recognition as a producer organisation laid down by European Union and national legislation

Submission and implementation of an operational programme

15 % of the aid must be spent on climate and environmental measures with a minimum of three activities and 2 % for research development.

The maintenance period for investments under the Operational Programme shall be 5 years. If the investment has a tax depreciation period of less than five years, the maintenance period shall be 3 years for small and medium-sized enterprises.

Grants may be provided for investments, including leasing, in a single instalment or in annual instalments approved in the operational programme.

In addition to the costs listed in Annex III, are also eligible:

- the fees for the services used, which are carried out in the operational programme, are carried out within the framework of activities intended to achieve the objectives of the operational programme (for example, but not exhaustively: consultancy services, consultancy services, expert activities, research and experimentation, marketing communication, promotion, quality assurance systems development, audit, preparation, etc.
- costs of meetings and training programmes where they are related to the operational programme, including daily allowances, transport and accommodation costs, where applicable, on a standard flat-rate or scales of unit costs basis.
- Flat rate for staff and administrative costs linked to the management of the operational fund or the preparation, implementation and follow-up of the operational programme, up to a maximum of 2 % of the approved operational fund

6 Form and rate of support/amounts/calculation methods

Support may take any of the following forms:

reimbursement of eligible costs actually incurred by a beneficiary; Article 44(1)(a)

The Union financial assistance shall be equal to the amount of the financial contributions referred to in Article 51(1), point (a), actually paid and limited to 50 % of the actual expenditure incurred.

The Union financial assistance shall be limited to: 4.1 % of the value of the marketed production of each producer organisation; 4.5 % of the value of marketed production of each association of producer organisations; 5 % of the value of marketed production of each transnational producer organisation or transnational association of producer organisations.

Those limits may be increased by 0,5 percentage points provided that the amount in excess of the relevant percentage set out in the first subparagraph is used solely for one or more interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (h), (i) and (j). In the case of associations of producer organisations, including transnational associations of producer organisations, those interventions may be implemented by the association on behalf of its members.

At the request of a producer organisation or of an association of producer organisations, the 50 % limit provided for in paragraph 1 shall be increased to 60 % for an operational programme or part of an operational programme if at least one of the following applies:

transnational producer organisations implement in two or more Member States interventions linked to the objectives referred to in Article 46, points (b), (e) and (f);

one or more producer organisations or associations of producer organisations are engaged in interventions operated on an interbranch basis;

the operational programme concerns only specific aid for the production of organic products within the scope of Regulation (EU) 2018/848;

the producer organisation or the association of producer organisations recognised under Regulation (EU) No 1308/2013 implements for the first time an operational programme;

producer organisations market less than 20 % of fruit and vegetable production in a Member State;

the producer organisation operates in one of the outermost regions;

the operational programme comprises the interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (i) and (j);

the operational programme is for the first time implemented by a recognised producer organisation which is the result of a merger between two or more recognised producer organisations.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objective referred to in Article 46, point (d), if that expenditure covers at least 5 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objectives referred to in Article 46, points (e) and (f), if that expenditure covers at least 20 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 100 % in the following cases:

market withdrawals of fruit and vegetables which do not exceed 5 % of the volume of marketed production of each producer organisation and which are disposed of by way of:

free distribution to charitable organisations and foundations approved to that effect by the Member States, for use in their activities to assist persons whose right to public assistance is recognised in national law, in particular because they lack the necessary means of subsistence;

free distribution to penal institutions, schools, public education institutions, establishments referred to in Article 22 of Regulation (EU) No 1308/2013 and children's holiday camps, hospitals and old people's homes designated by the Member States; Member States shall take all necessary steps to ensure that the quantities thus allocated are only additional to the quantities normally purchased by such establishments;

In regions of the Member States in which the degree of organisation of producers in the fruit and vegetables sector is significantly below the Union average, Member States may grant producer organisations recognised under Regulation (EU) No 1308/2013 national financial assistance equal to a

maximum of 80 % of the financial contributions referred to in Article 51(1), point (a), of this Regulation and up to 10 % of the value of the marketed production of any such producer organisation. The national financial assistance shall be additional to the operational fund.

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold
R.10 Share of farms participating in producer groups, producer organisations, local markets, short supply chain circuits and quality schemes supported by the CAP

R.11/Fruit and Vegetables Share of value of marketed production by producer organisations or producer groups with operational programmes in certain sectors

R.5 Share of farms with supported CAP risk management tools

5 Specific design, requirements and eligibility conditions of the intervention

Description

Implementation of actions addressing sectoral objectives submitted by recognised producer organisations and included in operational programmes adopted by the responsible authority

Responsibilities

Implementation and maintenance of the implemented activities in accordance with the objectives set out in the operational programmes

Preparation and submission of the report on the implementation of operational programmes

Participation in compulsory training relating to the fulfilment of the conditions for recognition and the implementation of operational programmes.

Eligibility criteria

Compliance with the conditions for recognition as a producer organisation laid down by the European Union and national legislation

Submission and implementation of operational programmes

15 % of the aid must be allocated to climate and environmental measures comprising at least three activities and 2 % to research development.

The measure applies to apples, sour cherries, elderberries, plums, peppers, tomatoes, canned cucumbers, green peas and sweetcorn.

The maximum amount that can be financed with the operational fund shall not be higher than the sum of the cost of the physical storage, in the frozen or processed form where relevant, and the financial cost due to immobilising the value of the product at current market prices. This maximum amount shall not include the possible freezing or processing costs or the possible devaluation of the product.

The processed product must be placed in public storage for a period of half a year from the date of processing, but not more than one third of the product's date of minimum durability.

In addition to the costs listed in Annex III

- Public storage fees, including sealing and electronic storage
- the fees for the services used, which are included in the operational programme, are implemented in the context of activities aimed at achieving the objectives of the operational programme (for example, but not exhaustive: consultancy services, consultancy services, expert activities, research and experimentation, marketing communication, promotion, quality assurance systems development, auditing, preparation, etc.
- Flat rate for staff and administrative costs linked to the management of the operational fund or to the preparation, implementation and monitoring of the operational programme, up to a maximum of 2 % of the approved operational fund

6 Form and rate of support/amounts/calculation methods

Support may take any of the following forms:

reimbursement of eligible costs actually incurred by a beneficiary; Article 44(1)(a)

unit costs; Article 44(1)(b)(2)(a)(i), (c)

.

The Union financial assistance shall be equal to the amount of the financial contributions referred to in Article 51(1), point (a), actually paid and limited to 50 % of the actual expenditure incurred.

The Union financial assistance shall be limited to: 4.1 % of the value of the marketed production of each producer organisation; 4.5 % of the value of marketed production of each association of producer organisations; 5 % of the value of marketed production of each transnational producer organisation or transnational association of producer organisations.

Those limits may be increased by 0,5 percentage points provided that the amount in excess of the relevant percentage set out in the first subparagraph is used solely for one or more interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (h), (i) and (j). In the case of associations of producer organisations, including transnational associations of producer organisations, those interventions may be implemented by the association on behalf of its members.

At the request of a producer organisation or of an association of producer organisations, the 50 % limit provided for in paragraph 1 shall be increased to 60 % for an operational programme or part of an operational programme if at least one of the following applies:

transnational producer organisations implement in two or more Member States interventions linked to the objectives referred to in Article 46, points (b), (e) and (f);

one or more producer organisations or associations of producer organisations are engaged in interventions operated on an interbranch basis;

the operational programme concerns only specific aid for the production of organic products within the scope of Regulation (EU) 2018/848;

the producer organisation or the association of producer organisations recognised under Regulation (EU) No 1308/2013 implements for the first time an operational programme;

producer organisations market less than 20 % of fruit and vegetable production in a Member State;

the producer organisation operates in one of the outermost regions;

the operational programme comprises the interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (i) and (j);

the operational programme is for the first time implemented by a recognised producer organisation which is the result of a merger between two or more recognised producer organisations.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objective referred to in Article 46, point (d), if that expenditure covers at least 5 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objectives referred to in Article 46, points (e) and (f), if that expenditure covers at least 20 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 100 % in the following cases:

market withdrawals of fruit and vegetables which do not exceed 5 % of the volume of marketed production of each producer organisation and which are disposed of by way of:

free distribution to charitable organisations and foundations approved to that effect by the Member States, for use in their activities to assist persons whose right to public assistance is recognised in national law, in particular because they lack the necessary means of subsistence;

free distribution to penal institutions, schools, public education institutions, establishments referred to in Article 22 of Regulation (EU) No 1308/2013 and children's holiday camps, hospitals and old people's homes designated by the Member States; Member States shall take all necessary steps to ensure that the quantities thus allocated are only additional to the quantities normally purchased by such establishments;

In regions of the Member States in which the degree of organisation of producers in the fruit and vegetables sector is significantly below the Union average, Member States may grant producer organisations recognised under Regulation (EU) No 1308/2013 national financial assistance equal to a maximum of 80 % of the financial contributions referred to in Article 51(1), point (a), of this Regulation and up to 10 % of the value of the marketed production of any such producer organisation. The national financial assistance shall be additional to the operational fund.

Compliance with the conditions for recognition as a producer organisation laid down by the European Union and national legislation

Submission and implementation of operational programmes

15 % of the aid must be allocated to climate and environmental measures comprising at least three activities and 2 % to research development.

The recipient of products withdrawn from the market may be the host organisation

- with regard to Article 52(6)(a)(i) of Regulation (EU) No 2115/2021 of the European Parliament and of the Council, a member of the European Food Banks Association, established on the basis of the Government Decree on the establishment and detailed rules of operation of the Charter Council;
- as regards Article 52(6)(a)(ii) of Regulation (EU) No 2115/2021 of the European Parliament and of the Council
- a prison listed in the Ministerial Decree on the designation of prisons,
- an educational institution registered under the National Public Education Act,
- a health institution holding an operating licence pursuant to the Government Decree on the general conditions for the exercise of health services and the operating authorisation procedure,
- service provider registered in accordance with the Government Decree on the official registration and control of social, child welfare and child protection service providers, institutions and networks.
- In the case of commingled animals for purposes other than free distribution, it may be a host organisation
- the enclosures registered in the National Database in accordance with the Ministerial Decree on the national registration system for enclosures, holdings and certain data relating thereto,
- zoo and circus menagerie registered and licensed under the Animal Protection and Welfare Act,
- is entitled to hunt registered in accordance with the Act on Wild Wildlife Conservation, Wildlife Management and Hunting.
- in the case of processing into non-food products, the withdrawn products shall not revert to the commercial food market. Alcohol derived from distillation may be used exclusively for industrial or energy purposes.

A flat rate for staff and administrative costs linked to the management of the operational fund or to the preparation, implementation and monitoring of the operational programme may be granted up to a maximum of 2 % of the approved operational fund.

6 Form and rate of support/amounts/calculation methods

Support may take the form of unit costs. Article 44(1)(b)(2)(a)(i), (c)

Expenditure on interventions of the types of interventions referred to in Article 47(2)(f), (g) and (h) of Regulation (EU)/2021/2115 shall not exceed one third of the expenditure.

The Union financial assistance shall be equal to the amount of the financial contributions referred to in Article 51(1), point (a), actually paid and limited to 50 % of the actual expenditure incurred.

The Union financial assistance shall be limited to: 4.1 % of the value of the marketed production of each producer organisation; 4.5 % of the value of marketed production of each association of producer organisations; 5 % of the value of marketed production of each transnational producer organisation or transnational association of producer organisations.

Those limits may be increased by 0,5 percentage points provided that the amount in excess of the relevant percentage set out in the first subparagraph is used solely for one or more interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (h), (i) and (j). In the case of associations of producer organisations, including transnational associations of producer organisations, those interventions may be implemented by the association on behalf of its members.

At the request of a producer organisation or of an association of producer organisations, the 50 % limit provided for in paragraph 1 shall be increased to 60 % for an operational programme or part of an operational programme if at least one of the following applies:

transnational producer organisations implement in two or more Member States interventions linked to the objectives referred to in Article 46, points (b), (e) and (f);

one or more producer organisations or associations of producer organisations are engaged in interventions operated on an interbranch basis;

the operational programme concerns only specific aid for the production of organic products within the scope of Regulation (EU) 2018/848;

the producer organisation or the association of producer organisations recognised under Regulation (EU) No 1308/2013 implements for the first time an operational programme;

producer organisations market less than 20 % of fruit and vegetable production in a Member State;

the producer organisation operates in one of the outermost regions;

the operational programme comprises the interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (i) and (j);

the operational programme is for the first time implemented by a recognised producer organisation which is the result of a merger between two or more recognised producer organisations.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objective referred to in Article 46, point (d), if that expenditure covers at least 5 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objectives referred to in Article 46, points (e) and (f), if that expenditure covers at least 20 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 100 % in the following cases:

market withdrawals of fruit and vegetables which do not exceed 5 % of the volume of marketed production of each producer organisation and which are disposed of by way of:

free distribution to charitable organisations and foundations approved to that effect by the Member States, for use in their activities to assist persons whose right to public assistance is recognised in national law, in particular because they lack the necessary means of subsistence;

free distribution to penal institutions, schools, public education institutions, establishments referred to in Article 22 of Regulation (EU) No 1308/2013 and children's holiday camps, hospitals and old people's homes designated by the Member States; Member States shall take all necessary steps to ensure that the quantities thus allocated are only additional to the quantities normally purchased by such establishments;

In regions of the Member States in which the degree of organisation of producers in the fruit and vegetables sector is significantly below the Union average, Member States may grant producer organisations recognised under Regulation (EU) No 1308/2013 national financial assistance equal to a maximum of 80 % of the financial contributions referred to in Article 51(1), point (a), of this Regulation

and up to 10 % of the value of the marketed production of any such producer organisation. The national financial assistance shall be additional to the operational fund.

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold
R.10 Share of farms participating in producer groups, producer organisations, local markets, short supply chain circuits and quality schemes supported by the CAP
R.11/Fruit and Vegetables Share of value of marketed production by producer organisations or producer groups with operational programmes in certain sectors
R.5 Share of farms with supported CAP risk management tools

5 Specific design, requirements and eligibility conditions of the intervention

Description

Implementation of actions pursuing sectoral objectives included in the operational programmes submitted by recognised producer organisations and adopted by the responsible authority

Obligations

Implementation and maintenance of the activities implemented in accordance with the objectives set out in the operational programmes

Preparation and submission of the report on the implementation of operational programmes

Participation in compulsory training related to the fulfilment of the recognition criteria and the implementation of the operational programmes.

Eligibility criteria

Compliance with the conditions for recognition as a producer organisation laid down by European Union and national legislation

Submission and implementation of an operational programme

15 % of the aid must be spent on climate and environmental measures with a minimum of three activities and 2 % for research development.

List of products eligible for support under the measure:

1. Apples
2. Beans
3. Brussels sprouts
4. Courgettes
5. Table grapes
6. Cherries
7. Walnuts
8. Salad
9. Garlic
10. Apricot
11. Cabbage
12. Kohlrabi
13. Cauliflower
14. Pears
15. Almonds
16. Hazel
17. Peaches and nectarines
18. Tomatoes
19. Leek

 Cherries 1 114,81
 Melons 3 347,48
 * in heated housing

For products not covered here, the maximum amounts of aid that may be claimed will be determined by the Minister per hectare in the operational programme.

The non-harvesting measures that may be included in the operational programme are:

denaturing,

incorporation into soil (ploughing, ploughing, disposing, incineration of fruit in the declared area and other measures to carry out non-harvesting),

other measures duly justified by the producer organisation and approved by the Minister.

The measure is approved by the Minister if it does not have a harmful environmental impact or a phytosanitary risk.

Support under the green harvesting measure may be granted only if, in respect of the area declared, the Treasury also establishes full compliance with the rules relating to the application of the measure during the on-the-spot check.

Aid shall not be granted in the case of green harvesting if a significant part of the normal harvest has been carried out

a flat rate for staff and administrative costs linked to the management of the operational fund or the preparation, implementation and follow-up of an operational programme may be granted up to a maximum of 2 % of the approved operational fund.

6 Form and rate of support/amounts/calculation methods

Support may take the form of unit costs; Article 44(1)(b)(2)(a)(i), (c)

Expenditure on interventions of the types of interventions referred to in Article 47(2)(f), (g) and (h) of Regulation (EU)/2021/2115 shall not exceed one third of the expenditure.

The Union financial assistance shall be equal to the amount of the financial contributions referred to in Article 51(1), point (a), actually paid and limited to 50 % of the actual expenditure incurred.

The Union financial assistance shall be limited to: 4.1 % of the value of the marketed production of each producer organisation; 4.5 % of the value of marketed production of each association of producer organisations; 5 % of the value of marketed production of each transnational producer organisation or transnational association of producer organisations.

Those limits may be increased by 0,5 percentage points provided that the amount in excess of the relevant percentage set out in the first subparagraph is used solely for one or more interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (h), (i) and (j). In the case of associations of producer organisations, including transnational associations of producer organisations, those interventions may be implemented by the association on behalf of its members.

At the request of a producer organisation or of an association of producer organisations, the 50 % limit provided for in paragraph 1 shall be increased to 60 % for an operational programme or part of an operational programme if at least one of the following applies:

transnational producer organisations implement in two or more Member States interventions linked to the objectives referred to in Article 46, points (b), (e) and (f);

one or more producer organisations or associations of producer organisations are engaged in interventions operated on an interbranch basis;

the operational programme concerns only specific aid for the production of organic products within the scope of Regulation (EU) 2018/848;

the producer organisation or the association of producer organisations recognised under Regulation (EU) No 1308/2013 implements for the first time an operational programme;

producer organisations market less than 20 % of fruit and vegetable production in a Member State;

the producer organisation operates in one of the outermost regions;

the operational programme comprises the interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (i) and (j);

the operational programme is for the first time implemented by a recognised producer organisation which is the result of a merger between two or more recognised producer organisations.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objective referred to in Article 46, point (d), if that expenditure covers at least 5 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objectives referred to in Article 46, points (e) and (f), if that expenditure covers at least 20 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 100 % in the following cases:

market withdrawals of fruit and vegetables which do not exceed 5 % of the volume of marketed production of each producer organisation and which are disposed of by way of:

free distribution to charitable organisations and foundations approved to that effect by the Member States, for use in their activities to assist persons whose right to public assistance is recognised in national law, in particular because they lack the necessary means of subsistence;

free distribution to penal institutions, schools, public education institutions, establishments referred to in Article 22 of Regulation (EU) No 1308/2013 and children's holiday camps, hospitals and old people's homes designated by the Member States; Member States shall take all necessary steps to ensure that the quantities thus allocated are only additional to the quantities normally purchased by such establishments;

In regions of the Member States in which the degree of organisation of producers in the fruit and vegetables sector is significantly below the Union average, Member States may grant producer organisations recognised under Regulation (EU) No 1308/2013 national financial assistance equal to a maximum of 80 % of the financial contributions referred to in Article 51(1), point (a), of this Regulation and up to 10 % of the value of the marketed production of any such producer organisation. The national financial assistance shall be additional to the operational fund.

R.11/Fruit and Vegetables Share of value of marketed production by producer organisations or producer groups with operational programmes in certain sectors
R.5 Share of farms with supported CAP risk management tools

5 Specific design, requirements and eligibility conditions of the intervention

Description

Implementation of actions addressing sectoral objectives submitted by recognised producer organisations and included in operational programmes adopted by the responsible authority

Responsibilities

Implementation and maintenance of the implemented activities in accordance with the objectives set out in the operational programmes

Preparation and submission of the report on the implementation of operational programmes

Participation in compulsory training relating to the fulfilment of the conditions for recognition and the implementation of operational programmes.

Eligibility criteria

Compliance with the conditions for recognition as a producer organisation laid down by the European Union and national legislation

Submission and implementation of operational programmes

15 % of the aid must be allocated to climate and environmental measures comprising at least three activities and 2 % to research development.

Premiums for agricultural insurance may be included in the operational programme,

1. approved in advance by the Minister on the basis of the Act on the management of weather and other natural risks affecting agricultural production,
2. which complies with the general conditions of an agricultural insurance contract which may benefit from premium support, laid down by the Ministerial Decree on the conditions for receiving aid for agricultural insurance premiums, and
3. concluded by the producer organisation in its capacity as contracting party for the benefit of the producer members as insured persons.

The total public support shall not exceed 80 % of the cost of the insurance premiums paid for by producers for insurance against losses.

Harvest and production insurance interventions shall not cover insurance payments which compensate producers for more than 100 % of the income loss suffered, taking into account any compensation the producers obtain from other support or insurance schemes related to the insured risk.

Flat rate for staff and administrative costs linked to the management of the operational fund or to the preparation, implementation and monitoring of the operational programme, up to a maximum of 2 % of the approved operational fund

6 Form and rate of support/amounts/calculation methods

Support may take any of the following forms:

reimbursement of eligible costs actually incurred by a beneficiary; Article 44(1)(a)
unit costs; Article 44(1)(b)(2)(a)(i), (c)

The Union financial assistance shall be equal to the amount of the financial contributions referred to in Article 51(1), point (a), actually paid and limited to 50 % of the actual expenditure incurred.

The Union financial assistance shall be limited to: 4.1 % of the value of the marketed production of each producer organisation; 4.5 % of the value of marketed production of each association of producer organisations; 5 % of the value of marketed production of each transnational producer organisation or transnational association of producer organisations.

Those limits may be increased by 0,5 percentage points provided that the amount in excess of the relevant percentage set out in the first subparagraph is used solely for one or more interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (h), (i) and (j). In the case of associations of producer organisations, including transnational associations of producer organisations, those interventions may be implemented by the association on behalf of its members.

At the request of a producer organisation or of an association of producer organisations, the 50 % limit provided for in paragraph 1 shall be increased to 60 % for an operational programme or part of an operational programme if at least one of the following applies:

transnational producer organisations implement in two or more Member States interventions linked to the objectives referred to in Article 46, points (b), (e) and (f);

one or more producer organisations or associations of producer organisations are engaged in interventions operated on an interbranch basis;

the operational programme concerns only specific aid for the production of organic products within the scope of Regulation (EU) 2018/848;

the producer organisation or the association of producer organisations recognised under Regulation (EU) No 1308/2013 implements for the first time an operational programme;

producer organisations market less than 20 % of fruit and vegetable production in a Member State;

the producer organisation operates in one of the outermost regions;

the operational programme comprises the interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (i) and (j);

the operational programme is for the first time implemented by a recognised producer organisation which is the result of a merger between two or more recognised producer organisations.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objective referred to in Article 46, point (d), if that expenditure covers at least 5 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objectives referred to in Article 46, points (e) and (f), if that expenditure covers at least 20 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 100 % in the following cases:

market withdrawals of fruit and vegetables which do not exceed 5 % of the volume of marketed production of each producer organisation and which are disposed of by way of:

free distribution to charitable organisations and foundations approved to that effect by the Member States, for use in their activities to assist persons whose right to public assistance is recognised in national law, in particular because they lack the necessary means of subsistence;

free distribution to penal institutions, schools, public education institutions, establishments referred to in Article 22 of Regulation (EU) No 1308/2013 and children's holiday camps, hospitals and old people's homes designated by the Member States; Member States shall take all necessary steps to ensure that the quantities thus allocated are only additional to the quantities normally purchased by such establishments;

In regions of the Member States in which the degree of organisation of producers in the fruit and vegetables sector is significantly below the Union average, Member States may grant producer organisations recognised under Regulation (EU) No 1308/2013 national financial assistance equal to a maximum of 80 % of the financial contributions referred to in Article 51(1), point (a), of this Regulation and up to 10 % of the value of the marketed production of any such producer organisation. The national financial assistance shall be additional to the operational fund.

RISK(46(j)) crisis prevention and risk management, aimed at avoiding and dealing with crises in the markets of the relevant sector

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO1 Support viable farm income and resilience of the agricultural sector across the Union in order to enhance long-term food security and agricultural diversity as well as to ensure the economic sustainability of agricultural production in the Union

SO2 Enhance market orientation and increase farm competitiveness, both in the short and long term, including greater focus on research, technology and digitalisation

SO3 Improve the farmer' position in the value chain

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
1.2.3	Offsetting and mitigating the impact of market risks	2	Yes
3.1.1	Promoting horizontal and vertical integration, coordination and cooperation	1	Yes
3.1.2	Increase the number and market efficiency of sectoral cooperation (including PO, PG)	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold
R.10 Share of farms participating in producer groups, producer organisations, local markets, short supply chain circuits and quality schemes supported by the CAP
R.11/Fruit and Vegetables Share of value of marketed production by producer organisations or producer groups with operational programmes in certain sectors
R.5 Share of farms with supported CAP risk management tools

5 Specific design, requirements and eligibility conditions of the intervention

Description

Implementation of the activities serving the sectoral objectives included in the operational programs

submitted by a producer organisation, association of producer organisations, transnational producer organisation, transnational association of producer organisations and accepted by the responsible authority

Obligations

The implemented activities are the implementation and maintenance of the objectives defined in the operational programs

Preparation and submission of a report on the implementation of operational programs

Participation in mandatory training related to the Fulfillment of recognition conditions and the implementation of operational programs.

Eligibility conditions

Compliance with the conditions set by European Union and national legislation for recognition as a producer organisation

Submission and implementation of an operational programme

15 % of the support must be spent on climate and environmental protection measures consisting of at least three activities, and 2 % on research and development.

For each producer organisation, association of producer organisations, producer group or individual producer participating in the coaching provided by a producer organisation, association of producer organisations, transnational producer organisation, transnational association of producer organisations within the framework of the operational programme, a preliminary assessment must be prepared with regard to the content, duration, expected results and documentation of the coaching. The objective of coaching should be

- exchanging best practices related to crisis prevention and management interventions helping the beneficiary to benefit from experience with implementation of crisis prevention and risk management interventions;

- creating networking opportunities for coaching providers and recipients, for the use of marketing channels as a means of crisis prevention and management.

For several producer organisations, associations of producer organisations, producer groups or individual producers, coaching can only be given at the same time if it is justified based on the results of the preliminary needs assessment.

In the case of coaching, the operational program must show the number of participating producer organisations, associations of producer organisations, producer groups or individual producers, the number of Occasions of coaching, its total duration, and its total cost per cost type, and the methodology of the preliminary needs assessment must be attached, planned content and pattern.

Coaching interventions shall not be Outsourced

The followings can be accounted for in addition to the eligible costs listed in Annex III of the Commission Implementing Regulation (EU) 2022/126

- fees for the services used, which are realised in the framework of the activities envisaged at contributing to the objective of crisis prevention and risk management, aimed at avoiding and dealing with disturbances in the markets (for example, but not exhaustively: consulting services, specialist consulting services, expert activities, communication, etc.)

- the costs of meetings and training programs, if they are related to the operational programme, including per diems, as well as travel and accommodation costs, where applicable on a flat-rate or unit cost reimbursement basis.

- flat-rate staff and administrative costs related to the management of the operating fund or the preparation, implementation and monitoring of the operational programme, up to a maximum of 2 % of the approved operating fund

6 Form and rate of support/amounts/calculation methods

Supporting can take any of the following forms:

reimbursement of eligible costs actually incurred by a beneficiary; Article 44(1)(a)

unit costs; Article 44(1)(b)(2)(a)(i), (c)

The EU financial support is the same as the amount of the financial contributions referred to in point (a) of Article 51(1) actually paid, and may not exceed 50 % of the actual expenses incurred.

The maximum level of EU financial support: 4.1 % of the value of the products marketed by the given producer organisation; 4.5 % of the value of the products marketed by the given association of producer organisations; 5 % of the value of the products marketed by the given transnational producer organisation or producer organisation association.

These limit values may be increased by 0.5 percentage points if the amount exceeding the relevant percentage value defined in the first subparagraph is used exclusively for one or more interventions related to the objectives referred to in points d, e, f, h, i) and j) of Article 46. In the case of associations of producer organisations, including transnational associations of producer organisations, these interventions can be carried out by the association on behalf of the members.

The upper limit of 50 % prescribed in paragraph (1) must be increased to 100 % in the following cases: actions related to personalised coaching provided to other producer organs recognised under Regulation 1308/2013EU – provided that the relevant producer organs operate in the regions referred to in Article 53 (2) of this regulation – or related to personalised coaching provided to individual producers related actions;

In the regions of the Member States where the degree of organisation of producers in the fruit and vegetable sector is significantly lower than the EU average, the Member States may provide producer organisations – recognised on the basis of Regulation (EU) 1308/2013 – with a national financial support of up to 80 % of the financial support referred to in Article 51(1)(a) of this Regulation and national financial support of up to 10 % of the value of the products marketed by any such producer organisation. The national financial support supplements the operating fund.

7 Additional information specific to the Type of Intervention

The intervention shall be implemented in accordance with the Article 13 of the regulation (EU) 2022/126.

8 WTO compliance

Green Box

Paragraph 2 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The support programme complies with the terms of the WTO green box, as it fully follows II. conditions referred to in point 2 of the annex. Within the framework of their operational programs, producers create services for agricultural producers who are members of the producer organisation.

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.10 Share of farms participating in producer groups, producer organisations, local markets, short supply chain circuits and quality schemes supported by the CAP

R.11/Fruit and Vegetables Share of value of marketed production by producer organisations or producer groups with operational programmes in certain sectors

R.5 Share of farms with supported CAP risk management tools

5 Specific design, requirements and eligibility conditions of the intervention

Description

Implementation of actions addressing sectoral objectives submitted by recognised producer organisations and included in operational programmes adopted by the responsible authority

Responsibilities

Implementation and maintenance of the implemented activities in accordance with the objectives set out in the operational programmes

Preparation and submission of the report on the implementation of operational programmes

Participation in compulsory training relating to the fulfilment of the conditions for recognition and the implementation of operational programmes.

Eligibility criteria

Compliance with the conditions for recognition as a producer organisation laid down by the European Union and national legislation

Submission and implementation of operational programmes

15 % of the aid must be allocated to climate and environmental measures comprising at least three activities and 2 % to research development.

Promotional communication and marketing activities shall pursue one of the following objectives:

1. increasing awareness of the merits of Union agricultural products and of the high standards applicable to their production methods in the Union;
2. increasing the competitiveness and consumption of Union agricultural products and certain processed products produced in the Union and raising their profile both inside and outside the Union for sectors other than wine;
3. increasing awareness about Union quality schemes both inside and outside the Union;
4. increasing the market share of Union agricultural products and certain processed products produced in the Union, specifically focusing on the markets in third countries that have the highest growth potential;
5. contributing, where relevant, to restore the normal market conditions in the Union market in the event of serious market disturbance, loss of consumer confidence or other specific problems;
6. increasing awareness of sustainable production;
7. increase consumer awareness of brands/trade marks in the fruit and vegetables sector marketed by producer organisations, associations of producer organisations, transnational producer organisations and transnational associations of producer organisations

In addition to the costs listed in Annex III, eligible

- the fees for the services used, which are included in the operational programme, are implemented in the context of activities aimed at achieving the objectives of the operational programme (for example, but not exhaustive: consultancy services, consultancy services, expert activities, research and experimentation, marketing communication, promotion, quality assurance systems development, auditing, preparation, etc.
- costs of meetings and training programmes where they are related to the operational programme, including daily allowances, transport and accommodation costs, where applicable, on a standard flat-rate or scales of unit costs basis.
- The price difference resulting from the difference between the selling price of fruit and vegetables sold under the communication measure and the selling price of the product sold outside the measure, where the quantity covered by the measure exceeds by at least 25 % the quantity sold

prior to the measure.

- flat rate for staff and administrative costs linked to the management of the operational fund or to the preparation, implementation and monitoring of the operational programme, up to a maximum of 2 % of the approved operational fund

6 Form and rate of support/amounts/calculation methods

Support may take any of the following forms:

reimbursement of eligible costs actually incurred by a beneficiary; Article 44(1)(a)

unit costs; Article 44(1)(b)(2)(a)(i), (c)

The Union financial assistance shall be equal to the amount of the financial contributions referred to in Article 51(1), point (a), actually paid and limited to 50 % of the actual expenditure incurred.

The Union financial assistance shall be limited to: 4.1 % of the value of the marketed production of each producer organisation; 4.5 % of the value of marketed production of each association of producer organisations; 5 % of the value of marketed production of each transnational producer organisation or transnational association of producer organisations.

Those limits may be increased by 0,5 percentage points provided that the amount in excess of the relevant percentage set out in the first subparagraph is used solely for one or more interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (h), (i) and (j). In the case of associations of producer organisations, including transnational associations of producer organisations, those interventions may be implemented by the association on behalf of its members.

At the request of a producer organisation or of an association of producer organisations, the 50 % limit provided for in paragraph 1 shall be increased to 60 % for an operational programme or part of an operational programme if at least one of the following applies:

transnational producer organisations implement in two or more Member States interventions linked to the objectives referred to in Article 46, points (b), (e) and (f);

one or more producer organisations or associations of producer organisations are engaged in interventions operated on an interbranch basis;

the operational programme concerns only specific aid for the production of organic products within the scope of Regulation (EU) 2018/848;

the producer organisation or the association of producer organisations recognised under Regulation (EU) No 1308/2013 implements for the first time an operational programme;

producer organisations market less than 20 % of fruit and vegetable production in a Member State;

the producer organisation operates in one of the outermost regions;

the operational programme comprises the interventions linked to the objectives referred to in Article 46, points (d), (e), (f), (i) and (j);

the operational programme is for the first time implemented by a recognised producer organisation which is the result of a merger between two or more recognised producer organisations.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objective referred to in Article 46, point (d), if that expenditure covers at least 5 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 80 % for expenditure linked to the objectives referred to in Article 46, points (e) and (f), if that expenditure covers at least 20 % of the expenditure under the operational programme.

The 50 % limit provided for in paragraph 1 shall be increased to 100 % in the following cases:

market withdrawals of fruit and vegetables which do not exceed 5 % of the volume of marketed production of each producer organisation and which are disposed of by way of:

free distribution to charitable organisations and foundations approved to that effect by the Member States, for use in their activities to assist persons whose right to public assistance is recognised in national law, in particular because they lack the necessary means of subsistence;

free distribution to penal institutions, schools, public education institutions, establishments referred to in Article 22 of Regulation (EU) No 1308/2013 and children's holiday camps, hospitals and old people's

homes designated by the Member States; Member States shall take all necessary steps to ensure that the quantities thus allocated are only additional to the quantities normally purchased by such establishments; In regions of the Member States in which the degree of organisation of producers in the fruit and vegetables sector is significantly below the Union average, Member States may grant producer organisations recognised under Regulation (EU) No 1308/2013 national financial assistance equal to a maximum of 80 % of the financial contributions referred to in Article 51(1), point (a), of this Regulation and up to 10 % of the value of the marketed production of any such producer organisation. The national financial assistance shall be additional to the operational fund.

CAP SECTORAL OBJECTIVE Code + Description

CAP SPECIFIC OBJECTIVE Code + Description Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold

SO6 Contribute to halting and reversing biodiversity loss, enhance ecosystem services and preserve habitats and landscapes
XCO Cross-cutting objective of modernising the sector by fostering and sharing of knowledge, innovation and digitalisation in agriculture and rural areas, and encouraging their uptake

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
6.5.3	Ensuring stability of Pollination systems	1	Yes
CCO.1.1	Support for practice-oriented knowledge transfer in support of sectoral objectives	1	Yes
CCO.1.6	Knowledge transfer to accelerate generational renewal in agriculture and forestry	2	Yes
CCO.1.7	Training of special advisers	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description
Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

5 Specific design, requirements and eligibility conditions of the intervention

Description

Organising and participating in international and regional professional events helps to modernise the sector, learn about and apply innovation through the latest knowledge gained there. Technical study visits, training courses in apiculture and other forms of dissemination of knowledge (e.g. professional newspapers, films, publications, websites) serve to increase and share knowledge. Support for the

activities of professional organisations (including costs of national coordination of training in beekeeping, rental of premises for training courses, fees for speakers and interpreters, accommodation, travel and meal costs, production, postage, advertising costs, regularisation costs) and support for the activities of specialist consultants and service networks (e.g. consultancy fees, service network service fees) will also contribute to the coordinated operation of the sector, the development of knowledge, the spread of innovation and the modernisation of the sector and its digitalisation. Training and organisational support increase the resilience of the sector, which also supports food security.

Service networks are established for bee health and environmental pressures, phenological and meteorological apiculture monitors.

Monitoring of bee health and environmental pressures will support e.g. the fee for the service, the cost of analysis and publication of the publication. The service covers both field crops and bee population testing. On the basis of the examination of samples of plants and bees, flaws in agricultural and apiculture techniques are detected (unreasonable environmental pressures using spraying or apiculture medicinal products, bee poisoning, bee health status, use of unauthorised substances, technological discipline).

An annual publication on the results of the observations (bee health status, technological assessments) is produced to increase and share knowledge, with a summary and recommendations, which provides useful information for both beekeepers and farmers, but also for the authority.

The activities of the phenological and meteorological beekeeping monitoring network help to plan migration times by monitoring the phenological status of individual bee pastures in different parts of the country on an accessible information interface. The service fee will be subsidised to facilitate the activity.

The intervention is a continuation of the well-functioning measures of the apiculture programme with measures for which the beneficiaries of the aid are apiculture organisations and service networks and support for the above objectives. Detailed internal rules shall be drawn up for the implementation of the intervention.

Experts and organisations implementing AKIS-type measures may be partially linked to the Knowledge Network and the CAP Network.

The requirement for the organisation and participation of events, dissemination of knowledge, training, study visits and support for participation may be linked to the minimum number of participants or, in the case of the organisation of member organisations, to the certification of the national apiculture organisation that its professional standards correspond to eligibility. Depending on the subject of the grant, the grant application may be submitted by the beneficiary on one or more occasions per implementation period, with the proviso that multiple submissions may not concern support for the same event or programme.

Eligible costs for the intervention:

- costs of training and training organisation;
- staff and administrative costs;
- rapporteurs' prizes;
- costs of production and distribution of literature and journals and specialised films;
- costs of professional events and study visits;
- costs of consultancy and services.

Specific conditions of the aid:

The support of the network of consultants and service providers shall be conditional on the submission of summary reports on the activities.

Proof of completion or proof of payment of certified costs is also a general aid requirement.

Ineligible costs of the intervention:

No aid may be requested for the purchase or translation of a professional journal, study, statistics and bee health literature drawn up by the coordinator, the coordinator's assistant, the beekeeping consultants or the senior consultant, or not published.

Beneficiaries of interventions:

- the national apiculture organisation and its member organisations;
 - service networks.

Interventions are the Strategic Plan Regulation. Achievement of the specific objective set out in point (f) of Article 6(1) (SO6) and the horizontal objective (xCO) referred to in paragraph 2. The provision of advisory services, technical assistance, training, information and exchange of best practices for beekeepers and beekeepers' organisations (Article 55(1)(a) of the Strategic Plan Decree) shall be used for the operation of the sector-specific advisory system and the transfer of knowledge and knowledge and knowledge, through the operation of the consultancy system, support for the activities of professional beekeepers' organisations, professional training and practical knowledge transfer. At the same time, organised knowledge transfer also supports generational renewal in agriculture (CCO). Improving farmers' knowledge of the results of environmental monitoring and monitoring will also increase knowledge on the effects of agriculture on the environment, which can strengthen the motivation of close-to-nature farming (biobeekeeping) (SO6).

The 2023 CAP envelope can also be used to cover support needs arising during the extended period of the 2022 apiculture year (01/08/2022 – 31.12.2022).

6 Form and rate of support/amounts/calculation methods

A grant of up to 100 % of the certified costs for each action (e.g. contractor fees or commission fees for organising events, production of information material, renting of venues) or a specific amount covering part of the costs (e.g. event newspaper production), other measures with a ceiling (e.g. translation costs of producing information material, or food, travel and accommodation costs for attending events).

The planned support envelope for 2023 (EU part of EUR 250000 and domestic part of EUR 250000) no longer includes the allocation for the extended apiculture year 2022. The EU part of the amount deducted for the extended apiculture year is EUR 500000 and the domestic part is EUR 500000. The planned support envelope for 2024 (EU part of EUR 634871, domestic part of EUR 634871) – and the allocation planned for 2025-2027 (EU part of EUR 627371/year, domestic part of EUR 627371/year) are based on the fact that part of the events and trainings were cancelled or online during the COVID outbreak and that online solutions are expected to continue to spread in the future.

In addition, experience and changes in needs in 2022-2023 have been taken into account, leading to a slight correction of the framework use, thus increasing the planned envelope by 3.3 % to continue supporting professional study visits, which, according to the previous plan, would have been phased out.

7 Additional information specific to the Type of Intervention

—

8 WTO compliance

Green Box

Paragraph 2 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The intervention shall comply with the following points in paragraph 2 of Annex 2 to the World Trade Organisation Agreement on Agriculture:

training services, including both general and vocational training facilities;

expansion and advisory services, including the provision of tools to facilitate the transmission of information and research results to producers and consumers;

The intervention is consistent with the general services contained in Annex 2 to the World Trade Organisation Agreement on Agriculture, such as training services, advisory services, inspection services, and the provision of tools for the transfer of information.

The intervention falls within the scope of public service programmes, does not affect trade or production, does not involve price support for producers and does not involve consumer transfers.
They do not involve direct payments to producers or distributors.

9 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Planned Unit Amount	Region(s)	Result Indicator(s)
SC02_O37_A01_BN - Unit aid to beneficiaries for knowledge transfer in apiculture and technical assistance	Average		
SC02_O37_A02_ON - Unit aid per application for apiculture knowledge transfer and technical assistance	Average		

Description

SC02_O37_A01_BN - Unit aid to beneficiaries for knowledge transfer in apiculture and technical assistance

The apiculture sector programme continues on the basis of the well-functioning national apiculture programme. Therefore, during the calculation of the unit amount, we took into account the available 1-year historical data collected by the Paying Agency for measures falling under this type of intervention in the domestic title decree, which entered into force in 2021, on the basis of the apiculture programme amended in 2021.

In the first quarter of FY2024, a beneficiary output is calculated, with an application output in the subsequent periods. Based on the experience of recent years, due to the anticipated temporary decrease in the number of events and cost savings, we use 64 beneficiaries in the first quarter of 2024 with a unit amount per EU grant of EUR 2500 per beneficiary, a unit amount of 270 applications for a further three quarters, a unit amount of EUR 1759 and a request of 380/year and 1651 for 2025-2027, based on the experience of recent years.

Due to the uncertainty of the increase in the cost of events, a difference of almost 20 % in the average unit amount is planned.

SC02_O37_A02_ON - Unit aid per application for apiculture knowledge transfer and technical assistance

The apiculture sector programme continues on the basis of the well-functioning national apiculture programme. Therefore, during the calculation of the unit amount, we took into account the available 1-year historical data collected by the Paying Agency for measures falling under this type of intervention in the domestic title decree, which entered into force in 2021, on the basis of the apiculture programme amended in 2021.

In the first quarter of FY2024, a beneficiary output is calculated, with an application output in the subsequent periods. Based on the experience of recent years and due to the foreseeable increase in the number and costs of events, we use 270 applications for a further three quarters of financial year 2024, a unit amount of EUR 1759 and a request of 380/year and 1651 for the years 2025 to 2027.

Due to the uncertainty of the increase in the cost of events, a difference of almost 20 % in the average unit amount is planned.

10 Planned Unit Amounts - Financial table with output

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	Total 2023 - 2027

2.1.2	Creation of modern generation capacities	2	Yes
2.1.3	Increasing the level of processing of agricultural raw materials	1	Yes
4.7.1	Development and use of climate-additive and climate-adaptive plant and animal breeds	1	Yes
6.5.3	Ensuring stability of Pollination systems	1	Yes
6.6.1	Genetic conservation and land use in climate adaptive agriculture and forestry	2	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.35 Share of beehives supported by the CAP

5 Specific design, requirements and eligibility conditions of the intervention

Description

The aim of the intervention is to facilitate the purchase of equipment necessary for the exercise of apiculture activities, the purchase of veterinary medicinal products and equipment necessary to preserve the number and health of bee colonies and the purchase of controlled breeding material, as well as tools to improve community contact between beekeeping organisations and their members (e.g. office technology, computer tools, photocopiers) and the purchase of glass moulds for the uniform appearance and quality of beekeeping products.

Aided tools for the pursuit of apiculture activities are those necessary for the extraction of honey and apiculture products (e.g. bee lees, lids, lidlers, honey filter vats, pollen collectors, pollen dryers), presentation (e.g. honey pumps, honey warmers, honey filling machines, pollen cleaners, pollen dryers) and storage (e.g. barrels). Furthermore, the range of equipment and auxiliary equipment (e.g., comb containers, refrigeration equipment, freezer chambers, compressors, high-pressure washing equipment, forklift trucks, lifting equipment, bee-containers, power supply equipment, grass casings, protection systems, hives balances) and the cost of renting vehicles are also supported.

In addition to the medicinal and veterinary medicinal products used in beekeeping that preserve the health of bee colonies, vehicles and occupational safety devices (e.g. protective clothing, gas masks, filters) for their application are supported.

The purchase of hygienic sleepers to assess the contamination of acacia is supported for alternative health protection, whereas preventive control supports e.g. the replacement of beehives, framework headings and queen bees by purchase, the purchase of ozone generators, the planting of trees for bee pastures, semi-tanks, shrubs and bushes. The latter can be planted on and around the apiculture site, thus helping colonies to weather the harsh period of natural bee pasture in the longer term.

The moulds for the uniform appearance and quality of apiculture products are prepared by the national apiculture organisation. These bottles can be purchased by beekeepers in order to ensure a uniform presentation of the apiculture products. Excise seals attached to shape glass guarantee quality and therefore help consumers to choose quality products.

The acquisition of the equipment necessary for the performance of apiculture activities contributes to the continuous innovation of technology, which leads to the efficiency of the activity and thus to increased competitiveness. The purchase of new equipment from an official manufacturer or distributor is eligible. The aid increases investment activity by improving capitalisation, which also contributes to the development of technology. In addition to competitiveness, this enhances market orientation.

The improvement of the health and genetic condition of the bee population serves to preserve the number, health and native genetic stock of bee colonies. This contributes to the protection of the ecosystem and the maintenance of ecosystem services.

The intervention is a continuation of the well-functioning measures of the apiculture programme with measures for which beekeepers are the beneficiaries of aid, and the aid serves the above objective.

Detailed internal rules shall be drawn up for the implementation of the intervention.

Some of the measures taken to enhance competitiveness may be linked to Pillar II innovation cooperation (EIP) interventions and support for small farms.

The improvement of the health and genetic condition of the bee population can be complemented by support for animal welfare under Pillar II in the apiculture sector. The funds under Pillar I and Pillar II are well delineated at the level of funding objectives or at the level of the call for proposals.

Only products holding an official authorisation and registered in an official register, as well as propagating material, shall be eligible for aid.

Beneficiaries:

investments in tangible and intangible assets:

- Apiculture equipment may be supported by a beekeeper or producer group who is a member of a national apiculture organisation, provided that the applicant has a bee colony according to the official register.
- Apiculture organisations are eligible for aid to support the activities of organisations. The national apiculture organisation is the holder of the support for moulds.
- combatting beehive invaders and diseases, in particular varroasis;
- An beekeeper who is a member of a national apiculture organisation is entitled to support protection,

provided that the applicant has a bee colony according to the official register.

restocking of bees in the Union, including bee breeding;

- An beekeeper who is a member of a national beekeeping organisation is entitled to support the restocking of bees if the applicant has a bee colony according to the official register.

rationalisation of transhumance;

- An beekeeper who is a member of a national beekeeping organisation is entitled to support the rationalisation of transhumance if the claimant has a bee colony according to official records.

Eligible costs for the intervention:

investments in tangible and intangible assets and other actions, including:

- new beekeeping tools, aids and equipment used in beekeeping practices,
- new apiculture equipment for the production, extraction, storage and presentation of honey and apiculture products
- new products, tools, machinery and equipment for spleen storage
- office and moulds
- procurement of hygienic sleepers for alternative defence
- cost of purchase of beehives, frame and comb exchange, ozone generator, bee pasture, bushes, etc., for preventive measures.

combatting beehive invaders and diseases, in particular varroasis;

- medicinal products, medicinal products and vehicles necessary for the professional veterinary treatment of bee colonies against pests and diseases with an authorised substance
- purchase of application equipment and equipment

restocking of bees in the Union, including bee breeding;

- the cost of the purchase of maternal crèche and maternal crèche.

rationalisation of transhumance;

- migration aids
- leasing, hire and meadow purchase of special towed vehicles used for transhumance
- rental of vehicles

Specific conditions of the aid:

Only devices, machinery and equipment for which an official marketing authorisation has been granted are eligible.

Aided apiculture equipment must be kept and operated for 5 years and 3 years for the subsidised office equipment.

The purchase of the same type of apiculture equipment within 5 years and the purchase of the same type of office equipment within 3 years is not allowed.

The aid is available in the case of membership of a national apiculture organisation.

Investments may be carried out outside the beneficiary's premises.

Equipment and vehicles intended to protect health are not eligible on their own, but only in the case of joint purchases of veterinary medicinal products.

Development of the environment for beehealth: for the purchase of bee pastures, shrubs, semi-srubs and bushes listed on the website of the national apiculture organisation, the purchase price is eligible for applicants who are members of the apiculture organisation(http://www.omme.hu/wp-content/uploads/2021/08/MMNP-fajlista_bővített.pdf).

This aid is separate from forestry aid.

The planting of bee pasture crops supported in this way is limited to a small area, so that there is no forestry or other economic benefit.

Ineligible costs of the intervention:

acquisition of self-produced assets and second-hand assets

products not authorised by the Hungarian authorities for bee colonies;

—propagation material from a herd which has not been registered by a Hungarian breed society or which is not naturalised.

The intervention serves the specific objectives set out in Article 6(1)(b)(d) and (f) of the Strategic Plan Regulation on the basis of Article 55(1)(b) of the Strategic Plan Regulation.

In order to increase the competitiveness of farms in the short and long term, thereby making them more market-oriented, the purchase of equipment necessary to carry out apiculture activities will help them to increase their competitiveness. The acquisition of new assets also leads to the development of technology which helps to increase added value (SO2).

Medicated, alternative and preventive measures against bee pests and pathogens serve to preserve the bee population, thus contributing to climate change mitigation, adaptation to climate change, halting and reversing biodiversity loss and enhancing ecosystem services. By supporting the purchase of controlled breeding material, the use of a climate-resilient and climate adaptive breed and genetic preservation (SO4, SO6) is achieved.

The 2023 CAP envelope can also be used to cover support needs arising during the extended period of the 2022 apiculture year (01/08/2022 – 31.12.2022).

6 Form and rate of support/amounts/calculation methods

Forms of support:

—reimbursement of expenses

—bank guarantee

—An institutional guarantee at a preferential fee may be used within the intervention to supplement the aid intensity, which constitutes a guarantee from the Agricultural Credit Guarantee Foundation for all investments.

The aid applied to the intervention will be cleared on the basis of the eligible costs actually incurred by the beneficiary under Article 44(1)(a) SPR, as certified by an invoice.

Grants of between 50 % and 100 % of the certified costs for each action, or a specific amount or cap to cover part of the costs.

The planned support envelope for 2023 (EU part of EUR 3204227/year, domestic part of EUR 3204227/year) because the amount allocated for the extended apiculture year 2022 is no longer included. The EU part of the amount deducted for the extended apiculture year is EUR 175000/year and the domestic part is EUR 175000/year. The EU part of the planned support envelope of EUR 7027422 for the financial year 2024 is EUR 3513711 and the domestic part is EUR 3513711. The planned support envelope of EUR 7036217 for 2025-2027 (EU part of EUR 3518108,5/year, domestic part of EUR 3518108,5/year)

The planned support framework is determined on the basis of the framework and use of the 2020-2021 funding period of the apiculture programme, taking into account the fact that the interest in new technological tools, the materials and tools used to control bee health and the purchase of queen bee can be considered to be lasting and a significant increase in prices is expected, as well as the possibility of support through preventive bee health measures.

7 Additional information specific to the Type of Intervention

8 WTO compliance

Green Box

Paragraph 2 of Annex 2 WTO

Attention! Interventions under Article 55(1)b subpoints (i) and (ii) according to Article 10 and Annex II are obliged to comply with WTO Green Box criteria. Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

Support for equipment, equipment and aids necessary for the pursuit of apiculture activities complies with the following paragraphs of Annex 2 to the World Trade Organisation (WTO) Agreement on Agriculture:

Annex No 2: Domestic support – Basis for exemption from the reduction obligation

(1) Domestic support measures for which exemptions from reduction commitments are requested must comply with the basic requirement that they have no or at most minimal trade distorting effects or effects on production. Accordingly, any measure for which an exemption is requested must comply with the following essential criteria:

the aid in question must be provided through a public government programme (including loss of public revenue) which does not involve consumer credit transfers; and,

the aid in question shall not constitute price support to producers;

The pharmaceutical, alternative and preventive measures to preserve the health of bee colonies comply with the following paragraph 2 of Annex 2 to the World Trade Organisation (WTO) Agreement on Agriculture:

pest and disease control, including general and product-specific pest and disease control measures such as early warning systems, quarantine and eradication;

The equipment support has no impact on trade in beekeeping products or on production, does not involve price support for apiculture products to producers and does not involve consumer transfers or direct payments to producers or distributors.

The objective of the intervention to preserve the health of bee colonies is to protect against pests and diseases referred to in point 2(b) of Annex 2 to the WTO Agreement on Agriculture.

9 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Planned Unit Amount	Region(s)	Result Indicator(s)
SC03_O37_A01_BN - Unit aid per beneficiary for equipment development in the apiculture sector	Average		R.35
SC03_O37_A02_BN - Unit aid for the purchase of equipment to support the activities of apiculture organisations	Average		
SC03_O37_A03_BN - Unit aid per beneficiary for aid for the control of bee diseases and pests	Average		R.35
SC03_O37_A04_BN - Unit aid per beneficiary for the development of bee genetic stock	Average		R.35
SC03_O37_A05_BN - Unit aid per beneficiary for the purchase of equipment to facilitate migration	Average		R.35
SC03_O37_A06_ON - Unit aid per application for asset development in the apiculture sector	Average		R.35
SC03_O37_A07_ON - Unit aid per application for the purchase of equipment to support the activities of apiculture organisations	Average		
SC03_O37_A08_ON - Unit aid per application for aid for the control of bee diseases and pests	Average		R.35
SC03_O37_A09_ON - Unit aid per application for the development of bee genetic resources	Average		R.35
SC03_O37_A10_ON - Unit aid per application for the acquisition of equipment to facilitate migration	Average		R.35

Description

SC03_O37_A01_BN - Unit aid per beneficiary for equipment development in the apiculture sector

On the basis of the amendment of the apiculture programme in 2021, the Hungarian decree of title entered into force in 2021 for measures falling under this type of intervention, taking into account the available 1-year historical data collected by the paying agency, the average amount of EU aid per beekeeper actually making use of the aid in euros and, as of 2024, the average EU aid amount for beekeepers' applications. [Pursuant to Article 44(2)(a) (i) SPR.]

In the first quarter of FY2024, a beneficiary output is calculated, with an application output in the subsequent periods. Taking into account the available data, the following outputs and unit amounts are planned.

Aid for the extraction and presentation of honey and apiculture products, as well as for the storage of combs and the modernisation of other tangible assets used in apiculture, is calculated with 274 beneficiaries in the first quarter of FY2024, a unit amount per EU aid of EUR 250 per beneficiary, a unit amount per additional three quarters of 300 applications, a unit amount of EUR 188.5, and an annual amount of 500 applications and 150 units for the years 2025 to 2027.

The budget planned to support the instruments, as well as the number of eligible applications, will be significantly reduced during the amendment of the CAP plan and the unit amount will be reduced.

Due to the uncertainty of the level of cost increase, a 20 % difference in the average unit amount is planned.

SC03_O37_A02_BN - Unit aid for the purchase of equipment to support the activities of apiculture organisations

On the basis of the apiculture programme amended in 2021, for measures falling under this type of intervention in the Hungarian Decree which entered into force in 2021, taking into account the available 1-year historical data collected by the paying agency, the average EU aid amount per bee-keeping organisation actually used is in euros and, as of 2024, the average EU aid amount for applications from beekeeping organisations. [Pursuant to Article 44(2)(a) (i) SPR.]

In the first quarter of FY2024, a beneficiary output is calculated, with an application output in the subsequent periods. Taking into account the available data, the following outputs and unit amounts are planned.

We use 3 beneficiaries, a unit amount per beneficiary of EUR 600 per beneficiary in the first quarter of the 2024 financial year, 100 applications, a unit amount of EUR 241.5 per year and an annual amount of 250 units for the years 2025 to 2027 to support the purchase of equipment to support the activities of apiculture organisations.

The budget foreseen for the support of the instruments is limited, the number of eligible applications and the unit amount decreases significantly during the amendment of the CAP plan.

Due to the uncertainty of the increase in costs, a 20 % difference in the average unit amount is planned.

SC03_O37_A03_BN - Unit aid per beneficiary for aid for the control of bee diseases and pests

On the basis of the amendment of the apiculture programme in 2021, the Hungarian decree of title entered into force in 2021 for measures falling under this type of intervention, taking into account the available 1-year historical data collected by the paying agency, the average amount of EU aid per beekeeper actually making use of the aid in euros and, as of 2024, the average EU aid amount for beekeepers' applications. . [Pursuant to Article 44(2)(a) (i) SPR.]

We do not count for payments in the first quarter of FY2024, and in the subsequent periods we calculate the output of the claim. Taking into account available data and expected cost increases, the following outputs and unit amounts are planned.

Support for the control of bee diseases and pests is calculated on the basis of 12500 applications and a unit amount of EUR 235.5 per EU subsidy for financial year 2024, 8500 applications and EUR 338 per application for the financial year 2025-2027.

The budget planned to support products and equipment to maintain the health status of the bee population, as well as the unit amount, will increase significantly, keeping the number of eligible applications at the same level during the amendment of the CAP plan, with a significant increase in applications in 2024 and a subsequent normalisation of the number of applications in view of the publication of the new item regulation in 2024.

Due to the uncertainty of the level of cost increase, a 20 % difference in the average unit amount is planned.

SC03_O37_A04_BN - Unit aid per beneficiary for the development of bee genetic stock

On the basis of the amendment of the apiculture programme in 2021, the Hungarian decree of title entered into force in 2021 for measures falling under this type of intervention, taking into account the available 1-year historical data collected by the paying agency, the average amount of EU aid per beekeeper actually making use of the aid in euros and, as of 2024, the average EU aid amount for beekeepers' applications. [Pursuant to Article 44(2)(a) (i) SPR.]

We do not count for payments in the first quarter of FY2024, and in the subsequent periods we calculate the output of the claim. Taking into account the available data, the following outputs and unit amounts are planned.

To support the development of bee genetic resources, a unit amount of 2800 applications and an application of EUR 71.5 per EU subsidy for the financial year 2024-2027 is calculated. EUR 116 from 2025 onwards

The planned framework for support for genetic renewal, as well as the number of eligible applications during the amendment of the CAP plan, will be

significantly reduced and the unit amount will be reduced.

Due to the uncertainty of the level of cost increase, a 20 % difference in the average unit amount is planned.

SC03_O37_A05_BN - Unit aid per beneficiary for the purchase of equipment to facilitate migration

On the basis of the amendment of the apiculture programme in 2021, the Hungarian decree of title entered into force in 2021 for measures falling under this type of intervention, taking into account the available 1-year historical data collected by the paying agency, the average amount of EU aid per beekeeper actually making use of the aid in euros and, as of 2024, the average EU aid amount for beekeepers' applications. . [Pursuant to Article 44(2)(a) (i) SPR.]

In the first quarter of FY2024, a beneficiary output is calculated, with an application output in the subsequent periods. Taking into account the available data, the following outputs and unit amounts are planned.

We use 150 beneficiaries, EUR 250/beneficiary per unit amount per EU grant in the first quarter of FY2024, 1000 applications for a further three quarters, a unit amount of EUR 185 per application and 1100 and 202 per year for the years 2025 to 2027 to support the acquisition of migration facilities.

The budget planned to support the instruments, as well as the number of eligible applications, will be significantly reduced during the amendment of the CAP plan and the unit amount will be reduced.

Due to the uncertainty of the level of cost increase, a 20 % difference in the average unit amount is planned.

SC03_O37_A06_ON - Unit aid per application for asset development in the apiculture sector

On the basis of the apiculture programme amended in 2021, the average EU aid amount in euros for measures falling under this type of intervention in the Hungarian Decree of title entered into force in 2021, taking into account the available 1-year historical data of the paying agency, at the request of the beekeepers who actually made use of the aid. [Pursuant to Article 44(2)(a) (i) SPR.]

In the first quarter of FY2024, a beneficiary output is calculated, with an application output in the subsequent periods. Taking into account available data and expected cost increases, the following outputs and unit amounts are planned.

Support for the extraction and presentation of honey and apiculture products, as well as for the storage of combs and the modernisation of other tangible assets used in apiculture, is calculated for a further three quarters of the 2024 financial year with 300 applications, a unit amount of EUR 188.5 per year and 500 applications and 150 units per year for the years 2025 to 2027.

The budget planned to support the instruments, as well as the number of eligible applications, will be significantly reduced during the amendment of the CAP plan and the unit amount will be reduced.

Due to the uncertainty of the level of cost increase, a 20 % difference in the average unit amount is planned.

SC03_O37_A07_ON - Unit aid per application for the purchase of equipment to support the activities of apiculture organisations

On the basis of the apiculture programme amended in 2021, the average amount of EU aid in euros granted at the request of the apiculture organisations actually making use of this type of intervention is the average amount of EU aid in euros for measures falling under this type of intervention, which entered into force in 2021, taking into account the available 1-year historical data collected by the paying agency. [Pursuant to Article 44(2)(a) (i) SPR.]

In the first quarter of FY2024, a beneficiary output is calculated, with an application output in the subsequent periods. Taking into account available data and expected cost increases, the following outputs and unit amounts are planned.

Support for the purchase of equipment to support the activities of apiculture organisations is calculated for the three additional quarters of 2024 with 100 applications, a unit amount of EUR 241.5 per year and 100 applications and 250 units per year for the years 2025 to 2027. The budget planned to support the instruments is limited, the number of eligible applications and the unit amount decrease significantly during the amendment of the CAP plan due to the change in output unit.

Due to the uncertainty of the increase in costs, a 20 % difference in the average unit amount is planned.

SC03_O37_A08_ON - Unit aid per application for aid for the control of bee diseases and pests

On the basis of the apiculture programme amended in 2021, the average EU aid amount in euros for measures falling under this type of intervention in the Hungarian Decree of title entered into force in 2021, taking into account the available 1-year historical data of the paying agency, at the request of the beekeepers who actually made use of the aid. [Pursuant to Article 44(2)(a) (i) SPR.]

We do not count for payments in the first quarter of FY2024, and in the subsequent periods we calculate the output of the claim. Taking into account available data and expected cost increases, the following outputs and unit amounts are planned.

Support for the control of bee diseases and pests is calculated on the basis of 12500 applications and EUR 235.5 per additional three quarters of financial year 2024, 8500 applications per year and EUR 338 per year in the financial year 2025-2027. The budget planned to support products and equipment to maintain the health status of the bee population, as well as the unit amount, will increase significantly, keeping the number of eligible applications at the same level during the amendment of the CAP plan, with a significant increase in applications in 2024 and a subsequent normalisation of the number of applications in view of the publication of the new item regulation in 2024.

A 20 % difference in the average unit amount is planned due to uncertainty about the level of cost increase

SC03_O37_A09_ON - Unit aid per application for the development of bee genetic resources

On the basis of the apiculture programme amended in 2021, the average EU aid amount in euros for measures falling under this type of intervention in the Hungarian Decree of title entered into force in 2021, taking into account the available 1-year historical data of the paying agency, at the request of the beekeepers who actually made use of the aid. [Pursuant to Article 44(2)(a) (i) SPR.]

We do not count for payments in the first quarter of FY2024, and in the subsequent periods we calculate the output of the claim. Taking into account available data and expected cost increases, the following outputs and unit amounts are planned.

The planned envelope to support genetic renewal, which proved to be oversized, was temporarily significantly reduced and the unit amount decreased during the amendment of the latter CAP plan. To support the development of bee genetic resources, a unit amount per year of EU aid of 2.800 applications and EUR 71,5 per year is calculated for financial year 2024. In the years 2025 to 2027, on the basis of the rebounding needs, it is necessary to revisit the support framework, to increase it and to increase the unit amount in order to preserve the aid intensity due to increased mother production costs. Thus, for the financial years 2025 to 2027, we calculate a unit amount per EU subsidy per application of 2800 applications and an application of EUR 116.

A 20 % difference in the average unit amount is planned due to uncertainty about the level of cost increase

SC03_O37_A10_ON - Unit aid per application for the acquisition of equipment to facilitate migration

On the basis of the apiculture programme amended in 2021, the average EU aid amount in euros for measures falling under this type of intervention in the Hungarian Decree of title entered into force in 2021, taking into account the available 1-year historical data of the paying agency, at the request of the beekeepers who actually made use of the aid. [Pursuant to Article 44(2)(a) (i) SPR.]

In the first quarter of FY2024, a beneficiary output is calculated, with an application output in the subsequent periods. Taking into account available data and

expected cost increases, the following outputs and unit amounts are planned.

We use 1000 applications, a unit amount of EUR 185 per year and 1100 applications and 202 unit amounts per year for the years 2025 to 2027 to support the acquisition of migration equipment in the additional three quarters of FY2024. The budget planned to support the instruments, as well as the number of eligible applications during the amendment of the CAP plan, will be significantly reduced and the unit amount decreases due to the change in output unit.

Due to the uncertainty of the level of cost increase, a 20 % difference in the average unit amount is planned.

10 Planned Unit Amounts - Financial table with output

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	Total 2023 - 2027
SC03_O37_A01_BN - Unit aid per beneficiary for equipment development in the apiculture sector	Planned unit amount (Total Union expenditure in EUR)	250.00	250.00	0.00	0.00	0.00	
	O.37 (unit: Beneficiaries)	1,500.00	274.00	0.00	0.00	0.00	Sum: 1,774.00 Max: 1,500.00
	Annual indicative financial allocation (Total Union expenditure in EUR)	375,000.00	68,500.00	0.00	0.00	0.00	443,500.00
SC03_O37_A02_BN - Unit aid for the purchase of equipment to support the activities of apiculture organisations	Planned unit amount (Total Union expenditure in EUR)	600.00	600.00	0.00	0.00	0.00	
	O.37 (unit: Beneficiaries)	50.00	3.00	0.00	0.00	0.00	Sum: 53.00 Max: 50.00
	Annual indicative financial allocation (Total Union expenditure in EUR)	30,000.00	1,800.00	0.00	0.00	0.00	31,800.00
SC03_O37_A03_BN - Unit aid per beneficiary for aid for the control of bee diseases and pests	Planned unit amount (Total Union expenditure in EUR)	224.59	224.59	0.00	0.00	0.00	
	O.37 (unit: Beneficiaries)	8,000.00	0.00	0.00	0.00	0.00	Sum: 8,000.00 Max: 8,000.00
	Annual indicative financial allocation (Total Union expenditure in EUR)	1,796,727.00	0.00	0.00	0.00	0.00	1,796,727.00
SC03_O37_A04_BN - Unit aid per beneficiary for the development of bee genetic stock	Planned unit amount (Total Union expenditure in EUR)	167.50	167.50	0.00	0.00	0.00	
	O.37 (unit: Beneficiaries)	3,000.00	0.00	0.00	0.00	0.00	Sum: 3,000.00 Max: 3,000.00

	Annual indicative financial allocation (Total Union expenditure in EUR)	502,500.00	0.00	0.00	0.00	0.00	502,500.00
SC03_O37_A05_BN - Unit aid per beneficiary for the purchase of equipment to facilitate migration	Planned unit amount (Total Union expenditure in EUR)	250.00	250.00	0.00	0.00	0.00	
	O.37 (unit: Beneficiaries)	2,000.00	150.00	0.00	0.00	0.00	Sum: 2,150.00 Max: 2,000.00
	Annual indicative financial allocation (Total Union expenditure in EUR)	500,000.00	37,500.00	0.00	0.00	0.00	537,500.00
SC03_O37_A06_ON - Unit aid per application for asset development in the apiculture sector	Planned unit amount (Total Union expenditure in EUR)	0.00	188.50	150.00	150.00	150.00	
	O.37 (unit:)	0.00	300.00	500.00	500.00	500.00	Sum: 1,800.00 Max: 500.00

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

5 Specific design, requirements and eligibility conditions of the intervention

Description

Marketing and promotion activities linked to the events and on their own are primarily aimed at raising consumer awareness, increasing consumer confidence and understanding of the benefits of organic products. This activity includes e.g. beekeeping meetings, honey festivals, schools, honey tasting, distribution of promotional and information material, or the organisation of player competitions on

pollinators and the distribution of painters to children. The members of the Honey Knight Order are regular participants in these occasions, where their mere appearance is of considerable marketing value. Monitoring measures to improve the quality of apiculture products increase market orientation by monitoring honey marketed in Hungary, which differs from the mandatory analyses and official controls. The quality improvement measure is based on the continuous monitoring, sampling and evaluation of the apiculture organisation representing beekeepers, the results of which are accessible to anyone, thus helping to increase conscious consumption and produce quality. The aim of the measure is not to support laboratories, but the entire monitoring activity, which has an indirect impact on improving product quality due to the publication of the monitoring results.

The national coordination of the above activities, together with market monitoring, is carried out by the apiculture organisation with the involvement of an expert.

The costs of marketing and promotion activities, monitoring and coordination of apiculture products and market monitoring related to these activities are eligible.

The monitoring of commercial honey is subject to the publication of the results. Publication takes place in a professional journal and/or on the website of the national apiculture organisation, which may, where appropriate, encourage the distributor to develop and update the technology.

Continuation of the well-functioning measures of the apiculture programme with those for which the above objectives are supported. Detailed internal rules shall be drawn up for the implementation of the intervention.

It does not complement other interventions within the two pillars.

Beneficiary:

national apiculture organisation.

Eligible costs for the intervention:

monitoring, marketing and promotion costs, administrative costs, analysis and publication costs.

Ineligible costs: cost of testing by a non-accredited laboratory.

Interventions shall address the specific objectives set out in Article 6(1)(b) and (f) of the Strategic Plan Regulation and the horizontal objective referred to in paragraph 2. Market orientation and economic competitiveness are enhanced by promotion, communication and marketing (Article 55(1)(f) of the Strategic Plan Decree). Consumer awareness is also strengthened through awareness-raising (SO2, CCO). Adequate information for consumers also serves to raise awareness of the importance of biodiversity (SO6, CCO).

The 2023 CAP envelope can also be used to cover support needs arising during the extended period of the 2022 apiculture year (01/08/2022 – 31.12.2022).

6 Form and rate of support/amounts/calculation methods

A grant of up to 100 % of the certified costs for each action, or a specific amount covering part of the costs, with a ceiling for other actions.

The planned support envelope for 2023 (EU part of EUR 127800/year, domestic part of EUR 127800/year) because the amount allocated for the extended apiculture year 2022 is no longer included. The EU part of the amount deducted for the extended apiculture year is EUR 14200/year and the domestic part is EUR 14200/year.

Planned support framework 2024-2027 (2024. The EU's share is EUR 122645 and the domestic part is EUR 122645; 2025-2027 The EU part is EUR 125747,5 and the domestic part is EUR 125747,5) based on the fact and utilisation of the increased MMNP 2020-2021 funding period, taking into account the fact that some of the events and trainings were cancelled or online during the COVID outbreak and that online solutions are expected to continue to flourish in the future.

The planned support framework is determined on the basis of the co-financed actual data and utilisation of the increased MMNP 2020-2021 funding period, taking into account the decrease in activity during the

period considered due to the COVID outbreak, but the reinvigoration of marketing activities at the end of the outbreak. In addition, the experience and changes in needs of 2022-2023 have been taken into account, leading to a slight correction of the use of the framework, thus increasing the planned framework by 2.5 % to introduce support for the coordination of market monitoring activities.

7 Additional information specific to the Type of Intervention

—

8 WTO compliance

Green Box

Paragraph 2 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The intervention corresponds to the marketing and promotion services referred to in paragraph 2(f) of Annex 2 to the WTO Agreement on Agriculture.

9 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Planned Unit Amount	Region(s)	Result Indicator(s)
SC01_O37_A01_BN - Unit aid to beneficiaries of apiculture marketing measures	Average		
SC01_O37_A02_ON - Unit aid per application for apiculture marketing measures	Average		

Description

SC01_O37_A01_BN - Unit aid to beneficiaries of apiculture marketing measures

The amount of aid in euro per application based on the planned action number of the measures for marketing apiculture.

On the basis of the apiculture programme amended in 2021, some of the measures that fall under this type of intervention in the Hungarian legal title decree, which entered into force in 2021, are not eligible for support during the implementation of the CAP plan, while others have not been used due to the COVID-19 outbreak, so we do not have historical data for planning purposes for the national apiculture programme. We therefore reviewed the costs of the apiculture marketing activities previously carried out by apiculture associations, taking into account the increase in costs. Furthermore, Hungary plans to increase its marketing and promotion activities, which also requires the coordination of domestic and foreign marketing activities related to the Hungarian apiculture sector. Together with quality improvement measures that also serve marketing purposes, we obtained data on the average costs of these interventions to establish the unit amount.

In the first quarter of FY2024, a beneficiary output is calculated, with an application output in the subsequent periods. Based on the experience of recent years, despite maintaining the number of events at a level and the foreseeable increase in the costs of the CAP plan, we use 1 beneficiary, EUR 7100 per beneficiary per unit per EU grant in the first quarter of FY2024, an amount of 16 applications for the remaining three quarters, a unit amount of EUR 7040,5 per application and 19 annual requests and 6 618 unit amounts for the years 2025 to 2027 due to cost savings.

Due to the uncertainty of the increase in the cost of events, a 20 % difference in the average unit amount is planned.

SC01_O37_A02_ON - Unit aid per application for apiculture marketing measures

The amount of aid in euro per application based on the planned action number of the measures for marketing apiculture.

On the basis of the apiculture programme amended in 2021, some of the measures that fall under this type of intervention in the Hungarian legal title decree, which entered into force in 2021, are not eligible for support during the implementation of the CAP plan, while others have not been used due to the COVID-19 outbreak, so we do not have historical data for planning purposes for the national apiculture programme. We therefore reviewed the costs of the apiculture marketing activities previously carried out by apiculture associations, taking into account the increase in costs. Furthermore, Hungary plans to increase its marketing and promotion activities, which also requires the coordination of domestic and foreign marketing activities related to the Hungarian apiculture sector. Together with quality improvement measures that also serve marketing purposes, we obtained data on the average costs of these interventions to establish the unit amount.

In the first quarter of FY2024, a beneficiary output is calculated, with an application output in the subsequent periods. Based on the experience of recent years, and due to the foreseeable increase in the number and costs of events, we calculate 16 applications for a further three quarters of the 2024 financial year, a unit amount per application of EUR 7040,5 and an annual application of 19 years and 6618 for the years 2025 to 2027.

Due to the uncertainty of the increase in the cost of events, a 20 % difference in the average unit amount is planned.

10 Planned Unit Amounts - Financial table with output

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	Total 2023 - 2027

2.1.11	Creation of new plantations, refurbishment and modernisation of plantations	2	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.9 Share of farmers receiving investment support to restructure and modernise, including to improve resource efficiency

5 Specific design, requirements and eligibility conditions of the intervention

Description

In accordance with Article 58(1)(a)(i), (ii), (iii) and (iv) of the SPR Regulation, only the relocation, varietal conversion or grafting of vineyards with a replanting permit, the improvement of the techniques of cultivation of plantations and the replanting of vineyards following compulsory grubbing-up for health or phytosanitary reasons ordered by the competent authority of the Member State shall be possible under the intervention. No support will be provided for any other type of investment operation.

With a view to renovating and modernising plantations, the measure focuses on varieties that are most linked to the soil and climate characteristics and winegrowing traditions of the wine-growing regions and for which there is market demand in the long term. In addition, one of our aims is to involve the best places of production; therefore, priority is given to areas where the cadastre of the vineyard area is higher. Taking into account the above-mentioned criteria, plantations help to increase the operational and business efficiency of production.

Plant health problems with capital destruction in Hungary have increased over the last decade. Therefore, in the event of compulsory grubbing-up, which becomes essential in the course of protection, vine

growers should be able to plant the grubbed-up with aid in order to reduce their income as little as possible.

(a) Individual plans may only be approved if they are in possession of a valid replanting authorisation to carry out the activities.

(b) No individual plan for varietal conversion or transplantation may be submitted:

Where the operation has been started before the submission of the individual plan;

For which restructuring aid has been granted in the 10 wine years preceding the submission of the individual plan;

Whose eligible area is less than 0.12 ha.

(C) In the case of development of wine-growing techniques, it is not possible to submit an individual plan for an area:

Where the operation started before the submission of the individual plan;

Which have granted restructuring aid in the 10 wine years preceding the submission of the individual plan;

With an eligible area of less than 0.21 ha;

4. where the area indicated in the individual plan is not considered as a growing vineyard.

In the case of a measure under paragraph 1(iii) of the SPR Regulation, the rules on replanting or resettlement shall apply.

6 Form and rate of support/amounts/calculation methods

We wish to calculate the level of support on the basis of unit costs determined in accordance with Article 44(1)(b) of the SPR Regulation. The unit costs are established on the basis of a document certifying actual costs drawn up for an intervention under Article 44(2)(a)(i) and (ii) of the SPR Regulation. The aid is calculated on the basis of the costs accepted on the basis of the supporting document as follows:

The amount of the aid is the flat-rate costs and compensation as evidenced by the supporting documents

(a) up to 75 % where the area covered by the measure is located in a world heritage area and the world heritage area is located in a less developed region

(b) up to 60 % if the area concerned by the measure does not fulfil the condition set out in point (a), but complies with the restructuring plan of the geographical indication in which the area concerned by the measure is located,

(C) up to 50 % if the individual plan does not comply with any restructuring plan.

This measure contributes to the achievement of the objective set out in Article 60(4) of Regulation (EU) No 2115/2021 by planting vine varieties resistant to diseases. The planting of varieties resistant to diseases contributes to the achievement of the objective set out in Article 12(1), point (c), of Regulation (EU) 2022/126 by reducing the demand for chemicals for the cultivation of those vine varieties, thereby reducing the environmental burden. In the last 3 wine years, between 2019/2020 and 2021/2022, 480 hectares of inter-specific varieties have been planted under the vineyard restructuring and conversion measures. During this time, 270 winegrowers planted interspecific varieties. As of the 2023/2024 wine marketing year, we expect 40 hectares of inter-specific vine varieties to be planted per year. This means 75 winegrowers between 2024 and 2027. Taking into account the planned unit amount of RESTVINEY(58(1)a) EUR 546.800 is added, contributing to the target set out in Article 60(4) of Regulation (EU) 2021/2115.

7 Additional information specific to the Type of Intervention

All information on the intervention is given in point 6

8 WTO compliance

Green Box

Paragraph 11 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The objective of the aid is to eliminate structural handicaps that can be objectively demonstrated on the basis of paragraph 11(a), by providing that the condition of the aid is only an objectively ascertainable priority or eligibility criterion aimed at eliminating structural handicaps.

9 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Planned Unit Amount	Region(s)	Result Indicator(s)
SC05_O36_A01_HA - Relocation, varietal conversion, modernisation of the support system	Average		R.9

Description

SC05_O36_A01_HA - Relocation, varietal conversion, modernisation of the support system

The unit amount, determined on the basis of actual data for 2021 (ISAMM 00652 reports), shows the average amount of aid paid for the improvement of relocation, varietal conversion and cultivation techniques per hectare. Unit amounts have increased since 2018 and exceeded EUR 10200/ha in 2021. Taking into account inflation forecasts affecting input prices and expected wage growth, the unit amount is expected to increase by 30 %. In determining the maximum planned unit amount, we have taken into account that needs are expected to be shifted towards higher support-intensive investments, which could result in an expected increase in the unit amount. The unit amount per hectare and based on the individual plans submitted will be clarified on the basis of the aid application amount for the year in question. The method for establishing the unit costs determining the unit amount is set out in the supporting document prepared for the measure, which is prepared on the basis of Article 44(2)(a) of Regulation (EU) 2021/2115.

10 Planned Unit Amounts - Financial table with output

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	Total 2023 - 2027

R.15 Supported investments in renewable energy production capacity, including bio-based (in MW)

R.16 Share of farms benefitting from CAP investment support contributing to climate change mitigation and adaptation, and to the production of renewable energy or biomaterials

R.9 Share of farmers receiving investment support to restructure and modernise, including to improve resource efficiency

5 Specific design, requirements and eligibility conditions of the intervention

Description

The wine and wine sector requires targeted investment support, which provides funds for the long term, in a pre-planned manner and under conditions known in advance, by creating new modern production capacities.

Winegrowers suffer from a shortage of labour, the efficiency of vine production and their competitiveness can be improved by increasing the mechanisation and modernisation of cultivation. It is therefore necessary to support the purchase of machinery for wine-growing.

In order to stop and reduce the growing wild damage in vineyards, we want to make it possible to set up wildlife fences and nets. This will also help winegrowers to make wine growers more profitable.

Improving the operational and business efficiency of production requires the use of modern energy-saving tools in wineries. Modern equipment and technological solutions make it possible to increase the level of processing.

Aid may only be granted for the purchase of new machinery and equipment, including computer software. All machinery must be purchased and installed before the aid is claimed. As the measures are limited to the purchase of new machinery, operations such as buildings, real estate or leasing are not eligible under the measure.

The objective of this measure is to improve the overall performance of the enterprise and to improve its adaptation to market needs and to increase its competitiveness, and applies to the production or marketing of grapevine products as referred to in Article 50(1) of Regulation (EU) No 1308/2013.

The aid may not exceed HUF 100 million for a single beneficiary in the case of wine-making machinery. In the case of machinery for viticulture, a maximum of HUF 10 million per applicant.

The eligible costs are based on supporting documents submitted by applicants. The eligible costs proposed are:

- Purchase of machinery and equipment for vine cultivation, including related computer software, Production or marketing of wineproducts: the purchase of new machinery and equipment, including computer software,
- Quality control: the purchase of new machinery and equipment, including computer software,
- Marketing of wine products: the purchase of new machinery and equipment, including computer software,
- Investments generally linked to the economy: purchase of new machinery and equipment, including computer software.

Only new non-used fences, nets, nets, fencing elements and their fixation equipment, as well as labour costs related to the establishment, shall be eligible for support.

In order to ensure that the proposed costs of products do not exceed normal market prices, applicants should provide detailed cost estimates attached to the application. Cost estimates must be based on several offers, which the applicant must attach to the application.

Eligibility criteria for applications for the purchase of machinery for viticulture:

Aid shall be granted for phytotechnical machines for vine cultivation, stock purification, truncation, foliage, pre-pruning and foliage.

-minimum farm size 4 ha (taking into account the size of the vineyards used by the applicant)

Selection criteria:

-the order of applicants for aid is determined by the ascending order of farm size and turnover.

We intend to enforce compliance with Article 12(1)(a) of Regulation (EU) No 126/2022 partly in this measure by supporting investments in renewable energy production. For energy saving investments, support shall only be granted to the extent set out in Article 11(3) of Regulation (EU) 2022/126.

6 Form and rate of support/amounts/calculation methods

The amount of aid calculated in accordance with Article 59(2)(a) and (b) of the SPR Regulation shall be the amount of the aid certified under Article 44(1)(a) of the SPR Regulation.

For wildlife protection equipment, we wish to calculate the level of support on the basis of unit costs established in accordance with Article 44(1)(b) of the SPR Regulation. The unit costs are established on the basis of a document certifying actual costs drawn up for an intervention under Article 44(2)(a)(i) and (ii) of the SPR Regulation.

7 Additional information specific to the Type of Intervention

8 WTO compliance

Green Box

Paragraph 11 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

The objective of the aid is to eliminate structural handicaps that can be objectively demonstrated on the basis of paragraph 11(a), by providing that the condition of the aid is only an objectively ascertainable priority or eligibility criterion aimed at eliminating structural handicaps.

9 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Planned Unit Amount	Region(s)	Result Indicator(s)
SC06_O36_A01_BN - Investment in the wine sector	Average		R.15; R.16; R.9

Description

SC06_O36_A01_BN - Investment in the wine sector

For the calculation of the unit amount, we took into account the actual figure of the average subsidy amount per beneficiary for 2021 (ISAMM 00652 reports) for winemaking machinery and equipment. In 2021, the average grant amount was almost EUR 30000. Taking into account inflation forecasts affecting input prices and expected wage growth, the unit amount is expected to increase by 35 %. In determining the planned unit amount, we have taken into account that needs are expected to be shifted towards higher support-intensive investments, which could result in an expected increase in the unit amount. The unit amounts will be clarified on the basis of the aid applications submitted on the basis of the aid claim for the year in question.

10 Planned Unit Amounts - Financial table with output

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	Total 2023 - 2027

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold
R.5 Share of farms with supported CAP risk management tools

5 Specific design, requirements and eligibility conditions of the intervention

Description

The area is eligible if: • The applicant has a non-zero harvest report on the declared area for at least one year in the previous two years • The notified vineyard is registered as a production plantation for the last two years, • Appropriate pruning, nursing and plant protection in the previous year in the case of the declared vineyard, • The same parcel is not eligible for aid in two consecutive harvest years. Applications may not be submitted if the eligible area is less than 0.2 ha. The following activity consists of green harvesting: total removal of grape bunches in their immature state, thus reducing the production of the area concerned to zero.

Support may be granted for the following operations:

- Harvest costs;
- Loss of income from the sale of the grapes.

The green harvesting measure can be carried out manually or by machine, so that the implementation of the measure has no additional environmental impact compared to the normal harvest of the vineyard.

We intend to determine the actual amount of aid as a flat-rate aid on the basis of the average of the quantities of grapes harvested in the three years preceding the year of application of the measure divided by the eligible area. In the context of green harvesting in vineyards, the fixed flat-rate amount relates to the direct removal of grape bunches from the plant and to the loss of income resulting from such removal. The application of the measure is subject to the condition that pruning according to the cultivation method has been carried out in the area covered by the aid, plant-care, plant protection and weed management work in accordance with the growing season. The measurement of the eligible area for each area covered by the measure and the ex post verification of the area covered by the measure will be checked.

6 Form and rate of support/amounts/calculation methods

On the basis of Article 44(1)(b) of the SPR Regulation, the amount of the costs covered by the supporting documents drawn up in accordance with Article 44(2)(a)(i) of the SPR Regulation, as referred to in Article 59(3) of the SPR Regulation, is the aid.

SC07_O36_A01_HA - Area supported for green harvesting	Average		R.5

Description

SC07_O36_A01_HA - Area supported for green harvesting

The current value of the unit amounts has been calculated on the basis of the actual figures of the green harvesting measure applied in 2019 and 2020 (ISAMM 00652 reports), which will be clarified on the basis of the aid claims submitted if green harvesting is used. When planning the planned unit amount, account must be taken of the significant increase in the price of vines, which must be taken into account when determining the amount of aid. The method for establishing the unit costs determining the unit amount is set out in the supporting document prepared for the measure, which is prepared on the basis of Article 44(2)(a) of Regulation (EU) 2021/2115.

5 Specific design, requirements and eligibility conditions of the intervention

Description

Support for the development of a new wine-sector product, a new process or technology, a new packaging method or new production technique, or support adaptation in the case of technology not yet used in Hungary. At the operational level, which contributes to the efficiency of enterprises using the new technology or process and to the development of environmentally sound technologies.

Eligible measures

Through this intervention, we intend to support, inter alia:

the development of new technologies for the production of alcohol-reduced and de-alcoholised wine products,

research into the use of new environmentally friendly packaging in the wine sector,

the development and deployment of new technology and information technology (IT) solutions not yet in use in Hungary,

other innovative solutions.

As part of the intervention, no aid shall be granted for eligible machinery, equipment, technology and IT solutions under the investment measure – INVWINE(58(1)(b)).

Eligible: wine producers, universities, research institutes or consortia set up by them.

6 Form and rate of support/amounts/calculation methods

Reimbursement of eligible costs actually incurred by the beneficiary pursuant to Article 44(1)(a) of the SPR Regulation as follows:

50 % if the area concerned by the measure is located in a less developed region,

40 % if the area covered by the measure is located in a region other than the less developed regions.

R.1 Number of persons benefitting from advice, training, knowledge exchange, or participating in European Innovation Partnership (EIP) operational groups supported by the CAP in order to enhance sustainable economic, social, environmental, climate and resource efficiency performance

5 Specific design, requirements and eligibility conditions of the intervention

Description

In the wine sector, the provision of information to operators to comply with legal obligations (legislative changes) plays a key role in economic sustainability and increasing competitiveness.

The provision of advice to help meet the standards of employment conditions, employers' obligations, including rules on the employment of seasonal workers, types of employment contracts, rest periods and minimum wages, is of utmost importance in order to adapt to rapidly changing regulations. When preparing for compliance with occupational health and safety standards, risks can be reduced (e.g. harvest works, chemical use, risks of accidents and damage to health that may occur during cellar operations).

The advice covers general information related to legal obligations (e.g. employment conditions, simplified employment) and compliance with complex legal obligations such as excise legislation or waste management.

The advisory service provides an opportunity to present good practices, to develop and deliver solutions for a wide range of operators in the wine sector, which will make the daily work of operators in the wine sector easier and more efficient.

Advisory services may be aimed at:

- information to facilitate compliance with employment conditions, employer obligations and occupational health and safety requirements,
- to assist in compliance with general legislation,
- technical assistance for the fulfilment of administrative obligations,
- the transfer of knowledge of cultivation techniques,
- to facilitate business and business processes,
- to raise awareness of accounting rules.

The beneficiaries of the aid may be an interbranch organisation recognised in the wine sector.

The aid intensity is 50 % of the direct or eligible costs.

In view of the fact that the aid can only be used by a recognised interbranch organisation, of which only one is located in Hungary, it is not necessary to grant selection criteria.

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

R.39 Number of rural businesses including bio-economy businesses developed with CAP support

5 Specific design, requirements and eligibility conditions of the intervention

Description

Under the by-product distillation aid scheme, Hungary distils annually between 20000-32 000 tonnes of grape marc and 50000-150 000 hectolitres of wine lees through aid, helping to reduce the costs of withdrawal of the by-product of wine producers.

The beneficiary must be able to produce raw alcohol from by-products for industrial purposes. the beneficiary must have the technical and personnel conditions for receiving the by-products.

This aid shall be granted for the following operations:

- Delivery of the by-product to the distillery,
- Storage of the by-product,
- Distillation of the by-product.

All other operations are not supported.

6 Form and rate of support/amounts/calculation methods

Under Article 44(1)(b) of the SPR Regulation, the unit amount determined on the basis of Article 44(2)(a)(i) of the SPR Regulation.

We intend to partially enforce compliance with Article 12(1)(a) of Regulation (EU) No 126/2022 under this measure for an amount of EUR 1200000. In the context of subsidised distillation, most of the large-scale wine breast products can be withdrawn by means of controlled environmentally friendly technology and the use of renewable energy, with economical transport that is less onerous to the age. In the case of wine enterprises with large quantities of wine by-products, environmentally sound use of the by-products is practically excluded (e.g. return to soil in the absence of sufficient vineyards). Hungary does not have the capacity to compost a large quantity of wine by-products. Wine-growing enterprises are able to choose more environmentally appropriate cutting than handing over waste and coal water processing. By-products to be distilled are traced, so that the by-products do not end up uncontrolled in the surrounding area, in live water or in the sewage system.

9 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Planned Unit Amount	Region(s)	Result Indicator(s)
SC08_O36_A01_HL - Distillation of wine by-products	Average		R.39

Description

SC08_O36_A01_HL - Distillation of wine by-products

For the calculation of the unit amount, the average of the actual data for the years 2018-2021 (ISAMM 00652 reports) was taken into account for the aid for the distillation of grape marc and wine lees. When calculating the unit amount, we calculated the aid amount for distillation of EUR 1.1/hlf for grape marc and EUR 0.5/hlf for wine lees. When establishing the planned unit amount, the average unit amount of the aid paid for the distillation of grape marc and wine lees was determined on the basis of the actual figures for the reference period. For the maximum planned unit amount, we considered the possibility of distilling a higher percentage of marc, which could increase the value of the unit amount.

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

5 Specific design, requirements and eligibility conditions of the intervention

Description

The national information campaign contributes greatly to the competitive growth of the Hungarian wine sector. The Government of Hungary pays particular attention to the maintenance and creation of jobs. Preserving the rural population, protecting and developing local employment opportunities therefore play an important role.

Eligibility criteria:

—a clear description of the objectives pursued by the promotion activity on the basis of impact indicators reflecting its actual impact on the development of trade

—detailed description of how the objectives will be achieved by the selected sites, programme schedule and planned actions

—details that the applicant has sufficient human, technical and financial resources to ensure the effective implementation of the operation

—description of whether the applicant for aid possesses a sufficient quantity and quality of wine products

or how it can be provided during the implementation of the programme and in the following five years
In the case of the aid applicant, we will examine whether it has the necessary own contribution to the promotion programme to be implemented.

Selection criteria

—The applicant has not yet received promotion support or, if so, is targeting a new country or a new market in that country for which no promotion has been carried out

—Multi-country wine promotion programme

—The beneficiary association included in the wine promotion programme is also a member of a wine community organisation (or professional organisation)

—The wine promotion programme corresponds to the promotion plan or plans concerned

—Statement on the use of the graphic elements of the Hungarian wine image manual

—The actual implementation of the wine promotion programme would be carried out by an implementing body which had previously carried out an activity included in the wine powder programme

—The wine promotion programme contains a detailed description of the current market situation of the products covered by the promotion and the market situation to be achieved by the implementation of the programme

—High quality of the description of the current market situation of the products included in the wine promotion programme and of the market situation to be achieved by the implementation of the programme

—The submitter undertakes to submit an impact assessment assessing the impact and effectiveness of the programme, carried out by a body independent of the applicant and the implementing body

—The degree of reality of the quantified expected results of the wine promotion programme and the degree of consistency between these results and the costs set out in the wine promotion programme

6 Form and rate of support/amounts/calculation methods

Eligible costs actually incurred, certified and verified in accordance with Article 44(1)(a) of the SPR Regulation shall be the amount referred to in Article 59(7) SPR.

9 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Planned Unit Amount	Region(s)	Result Indicator(s)
SC09_O36_A01_BN - Producers receiving aid for wine promotion in third-countries	Average		

Description

SC09_O36_A01_BN - Producers receiving aid for wine promotion in third-countries

The unit amount was determined on the basis of the actual data for 2021 (ISAMM 00652 reports). On this basis, the aid amount per beneficiary amounted to almost EUR 20000. Taking into account inflation forecasts, expected wage growth and expected fuel costs, we expect a 50 % unit increase. When setting the maximum planned unit amount, it is assumed that applicants will implement more complex promotional activities with a larger budget. The determination of the unit amount will be reviewed on the basis of the cost relationships and actual commitments for the period.

10 Planned Unit Amounts - Financial table with output

5 Specific design, requirements and eligibility conditions of the intervention

Description

The EU wine sector has not only an economic but also a cultural heritage value. The reputation, history and wine-growing traditions of European vineyards are unique tourist attractions in the world. Promoting wine tourism is therefore important not only in terms of diversification, but also in terms of the identity of the regions, strengthening the market position of quality EU wines. Therefore, these services play a key role in economic sustainability and increasing competitiveness.

In order to improve the competitiveness of the grape and wine sector, it is necessary to increase the reputation of vineyards and to promote wine tourism in wine-growing regions. Wine tourism is an important factor in increasing the reputation and acceptance of wine-sector products with the characteristics of the production area and typical of a given region, which is able to demonstrate the characteristics of the production of these wine-sector products, the countryside and the importance of vineyards in the region. It is therefore important to inform consumers about the potential of wine tourism

by highlighting specific features and sending positive messages about it. The dissemination and dissemination of the opportunities and services associated with wine tourism, e.g. information boards, press products, online appearances or local, awareness-raising, will help to develop wine tourism and increase the region's reputation. Wine tourism, through direct contact with the producer, contributes to the dissemination of knowledge, to the consumer's knowledge, to the promotion of wine products and to the dissemination of relevant messages.

The activities of interbranch organisations help to increase competitiveness by increasing the choice of wine products more closely linked to regions, vineyards and vineyards by wine consumers with knowledge. The promotion of wine tourism facilitates direct sales, personal communication and experience in wine-growing and wine-making sites.

Supporting tourism based on cultural values fosters the sustainable development of EU wineries, contributes to a more conscious consumer attitude and promotes and publicises the lifestyles of winemakers. Wine tourism contributes to revitalising rural areas in a sustainable way, creating new income opportunities and increasing demand for wine.

Eligible activities:

- activities aimed at increasing the reputation of vineyards used by wine operators and contributing to the promotion of wine tourism.

The aid intensity is 50 % of the direct or eligible costs under Article 59(4) of the CAP ST Regulation.

In view of the fact that the aid can only be used by a recognised interbranch organisation, of which only one is located in Hungary, it is not necessary to grant selection criteria.

6 Form and rate of support/amounts/calculation methods

Article 44(1)(a) of the SPR Regulation

7 Additional information specific to the Type of Intervention

5 Specific design, requirements and eligibility conditions of the intervention

Description

The globalisation of the wine market, the rapid change in consumer habits and the emergence on export markets require new knowledge and strategies on the part of wineries. Small and medium-sized producers often struggle to respond to these challenges. A deeper understanding of market developments is an essential element for increasing economic sustainability and competitiveness in the wine sector. The aid is aimed at market monitoring and awareness-raising, which facilitates the transparency of the wine market and information-based decision-making.

The availability of data generated in the sector in an orderly manner after analysis and processing will contribute to improving the performance of operators in the wine sector in terms of the efficiency of sustainable economic, social, environmental and climate resources. Up-to-date market information and studies support their economic decisions to contribute to the competitiveness of operators in the wine sector.

The National Council of Wine Communities, as a recognised interbranch organisation in the sector, can make this information available to operators in the sector at events, electronic interfaces or presentations

organised specifically for this purpose.

Available data sources:

- domestic, European Union and international market data, market trends and changes thereto,
- country-specific analyses of changes in a country's market developments;
- data provided by industry during official procedures without personal data;
- the data that can be obtained from the mandatory data submissions of market participants,
- quantitative and qualitative market research on consumer habits and consumer needs.

On the basis of the results of the processing and analysis of available data, it will enable market participants to draw up and disseminate studies, forecasts of market developments and their expected changes.

These measures contribute to the stability of the wine market, enhance adaptability, increase competitiveness and facilitate market access.

Activities related to market information transfer:

- data collec.
- data analytics;
- preparation of a statement,
- transmission of statements and reports to producers, granting access to them.

Applications for aid shall be subject to the condition that they provide advice at least once a year, in a manner accessible to operators in the sector, with the content and form indicated in the aid application submitted by the interbranch organisation.

The aid intensity is 50 % of the direct or eligible costs under Article 59(4) of the CAP ST Regulation.

In view of the fact that the aid can only be used by a recognised interbranch organisation, of which only one is located in Hungary, it is not necessary to grant selection criteria.

4 Result indicator(s)

RESULT INDICATORS Code + Description Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold

5 Specific design, requirements and eligibility conditions of the intervention

Description

Promotion in third countries contributes greatly to the competitive growth of the Hungarian wine sector. Hungary needs to build new markets in third countries to reach new consumers. In addition to new beneficiaries, former beneficiaries are also encouraged.

Eligibility criteria:

—clear presentation of the objectives pursued by the promotion activity on the basis of impact indicators reflecting the real impact of the promotion activity on the development of trade

—detailed description of how the selected sites, programme schedule and planned actions serve to achieve the targets

—describe in detail that the applicant for support has sufficient human, technical and financial resources to ensure the effective implementation of the operation

—a description of whether the applicant possesses wine products of sufficient quantity and quality or how it can ensure it during the implementation of the scheme and in the following five years

In the case of the applicant, we will examine whether he has the necessary own contribution to the promotion programme planned to be carried out.

Selection criteria

—The applicant has not yet received promotion aid or, if so, targets a new country or new market in a given country for which no promotion has been carried out

- Multi-country wine promotion programme
- Member of a wine community organisation (or professional organisation) of the beneficiary association included in the wine promotion programme
- The wine promotion programme complies with the promotion plan or plans concerned
- Declaration on the use of the visual elements of the Hungarian wine image manual
- The actual implementation of the wine promotion programme would be carried out by an implementing body which had previously carried out the activity covered by the wine powdering programme
- The wine promotion programme shall contain a detailed description of the current market situation of the products promoted and the market situation to be achieved by the implementation of the programme
- High quality description of the current market situation of the products included in the wine promotion programme and of the market situation to be achieved by the implementation of the programme
- The applicant undertakes to submit an impact assessment carried out by an organisation independent of the submitter and the implementing body, assessing the impact and effectiveness of the programme
- The degree of reality of the quantified expected results of the wine promotion programme and the degree of consistency between these results and the costs defined in the wine promotion programme

6 Form and rate of support/amounts/calculation methods

Eligible costs actually incurred, certified and verified in accordance with Article 44(1)(a) of the SPR Regulation shall be the amount referred to in Article 59(7) SPR.

7 Additional information specific to the Type of Intervention

[All information on the intervention is given in point 6](#)

8 WTO compliance

Green Box

Paragraph 2 of Annex 2 WTO

Explanation of how the intervention respects the relevant provisions of Annex 2 to the WTO Agreement on Agriculture as specified in Article 10 of this Regulation and in Annex II to this Regulation (Green Box)

Under paragraph 2(f), it is intended to support marketing and advertising services, including a clear definition of the scope and timing of the eligible services.

9 Planned Unit Amounts - Definition

Planned Unit Amount	Type of Planned Unit Amount	Region(s)	Result Indicator(s)
SC10_O36_A01_BN - Beneficiaries receiving support for wine promotion in external markets	Average		

Description

SC10_O36_A01_BN - Beneficiaries receiving support for wine promotion in external markets

The unit amount was determined on the basis of the actual data for 2021 (ISAMM 00652 reports). On this basis, the aid amount per beneficiary exceeded EUR 150000. Taking into account inflation forecasts, expected wage growth and expected fuel costs, we expect a 33 % unit increase. When setting the maximum planned unit amount, it is assumed that applicants will implement more complex promotional activities with a larger budget. The determination of the unit amount will be reviewed on the basis of the cost relationships and actual commitments for the period.

10 Planned Unit Amounts - Financial table with output

Planned Unit Amount	Financial Year	2023	2024	2025	2026	2027	Total 2023 - 2027

2 Related Specific Objectives, Cross-Cutting Objective and relevant Sectoral Objectives

CAP SPECIFIC OBJECTIVE Code + Description	Recommended CAP Specific Objectives for this Type of Intervention are displayed in bold
SO4	Contribute to climate change mitigation and adaptation, including by reducing greenhouse gas emission and enhancing carbon sequestration, as well as promote sustainable energy
SO5	Foster sustainable development and efficient management of natural resources such as water, soil and air, including by reducing chemical dependency
SO6	Contribute to halting and reversing biodiversity loss, enhance ecosystem services and preserve habitats and landscapes
SO9	Improve the response of Union agriculture to societal demands on food and health, including high quality, safe, and nutritious food produced in a sustainable way, the reduction of food waste, as well as improving animal welfare and combatting antimicrobial resistances

3 Need(s) addressed by the intervention

Code	Description	Prioritisation at the level of the CAP Strategic Plan	Addressed in CSP
4.1.1	Improving the carbon sequestration capacity of soils and ecosystems	1	Yes
5.1.1	Developing soil and nutrient management at farm level	1	Yes
5.1.2	Reducing nutrient losses, preventing nutrient leaching	1	Yes
5.1.3	Restoring degraded soils and improving their water management	1	Yes
5.2.1	Sustainable use of surface and groundwater	1.	Yes
5.3.1	Promoting water retention in soil and landscape	1	Yes
5.4.1	Reducing emissions of air pollutants and particulate matter of agricultural origin	3	Yes

5.4.2	Reducing ammonia emissions from agriculture	2	Yes
5.5.2	Integrated environmentally friendly pest management	1	Yes
6.1.2	Maintenance or improvement of the natural condition of high nature value sites	1	Yes
6.1.3	Maintenance and development of grasslands in good ecological status and species richness	2	Yes
6.4.1	Developing up-to-date data collection and monitoring systems for measuring biodiversity	1	Partially
9.2.1	Promote the use of a rational, predictive targeted pesticide	1	Yes

4 Result indicator(s)

RESULT INDICATORS Code + Description	Recommended result indicators for the selected CAP Specific Objectives of this intervention are displayed in bold
R.12 Share of utilised agricultural area (UAA) under supported commitments to improve climate adaptation	
R.14 Share of utilised agricultural area (UAA) under supported commitments to reduce emissions or to maintain or enhance carbon storage (including permanent grassland, permanent crops with permanent green cover, agricultural land in wetland and peatland)	
R.19 Share of utilised agricultural area (UAA) under supported commitments beneficial for soil management to improve soil quality and biota (such as reducing tillage, soil cover with crops, crop rotation included with leguminous crops)	
R.20 Share of utilised agricultural area (UAA) under supported commitments to reduce ammonia emission	
R.21 Share of utilised agricultural area (UAA) under supported commitments for the quality of water bodies	
R.22 Share of utilised agricultural area (UAA) under supported commitments related to improved nutrient management	
R.23 Share of utilised agricultural area (UAA) under supported commitments to improve water balance	
R.24 Share of Utilised Agricultural Area (UAA) under supported specific commitments which lead to a sustainable use of pesticides in order to reduce risks and impacts of pesticides, such as pesticides leakage	
R.31 Share of utilised agricultural area (UAA) under supported commitments for supporting biodiversity conservation or restoration including high-nature-value farming practices	
R.33 Share of total Natura 2000 area under supported commitments	
R.34 Share of utilised agricultural area (UAA) under supported commitments for managing landscape features, including hedgerows and trees	

5 Specific design, requirements and eligibility conditions of the intervention

Describe what are the specific objectives and content of the intervention including specific targeting, principles of selection, links with relevant legislation, complementarity with other interventions/sets of operations in both pillars and other relevant information.

Objective of the intervention: —sustainable development of rural areas; —preserving and improving the state of the environment (soil and water) by developing a production structure appropriate to the conditions of the place of production, —avoiding and preventing agricultural environmental pressures, —strengthening agricultural practice based on the sustainable use of natural resources, —conservation of biodiversity, —by developing environmentally friendly farming and sustainable use of landscapes and landscape management, —improvement of agrobiodiversity, —improve livestock and crop production rates by encouraging extensive livestock farming, —promoting quality food production by promoting environmentally sound farming practices, —combating adverse climate change and adapting to climate change through an appropriate production

structure and land-use change.

Agri-environmental payments are a voluntary payment scheme whereby scheme participants undertake to carry out additional farming activities in order to achieve agri-environmental objectives. The aid is conditional on compliance with the activities undertaken for the duration of the commitment.

The intervention is based on specific, verifiable standards which, by their direct or indirect impact, achieve the objectives set by the intervention. The intervention is based on land use, for which the following 8 main categories are distinguished:

Horizontal:

1. Arable land (s)
2. Grassland (grass)
3. Plantation (u)
4. Cane (n)

Zonal:

5. AAU arable land
 - a. Football Protection Areas
 - b. Blue blood control areas
 - C. Inland bird protection areas
 - D. Mountain and hillside bird protection areas
6. MTÉ grassland
 - a. Football Protection Areas
 - b. Plain bird protection areas
 - C. Mountain and hillside bird protection areas
 - D. Nappal butterfly protection areas
7. Arable land for water protection:
 - a. Erosion-sensitive cropland
 - b. Inland water sensitive cropland
 - C. Fluice-sensitive cropland
8. Grasslands for water protection:
 - a. Inland water sensitive grassland

For each land use category, standards may fall into the following two categories:

a. **Basic agri-environmental management packages (mandatory):** *standards going beyond the other requirements listed in Article 70 of Regulation (EU) 2021/2115.*

These standards and/or combinations of standards shall be met by land use category (arable, grassland, plantation, reedy) or per area delimitation category (horizontal (A), zonal (ZA)) and the payment shall not be made per standard but as a single payment for all standards.

b. **Optional specifications (V):** *in addition to the basic package, provisions that address different environmental challenges (sown structure requirements, soil and water protection, biodiversity conservation, etc.) and from which beneficiaries are free to choose.*

By thematic group (on the basis of land use categories or demarcation) where the number of optional specifications allows a minimum of 2 standards to be chosen. The payment amount shall be determined per standard.

For operations under the type of intervention established pursuant to Article 70, where mandatory standards, requirements or obligations (benchmarks) are amended to bring them into line with the AÖP, the beneficiary may decide not to accept the adjustment/modification and the commitment in question shall cease to be valid and the farmer shall not be required to repay the aid already paid for the period of validity of the commitment.

Principles governing the establishment of selection criteria, which may be partially applied (selection criteria):

Farmers are selected on the basis of a scoring system which gives preference to those who make greater environmental commitments to their areas. Each specification has a stand-alone numerical value expressing the environmental added value of the Regulation, which differs from one territorial category to another.

The environmental value of the chosen standards is included in the selection criteria, i.e. farms with a higher environmental impact are given priority when allocating funds.

The selection criteria include the following elements:

Priority should be given to proposals with higher environmental added value as a general selection criterion. In particular:

—the environmental added value of the specifications chosen;

—the environmental delimitation of the area covered;

to be taken into account.

Natura 2000 agri-environmental payments:

The land use requirements for Natura 2000 grasslands and the grassland management requirements of the AEM overlap in whole or in part. If the farmer wishes to benefit from both types of aid for the same area, he would be paid twice for the same requirements. In order to avoid overcompensation, compliance with the cost-related requirements in both places can only be compensated under one of the aid schemes, and therefore, in the case of Natura 2000 grassland payments, the AEM payments for the same area will be reduced by the aid sub-total for the ‘common’ standards.

The following cut-off categories are taken into account in the design at block level:

- Natura 2000
- ATAFF Areas
- Nitrate vulnerable zones
- Erosion-sensitive areas
- Inland Water Vulnerable Areas
- Drought vulnerable areas

Link to other interventions:

RD58_A01_TRA_78 – Support for training and demonstration facilities

Define eligible beneficiaries and specific eligibility criteria where relevant related to the beneficiary and area

Eligible Beneficiaries: farmers;

Eligibility criteria

—The area covered by the aid shall be at least 1 ha for each crop and 2 ha if the ‘maintenance of traditional fruit orchards’ standard is chosen in the case of vineyards. The ‘maintenance of traditional fruit’ requirement is not optional in the case of vineyards.

—With the exception of the ‘maintenance of traditional fruit’ requirement in the case of vineyards, the age of the plantations imported into the aid may not exceed 26 years in the year of submission of the application, except for walnuts, chestnuts and grapes.

—The farmer is entitled to impose a local standard only in respect of areas defined at the physical block level, in the area indicated in the LPIS or as verifiable from the specified bodies, in respect of areas meeting the territorial criteria.

—Ensure that commitments other than support under Article 31 of Regulation (EU) 2021/2115 (Basic Agro-Ecological Programme) are implemented.

- At the same time, the continuous area covered by the commitment included in the agri-environmental management payment may not be included in the support for organic farming.

Define eligible type of support (non-IACS) or commitments (IACS) and other obligations

Commitments (commitments):

—The beneficiary participates in compulsory training related to the grant. The aid applicant shall be exempted from the training obligation if it has already been completed within the 5 years preceding the date of submission of the aid application.

—Managing the management log.

The commitments, aid amounts per standard, land use (arable, grassland, plantation, reed) and area delimitation (horizontal, zonal) category for each thematic set of specifications are set out in the tables below. The following tables also show the identification of reference levels and usual farming practices beyond which the requirements of the sub-measure go beyond.

Abbreviations used for the legal identification of the reference level:

- GAEC: Good Agricultural and Environmental Conditions (GAEC)
- SMR 2: Statutory Management Requirements (SMR)
- GOM: Mandatory Code of Good Practice
- NJSZ: Other binding requirements laid down in national legislation
